GENERAL INFORMATION ABOUT THE CONTENTS OF THIS FILE

Submissions by the public in compliance with the Commission Rules and Operating Procedures (ROPs), Rule 4.3, are distributed to the Commission and uploaded online. Please note that "compliance" means that the submission complies with deadline, delivery method (hard copy and/or electronic) AND the number of copies. Please review the Commission ROPs to ensure that you meet the submission requirements. The ROPs can be accessed at **http://planning.lacity.org**, by selecting "Commissions & Hearings" and selecting the specific Commission.

All compliant submissions may be accessed as follows:

- **"Initial Submissions"**: Compliant submissions received no later than by end of day Monday of the week prior to the meeting, which are not integrated by reference or exhibit in the Staff Report, will be appended at the end of the Staff Report. The Staff Report is linked to the case number on the specific meeting agenda.

- **"Secondary Submissions"**: Submissions received after the Initial Submission deadline up to 48-hours prior to the Commission meeting are contained in this file and bookmarked by the case number.

- **"Day of Hearing Submissions"**: Submissions after the Secondary Submission deadline up to and including the day of the Commission meeting will be uploaded to this file within two business days after the Commission meeting.

Material which does not comply with the submission rules is not distributed to the Commission.

ENABLE BOOKMARS ONLINE:

Project Site: 456 West 9th Street, San Pedro CA 90731
Case No: ADM-2018-5752-DB-SIP

Dear City Planning Commission,

Please let it be known that we are adamantly against this project as it is currently specified. The parking spaces being taken away from the general public are very important for the downtown businesses to survive.

In order to gain our support for this project, LINC-Core San Pedro Lofts LP would need to provide the same parking spaces that exist now, in addition to their dwelling units parking. Thereby adding several more parking levels to the project.

It's unconscionable that City Planning will allow this project to remove the current amount of parking without requiring the same parking to be included as part of the site.

Sincerely,

Mary Jo + Robert Masters

Re: Case no. ADM-2018-5752-DB-SIP

Hi Connie,

I wanted to follow up from our phone conversation today. Thank you for taking the time to answer my questions!

To recap, I'm representing Alliance Alice M. Baxter College-Ready High School, located at 461 W 9th St, San Pedro, CA 90731, across the street from the proposed project. The school enrolls 300+ students in 9-12th grade and employs 30+ staff members. We are a full high school offering college-prep curriculum, not a vocational school as the hearing notice shows on parcel 145.

Because of our space constraints on site, the school uses at least 30 municipal parking spaces every day for staff members as well as students, parents, vendors, and other stakeholders. This is our only concern about the proposal. Currently, the municipal lot has around 100 public spots, whereas the proposal only allocates 52 spots for public use. This creates a serious inconvenience for anyone who needs to visit Alliance Baxter, which is a growing school with increasing enrollment. We would ask that more spots be allocated for public use and/or that a certain number of spots be allocated *only* for Alliance Baxter use.

I look forward to attending the hearing on Thursday morning and will reiterate these concerns when given the opportunity.

As another note, the school never received the hearing notice sent to the school. It was only brought to our attention this week through a concerned neighbor.

Thank you for your time,
Rebeccah

Re: Project Site: 456 W. 9th St., San Pedro, CA 90731

Case No: ADM-2018-5752-DB-SIP

Attn: City Planning Commission,

As owners of the building and Gallery 478 at 478 West 7th St., we agree with the idea of affordable housing but are very concerned regarding any loss of public parking.

It appears that the proposed project would take away the number of available parking spaces that now exist. With the present growth of the downtown area we are going to need more parking spaces, not less.

We don't approve of this project the way it stands. Without providing at least the number of parking spaces that are now available, you would not be able to accommodate the already existing businesses, let alone the inevitable expansion of future businesses, commerce, the general public and the many people interested in visiting our downtown area.

Sincerely,

Ray & Nancy Carofano

Item No. 7

Department of City Planning

City Hall, 200 N. Spring Street, Los Angeles, CA 90012

January 2, 2019

TO: City Planning Commission

FROM: Laura Frazin Steele, City Planner

TECHNICAL MODIFICATIONS TO THE STAFF RECOMMENDATION REPORT FOR CASE NO. CPC-2016-2568-GPA-VZC; 12420 W. OSBORNE STREET

The following technical modifications/corrections need to be incorporated into the staff recommendation report to be considered at the City Planning Commission meeting of January 10, 2019, related to Item No. 7 on the meeting agenda.

FINDINGS

C. CEQA FINDINGS

A Mitigated Negative Declaration, Case No. ENV-2016-2569-MND, was prepared for the proposed project. The Department of City Planning published the Mitigated Negative Declaration beginning November 29, 2018 for 20 days ending December 19, 2018 for the subject case. The Lead Agency found potential negative impacts could occur from the project's implementation due to:

Cultural Resources
Tribal Cultural Resources

Other identified potential impacts not specifically mitigated by these conditions are already subject to existing City ordinances (Sewer Ordinance, Grading Ordinance, Flood Plain Management, Xeriscape Ordinance, Stormwater Ordinance, etc.) which are specifically intended to mitigate such potential impacts on all projects.

~~On the basis of the whole of the record before the Advisory Agency including any comments received, the Advisory Agency found that, with imposition of the mitigation measures and the Mitigation Monitoring Program included in Case No. ENV-2016-2569-MND and listed as Environmental Conditions in this report, there would be no substantial evidence that the proposed project will have a significant effect on the environment. As of the preparation date of this staff report, no comments on the MND have been received.~~

FOUND, pursuant to CEQA Guidelines Section 15074(b), after consideration of the whole of the administrative record, including the Mitigated Negative Declaration, No. ENV-2016-2569-MND, as circulated on November 29, 2018, ("Mitigated Negative Declaration"), and all comments received, with the imposition of mitigation measures, there is no substantial evidence that the project will have a significant effect on the environment; FOUND the Mitigated Negative Declaration reflects the independent judgment and analysis of the City; FOUND the mitigation measures have been made enforceable conditions on the project; and ADOPTED the Mitigated Negative Declaration and the Mitigation Monitoring Program prepared for the Mitigated Negative Declaration.

The records upon which this decision is based are with Valley Project Planning, Department of City Planning, 6262 Van Nuys Boulevard, Room 430, Los Angeles, CA 90012.

Hand Delivered: January 10, 2019 City Planning Commission Hearing

Re: Proposed Affordable Housing at 456-462 W. 9th Street

The Central San Pedro Neighborhood Council requests a 30-day continuance of the City's Planning Commission hearing of the matter. During our January 8, 2019 regular board and stakeholder meeting, several concerned citizens presented new information regarding a covenant that the City of Los Angeles and adjacent landowners had made in prior years. The details and how it pertains to this new 55-year lease were not clear; therefore, our board feels that additional time is necessary to investigate the existence and details of this covenant.

Several stakeholders also expressed their frustrations at not having received proper notification of the new development.

Central San Pedro has recently experienced an uptick in new development. Many of the developments are very large in comparison to our current neighborhood. Although we welcome with open arms new housing, especially affordable, we cannot turn our backs to our stakeholders. Many families have been here for generations and have made significant contributions and sacrifices for the well-being of the community. We need to make sure that we take this into consideration when moving forward with new development and our changing skyline.

Due to the time sensitive nature of this matter The CeSPNC would like a response to this letter from your office as soon as possible.

Sincerely,

Alexander Hall

Re: **Proposed Affordable Housing at 456-462 W. 9th Street**

The Central San Pedro Neighborhood Council requests a 30-day continuance of the City's Planning Commission hearing of the matter. During our January 8, 2019 regular board and stakeholder meeting, several concerned citizens presented new information regarding a covenant that the City of Los Angeles and adjacent landowners had made in prior years. The details and how it pertains to this new 55-year lease were not clear; therefore, our board feels that additional time is necessary to investigate the existence and details of this covenant. Several stakeholders also expressed their frustrations at not having received notification of the new development.

During this same meeting LINC Housing presented their proposal for the construction of an affordable housing project and we hereby offer our support. LINC Housing, in partnership with National Core and Ace, was selected by the City's Housing Department to construct affordable housing on the City owned parking lot located at 456-462 W 9th Street. They have extensive experience having developed approximately 17,000 such units in LA County and managing 14,000 of them.

They are proposing to build 91 for rent workforce housing units with 5 studios, 27 1-bedroom, 36 2-bedroom, and 23 3-bedroom units, including 9 units for persons with very low-incomes. They range in size from 450 square feet for a studio to 1400 square feet for a 3 bedroom. The property would continue to be owned by the city of Los Angeles with a 55-year lease and guarantee of affordable & low-income housing for that time period. The ground floor would include 52 public parking places (in place of the approximately 102 existing spaces), 4900 square feet of commercial space to be used by the Harbor Community Clinic to provide medical and dental services, and a community center to be used for on-site resident services, classes, and a technology center. The second floor would contain 42-45 parking spaces for residents and 10,500 sq feet of open space with 2 play areas. There would also be roof deck area open to residents. They anticipate breaking ground in early 2020 and 2 years for construction.

They will provide a resident manager and one full time social service staff person to provide LINC Care, in-house support services, activities, and appropriate referrals. Those in need of more intensive case management will be referred to the Harbor Clinic Case Manager.

There is currently a shortage of housing across the socioeconomic board, our community is no exception. Developments such as these can benefit the community and our businesses in many ways. It is imperative that we work closely with the community to make sure that our daily lives and our neighborhoods are not negatively affected by new development.

Therefore, we support this project with the following comments and concerns:

- That first and foremost a 30-day continuance is granted to allow the investigation of any agreements/covenants made with the adjacent landowners and how they are affected by this new lease.
- This is a significant reduction in public parking and may impact the surrounding businesses and residents.
- 42-45 parking spaces seems to be too few for residents.
- We suggest that in order to discourage residents from using the public parking in lieu of the residential parking, that the public parking should be limited to 2 to 4 hours.

Due to the time sensitive nature of this matter The CeSPNC would like a response to this letter from your office as soon as possible.

Sincerely,

Alexander Hall

Alexander Hall, President
On behalf of the Central San Pedro Neighborhood Council

Los Angeles, CA 90017

Re: Agenda Item # 6 – 456 West 9th Street, San Pedro

Dear President Millman and Honorable Commission Members:

The proposed 6-story mixed-use affordable housing development would replace a 100+ space municipal parking lot (LADOT Facility No. 641) that is used by businesses in the area, including visitors to the Alliance Alice M. Baxter College-Ready High School across 9th Street.

The Staff Recommendation Report for the project states on page A-6 that it "involves the demolition of the existing surface parking lot for the construction of the 6-story mixed-use building. However, the project proposes to maintain the same number of parking spaces to be available to the public." The Report goes on to state that although zero (0) parking spaces are required for the project's residential uses, due to its proximity to transit, it will provide 10 commercial parking spaces, 49 residential parking spaces, and 52 parking spaces to be used by the general public. Given that the parking lot currently contains more than 100 public parking spaces, if only 52 parking spaces will be available for use by the general public, then not all of the existing parking spaces will be replaced.

Our school site was previously developed and used as a church before it was converted to a high school in 2014, pursuant to a Coastal Development Permit. When our site was developed as a church, it was granted a waiver of 60 parking spaces by the City Planning Commission in Case No. CPC 8667 (pages 1-2 of the report attached, full copy available upon request). A waiver for 14 spaces was granted based on the school property's participation in the assessment district for the municipal parking lot, under the provisions of LAMC Section 12.21.A.4(o). The other waiver for 46 spaces was based on the then owner of the school property making a donation to the City of some lots that it owned which were adjacent to the municipal parking lot, in lieu of a monetary payment. The Planning Commission overrode the recommendations of its staff and determined that this property donation justified the waiver of the additional 46 spaces, without the need of any payments. The City acknowledged that the waiver still applied to the conversion to a high school because it has the same parking requirement as a church.

Our site has relied on these parking waivers for many years and utilized the public parking in the municipal lot. If the available spaces open to the public will be cut in half by the new mixed-use project, then not all of the public parking is being replaced. Our understanding is that in other cases of development over municipal parking lots, all of the public parking has been replaced. We would urge the City to do the same in this case.

Thank you for your consideration. Please contact us if you have any questions regarding these matters.

Thank you,

RECOMMENDATION

ACTION RECOMMENDED BY THE STAFF: That the Commission

Adopt the staff report.

Disapprove the request as filed by the Applicant.

Approve the waiver of 60 parking spaces being provided by covenant on Parcel No. 1 required for the building on Parcel No. 2 (described as Lots 1 through 8, inclusive of Amar's Subdivision, Block 10, Town of San Pedro) as shown on Exhibit "A" subject to the following provisions and conditions:

1. Fourteen (14) spaces of the 60 to be waived for the owner's present participation in the assessment of Vehicle Parking District No. 110.

2. Twenty-five (25) spaces of the 60 to be waived in consideration of the donation in fee to the City of Los Angeles of Lot 7 and the westerly 9.5 feet of Lot 8 of Leo's Subdivision of Lots 1 and 4 of Block 9 of the City of San Pedro, California.

3. Remaining twenty-one (21) spaces of the 60 to be waived either:

   a. By an 'in lieu' cash payment into the Parking Meter Fund; said payment to be based on current land acquisition and improvement costs to provide said (21) spaces, as determined by the Off-Street Parking Commission; or

   b. By covenant provide the additional twenty-one (21) spaces on other property within seven hundred and fifty (750) feet of said Parcel No. 2 as required in Section 12.21-A,4(g) of the Municipal Code.

4. This action to approve Item Nos. 1, 2, and 3 above to supersede the Planning Department's action of June 11, 1970 concerning the subject case.

Transmit a copy of the staff report and the Commission's action on this matter to the Applicant, the Department of Building and Safety and the Board of Parking Commissioners.

Approved:

Calvin S. Hamilton
CALVIN S. HAMILTON
Director of Planning

ACTION OF THE CITY PLANNING COMMISSION

Adopted the staff report in part. Condition No. 3 recommended by the staff was not imposed by the Commission. Condition No. 2 was revised to waive 46 spaces in lieu of the 25 recommended by the staff.

Approved the requested waiver of a total of 60 parking spaces being provided by covenant on Parcel No. 1 required for the building on Parcel No. 2 (described as Lots 1 through 8, inclusive of Amar's Subdivision, Block 10, Town of San Pedro) as shown on Exhibit "A" subject to the following conditions:

1. Fourteen (14) spaces to be waived for the owner's present participation in the assessment of Vehicle Parking District No. 110.

2. Forty-six (46) spaces to be waived in consideration of the donation in fee to the City of Los Angeles of Lot 7 and the westerly 9.5 feet of Lot 8 of Leo's Subdivision of Lots 1 and 4 of Block 9 of the City of San Pedro, California.

The Commission directed that this action supersede the action of the Acting Director of Planning dated June 11, 1970 concerning the subject case.

ADDENDUM TO THE ENVIRONMENTAL IMPACT REPORT FOR THE LOS ANGELES MEMORIAL SPORTS ARENA REDEVELOPMENT PROJECT

I. Introduction

This document is an Addendum to the Environmental Impact Report (EIR) prepared for the Los Angeles Memorial Sports Arena Redevelopment Project (State Clearinghouse No. 2010041059), which was certified by the Los Angeles Memorial Coliseum Commission (Coliseum Commission) on February 2, 2011 (Certified EIR). The Certified EIR analyzed the demolition of the existing Los Angeles Sports Arena (Sports Arena) on an approximately 15-acre site in the southeastern portion of Exposition Park in the City of Los Angeles (Project Site), and the development of two potential options on the Project Site: (1) a multiple-use space that would serve as a public venue for civic gatherings, celebratory and entertainment events (e.g., festivals, carnivals, rallies, and concerts), and other similar uses (Multi-Use Project); or (2) a Major League Soccer (MLS) Stadium with a permanent seating capacity of approximately 22,000 seats and associated amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities (Original Stadium Project). After the Certified EIR was certified by the Coliseum Commission, the Coliseum Commission leased both the Los Angeles Memorial Coliseum (Coliseum) and Sports Arena sites to the University of Southern California (USC), allowing development of those uses approved under the Certified EIR. USC has now agreed with the Los Angeles Football Club (LAFC), which has acquired an MLS expansion franchise, to cooperate with LAFC's efforts to seek approval of certain modifications to the Original Stadium Project in order to develop the LAFC Stadium on the Project Site (Modified Project). The Modified Project would consist of the Original Stadium Project (reconfigured on the Project Site) together with the addition of up to approximately 105,900 square feet of ancillary facility floor area (up to approximately 119,000 gross square feet), including the following uses and floor areas: up to approximately 30,250 square feet of office and conference facility space, including no more than 21,250 square feet of office space; an approximately 36,000-square-foot "World Football" museum; up to approximately 27,750 square feet of team store or other retail space; and up to approximately 11,900 square feet of restaurant uses. The Modified Project also includes signage and lighting programs to support stadium operations.

In accordance with the California Environmental Quality Act (CEQA), the purpose of this Addendum is to analyze the Modified Project's proposed modifications to the Original

Stadium Project and to determine whether implementation of the Modified Project would result in any new significant environmental impacts that were not identified in the Certified EIR, or whether the previously identified significant impacts would be substantially more severe under the Modified Project.

This Addendum demonstrates that all of the potential environmental impacts associated with the Modified Project would be within the envelope of impacts already evaluated in the Certified EIR for the Original Stadium Project. Therefore, the Modified Project would not result in new significant impacts or increase the severity of significant impacts that were previously evaluated and disclosed in the Certified EIR.

II. CEQA Authority for Addendum

CEQA establishes the type of environmental documentation required when changes to a project occur after an EIR is certified. Specifically, Section 15164(a) of the CEQA Guidelines states that:

> *The lead agency or responsible agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred.*

Section 15162 of the CEQA Guidelines requires the preparation of a Subsequent EIR when an EIR has been certified or a negative declaration has been adopted for a project and one or more of the following circumstances exist:

1. Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

2. Substantial changes occur with respect to the circumstances under which the project is undertaken, which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

3. New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:

a. The project will have one or more significant effects not discussed in the previous EIR or negative declaration;

b. Significant effects previously examined will be substantially more severe than shown in the previous EIR;

c. Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

d. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

Likewise, California Public Resources Code (PRC) Section 21166 states that unless one or more of the following events occur, no subsequent or supplemental EIR shall be required by the lead agency or by any responsible agency:

- Substantial changes are proposed in the project which will require major revisions of the environmental impact report;
- Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report; or
- New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, becomes available.

As demonstrated by the analysis herein (refer to Section IV, Comparative Analysis of Modified Project Impacts, on page 31), the Modified Project would not result in any new significant impacts, nor would it substantially increase the severity of previously identified significant impacts. In addition, there are no substantial changes to the circumstances under which the Original Stadium Project analyzed in the Certified EIR would have been undertaken, and no new information of substantial importance which was not known and could not have been known when the Certified EIR was certified has been identified. Therefore the minor changes resulting from the Modified Project do not meet the standards for a Subsequent or Supplemental EIR pursuant to CEQA Guidelines Section 15162.

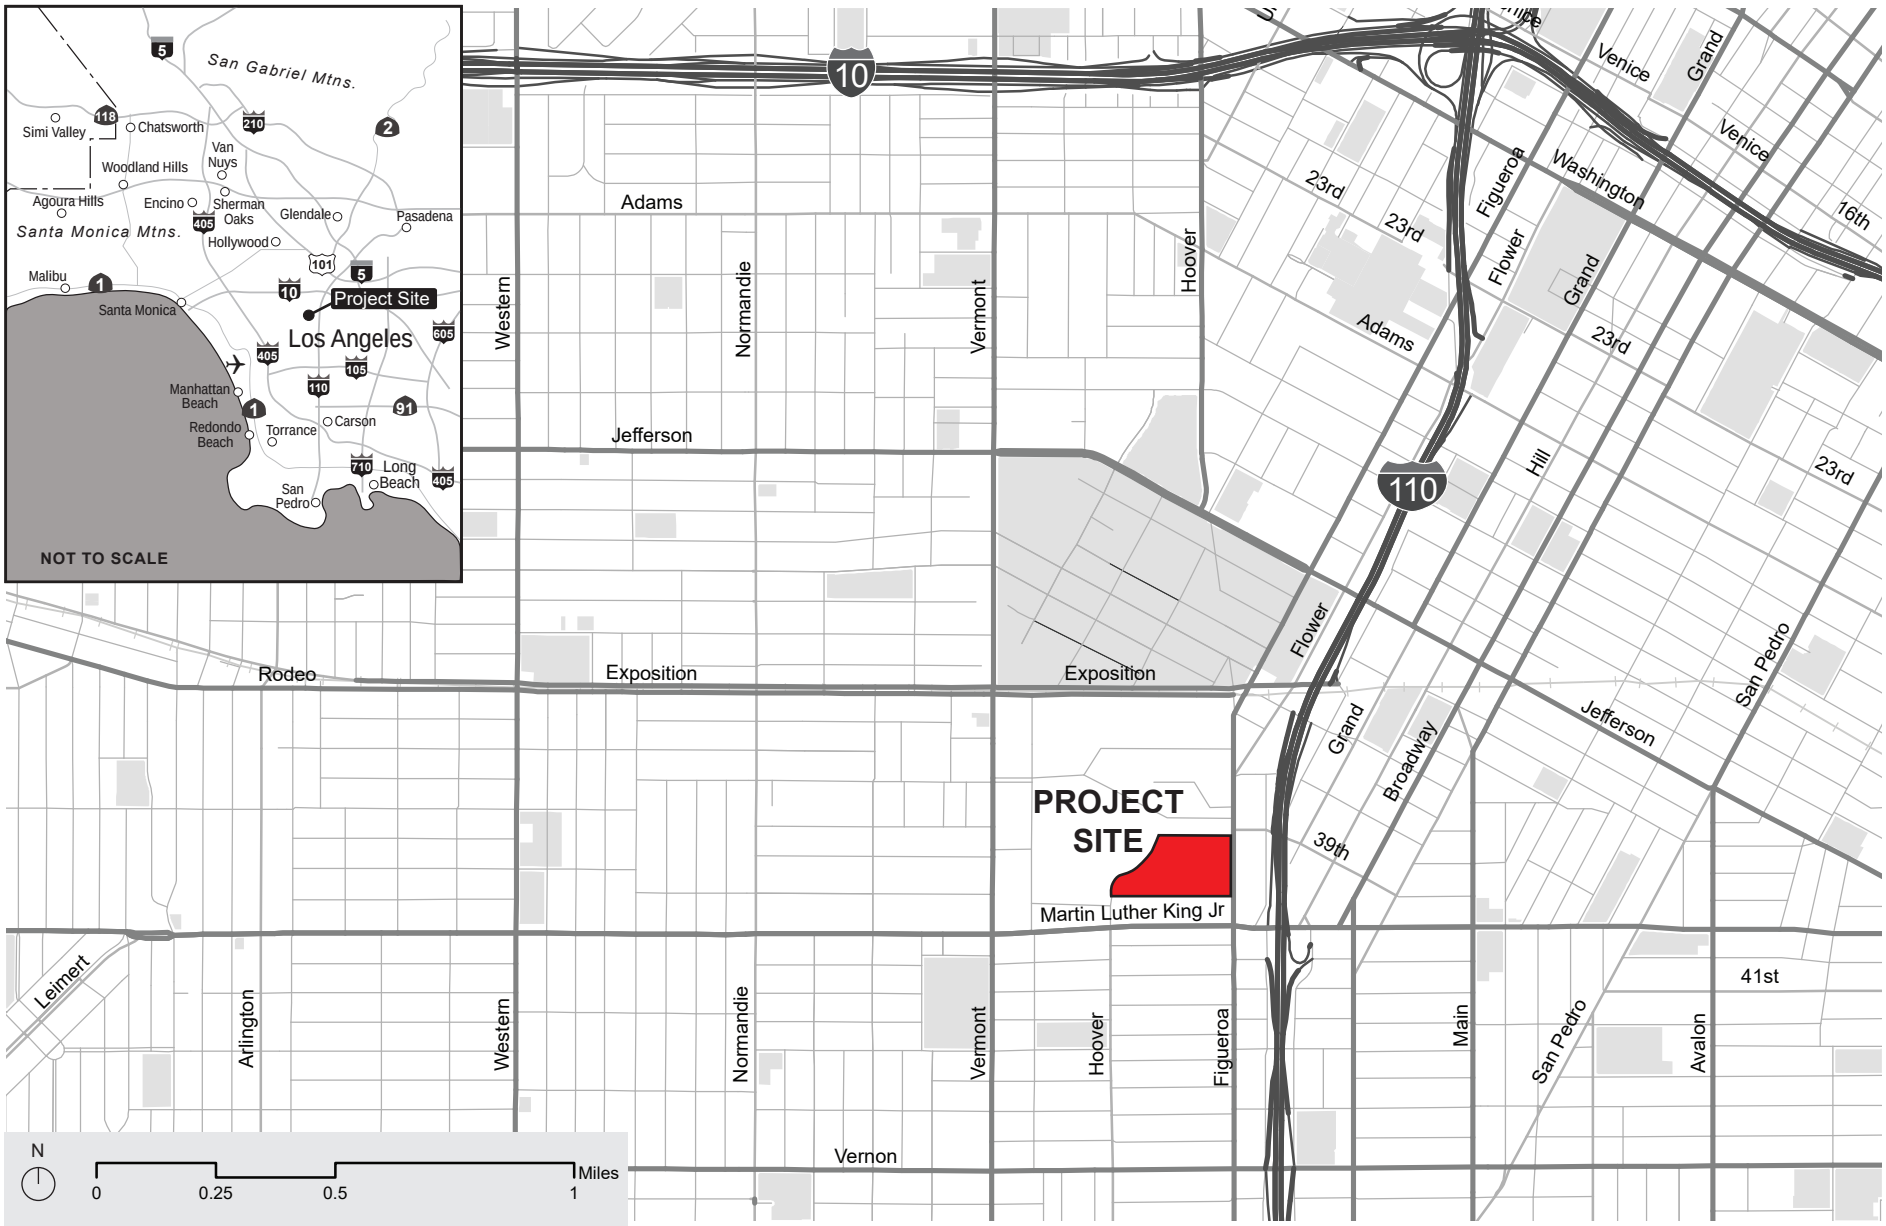
III. Project Description

A. Project Location and Existing Conditions

As shown in Figure 1 on page 5, the approximately 15-acre Project Site is located in the City of Los Angeles approximately 2 miles southwest of downtown, within Exposition Park. The Project Site includes the site of the existing Los Angeles Memorial Sports Arena (Sports Arena), located at 3939 South Figueroa Street, as well as immediately surrounding surface parking and landscape areas. The specific boundary of the irregularly shaped Project Site is shown in Figure 2 on page 6. As shown therein, the Project Site is bounded by Exposition Park Drive (Christmas Tree Lane) to the north, Figueroa Street to the east, Exposition Park Parking Lot 6 to the south, and South Coliseum Drive (Hoover Street) to the west. Regional access to the Project Site is provided by the Harbor Freeway (Interstate 110), located approximately 0.1 mile east of the Project Site. Major arterials serving the Project Site include Vernon Avenue, Martin Luther King, Jr. Boulevard, and Exposition Boulevard in the east-west direction; and Vermont Avenue, Figueroa Street, Hoover Street, and Flower Street in the north-south direction.

At approximately 160 acres, Exposition Park is the largest park in the Central Los Angeles area. It is bounded by Exposition Boulevard to the north, Figueroa Street to the east, Martin Luther King, Jr. Boulevard to the south, and Vermont Avenue to the west. Owned by the State of California and leased by various entities, Exposition Park houses the Coliseum; the Los Angeles Sports Arena (located on the Project Site); the California Science Center; the Dr. Theodore T. Alexander Jr. Science Center School; the California African American Museum; the Los Angeles County Natural History Museum; the Exposition Park Rose Garden; the Wallis Annenberg Building; and the Expo Center, which includes a swim stadium, recreation center, senior citizen center, amphitheater, and pre-school. The Project Site is generally situated in the southeastern portion of Exposition Park. All of Exposition Park, including the Project Site, is located within the City's South Los Angeles Community Plan Area, the eastern boundary of which is Figueroa Street. The Project Site is also within the boundaries of the Coliseum District Specific Plan (Specific Plan). All land uses east of Figueroa Street are located in the Southeast Los Angeles Community Plan Area.

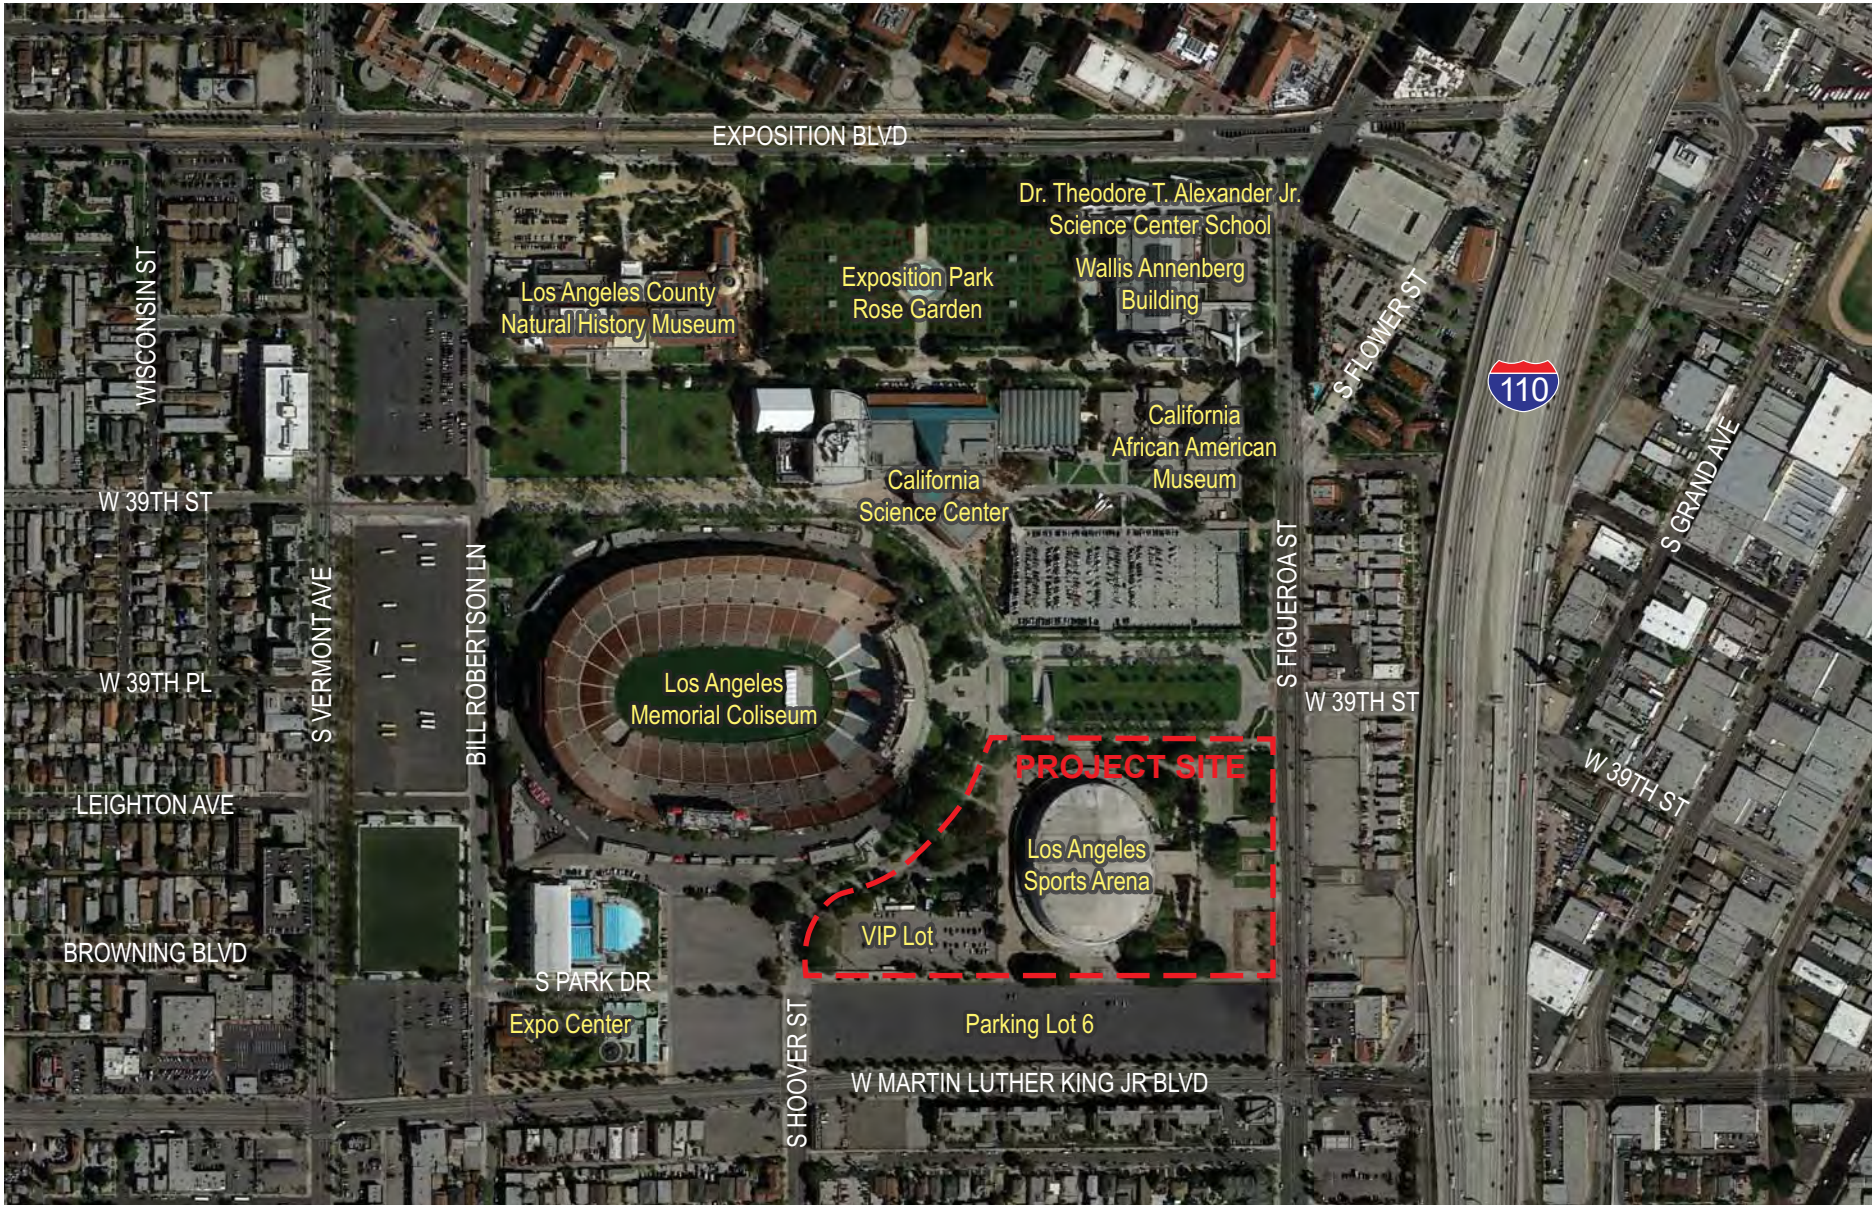
Land uses immediately adjacent to the Project Site include Christmas Tree Lane and adjacent landscaped areas to the north; the Coliseum and adjacent surface parking lots across South Coliseum Drive to the west and northwest; Parking Lot 6 to the south; and commercial/retail uses and surface parking lots fronting the east side of Figueroa Street to the east. Residential uses are also located in the vicinity of the Project Site, including multi-family residential uses fronting Flower Drive to the east, and multi-family



eyestone ENVIRONMENTAL

Figure 1
Regional and Vicinity Map

Source: Google Earth, 2015; Eyestone Environmental, 2015.



eyestone ENVIRONMENTAL

Figure 2
Aerial Photograph

Source: Google Earth, 2015; Eyestone Environmental, 2015.

residential uses on the south side of Martin Luther King, Jr. Boulevard to the south. In addition, the USC main campus is located north of Exposition Boulevard.

The predominant land use on the Project Site is the 16,740-seat Sports Arena. Since it commenced operations in 1959, the Sports Arena has hosted indoor sporting events as well as other major events including political conventions, concerts, trade shows, and rallies. The Sports Arena hosts weekday and weekend events, with attendance levels ranging from approximately 500 to approximately 55,000 attendees. The Sports Arena is an oval-shaped structure oriented along a north-south axis. It was constructed within a large excavated depression that extends approximately 25 feet below grade level; as such, the seven-story arena extends only approximately 45 feet above grade level. In addition to the Sports Arena, a surface parking lot for VIPs occupies the western portion of the Project Site. The VIP parking lot contains approximately 238 vehicle parking spaces and is accessed from South Coliseum Drive via Martin Luther King, Jr. Boulevard. The Project Site is generally flat, with the exception of the sunken court and seating within the Sports Arena structure, and a sunken landscaped courtyard extending off of the east side of the Sports Arena structure. The Project Site also includes several at-grade plazas and ornamental landscaping.

USC currently leases the Sports Arena, as well as the adjacent Coliseum, from the Coliseum Commission. USC's lease, including extension options, provides USC with the right to possess and use the Sports Arena site through 2054. The USC lease also contemplates the redevelopment of the Sports Arena site with a soccer stadium and associated ancillary facilities, provided that the seating capacity in any stadium does not exceed 24,950 seats. In addition, USC has entered into a Lease Option Agreement with the California Science Center (Sixth District Agricultural Association) that would provide USC with an option to enter into a new lease for the Sports Arena site that could be extended through 2111. USC and LAFC have proposed entering into a sublease for the Sports Arena site that would give LAFC the right to develop the Modified Project and possess and use the Sports Arena site consistent with the rights in these existing USC lease agreements.

As further discussed below, a distinct project site has been identified for the Modified Project's signage program (Signage Project Site), which encompasses an area within the Specific Plan that is slightly larger than the Project Site. Specifically, the Signage Project Site consists of the Project Site in addition to a small area at the southwest corner of Christmas Tree Lane and Figueroa Street, and Parking Lot 6 to the south of the Project Site, which is controlled by the State of California (California Science Center). The only proposed development involved within areas of the Signage Project Site that are outside the Project Site involves signage.

B. Projects Analyzed under the Certified EIR

As previously discussed, the Certified EIR analyzed the demolition of the existing Sports Arena and the redevelopment of the Project Site with two potential options: (1) the Multi-Use Project, which would include a multiple-use space that would serve as a public venue for civic gatherings, celebratory and entertainment events (e.g., festivals, carnivals, rallies, and concerts), and other similar uses, referred to as Option 1 in the Certified EIR; or (2) the Original Stadium Project, which would include an MLS Stadium with a permanent seating capacity of approximately 22,000 seats and associated amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities, referred to as Option 2 in the Certified EIR. Both of these development options were analyzed with an equal level of detail in the Certified EIR, and the Coliseum Commission has kept both options available for future consideration.

The Certified EIR assumed that under the Multi-Use Project (Option 1), all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed, and the Project Site would be redeveloped with a multiple-use space anchored by an open-air amphitheater. The multiple-use space would be improved to provide additional surface parking for Coliseum events and would serve as a public venue for civic events such as parades, rallies, public gatherings, festivals, and neighborhood carnivals, similar to the types of outdoor events currently held at the Sports Arena. The bowl-shaped amphitheater would be built into the depression currently occupied by the Sports Arena and would be surrounding by grass-covered seating levels (no fixed seating was proposed). To provide for flexible programming, it was assumed that the multiple-use space could support stand-alone events confined to the Project Site or, alternatively, serve as an extension space and/or overflow parking space for joint events held within Exposition Park, including the Coliseum. A variety of different types of events could be held at the multiple-use space, from outdoor concerts and cultural gatherings with anticipated attendance levels ranging from 500 to 4,000 attendees, to annual events such as charity walks, music festivals, and citywide celebrations with anticipated attendance levels ranging from 1,000 to 90,000 attendees. The Certified EIR assumed that under any possible joint use of the Coliseum and the multiple-use space, the total planned attendance would not exceed the current capacity of the Coliseum (i.e., 93,000 attendees).

The Certified EIR assumed that under the Original Stadium Project (Option 2), the existing Sports Arena would be removed and the Project Site would be redeveloped with an MLS Stadium with a permanent seating capacity of approximately 22,000 seats. The analysis in the Certified EIR assumed that the state-of-the art venue would host 15 MLS games in addition to non-soccer events similar in attendance size to historic operations of the Sports Arena, such as USC soccer games, open-air entertainment events such as

concerts and civic gatherings, and exhibition soccer games, and would serve as a practice facility for local soccer teams. The stadium would also include associated amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities. The VIP parking lot to the west of the proposed stadium was assumed to remain as surface parking. Similar to Option 1, the Certified EIR assumed that total attendance during simultaneous events at the Coliseum and the MLS Stadium would not exceed 93,000 attendees (refer to Mitigation Measure MM J-1 in the Certified EIR).

The Original Stadium Project was assumed to be an outdoor facility oriented on a north-south axis featuring dome-style architecture topped by a curved roof on its east and west sides. The stadium would be constructed within the existing depression currently occupied by the Sports Arena so that the field and much of the seating would be located below grade-level elevation. As a result, the stadium analyzed in the Certified EIR would occupy the same general field of view as the current Sports Arena building. The existing depression would be graded and reconfigured to accommodate the footprint of the stadium, requiring the import of approximately 125,000 cubic yards (cy) of soil.

The lighting for the soccer field would consist of highly focused and directional lighting arrays. Much of the lighting (and all of the high-intensity field lighting) would be directed downward into the bowl-shaped stadium. Low-level security lighting would also be installed throughout the remainder of the Project Site to mark walkways, parking areas, restroom facilities, and entrances. The proposed soccer stadium would also include landscaped plazas and roadways and perimeter landscaping.

The Certified EIR assumed that the Original Stadium Project would include advertising signage and naming rights consistent with similar sporting venues in the Los Angeles area. The Certified EIR explained that while a detailed signage program had not been developed for the Original Stadium Project, the signage program would be in conformance with all applicable requirements of the Los Angeles Municipal Code (LAMC), the design guidelines of the South Los Angeles Community Plan, and the overriding rules and regulations set forth for signage in the Coliseum District Specific Plan.

The construction analysis in the Certified EIR for the Original Stadium Project is based on an approximately 20-month construction schedule that involves the following phases: (1) demolition of the existing Sports Arena, resulting in 5.4 million cubic feet of demolition debris; (2) import of approximately 125,000 cy of soil; (3) grading and reconfiguration of the Project Site to accommodate the stadium footprint; (4) pouring of concrete to create the stadium foundation; (5) construction of the stadium and related support facilities; and (6) installation of grass and landscaping. Construction of the

Approved Multi-Use Project was assumed to entail a similar order of phasing, but with a shorter construction phase and an import of approximately 250,000 cubic yards of soil.

The Coliseum Commission certified the Certified EIR in February 2011. However, the Coliseum Commission did not select between the Original Stadium Project and the Multi-Use Project at that time. Both options remain open.

C. Modified Project

LAFC and USC have proposed entering into a lease agreement for the Sports Arena site that would enable LAFC to develop the Modified Project and possess and use the Sports Arena site consistent with USC's existing agreements with the Coliseum Commission and the California Science Center (Sixth District Agricultural Association). Those existing agreements recognize that the Sports Arena site may be redeveloped with the Original Stadium Project, analyzed as Option 2 in the Certified EIR. As described in detail below, in addition to the Original Stadium Project's approximately 22,000-seat soccer stadium and associated uses, LAFC is proposing certain modifications to the Original Stadium Project that include the addition of up to approximately 105,900 square feet of ancillary amenity floor area (up to approximately 119,000 gross square feet) that would be open during stadium events as well as on non-event days, refinements to the design of the stadium, the redevelopment of the VIP parking lot west of the stadium as a new parking area, and adjustments to construction phasing.[1] These modifications are hereafter referred to as the Modified Project.

A table summarizing the primary differences between the Original Project and the Modified Project is provided in Table 1 on page 11. A Conceptual Site Plan for the Modified Project is provided in Figure 3 page 13.

(1) Ancillary Uses and Northwest Plaza

Under the Modified Project, additional amenities supporting the primary stadium use and further activating the Project Site on non-event days (Ancillary Uses) would be incorporated into the project design to provide for a cohesive development that is comparable to other recently-constructed MLS venues. Specifically, the Ancillary Uses

[1] *The total amount of development would not exceed approximately 641,000 gross square feet.*

Table 1
Comparison Between the Original Stadium Project and the Modified Project

	Original Stadium Project	Modified Project
Demolition	Demolition of the Sports Arena	No Change
MLS Stadium	22,000 seating capacity; Would host MLS games, USC soccer games, open-air entertainment events (e.g., concerts and civic gatherings), and exhibition soccer games. Would include amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities.	No Change
Ancillary Uses		
Conference Facility and Office Space	0	≈ 30,250 sf (max. 21,250 sf office)
Museum	0	≈ 36,000 sf
Team Store and Other Retail	0	≈ 27,750 sf
Restaurant	0	≈ 11,900 sf (max. 4,250 sf high-turnover sit-down) (max. 2,550 sf fast food)
Total Ancillary Uses		≈ 105,900 sf (max)
Open Space and Pedestrian Plazas	Perimeter landscaping and pedestrian plaza areas. Open space square footage not specified.	≈ 143,000 square feet of improved public open space that would consist of pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas, potentially including water features, public art, and seating areas. Pedestrian plazas would include a main plaza at the northwest corner of Project Site and a large pedestrian gathering area along Figueroa Street.
Signage and Lighting	Signage consistent with the LAMC, South Los Angeles Community Plan, and Specific Plan. High-intensity field lighting (focused downward) and low-level security lighting throughout.	New Supplemental Use District (SUD) for signage to permit proposed signage program including up to ≈ 44,500 sf of signage for Modified Project including 19,200 sf digital signage, identification signs, temporary event signs, electronic digital displays, changeable message light-emitting diode (LED) boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed.

Table 1 (Continued)
Comparison Between the Original Stadium Project and the Modified Project

	Original Stadium Project	Modified Project
		Lighting would include illuminated signage in addition to field and security/wayfinding lighting.
Existing VIP Parking Lot	Retained and used for surface parking	Reconfigured and used for surface parking

sf = square feet

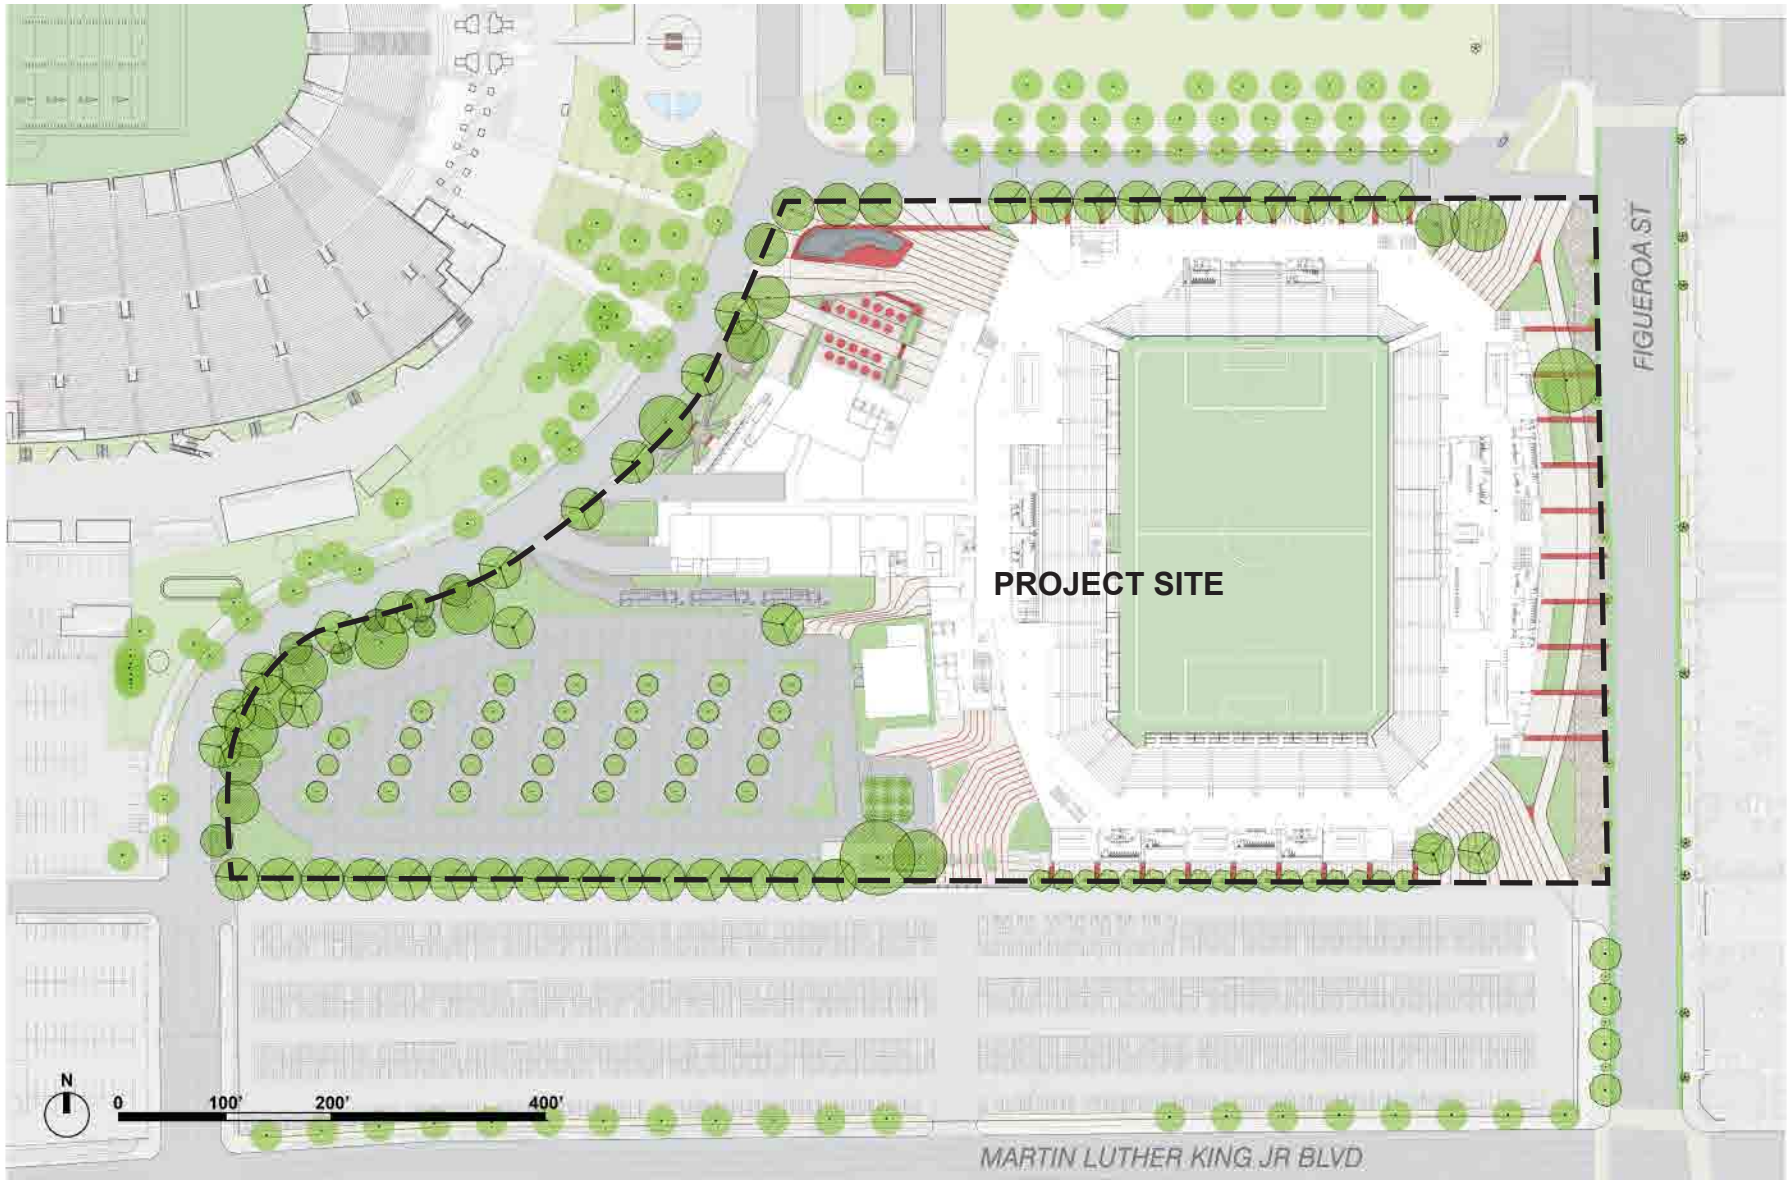
Square footage is calculated pursuant to the LAMC definition of floor area for the purpose of calculating floor area ratio (FAR). In accordance with LAMC Section 12.03, floor area is defined as: "[t]he area in square feet confined within the exterior walls of a building, but not including the area of the following: exterior walls, stairways, shafts, rooms housing building-operating equipment or machinery, parking areas with associated driveways and ramps, space for the landing and storage of helicopters, and basement storage areas."

Source: Eyestone Environmental, 2015.

would include a total of up to approximately 105,900 square feet of new floor area[2] (up to approximately 119,000 gross square feet) and would include the following:

- up to approximately 30,250 square feet (sf) of office and conference facility space, including no more than 21,250 sf of office space (with morning conference facility functions on non-event days limited to 261 attendees and evening conference facility functions on non-event days limited to 430 attendees if the maximum amount of office space is developed);
- an approximately 36,000-sf museum;
- up to approximately 27,750 sf of team store or other retail space (of which no more than 2,700 sf could be located along the Figueroa Street frontage of the Project Site); and up to approximately 11,900 sf of restaurant uses, including no more than 4,250 sf of high-turnover sit-down restaurants and 2,550 sf of fast food restaurants (with no more than 1,275 sf of the fast food space located along the Figueroa Street frontage of the Project Site).

[2] *Except where otherwise noted, square footage is calculated pursuant to the LAMC definition of floor area for the purpose of calculating floor area ratio (FAR). In accordance with LAMC Section 12.03, floor area is defined as: "[t]he area in square feet confined within the exterior walls of a building, but not including the area of the following: exterior walls, stairways, shafts, rooms housing building-operating equipment or machinery, parking areas with associated driveways and ramps, space for the landing and storage of helicopters, and basement storage areas."*



eyestone ENVIRONMENTAL

Figure 3
Conceptual Site Plan

Source: Gensler, 2015.

The primary function of the proposed conference facilities would be to provide programming for event day patrons (e.g., VIP gatherings and other programming during events at the stadium or the adjacent Coliseum). On non-event days, the conference facilities would serve as meeting spaces for conferences for outside organizations (such as USC, chambers of commerce, trade groups, and other types of businesses and organizations), with attendance limited based on the amount of office space that is developed, as described above. Additional conference facility attendees beyond the limits described above could be allowed by reducing the maximum office floor area from the proposed maximum of 21,250 sf. Specifically, for every reduction of 850 sf in office space floor area, the number of persons attending functions in the conference facility could be increased by 5.6 persons for morning conference facility functions on non-event days, and by 3.0 persons for evening conference facility functions on non-event days.

In addition to supporting stadium events (i.e., games and concerts), the Ancillary Uses would be open to the public on non-event days to serve as a catalyst for the revitalization of Exposition Park and to complement and enhance the existing venues and destinations within the park. For periods before, during, and after games/events at the proposed stadium, the Ancillary Uses would be open only to ticket-holding game/event patrons. Further, for events at the adjacent Coliseum reasonably anticipated to equal or exceed 25,000 patrons in attendance, including USC home football games, the Ancillary Uses would be open only to ticket-holding patrons of those events for periods before, during, and after the events. Refer to Project Design Feature O-4 in Section IV.O, Traffic/Transportation/Parking, on page 169 of this Addendum.

Most of the Ancillary Uses would be centered around a main entry plaza at the northwest corner of the Project Site (Northwest Plaza) that would connect to the stadium's main concourse and serve as a primary public entry to the stadium, although up to 3,975 sf of retail and restaurant uses could be located along the stadium's Figueroa Street frontage, as noted above. The Ancillary Uses would reach a maximum height of 75 feet above grade. The Northwest Plaza would provide a gathering space for pre-game events and other game-day activities and would serve as an active public space on non-event days (e.g., for small concerts, red carpet events, and community events such as food festivals or art fairs). Ground floor restaurants would open up to the plaza to provide outdoor dining and seating areas. The Northwest Plaza would be designed to provide a welcoming pedestrian environment with a mix of hardscape and landscaped areas, and could include water features, public art, and seating areas. Sound, lighting, and video components would also be incorporated into the design of the plaza. The Northwest Plaza would link to a system of enhanced pedestrian improvements and open space areas that would encircle the stadium. Specifically, the Modified Project would include approximately 143,000 square feet of improved public open space that would consist of pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas. The Ancillary Uses and the

Northwest Plaza would have the potential to operate from mid-morning (i.e., 10:00 A.M.) until 2:00 A.M., seven days a week, with some ancillary uses (e.g., the museum and retail uses) closing sooner. The conference facilities and office space would have the potential to operate earlier in the morning, as described above, and also would have the potential to operate seven days a week until 2:00 A.M.

(2) Stadium Design

As is the case under the Original Stadium Project, the proposed stadium under the Modified Project would have a maximum seating capacity of approximately 22,000 attendees and would host MLS games, USC field events (such as soccer games), open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. However, with the evolution of the project design, refinements and modifications have been made to the physical characteristics of the stadium. The following discussion provides a detailed description of the proposed stadium design under the Modified Project. Conceptual renderings of the proposed stadium are provided in Figure 4 through Figure 6 on pages 16 through 18. Stadium elevations are provided in Figure 7 and Figure 8 on pages 19 and 20.

Under the Modified Project, the proposed stadium would be oriented along a north-south axis and, like the Original Stadium Project, would be located within the eastern portion of the Project Site (within a portion of the footprint area currently occupied by the Sports Arena). The footprint of the stadium under the Modified Project would be somewhat larger than under the Original Stadium Project in order to provide for a more modern stadium that includes the amenities expected of a world-class professional sports stadium.

Most of the seating areas within the open-air stadium would be covered by a cantilevered roof canopy extended inward from the stadium's perimeter, with the field level placed approximately 20 feet below street level (as measured from the grade along Figueroa Street), roughly at the same elevation as the floor of the existing Sports Arena. The roof canopy would consist of a steel frame with a lightweight, ethylene tetrafluoroethylene (ETFE) canopy skin that would provide shade for most of the stadium's seating areas while also being translucent. The canopy skin would moderate the perceived height of the stadium because it would be permeable to light and would not be perceived as solid. The top of the roof canopy of the stadium would reach a maximum height of approximately 105 feet above street level, with rooftop structures extending to approximately 115 feet.

Based on the conceptual site plan, the stadium structure would be approximately 470 feet from the Coliseum peristyle when measured on the diagonal from the northwestern corner of the stadium. The westernmost façade of the Ancillary Uses building

NORTH ELEVATION

SOUTH ELEVATION

eyestone ENVIRONMENTAL

Figure 8
Proposed Stadium Elevations—North and South

Source: Gensler, 2015.

would be setback approximately 60 feet from South Coliseum Drive and approximately 270 feet from the Coliseum wall. The eastern façade of the stadium would be setback approximately 58 feet from Figueroa Street. The northern façade of the stadium structure would be setback 27 feet from the southern curb of South Coliseum Drive. Through the final design process, the stadium footprint could be moved or extended up to 40 feet to the west from the location depicted on the conceptual site plan shown in Figure 3 on page 13. Under this scenario, no building heights would increase, and the Ancillary Uses building would remain in the same location, though would be reconfigured in the area where it connects to the stadium. If adjusted in this manner, the stadium structure would be approximately 430 feet from the Coliseum peristyle. Under any buildout scenario, the Modified Project would retain the geometry of the existing sidewalk and curb line of South Coliseum Drive.

The stadium's seating bowl would be comprised of multiple levels that would provide a series of different seating types and amenities including a supporter's section, standing room terraces, premium clubs and suites, and general seating areas. The main concourse of the stadium would be located at street level and would provide an open-air, 360-degree circulation path around the stadium, connecting to several general and premium entry points distributed along the stadium perimeter. Premium spaces such as club lounges and suites would be interior spaces. A rooftop terrace at the top of the west seating bowl, along with two standing room terraces along the northern side of the stadium, would be featured spaces both during games and for other hospitality events, with potential hours of operation from mid-morning until 2:00 A.M., seven days a week. The rooftop terraces could include features such as seating areas, gathering spaces, water features (such as a reflection pool or pool), and art.

The stadium's northeast and southeast corners would be open to provide views into and out of the stadium seating bowl. Specifically, these openings would allow for clear views into the stadium from the street and sidewalk along Figueroa Street at the primary entry to Exposition Park, and would frame focal views of the downtown skyline from within the seating bowl, particularly from the southwest corner. The base of the stadium at street level would draw on material influences from the Coliseum and Swim Complex, incorporating similar materials and color palates, such as the Travertine and the concrete used extensively on those venues. Entry gates would be clearly identifiable and would prominently feature signage integrated into their design. As such, the design of the street level façades would relate to a human scale.

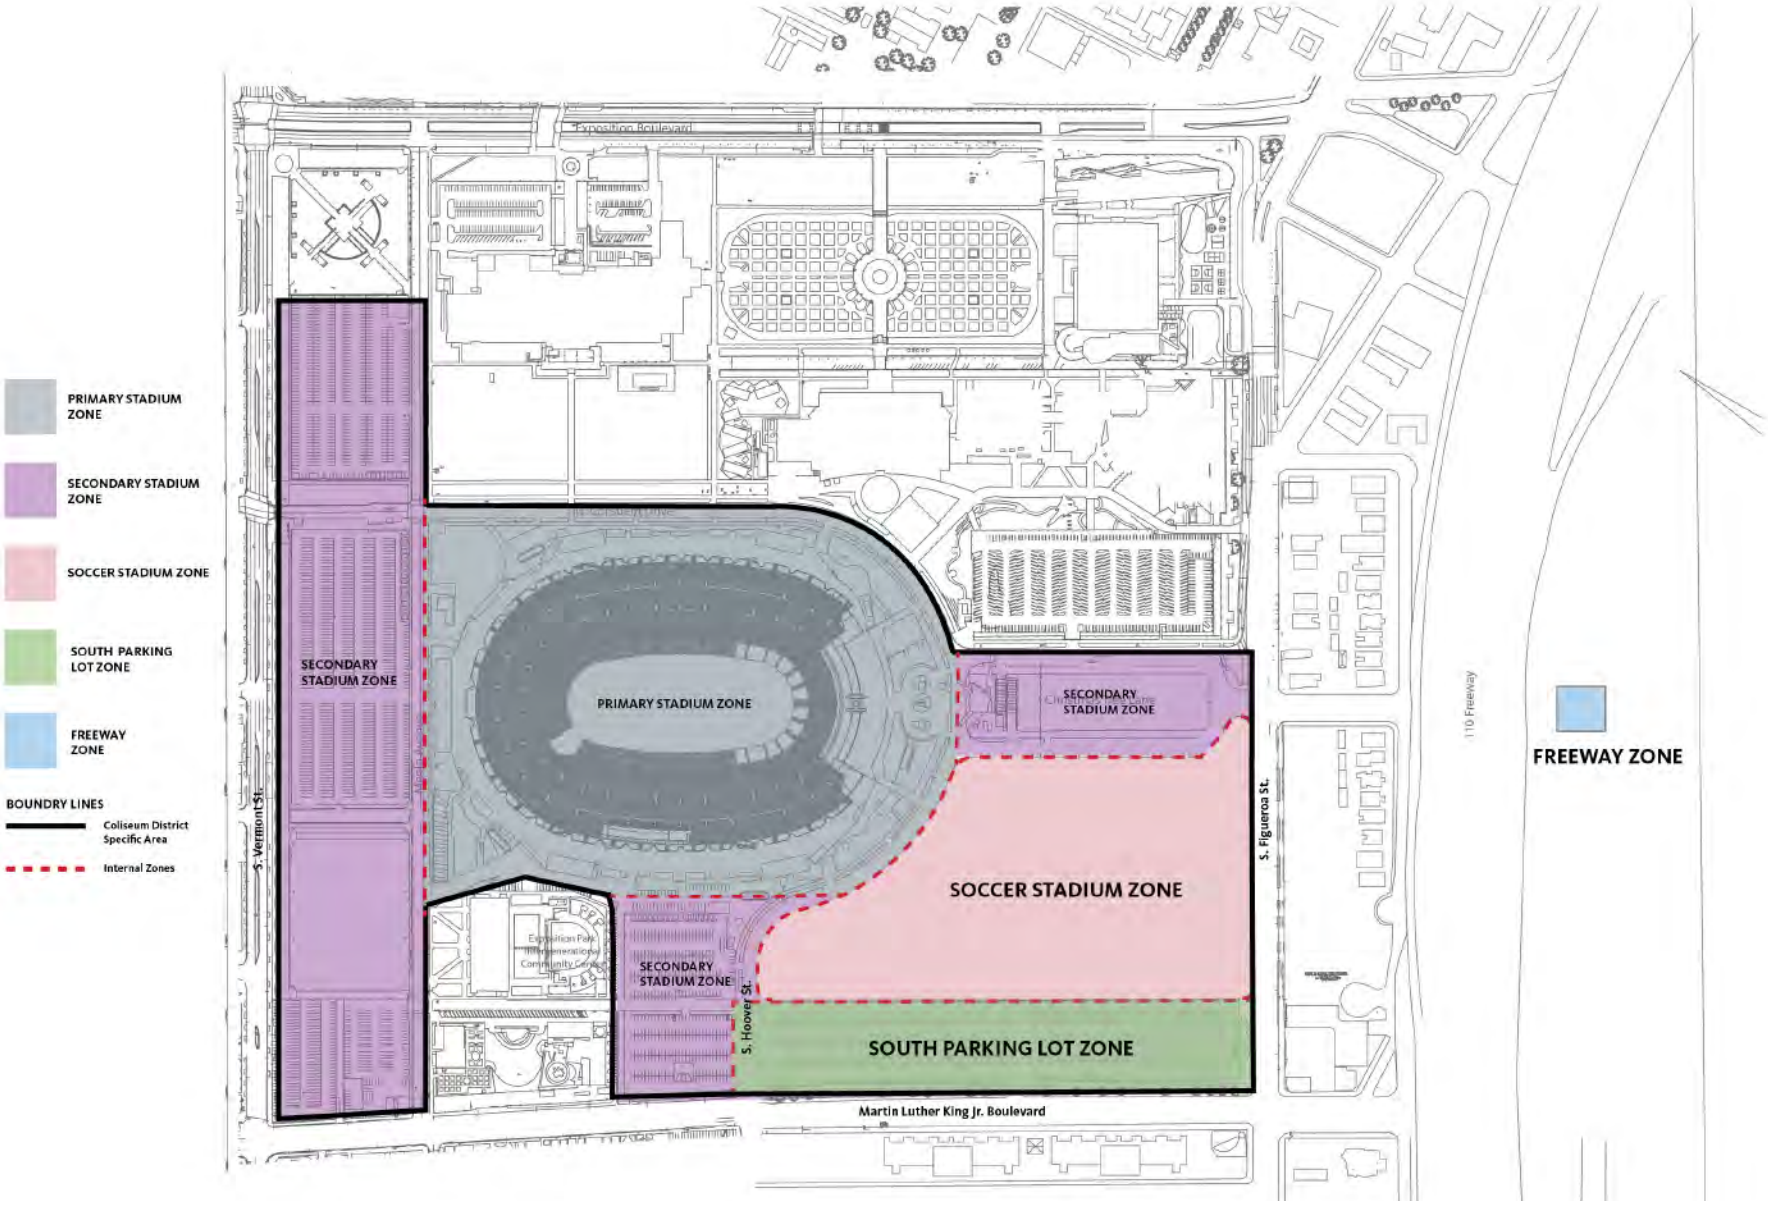
(3) Signage and Lighting

A signage program has been developed for the Modified Project that is an important element of a major league sports stadium. The proposed signage program would support

advertising and the naming and sponsorship rights to the Modified Project, generating revenue streams necessary for Modified Project funding. Signage rules and regulations pertaining to the Project Site are currently set forth in the Specific Plan. The Modified Project's signage program would be implemented through a new Supplemental Use Sign District (SUD), consistent with current City policies regarding the regulation of signage. Consistent with the Specific Plan, the proposed SUD would encompass the Project Site as well as all of the Specific Plan area. As part of the Modified Project's proposed Specific Plan amendment (refer to Section III.9, Discretionary Actions, on page 30 of this Addendum), the existing signage authorized in the Specific Plan, which includes some signage for the Project Site, the Coliseum, and surrounding areas, would be removed from the Specific Plan and relocated into the proposed SUD, along with modifications to permit the Modified Project's signage program. Signage rights previously allowed by the Specific Plan for the Coliseum and other areas in the Specific Plan area that are unrelated to the Modified Project's signage program would not change under the proposed SUD.

As shown on Figure 9 on page 23, the proposed SUD would encompass the entire Specific Plan area and would create five sign zones, the Primary Stadium Zone, Secondary Stadium Zone, Soccer Stadium Zone, South Parking Lot Zone, and Freeway Zone. The Project Site is located within the Soccer Stadium Zone. The proposed SUD would allow the same amount and variety of signage currently authorized by the Specific Plan in the Primary Stadium Zone, Secondary Stadium Zone, and Freeway Zone. A new signage program associated with the Modified Project would be allowed in the Soccer Stadium Zone. In addition, some limited new signage associated with the Modified Project would be allowed in the South Parking Lot Zone (i.e., Parking Lot 6 south of the Project Site). The areas where Modified Project-related signage would be permitted are collectively referred to as the Signage Project Site, as shown in Figure 10 on page 24. The Signage Project Site consists of the Project Site in addition to a small area at the southwest corner of Christmas Tree Lane and Figueroa Street (located in the SUD's proposed Soccer Stadium Zone), and Parking Lot 6 to the south of the Project Site (located in the SUD's proposed South Parking Lot Zone). The proposed signage program for the Signage Project Site, including permitted sign types, sizes, and locations, is provided in Appendix C of this Addendum.

As shown in Appendix C of this Addendum, total signage allowed in the Signage Project Site as part of the SUD for the Modified Project, excluding aerial view signs, information signs, temporary signs, and interior signs, would be approximately 44,500 square feet, including up to approximately 19,200 square feet of digital signage. Individual signs could vary from approximately 40 to 3,800 square feet in size, depending on the sign zone, sign type, and location. Permitted signage would include a freestanding digital sponsorship sign along Figueroa Street in the South Parking Lot Zone, a free-standing digital sign near the southeast corner of the Soccer Stadium Zone along Figueroa Street, a



eyestone ENVIRONMENTAL

Figure 10
Signage Project Site

Source: Gensler, 2015.

free-standing digital sign near the entry to Exposition Park at Christmas Tree Lane at the northeastern corner of the Soccer Stadium Zone adjacent to Figueroa Street, and digital signs integrated with the architecture of the stadium. In addition, smaller-scale, directional pedestrian and vehicular signage would be placed throughout the Signage Project Site as necessary to facilitate access and safety. The types and extent of permitted signage would emphasize the event and entertainment-oriented aspect of the Project Site. Specifically, signage types could include identification signs, temporary event signs, electronic digital displays, changeable message light-emitting diode (LED) boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed. In addition, the SUD would place limitations on the operating hours and illumination of permitted signs.

Lighting for the Modified Project would include lighting of the stadium, including the field and associated amenities and ancillary uses (e.g., outdoor dining and seating areas, plazas, and walkways). Lighting emissions resulting from the illuminated signage are expected to be emitted from three types of signs: front-lit signs, electronic digital displays, and changeable message LED boards.

(4) VIP Parking Lot

Under the Modified Project, the VIP parking lot west of the stadium, which contains approximately 238 vehicle parking spaces, would be reconfigured and re-landscaped to provide a secure, VIP parking lot with up to approximately 250 parking spaces. The parking lot would be surrounded by a perimeter fence and gates and accessed from South Coliseum Drive, similar to existing conditions.

(5) Figueroa Street Pedestrian Improvements and Project Site Boundary Modification

The Modified Project would provide a 40- to 70-foot setback along Figueroa Street to activate the pedestrian realm. This area would be developed as a broad, landscaped sidewalk to provide sufficient space for patrons to circulate and queue on event days, and to provide an inviting and safe pedestrian environment on non-event days. The portion of the sidewalk that would be redeveloped would include the on-site portion along the eastern boundary of the Project Site as well as two off-site portions north and south of the Project Site such that the improved sidewalk would extend from Christmas Tree Lane to Martin Luther King, Jr. Boulevard. Additionally, up to 3,975 sf of retail and restaurant use floor area could be located along the stadium's Figueroa Street frontage, as noted above. The Modified Project also includes a slight modification to the Project Site boundary at the northeast corner of the Project Site so that the Project Site boundary generally corresponds with the southern and western edges of the South Coliseum Drive and Figueroa Street

rights-of-way, respectively, as shown in Figure 1, Figure 2, and Figure 3 on pages 5. 6, and 13, respectively. With this change, the size of the Project Site remains approximately 15 acres, which is substantially consistent with the Project Site analyzed in the Certified EIR.

(6) Sustainability Features

The Modified Project would incorporate sustainability as part of its key design and operation criteria. In so doing, the Modified Project would comply with Title 24 of the California Code of Regulations, including Part 6 (Energy Efficiency Standards for Residential and Nonresidential Buildings) and Part 11 (California Green Building Standards Code, commonly referred to as the CALGreen Code), as well as the City of Los Angeles Green Building Code (2013), which incorporates the CALGreen Code into Chapter IX of the LAMC, in effect at the time of the Modified Project's permit application. The Modified Project would also be designed to be capable of achieving at least Silver certification under the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED)-BD+C or LEED-ND Rating System (v.3), or equivalent green building standards. Specific sustainability features that have been incorporated into the Modified Project are summarized below. It should be noted that while this Addendum evaluates the potential environmental impacts that would occur from the proposed modifications to the Original Stadium Project, i.e., the Ancillary Uses that would be developed under the Modified Project, in order to present a comprehensive and informative description of the degree of sustainability for the development as a whole, the proposed sustainability features would apply to all development located within the Project Site, including the stadium component of the Modified Project.

<u>Site Location and Community Access</u>

- The Project Site is located approximately two miles southwest of downtown, within Exposition Park, on a previously developed urban site where substantial existing infrastructure is in place (refer to Figure 1 on page 5). This location provides convenient pedestrian access to several stops on the Expo Light Rail Line, including the Expo Park/USC Station (0.35 mile from the Project Site) and the Expo/Vermont Station (0.7 mile from the Project Site), as well as the 37th Street/USC Silver Line Bus Rapid Transit (BRT) Station on the Harbor Transitway (located approximately 0.37 mile from the Project Site). All of these transit facilities are operated by the Los Angeles County Metropolitan Transportation Authority (Metro). The Project Site is also served by seven bus lines operated by Metro and the Los Angeles Department of Transportation (LADOT) within 0.25 mile of the Project Site.

Water Efficiency

- The Modified Project would reduce indoor potable water demand by at least 20 percent below 2013 CALGreen requirements.
- The Modified Project would comply with City Ordinance No. 170,978 (Water Management Ordinance), which imposes numerous water conservation measures in landscape, installation, and maintenance (e.g., use drip irrigation and soak hoses in lieu of sprinklers to lower the amount of water lost to evaporation and overspray, set automatic sprinkler systems to irrigate during the early morning or evening hours to minimize water loss due to evaporation, and water less in the cooler months and during the rainy season).
- The Modified Project would include conservation measures in accordance with Los Angeles Department of Water and Power (LADWP) requirements for new development in the City of Los Angeles (e.g., high-efficiency fixtures and appliances, weather-based irrigation systems, drought-tolerant landscaping).
- The Modified Project would use native, drought-tolerant plantings and xeriscape designs for non-playing field areas.

Water Quality

- The Applicant would prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) and Standard Urban Stormwater Mitigation Plan (SUSMP), both of which would include Best Management Practices (BMPs), subject to City of Los Angeles Department of Building and Safety approval. The Modified Project would comply with applicable Los Angeles County Regional Water Quality Control Board (LARWQCB) requirements including National Pollutant Discharge Elimination System (NPDES) and Municipal Separate Storm Sewer System (MS4) requirements.

Energy and Atmosphere

- The Modified Project would comply with the required measures of the 2013 Los Angeles Green Building Code and would implement additional efficiency measures to achieve a reduction in energy consumption that is greater than 25 percent relative to the ASHRAE 90.1-2007 standard, but no less than minimum compliance with the 2013 California energy efficiency standards (Title 24, Part 6). Energy efficiency would be achieved through building design and through the incorporation of energy-efficient heating, ventilation, and air conditioning (HVAC) systems, lighting, and appliances.

- Ten percent of the parking spaces provided in the Modified Project's VIP parking lot on the Project Site shall be constructed to accommodate the future placement of facilities for the recharging of electric vehicles.

Materials and Resources

- A minimum of 20 percent of all building materials would consist of pre-consumer and post-consumer recycled content and would be manufactured within a 500-mile radius of the Project Site.

- The Applicant would develop a construction and demolition debris recycling program to divert construction related solid waste and demolition debris from area landfills. Specifically, a minimum of 75 percent of all demolition and construction waste would be diverted for recycling.

- During operation, the Modified Project would divert solid waste from landfills through robust recycling, the donation of durable goods, and implementing a front-of-house composting program that includes sourcing biodegradable concessions packaging.

Indoor and Outdoor Air Quality

- An indoor air quality management plan would be prepared prior to construction. The design would specify interior finish materials such as adhesives, sealants, paints, flooring, and composite wood products with low emission rates of volatile organic compounds (VOCs) to reduce the generation of indoor air contaminants that are odorous, irritating and/or harmful to the comfort and well-being of the construction work force and building occupants.

- The Applicant would implement South Coast Air Quality Management District (SCAQMD)-recommended BMPs during construction and would comply with SCAQMD Rule 403—Fugitive Dust.

- The Applicant would use low-VOC paints for all interior and exterior surfaces.

(7) Site Access and Parking

Parking for the Modified Project would be provided by the supply available at Exposition Park. Exposition Park provides approximately 5,961 parking spaces in multiple parking lots and on streets within Exposition Park (not including the on-site VIP parking lot, as discussed below). These spaces are used by the Coliseum, the Sports Arena, the California Science Center, the Los Angeles County Natural History Museum, the California African American Museum, and other park visitors. Per the terms of a Non-Disturbance Agreement between the California Science Center and USC, during special events at the

Coliseum or Sports Arena (i.e., events with a reasonably anticipated or actual attendance of 3,000 people or more), 600 parking spaces may be reserved by the California Science Center in the Science Center parking structure and 375 spaces may be reserved by the Natural History Museum in Lot 3. If these reservations occur, an estimated 4,986 spaces would be available for events in the Exposition Park parking supply. The Modified Project would not alter these parking space allocations in the Non-Disturbance Agreement between the California Science Center and USC.

It should also be noted that the existing VIP parking lot located on the Project Site, which contains approximately 238 vehicle parking spaces, is not included in the approximately 5,961-space parking supply in Exposition Park. Under the Modified Project, this parking lot would be retained and reconfigured to provide up to approximately 250 spaces. This would increase the vehicle parking supply in Exposition Park to up to approximately 6,211 spaces (5,236 on special event days if the Science Center and Natural History Museum reservations occur).

Vehicle access to the Project Site would be provided off of Figueroa Street via Exposition Park Drive (Christmas Tree Lane) and Martin Luther King, Jr. Boulevard. Primary vehicle access on non-event days would occur at the existing signalized intersections of Hoover Street/Martin Luther King, Jr. Boulevard and Figueroa Street/ Exposition Park Drive/39th Street. Truck access to the Project loading docks would be provided from South Coliseum Drive (Hoover Street). Additionally, the south drive of Christmas Tree Lane could be closed to traffic and open to pedestrians prior to and during events at the stadium, and would be re-opened to allow for exiting traffic prior to completion of the event.

The Modified Project would provide a minimum of 440 bicycle parking spaces (two percent of the proposed stadium seating capacity) to encourage bicycling to events at the stadium, of which 107 (58 short-term and 49 long-term) would be provided in LAMC-compliant bike racks and would satisfy LAMC bicycle parking requirements for the Modified Project's Ancillary Uses on non-event days. The remaining 333 bicycle parking spaces would be managed via a bicycle valet service on event days.

(8) Construction

Construction of the Modified Project is anticipated to take approximately 20.5 months to complete, which is slightly longer than the construction duration assumed for the Original Stadium Project in the Certified EIR. Construction is anticipated to involve five key phases: abatement and soft demolition (approximately 10 weeks); structure demolition (approximately 14 weeks); grading (approximately 4 weeks); building construction (approximately 14 months); and site finishing (approximately 2 months,

overlapping with the last several weeks of building construction). It is estimated that demolition of the existing Sports Arena would create approximately 5.4 million cubic feet of debris, a large percentage of which would be reused on-site as base material. Up to 200,000 cubic yards (cy) of soil would be moved and re-compacted on-site. Whereas the Original Stadium Project analyzed in the Certified EIR estimated an import of approximately 125,000 cy of soil, the Modified Project could result in a total import/export of up to 30,000 cy of soil. Construction trucks and workers would access the Project Site via Martin Luther King, Jr. Boulevard, and construction worker parking would be coordinated through the Exposition Park General Manager.

(9) Discretionary Actions

The Lead Agency with discretionary authority to approve the Modified Project is the Coliseum Commission. In addition, the Modified Project would require various discretionary and ministerial approvals from the City of Los Angeles. In addition to approval of the Modified Project by the Coliseum Commission, approvals required for development of the Modified Project by the City of Los Angeles would include, but may not be limited to, the following:

- Amendment of the Coliseum District Specific Plan to expressly allow development standards for Modified Project (e.g., seating capacity, floor area ratio (FAR), height, signage, parking and uses);
- Director's Review (pursuant to Coliseum District Specific Plan);
- Alcohol Use Approval to expressly allow all establishments that would sell and serve alcohol (pursuant to Coliseum District Specific Plan);
- Sign District/Supplemental Use District (Zone Change) for Signage; and
- Possible Board of Police Commissioners permit for extended interior construction hours.

Other discretionary approvals for the Modified Project may include:

- Haul Route approval (as applicable);
- Possible approval of a property and/or project agreement by the Coliseum Commission authorizing the development of the Modified Project on the Project Site; and
- Possible approval of a Non-Disturbance Agreement or other agreements for LAFC's operation of the Modified Project by the State of California (California

Science Center—Sixth District Agricultural Association), including use of State-owned properties in Exposition Park for signage, parking, and construction staging.

IV. Comparative Analysis of Modified Project Impacts

The analyses provided below address each of the environmental issues analyzed in the Certified EIR and focus on the potential changes in environmental impacts that could result from implementation of the Modified Project. Specifically, potential impacts attributable to the Modified Project are compared with the analysis and findings within the Certified EIR to determine if such impacts are within the envelope of impacts documented in the Certified EIR, including whether new significant impacts would result from the Modified Project or whether previously identified significant impacts would be substantially more severe. As set forth by the analyses below, and as summarized in Table 2 on page 32, the Modified Project would not result in any new significant environmental impacts or a substantial increase in the severity of a significant impact already identified in the Certified EIR. In addition, a revised Mitigation Monitoring Program (MMP) containing all Project Design Features and Mitigation Measures applicable to the Modified Project, including applicable mitigation measures from the Certified EIR analysis, is included as Appendix A to this Addendum.

A. Aesthetics

The following analysis of the Modified Project's potential impacts associated with aesthetics (visual character and views, light and glare and shading) is based on the analysis provided in Section IV.A, Aesthetics, of the Certified EIR, and on the Environmental Impact Lighting Study (Lighting Study) prepared for the Modified Project by Francis Krahe & Associates, dated August, 2015, which is included in Appendix B of this Addendum. The Lighting Study evaluates the proposed lighting program associated with the Modified Project and determines whether the Modified Project would result in new significant light and glare impacts not previously identified in the Certified EIR.

(a) Visual Character and Views

(i) Construction

Construction-related visual character and views impacts were not assessed in detail in the Certified EIR. As set forth in the L.A. CEQA Thresholds Guide and within the Certified EIR, visual character and views impacts are based on a number of factors that are used to determine whether a Project would substantially alter, degrade, or eliminate the existing visual character of an area. As set forth on pages IV.A-21–IV.A-22 of the Certified EIR, these factors include the existing valued aesthetic features that would be removed; open space to be developed; integration of new structures with open spaces; contrast of project features with the area's aesthetic image; the potential for new structures to detract from the existing image of the area; the Project's contribution to the area's aesthetic value; and consistency of the Project with applicable design guidelines and/or regulations.

Similar to the Original Stadium Project, during construction activities for the Modified Project, the visual appearance of portions of the Project Site would be altered due to the removal of the existing Sports Arena building and redevelopment of the Project Site with a new stadium building, and the Modified Project's proposed Ancillary Uses and outdoor open space areas. Related construction activities including site preparation and grading and the staging of construction equipment and materials (i.e., bulldozers, portable toilets, and offices) would also alter the visual character of the Project Site. However, in accordance with Project Design Feature A-1, the perimeter of the Project Site would be screened, which would limit views of construction activities from off-site areas. Given the temporary nature of construction activities and the use of screening to limit views of construction activities, short-term construction activities would not substantially and adversely alter or degrade the existing visual character of the Project Site. As such, construction of the Modified Project would not result in any new significant impacts with respect to construction-related visual character and view impacts. Construction-related impacts to views and visual character would be less than significant, and no mitigation measures are required.

(ii) Operation

The Certified EIR for the Original Stadium Project concluded that impacts with respect to visual character and views during operation of the Original Stadium Project would be less than significant (refer to Section IV.A, Aesthetics, of the Certified EIR). As set forth above, the thresholds on which this analysis was based are stated on pages IV.A-21–IV.A-22 of the Certified EIR. As discussed in the Certified EIR, the Original Stadium Project would result in a notable change to the existing character of the Project Site, as the Sports Arena building would be demolished and replaced with a modern, open-roof stadium complex. The new soccer stadium proposed under the Original Stadium Project, while architecturally different than the existing Sports Arena, would have occupied approximately the same general height, mass, and orientation as the Sports Arena. In addition, architecturally, the Certified EIR stated that the Original Stadium Project would be designed to complement the existing public use structures within Exposition Park and would generally improve the visual character in the project area. Perimeter landscaping and pedestrian plaza areas of the Original Stadium Project would be improved around the stadium fronting Figueroa Street. In addition, the Certified EIR determined that views from residential and commercial uses in the outlying vicinity would not be adversely affected since the Original Stadium Project would occupy the same general field of view as the existing Sports Arena building. With regard to signage, the Certified EIR concluded that while a detailed signage program was not developed at the time of preparation of the EIR, signage would be implemented in accordance with all of the applicable codes of the LAMC, the design guidelines of the South Los Angeles Community Plan, as it pertains to signage, and the rules and regulations set forth in the Specific Plan. Accordingly, the Certified EIR determined that under the Original Stadium Project, visual character and view impacts, including impacts related to the addition of signage to the Project Site, would be less than significant.

As described in detail in Section III, Project Description of this Addendum, the physical development envelope under the Modified Project would not vary substantially from the Original Stadium Project. Specifically, as with the Original Stadium Project, the Modified Project includes an approximately 22,000-seat soccer stadium and associated uses, which would replace the existing Sports Arena within Exposition Park. Proposed modifications to the Original Stadium Project include the addition of up to approximately 105,900 square feet of ancillary amenity floor area (Ancillary Uses), and refinements to the design of the stadium and open space areas. Most of the Ancillary Uses would be centered around a main entry plaza at the northwest corner of the Project Site (Northwest Plaza) that would connect to the stadium's main concourse and serve as a primary public entry to the stadium. The Northwest Plaza is designed to serve as an active public space that would be integrated with ground-floor restaurants with outdoor dining areas. The Ancillary Uses would be a maximum of 75 feet above grade. The Modified Project would also include a 40- to 70-foot setback along Figueroa Street to activate the pedestrian

realm. Overall, as compared the Original Stadium Project, the Modified Project would provide enhanced pedestrian improvements and open space areas, including approximately 143,000 square feet of improved public open space around the Project Site that would include pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas and could potentially include water features, public art, and seating areas.

Under the Modified Project, the proposed stadium would be oriented along a north-south axis and, like the Original Stadium Project, would be located within the eastern portion of the Project Site (within a portion of the footprint area currently occupied by the Sports Arena). The footprint of the stadium under the Modified Project would be somewhat larger than under the Original Stadium Project in order to provide for a more modern stadium that includes the amenities expected of a world-class professional sports stadium. Most of the seating areas within the open-air stadium would be covered by a cantilevered roof canopy extended inward from the stadium's perimeter, with the field level placed approximately 20 feet below street level (as measured from the grade along Figueroa Street), roughly at the same elevation as the floor of the existing Sports Arena, consistent with the Original Stadium Project. The top of the roof canopy of the stadium would reach a maximum height of approximately 105 feet above street level, with rooftop structures extending to approximately 115 feet. The roof canopy skin would consist of a translucent, ETFE material, which would moderate the perceived height of the stadium because it would be permeable to light and would not be perceived as solid. The main concourse of the stadium would be located at street level and would provide an open-air, 360-degree circulation path around the stadium, connecting to several general and premium entry points distributed along the stadium perimeter. In addition, the stadium's northeast and southeast corners would be open to provide views into and out of the stadium seating bowl. Specifically, these openings would allow for clear views into the stadium from the street and sidewalk along Figueroa Street at the primary entrance to Exposition Park, and would frame focal views of the downtown skyline from within the seating bowl, particularly from the southwest corner. The base of the stadium at street level would draw on material influences from the Coliseum and Swim Complex, incorporating similar materials and color palates such as the Travertine and the concrete used extensively on those venues. Entry gates would be clearly identifiable and would prominently feature signage integrated into their design. As such, the design of the street level façades would relate to a human scale.

As discussed in detail in Section III, Project Description, on page 4 of this Addendum, the proposed Supplemental Use Sign District (SUD) for the Modified Project would authorize a new signage program in the proposed Signage Project Site, which consists of the Project Site in addition to a small area at the southwest corner of Christmas Tree Lane and Figueroa Street (located in the SUD's proposed Soccer Stadium Zone), and Parking Lot 6 to the south of the Project Site (located in the SUD's proposed South Parking

Lot Zone). Total signage allowed in the Signage Project Site as part of the SUD for the Modified Project, excluding aerial view signs, information signs, temporary signs, and interior signs, would be approximately 44,500 square feet, including up to approximately 19,200 square feet of digital signage. Individual signs could vary from approximately 40 to 3,800 square feet in size, depending on the sign zone, sign type, and location. Permitted signage would include a freestanding digital sponsorship sign along Figueroa Street in the South Parking Lot Zone, a free-standing digital sign near the southeast corner of the Soccer Stadium Zone along Figueroa Street, a free-standing digital sign near the entry to Exposition Park at Christmas Tree Lane at the northeastern corner of the Soccer Stadium Zone adjacent to Figueroa Street, and digital signs integrated with the architecture of the stadium. In addition, smaller-scale, directional pedestrian and vehicular signage would be placed throughout the Signage Project Site as necessary to facilitate access and safety. The types and extent of permitted signage would emphasize the event and entertainment-oriented aspect of the Project Site. Specifically, signage types could include identification signs, temporary event signs, electronic digital displays, changeable message LED boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed.

Based on the physical description of the Modified Project summarized above and the more detailed description provided in Section III, Project Description, of this Addendum, potential visual character and views impacts, including impacts related to signage, would continue to be less than significant under the Modified Project. The Project Site is located within an urbanized area and specifically within the 145-acre Exposition Park, a major community resource and destination within the City that includes the Coliseum, several museums, educational facilities, recreational amenities and open space areas, including existing signage and approved additional signage pursuant to the Coliseum District Specific Plan. Exposition Park, including the Sports Arena and the Coliseum, has been a renowned destination for major sporting and entertainment activities for decades. The Modified Project would therefore continue the primary existing use on the Project Site by providing an iconic sports and entertainment destination. Further, the Modified Project would replace an aging, underutilized indoor stadium with a new, open-air stadium characterized by contemporary, streamlined architecture. As shown in the visual renderings provided in Figure 4 through Figure 6 on pages 16 through 18 of this Addendum, the stadium would be designed to create an iconic venue for LAFC and the City of Los Angeles, and would consist of materials and color palates that draw influence from adjacent structures within Exposition Park, including the Coliseum. While the height and massing of the new structures would be taller than the existing Sports Arena, the proposed height of the new structures would be modulated with building heights that would range from approximately 75 feet above grade (for the Ancillary Uses in the Northwest Plaza, closest to the Coliseum) to approximately 105 feet above grade (for the proposed stadium roof structure located within the southeast portion of the site furthest from the Coliseum). The proposed building heights would be visually compatible with and within the context of the adjacent

Coliseum, which reaches a height of approximately 75 feet above grade at the Coliseum Bowl and a height of 124 at the top of the peristyle.[3] The Modified Project was specifically designed to respect the height of the Coliseum, so that its maximum height occurs at the edge furthest from the Coliseum (southeast corner), transitioning down to its lowest height of approximately 75 feet at the edge closest to the Coliseum. As discussed in detail in Section IV.E, Cultural Resources, on page 61 of this Addendum, the Coliseum's historic significance would not be materially impaired by the physical design of the Modified Project, and the change in setting under the Modified Project would result in a less than significant impact to the historic significance of the Coliseum.

In addition, the openings within the façade of the Modified Project's stadium and its translucent roof canopy would create additional architectural articulation and view opportunities (as discussed below), thereby contributing to the area's aesthetic value. Furthermore, as summarized above, the new structures would be integrated with approximately 143,000 square feet of improved public open space around the Project Site, which would include a new Northwest Plaza that would also be integrated with the Coliseum and adjacent areas within Exposition Park, as well as an expansive setback along Figueroa Street that would include enhanced landscape and streetscape to activate the western portion of the Project Site and create an inviting pedestrian space. Further, under the Modified Project, the street pattern, sidewalks, rows of trees, and central green space of North and South Coliseum Drives and Christmas Tree Lane would remain intact. In addition, trees and landscaping along the Modified Project's north and northwestern edges would provide screening when viewed from the Coliseum that would reduce the perception of the Modified Project's height and mass. In addition, the proposed reconfiguration and re-landscaping of the VIP parking lot would enhance the aesthetic character of the southern portion of the Project Site as compared to existing conditions. Thus, the visual appearance of the Modified Project would be appropriate in the context of existing development on and immediately surrounding the Project Site and the Modified Project would not degrade the general visual character of the Project Site.

The proposed signage program would represent an important component of the Modified Project and a strong visual element that would influence the aesthetics of the Project Site. As previously described, the Modified Project's signage program would allow a variety of sign types with requirements based on specific locations. The types and extent of permitted signage would emphasize the event- and entertainment-oriented aspect of the Project Site and complement the existing and approved signage environment in Exposition Park. The signage program is intended to support stadium operations and revitalize the

---

[3] *The Olympic Torch spire atop the central arch of the Coliseum peristyle reaches a height of approximately 124 feet above grade.*

Project Site as a major sports and entertainment venue, consistent with its historic use. Central to this concept is the goal of establishing a unique visual identity for the Project Site, which would be achieved in part through dynamic signage. As discussed in Section III, Project Description, on page 4 of this Addendum, the proposed SUD would place limitations on the types, amounts, locations, sizes, operating hours, and illumination of permitted signs. By design, Modified Project signage would be consistent with the character of a sports and entertainment venue (i.e., a well-lit and active environment with substantial pedestrian activity including nighttime activity), such as that which already exists on-site and within the surrounding area, including at the adjacent Coliseum. In addition, as discussed below, proposed signage would not result in significant light and glare impacts. Thus, proposed signage would not result in significant impacts associated with visual character when compared with the existing and contemplated visual character of the area as set forth in existing planning policies such as the Coliseum District Specific Plan. Overall, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.A, Aesthetics, of the Certified EIR), the Modified Project would result in less-than-significant impacts associated with visual character, and no mitigation measures are required.

With regard to views, as stated in the Certified EIR, due to the developed nature of the Project Site vicinity, existing views from the ground level are limited by existing structures and ornamental landscaping. Views of aesthetic resources in the Project Site vicinity include views of the Coliseum and landscaped open space areas within Exposition Park, as well as intermittent distant views of the downtown skyline. As discussed above, the stadium under the Modified Project would be located in the same general location of the existing Sports Arena. While the building height and massing would increase as compared to the existing Sports Arena and the Original Stadium Project, the building height would be modulated to locate shorter building heights closer to the Coliseum. However, there are very limited views of the Coliseum across the Project Site from the public right-of-way along Figueroa Street due to the presence of the Sports Arena and existing trees and landscaping. Accordingly, while the Modified Project would be taller than the Original Stadium Project, it would not result in the blockage of existing unobstructed views of the Coliseum. Further, the Modified Project has been sited so as to not block views of the Coliseum when entering Exposition Park from Figueroa Street (i.e., along Christmas Tree Lane), which is the most important public view corridor in the vicinity in terms of conveying the aesthetic and historic importance of the Coliseum (refer to Section IV.E, Cultural Resources, on page 61 of this Addendum). With regard to views of the downtown skyline, as is the case under existing conditions, and as would have been the case under the Original Stadium Project, such views would continue to be available on an intermittent basis. As compared to the Original Stadium Project, the openings in the Modified Project stadium's northeast and northwest corners would provide enhanced viewing opportunities of the downtown skyline, that are by design intended to provide dramatic and prominent views of this visual resource. With regard to landscaped open space areas within

Exposition Park, as was the case under the Original Stadium Project, the accessibility of such views would vary depending on the vantage point of the viewer. However, in general, the Modified Project would provide enhanced connections to adjacent open space areas through the Northwest Plaza and associated pedestrian walkways, providing more opportunities to access and view open space areas within Exposition Park. Thus, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.A, Aesthetics, of the Certified EIR), potential impacts associated with views under the Modified Project would be less than significant. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect visual character and views, including impacts related to signage, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(b) Light and Glare

(i) Construction

Potential impacts associated with construction-related lighting and glare were not assessed in detail in the Certified EIR. As set forth on page IV.A-22 of the Certified EIR, impacts with respect to light and glare would be significant if the Project would result in a new substantial source of light or glare, which would adversely affect day or nighttime views in the area.

The Modified Project would implement Mitigation Measure CR G-2 of the Certified EIR, which restricts exterior construction and demolition activities to the hours of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday. Thus, construction lighting would be limited to very short durations during the winter season and would be temporary. Further, construction-related illumination would be used for safety and security purposes only, in compliance with LAMC light intensity requirements. Additionally, in accordance with Project Design Feature A-1, the perimeter of the Project Site would be screened and would limit views of construction activities. Therefore, uses which are not adjacent to the Project Site would not be anticipated to be substantially affected by construction light or daytime glare. Thus, through implementation of the identified mitigation measure and Project Design Feature, and with adherence to existing LAMC regulations, light and glare impacts associated with proposed construction under the Modified Project would be less than significant. As such, construction of the Modified Project would not result in any new significant impacts with respect to construction-related lighting. No additional mitigation measures are required.

(ii) Operation

The Certified EIR for the Original Stadium Project concluded that impacts with respect to lighting during operation would be less than significant through compliance with mitigation measures (refer to Section IV.A, Aesthetics, of the Certified EIR). As set forth on page IV.A-22 the Certified EIR, impacts with respect to light and glare would be significant if a project would result in a new substantial source of light or glare, which would adversely affect day or nighttime views in the area. In the context of the applicable thresholds identified in the Certified EIR and applicable LAMC requirements related to lighting, the previously referenced Lighting Study was prepared for the Modified Project to determine whether potential lighting and glare from Modified Project operations would result in any new significant impacts that were not identified in the Certified EIR, or whether the previously identified significant impacts would be substantially more severe (see Appendix B of this Addendum). The Lighting Study specifically considers light and glare impacts to be significant if the Modified Project: (1) generates light intensity levels of 2.0 foot-candles or more at the property boundary from exterior on-site light sources[4]; (2) generates light emissions associated with an illuminated sign that produces a light intensity exceeding 3.0 foot-candles at the property line of a residence or other sensitive receptor; (3) creates new high contrast conditions visible from a field of view from sensitive receptor; or (4) incorporates substantial amounts of highly reflective building materials or signage (i.e., daytime glare) in areas that are highly visible to off-site glare-sensitive uses.

As discussed in the Certified EIR, the Original Stadium Project would include stadium lights and other sources of lighting such as pole-mounted lighting for parking lot areas, pedestrian walkways, and security lighting for pedestrian plaza areas that could result in light spillage onto adjacent properties and land uses. In particular, when compared with the existing indoor Sports Arena facility, nighttime events and games held at the Original Stadium Project would generate a high degree of artificial lighting in the night sky. However, under the Original Stadium Project, proposed lighting would be designed in a manner that limits spillover and light pollution to the maximum extent feasible. For example, the Certified EIR explained that the lighting system would employ directional lighting fixtures to illuminate the field level. In addition, Mitigation Measure A-1 required that outdoor lighting shall be designed and installed with shielding such that the light source cannot be seen from adjacent residential properties or the public right-of-way. With regard to daytime glare, Mitigation Measure A-2 limited the types of building materials to be employed in order to address potential daytime glare impacts. Thus, with the

---

[4] *The LAMC addresses lighting intensity levels at the property line of the nearest off-site residence of other light-sensitive use. To provide a conservative analysis, potential lighting impacts are based on the Specific Plan boundary or in the case of the eastern site boundary of the Project Site, the centerline of Figueroa Street.*

implementation of these measures, the Certified EIR concluded that Original Stadium Project's potential aesthetic impacts associated with light and daytime glare would be less than significant.

As with the Original Stadium Project, the Modified Project includes lighting and signage to support stadium operations. Lighting would include lighting of the stadium, including the field and associated amenities and ancillary uses (e.g., outdoor dining and seating areas, plazas, and walkways). As discussed above, new signage would be provided as part of a signage program for the Modified Project to emphasize the event and entertainment-oriented aspect of the Project that would be implemented via the proposed SUD. As described in detail in Section III, Project Description, on page 4, and within Appendix C of this Addendum, signage types for the Modified Project could include identification signs, temporary event signs, electronic digital displays, changeable message LED boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed. Lighting emissions resulting from the illuminated signage are expected to be emitted from three types of signs: front-lit signs, electronic digital displays, and changeable message LED boards.

A detailed analysis of the potential light and glare impacts associated with proposed lighting and signage under the Modified Project is provided in the Lighting Study included as Appendix B of this Addendum. As discussed in detail in the Lighting Study, a computer model was used to evaluate the Modified Project's potential lighting impacts. To analyze potential lighting impacts, both illuminance and glare from the Modified Project were evaluated. As discussed in the Lighting Study, illuminance is defined as the measured amount of illumination that falls on a given area from a light source, and glare (also referred to as contrast) is defined as the magnitude of the sensation that results when an individual views a surface from which light comes to the eye. A summary of these analyses is provided below. Also included in the evaluation of potential glare impacts below is an analysis of daytime glare.

Illuminance

As described in detail in the Lighting Study, the illuminance analysis for the Modified Project was conducted using a detailed computer model and in accordance with recommended practices established by the Illuminating Engineering Society of North America (IESNA). For the field and on-site lighting, the model evaluated potential lighting impacts at the centerline of Figueroa Street, at the southern Specific Plan boundary at the north edge of Martin Luther King, Jr. Boulevard, at the northern Specific Plan boundary at the north edge of Christmas Tree Lane and at the Specific Plan boundary west of Hoover Street. The analysis conservatively assumed simultaneous lighting of the field and associated amenities and Ancillary Uses within the Project Site. For signage, consistent with applicable LAMC requirements, the model evaluated potential lighting impacts at the

Figueroa Street east boundary, at the southern edge of Martin Luther King, Jr. Boulevard, at the north edge of Christmas Tree Lane and at the Specific Plan boundary west of Hoover Street. The analysis conservatively assumed simultaneous lighting of all proposed illuminated signage (including digital signage).

In addition, the analysis assumed incorporation of specific Project Design Features relative to lighting that would be implemented as part of the Modified Project and would reduce impacts associated with lighting. Specifically, as set forth in Project Design Feature A-2, stadium field lighting would be designed based on Major League Soccer (MLS) standards that stipulate the use of high performance lights with good color and good glare control. In accordance with Project Design Feature A-3, the Project's field lighting would include high-intensity LED fixtures in specified areas and a no lighting fixture zone would be specified as shown in Figure 34 of the Lighting Study. Furthermore, in accordance with Project Design Feature A-4, design elements would be incorporated to limit the direct view of the light source surface of all stadium light fixtures and to ensure that the light source cannot be seen from adjacent residential properties or the public right-of-way. In accordance with Project Design Feature A-5, all light sources, including illuminated signage, would comply with CALGreen (Part 11 of Title 24, California Code of Regulations). Finally, in accordance with Project Design Feature A-6, signage brightness would not exceed 800 candelas per square meter at night.

As summarized in Table 3 on page 44, potential illuminance impacts resulting from field and other on-site lighting proposed under Modified Project would be well below the 2.0-foot-candle significance threshold. In addition, the maximum calculated illuminance would be less than the IESNA recommendations of 8 lux (0.76 foot-candle) for Lighting Zone 3 in which the Project Site is located. As discussed in detail in the Lighting Study, the highest illumination levels would be along Figueroa Street. However, this area is already well illuminated with existing horizontal illuminance levels above 3.0 foot-candles directly across Figueroa Street from the Project Site. Furthermore, Mitigation Measures A-1 and A-2 set forth in the Certified EIR would continue to be incorporated to ensure that impacts associated with illumination from on-site lighting would be less than significant. Thus, no additional mitigation measures are required.

As discussed above, lighting emissions resulting from the illuminated signage proposed by the Modified Project are expected to be emitted from three types of signs: front-lit signs, electronic digital displays, and changeable message LED boards. In accordance with Project Design Feature A-5, illuminated signage would comply with the requirements outlined in CALGreen, and as such, would require 65 percent dimming of signage at night. In addition, in accordance with Project Design Feature A-6, signage brightness would not exceed 800 candelas per square meter at night. As described in detail in the Lighting Study and summarized in Table 4 on page 45, lighting impacts

Table 3
Field and Site lighting Illuminance Calculation Results

Location	Description	Illuminance (foot-candles)			Impact[a]
		Average	Maximum	Minimum	
1-1	Vertical Plane 80 feet high at Centerline of Figueroa St.	0.066	0.735	0.000	Below Threshold
1-2	Vertical Plane 80 feet high at north edge of Martin Luther King, Jr. Blvd.	0.010	0.259	0.000	Below Threshold
1-3	Vertical Plane 80 feet high at north edge of Christmas Tree Ln.	0.014	0.034	0.000	Below Threshold
1-4	Vertical Plane 80 feet high at Specific Plan Boundary west of Hoover St.	0.000	0.000	0.000	Below Threshold

[a] *Threshold is 2.0 foot-candles or more.*

Source: Francis Krahe & Associates, 2015.

resulting from the proposed illuminated signage on neighboring residential properties would be below the 3.0-foot-candle threshold. Thus, potential illumination impacts associated with signage would be less than significant and no mitigation measures are required.

Glare

With regard to glare/contrast from Modified Project lighting, the most sensitive locations for potential glare impacts are those sites closest to the Project Site. Thus, the most sensitive locations are to the east of the Project Site followed by the locations to the south of the Project Site. These locations were evaluated in detail in the Lighting Study.

As discussed above, the Modified Project would include a variety of lighting types, including high-intensity LED field lighting and LED pole lighting. However, as discussed in detail in the Lighting Study, the design of the Modified Project, together with the proposed Project Design Features, would limit direct view of any light sources from areas outside of the Specific Plan boundary. Specifically, as demonstrated by the detailed analysis in the Lighting Study, the receptors to the east of Figueroa Street would not experience high glare conditions due to design features of the Modified Project that screen the field surface and direct view of the field light fixtures, the use of opaque façades and walls that eliminate direct light, and the use of directed and shielded lighting per CALGreen. As such, the resulting contrast from lighting under the Modified Project would be low to medium, resulting in no glare impacts from new lighting sources. With respect to potential glare from

Table 4
Illuminated Signage Calculation Results

Location	Description	Illuminance (foot-candles)			Impact[a]
		Average	Maximum	Minimum	
2-1	Vertical plane 80 feet high at the east edge of Figueroa St.	1.150	2.900	0.100	Below threshold
2-2	Vertical plane 80 feet high at the south edge of Martin Luther King, Jr. Blvd.	0.120	0.600	0	Below threshold
2-3	Vertical plane 80 feet high at the north edge of Christmas Tree Ln.	0.220	0.300	0.100	Below threshold
2-4	Vertical plane 80 feet high at the Specific Plan Boundary west of Hoover St.	0	0	0	Below threshold

[a] *Threshold is 3.0 foot-candles or more.*

Source: Francis Krahe & Associates, 2015.

signage, as stated above, in accordance with Project Design Feature A-6, signage brightness would not exceed 800 candelas per square meter at night, which would ensure that adjacent sensitive receptors do not experience substantial glare effects from Modified Project signage. In addition, as required by the Outdoor Advertising Act, Modified Project signage would not contain flashing images that are visible from freeways. Electronic digital display signage with changing messages, including those visible from the freeway, would consist of static images that remain at a constant brightness for no less than 8 seconds, and then complete an instant refresh to the next image which would then be static for no less than 8 seconds.[5] Accordingly, potential nighttime glare impacts from the Modified Project, including the proposed signage program, would be less than significant and no mitigation measures are required.

With regard to potential impacts from daytime glare, Mitigation Measure A-2 in the Certified EIR requires that the exterior of the proposed structure shall be constructed of materials including, but not limited to high-performance and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize

[5] *The Outdoor Advertising Act defines "flashing" as a light or message that changes more than once every 4 seconds.*

glare and reflected heat. With continued implementation of this Mitigation Measure, potential daytime glare impacts under the Modified Project would be less than significant.

(c) Shading

Potential impacts associated with shading were not assessed in detail in the Certified EIR. As set forth in the L.A. CEQA Thresholds Guide, a project would have a significant shading impact if off-site shadow-sensitive uses would be shaded by project-related development for more than three hours between the hours of 9:00 A.M. and 3:00 P.M. Pacific Standard Time (between early November and early March), or more than four hours between the hours of 9:00 A.M. and 5:00 P.M. Pacific Daylight Time (between early March and early November).[6]

As discussed above, the proposed structures under the Modified Project would range in height from approximately 75 feet within the northwestern portion of the Project Site to a maximum of approximately 105 feet above street level, with rooftop structures extending to approximately 115 feet. The closest off-site shadow-sensitive uses to the Specific Plan area are residential uses located across Figueroa Street to the east followed by residential uses to the of south of Martin Luther King, Jr. Boulevard. Based on the proposed building heights, the maximum shadows that would be generated by the proposed structures would extend approximately 345 feet in a northern orientation during the winter. Given the location of the shadow-sensitive uses to the east and south of the site, as well as the presence of intervening roadways (i.e., Figueroa Street and Martin Luther King Jr., Boulevard) and surface parking areas, the Modified Project would not shade off-site shadow-sensitive uses for more than three hours during any time of the year. As such, the Modified Project's potential shading impacts would be less than significant and no mitigation measures are required.

Based on the analysis above, through the implementation of mitigation measures identified in the Certified EIR and the proposed Project Design Features, implementation of the Modified Project would not result in any new significant impacts with respect aesthetics, and would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

---

[6] *Shade-sensitive uses under the Los Angeles CEQA Thresholds Guide include routinely useable outdoor spaces associated with residential, recreational, or institutional (e.g., schools, convalescent homes) land uses; commercial uses such as pedestrian-oriented outdoor spaces or restaurants with outdoor dining areas; nurseries; and existing solar collectors.*

(d) Project Design Features and Mitigation Measures

The Modified Project would implement the following Project Design Features related to aesthetics:

PDF A-1: The perimeter of the Project Site shall be screened during primary construction activities to limit views of construction activities

PDF A-2: Stadium field lighting shall be designed based on Major League Soccer (MLS) standards that stipulate the use of high performance lights with good color and good glare control.

PDF A-3: The Project's field lighting shall be implemented in accordance with the zones established in Figure 34 of the Lighting Study.

PDF A-4: Design elements shall be incorporated to limit the direct view of the light source surface for all stadium light fixtures and to ensure that the light source cannot be seen from adjacent residential properties or the public right-of-way. Such design elements could include one or more of the following: use of light fixtures that comply with the ratings specified in CALGreen Table 5.106B; use of light fixtures with a focused output where the output angles greater than 20 degrees from beam centerline do not exceed 500 candelas; glare shields and louvers attached to the front face of the light fixture; and/or architectural screens to conceal the direct view of the LED light fixtures from the center of Figueroa Street to the east and the Coliseum District Specific Plan boundary to the north, south, and west.

PDF A-5: All light sources, including illuminated signage, shall comply with CALGreen (Part 11 of Title 24, California Code of Regulations).

PDF A-6: Signage luminance shall not exceed 800 candelas per square meter after sunset or before sunrise.

The following mitigation measures were included in the Certified EIR to reduce potential aesthetics impacts to less than significant levels. These Mitigation Measures would continue to be implemented as part of the Modified Project and have been incorporated into the MMP included with this Addendum (see Appendix A of this Addendum):

EIR Mitigation Measure MM A-1: Outdoor lighting shall be designed and installed with shielding such that the light source cannot be seen from adjacent residential properties or the public right-of-way.

EIR Mitigation Measure MM A-2: The exterior of the proposed structure shall be constructed of materials such as, but not limited to, high-performance

and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize glare and reflected heat.

B. Agriculture and Forestry Resources

The Certified EIR for the Original Stadium Project concluded that no impacts to agricultural resources would occur under the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR). Significant impacts to agricultural resources could occur if a project were to convert designated farmland to non-agricultural use, conflict with existing zoning for agricultural use or a Williamson Act contract, or otherwise result in the conversation of farmland. The Project Site is currently developed with the Sports Arena and is not located on designated Prime Farmland, Unique Farmland, or Farmland of Statewide Importance as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program. There are no existing or mapped agricultural resources within the Project Site and such uses are not proposed as part of the Modified Project. No agricultural zoning is present in the surrounding area, and no nearby lands are enrolled under the Williamson Act. Thus, the Modified Project would not result in the conversion of designated farmland. In addition, the Modified Project would not conflict with agricultural zoning or a Williamson Act contract. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR), no impacts to agricultural resources would occur under the Modified Project. No mitigation measures are required. Therefore, the Modified Project would not result in any new significant impacts with respect to agricultural resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

Potential impacts to forestry resources were not assessed in detail in the Certified EIR for the Original Stadium Project (Appendix G of the CEQA Guidelines was amended to include forestry resources effective March 2010). Significant impacts to forestry resources could occur if a project were to result in the loss or conversion of forest land, or conflict with existing zoning for forest land or timberland. The Project Site is located in an urbanized area and does not include any forest land or timberland. Additionally, the Project Site is not zoned for forest land, and is not used as forest land. Therefore, development of either the Original Stadium Project or the Modified Project would not conflict with existing zoning for, or cause rezoning of, forest land or timberland as defined by the Public Resources Code. Accordingly, no impacts to forestry resources would occur and no mitigation measures are required. Therefore, the Modified Project would not result in any new significant impacts with respect to forestry resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

C. Air Quality

(a) Construction

The Certified EIR for the Original Stadium Project concluded that air quality impacts from construction of the Original Stadium Project would be significant and unavoidable for regional emissions and less than significant for localized emissions (refer to Section IV.B, Air Quality, of the Certified EIR). The thresholds on which this analysis was based are stated on pages IV.B-21–IV.B-24 of the Certified EIR. As stated in the Certified EIR, the Original Stadium Project would generate pollutant emissions from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction, including the application of architectural coatings; paving and asphalting; construction workers traveling to and from the Project Site; delivery and hauling of construction supplies and debris to and from the Project Site; and, the fuel combustion generated by on-site construction equipment.

The Modified Project would consist of the Original Stadium Project (reconfigured on the Project Site) together with the addition of up to approximately 105,900 square feet of ancillary facility floor area (up to approximately 119,000 gross square feet). In addition, as described in Section III, Project Description, on page 4 of this Addendum, the Modified Project would have a slightly longer construction period (by 0.5 month) and a total import/export of up to 30,000 cubic yards (cy) of soil compared to the Original Stadium Project's estimated import of approximately 125,000 cy of soil. Therefore, construction haul trips are anticipated to be less under the Modified Project. However, as a result of the modifications proposed under the Modified Project, potential construction-related emissions associated with the Modified Project were quantified to determine whether the changes in the proposed development program would have the potential to increase the severity of previously identified significant impacts or result in new, previously unidentified significant impacts related to construction air emissions.

With regard to regional emissions, the Certified EIR determined that the peak daily emissions generated during construction of the Original Stadium Project would exceed the regional emissions threshold recommended by the South Coast Air Quality Management District (SCAQMD) for nitrogen oxides (NO_X) during the grading/site preparation phase, as well as the threshold for reactive organic compounds (ROG) during the building and coating phase. The Certified EIR included Mitigation Measures MM B-1 and MM B-2, requiring compliance with SCAQMD Rule 403 and the use of low-volatile organic compound (VOC) paints, respectively, to reduce these impacts to the extent feasible. However, even with implementation of these mitigation measures, the Certified EIR determined that levels of NO_X and ROG would exceed applicable thresholds. Therefore, the Certified EIR concluded that regional air quality impacts associated with construction emissions would be significant and unavoidable under the Original Stadium Project.

Construction of the Modified Project would generate regional pollutant emissions from the same general sources as the Modified Project, as described above (e.g., heavy-duty construction equipment, haul truck trips, and construction worker trips). Construction-related emissions associated with these sources were calculated using CalEEMod. Model results are provided in Appendix D of this Addendum. The calculations reflect the estimated types and quantities of construction equipment that would be used to remove existing structures and pavement; grade and excavate the Project Site; construct the proposed structures and related improvements; pave new parking; and plant new landscaping within the Project Site under the Modified Project. The analysis assumes that all construction activities would comply with SCAQMD Rule 403 regarding the control of fugitive dust (as reflected in Mitigation Measure MM B-1 in the Certified EIR) and that construction activities would utilize low-VOC paints (as reflected in Mitigation Measure MM B-2 in the Certified EIR). In addition, the Modified Project would incorporate Project Design Feature C-1 related to the control of exhaust emissions from on-site heavy-duty construction equipment, which is reflected in the emission calculations presented in Table 5 on page 51. The Modified Project would also implement Project Design Feature C-2 to encourage Project contractors to apply for SCAQMD Surplus Off-Road Opt-In for NO_X (SOON) funds, if applicable and available at the time of construction. The SOON program provides funding assistance to applicable fleets for the purchase of commercially-available low-emission heavy-duty engines to achieve near-term reduction of NO_X emissions from in-use off-road diesel vehicles. Implementation of Project Design Feature C-2 is not reflected in the Modified Project's emission calculations.

As shown in Table 5, peak daily construction emissions under the Modified Project would be less than those under the Original Stadium Project for all pollutants. However, as with the Original Stadium Project, peak daily emissions of NO_X and VOC would exceed the SCAQMD regional thresholds even with implementation of Mitigation Measures MM B-1 and MM B-2 set forth in the Certified EIR, which have been incorporated into the Modified Project's MMP included as Appendix A to this Addendum. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.B, Air Quality, of the Certified EIR), impacts with respect to regional air emissions during construction would be significant and unavoidable under the Modified Project. However, emissions would be less than levels analyzed in the Certified EIR. No other feasible mitigation measures have been identified to reduce impacts to a less-than-significant level.

With respect to localized emissions, the Certified EIR determined that on-site emissions generated by the Original Stadium Project during the different phases of construction would not exceed the established SCAQMD localized thresholds for NO_X (in the form of nitrogen dioxide (NO_2)), carbon monoxide (CO), particulate matter less than 10 microns in size (PM_{10}), and particulate matter less than 2.5 microns in size ($PM_{2.5}$).

Table 5
Modified Project Regional Construction Emissions[a]
(pounds per day)

Emission Source	VOC	NO_X	CO	$SO_{2.5}$	PM_{10}[b]	$PM_{2.5}$[b]
Modified Project						
2016	10	128	133	<1	18	9

Source: Eyestone Environmental, 2015.

Therefore, the Certified EIR concluded that impacts related to localized air emissions during construction would be less than significant under the Original Stadium Project.

With respect to quantifying mass emissions for localized analysis, only emissions that occur on-site are considered. Consistent with the SCAQMD Localized Significance Threshold (LST) methodology guidelines, emissions related to off-site delivery/haul truck activity and employee trips are not considered in the evaluation of localized impacts. As shown in Table 6 on page 52, localized construction emissions from the Modified Project would increase in comparison to levels analyzed in the Certified EIR for the Original Stadium Project. However, as with the Original Stadium Project, localized emissions of all criteria pollutants (CO, NO_X, PM_{10}, and $PM_{2.5}$) would remain below their respective SCAQMD LST significance thresholds. As such, consistent with the conclusions in the

Table 6

[a] *SCAQMD LSTs based on Source Receptor Area (SRA) 1, 5-acre active site area, and 25-meter receptor distance. The SCAQMD localized threshold for NO_X was revised compared to the threshold applied in the Certified EIR to account for the recently adopted 1-hour NO_2 National Ambient Air Quality Standards (NAAQS) of 188 microgram per cubic meter ($\mu g/m^3$), or an incremental threshold of 64 $\mu g/m^3$ for SRA 1.*

[b] *See Table IV.B-9 on page IV.B-31, Section IV.B, Air Quality, of the Certified EIR. Emissions shown are peak daily emissions during maximum impact phase.*

Source: Eyestone Environmental, 2015.

Certified EIR for the Original Stadium Project (refer to Section IV.B, Air Quality, of the Certified EIR), impacts with respect to localized air quality during construction would be less than significant under the Modified Project. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to air quality during construction, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(b) Operation

The Certified EIR for the Original Stadium Project concluded that air quality impacts from operation of the Original Stadium Project would be less than significant (refer to Section IV.B, Air Quality, of the Certified EIR). The thresholds on which this analysis was based are stated on pages IV.B-21–IV.B-24 of the Certified EIR. As stated in the Certified EIR, operational emissions generated by both stationary and mobile sources would result from normal day-to-day activities on the Project Site after completion of the Original Stadium Project. Stationary area source emissions would be generated by the consumption of natural gas for space and water heating devices and the operation of landscape maintenance equipment. Mobile source emissions would be generated by the motor vehicles traveling to and from the Project Site. Similar to the Original Stadium Project, air pollutant emissions associated with occupancy and operation of the Modified Project would be generated by the consumption of both electricity and natural gas on-site (stationary) and the operation of vehicles traveling to and from the Project Site (mobile). Therefore, each of these types of emissions is addressed below.

The Certified EIR (refer to Section IV.B, Air Quality, of the Certified EIR) concluded that no new significant air quality impacts would result from stationary sources (i.e., electricity or natural gas consumption) as the Original Stadium Project would replace an existing venue that is over 50 years old with a state-of-the-art venue that would include numerous sustainability and design features that would result in significantly increased energy efficiencies at the Project Site. Like the Original Stadium Project, the Modified Project includes a 22,000-seat MLS stadium (reconfigured on the Project Site) and the addition of up to approximately 105,900 square feet of ancillary facility floor area (up to approximately 119,000 gross square feet). While the Ancillary Uses would result in some additional electricity and natural gas consumption beyond levels analyzed in the Certified EIR on event days, any such increase would largely be offset by the Modified Project's compliance with applicable provisions of the 2013 CalGreen Code in accordance with the City of Los Angeles Green Building Code (Chapter IX, Article 9, of the LAMC, as amended pursuant to City of Los Angeles Ordinance No. 182,849). Specifically, the 2013 CalGreen Code is anticipated to be 30 percent more efficient than the 2008 Title 24 requirements for nonresidential construction that were applicable to the Original Stadium Project.[7] In addition, as shown in Table 7 on page 54, pollutant emissions related to energy sources would be considered a minor source of emissions resulting in less than 1 pound per day for all pollutants. Furthermore, like the Original Stadium Project, the proposed stadium under the Modified Project would be an outdoor venue, which would significantly reduce the

Source: Eyestone Environmental, 2015.

amount of stationary source emissions associated with heating and air conditioning compared to the existing Sports Arena. Therefore, like the Original Stadium Project, and consistent with the conclusions in the Certified EIR, event-day stationary source emissions under the Modified Project would be expected to be reduced compared to existing conditions, and would result in less-than-significant impacts.

With respect to mobile source emissions, the Certified EIR concluded that no new significant air quality impacts would result from a game or event hosted at the proposed stadium as compared to operation of the existing Sports Arena since the maximum capacity of the stadium would be within historic attendance levels at the Sports Arena (refer to Section IV.B, Air Quality, of the Certified EIR). Further, since the Coliseum and the Sports Arena currently hold events with up to 93,000 persons in attendance combined, the Certified EIR also concluded that no new air quality impacts would result from concurrent events in the Coliseum and Original Stadium Project with combined attendees of up to 93,000 persons, and included a mitigation measure (Mitigation Measure MM J-1) to ensure that events in the two venues are scheduled in such a manner as to not exceed this limit. As stated below, Mitigation Measure J-1 would continue to be implemented under the Modified Project, and has been incorporated into the Modified Project's MMP (see Appendix A of this Addendum). Like the Original Stadium Project analyzed in the Certified EIR, the Modified Project proposes a 22,000-seat professional soccer stadium. Pursuant to Project Design Feature O-4 in Section IV.O, Traffic/Transportation/Parking, on page 169 of this Addendum, the Ancillary Uses proposed as part of the Modified Project would be open only to ticket-holding game/event patrons during a period of time before, during and

after the game/event, with no material increase in event-related traffic expected. Therefore, because air quality impacts are assessed based on peak daily conditions, the Certified EIR's conclusions with respect to air quality impacts from event day daily trips would not change under the Modified Project, and potential impacts on event days in the Modified Project would remain less than significant. Additionally, the Certified EIR did not account for the trip reduction associated with the Expo Light Rail stations in proximity to the Project Site, as the Expo Light Rail Line was not in operation at the time the EIR was certified. The Expo Park/USC Station is located approximately 0.35 mile from the Project Site and the Expo/Vermont Station is located approximately 0.7 mile from the Project Site. Given the proximity of these stations, it is anticipated that a substantial number of attendees at the Modified Project would use the light rail on event days, further reducing the less-than-significant event day air quality impacts identified in the Certified EIR.

Because the Modified Project's proposed Ancillary Uses would be open to the public on non-event days, this analysis also addresses and quantitatively evaluates potential air quality impacts related to operation of the Ancillary Uses on non-event days. SCAQMD's CalEEMod was used to calculate regional mobile source emissions, on-road fugitive dust, and emissions from architectural coatings, landscape equipment, and energy use (see Appendix D of this Addendum for CalEEMod calculations). As shown in Table 7 on page 54, regional emissions resulting from operation of the Ancillary Uses are not expected to exceed any of the SCAQMD's daily regional operational thresholds. Therefore, air quality impacts from Modified Project operational emissions on non-event days would be less than significant. No mitigation measures are required.

As discussed in the Certified EIR, the Modified Project would also be subject to the SCAQMD's Air Quality Management Plan (AQMP). A project is considered consistent with the AQMP if it is consistent with the population, housing, and employment assumptions that form the basis of the AQMP. The Certified EIR determined that the Original Stadium Project would be consistent with the 2007 AQMP in effect at the time the Certified EIR was prepared because it would be consistent with applicable population, housing, and employment projections. The AQMP was updated in 2012 subsequent to the preparation of the Certified EIR. The 2012 AQMP adopted by the SCAQMD incorporates the Southern California Association of Governments' (SCAG) *2012–2035 Regional Transportation Plan/Sustainable Communities Strategy* (2012–2035 RTP/SCS) socioeconomic forecast projections of regional population and employment growth. As discussed below under Subsection IV.M, Population, Housing and Employment, on page 134 of this Addendum, employment impacts with respect to the stadium portion of the Modified Project would not change compared to levels analyzed in the Certified EIR. The 282 additional on-site employees that could result from the Modified Project's Ancillary Uses would represent approximately 0.9 percent of the anticipated employment growth in the subregion through 2018. Therefore, additional employees generated by the Modified Project would fall within

SCAG's employment projections for the Subregion. Furthermore, as discussed above, the Modified Project would not result in new significant impacts or substantially increase the severity of any significant impacts previously identified in the Certified EIR with respect to air quality. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.B, Air Quality, of the Certified EIR), impacts with respect to AQMP consistency would be less than significant under the Modified Project. No mitigation measures are required.

With regard to traffic-related localized air quality impacts, which were not analyzed in detail in the Certified EIR, as described further below in Subsection IV.O, Traffic/ Transportation/Parking, on page 149 of this Addendum, the Modified Project would not increase peak-hour trips compared to the Original Stadium Project during event days, which would have the highest peak hour trips compared to non-event days. Therefore, traffic-related localized air quality impacts would be similar to those of the Original Stadium Project (i.e., less than significant). In addition, ambient CO concentrations within the Air Basin have decreased subsequent to completion of the Certified EIR. The CO background concentration at the closest monitoring station to the Project Site (Downtown Central Los Angeles County) shows that the 1-hour CO concentration has decreased from 2.4 parts per million (ppm) in 2011 to 2.0 ppm in 2013. As a result, the potential for the Modified Project to result in CO "hotspots" has decreased as compared to the Original Stadium Project. However, as discussed above, even in the absence of the reduction in CO background concentration the Modified Project would not increase peak-hour trips compared to the Original Stadium Project. Therefore, the Modified Project's potential impacts with respect to CO "hotspots" would be less than significant and no mitigation measures are required.

The Certified EIR determined that potential air toxic impacts would be less than significant under the Original Stadium Project since the Original Stadium Project would not include any land uses involving the use, storage, or processing of carcinogenic or non-carcinogenic toxic air contaminants. The conclusion would not change under the Modified Project. Furthermore, the Modified Project would not locate sensitive receptors within siting distances identified by SCAQMD and California Air Resources Board (CARB) guidelines. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.B, Air Quality, of the Certified EIR), impacts with respect to toxic air contaminants would be less than significant under the Modified Project. No mitigation measures are required.

Potential odor impacts were not analyzed in detail in the Certified EIR. The Modified Project would not include any uses identified by the SCAQMD as being associated with substantial odors (e.g., agricultural uses, wastewater treatment plants, food processing plants, etc.). The Modified Project does include restaurant uses which have the potential to emit odors through cooking and charbroilers. However, the Modified Project would

minimize the release of odors from restaurant uses with odor reducing equipment as required by SCAQMD Rule 1138. Garbage collection areas for the Modified Project would be covered and situated away from the property line and sensitive uses where feasible. Good housekeeping practices would be sufficient to prevent objectionable odors related to trash facilities. Pursuant to Project Design Feature P-3 in Section IV.P, Utilities and Service Systems—Solid Waste, on page 189 of this Addendum, the Modified Project would also include a front-of-house composting program to reduce the amount of solid waste that would be disposed of at area landfills. The composting area would incorporate appropriate odor management practices to reduce odor emissions at adjacent receptors. Examples of such practices include nutrient balance, temperature, moisture content, and aeration control. Based on the distance to the nearest sensitive receptors and the odor control measures that would be employed, the proposed composting facilities would not result in significant odor impacts. Therefore, potential odor impacts under the Modified Project would be less than significant and no mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to operational air quality, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(i) Project Design Features and Mitigation Measures

The Modified Project would implement the following Project Design Features related to construction period air quality:

Project Design Feature C-1: Off-road diesel-powered construction equipment greater than 50 horsepower, that will be used an aggregate of 40 or more hours during any portion of construction activities, shall meet Tier 3 off-road emissions standards.

Project Design Feature C-2: The Applicant shall encourage construction contractors to apply for South Coast Air Quality Management District Surplus Off-Road Opt-In for NO_X (SOON) funds, should they be applicable and available at the time of construction initiation. The "SOON" program accelerates clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: www.aqmd.gov/home/programs/business/business-detail?title=off-road-diesel-engines.

The following mitigation measures were included in the Certified EIR to reduce to the maximum extent feasible the significant air quality impacts associated with construction of the Original Stadium Project. These Mitigation Measures would continue to be

implemented as part of the Modified Project, as revised, and have been incorporated into the MMP included with this Addendum (see Appendix A of this Addendum):

EIR Mitigation Measure MM B-1: The ~~Project~~ Applicant shall comply with SCAQMD Rule 403—Fugitive Dust. Examples of the types of dust control measures currently required and recommended include, but are not limited to, the following:

- Water active grading/excavation sites and unpaved surfaces at least three times daily;
- Sweep daily (with water sweepers) all paved construction parking areas and staging areas;
- Provide daily clean-up of mud and dirt carried onto paved streets from the site;
- Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site;
- Suspend excavation and grading activity when winds (instantaneous gusts) exceed 15 miles per hour over a 30-minute period or more; and
- An information sign shall be posted at the entrance to each construction site that identifies the permitted construction hours and provides a telephone number to call and receive information about the construction project or to report complaints regarding excessive fugitive dust generation. Any reasonable complaints shall be rectified within 24 hours of their receipt.

EIR Mitigation Measure MM B-2: The ~~Project~~ Applicant shall use low-VOC paints for all interior and exterior surfaces.

D. Biological Resources

The Certified EIR for the Original Stadium Project concluded that no impacts to biological resources would occur under the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR). Significant impacts to biological resources could occur if a project were to conflict with a habitat conservation plan or local ordinance protecting biological resources, or result in adverse effects on endangered and/or threatened species, riparian habitat, wetlands, other sensitive natural communities, or wildlife movement. The Project Site is a developed property located within a highly urbanized area. The Project Site and adjacent areas are predominantly developed with structures or urban open space areas that do not provide native or natural habitats (e.g., open space areas within Exposition Park). As stated in the Certified EIR, the Project Site does not contain any species identified as a candidate, sensitive, or special status species

in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service. In addition, there are no known locally designated natural communities on the Project Site or in the Project vicinity. Due to the highly urbanized surroundings, there are no federally protected wetlands, riparian habitats, wildlife corridors, or native wildlife nursery sites in the Project vicinity. Thus, as is the case with the Original Stadium Project, the Modified Project would not affect these types of resources. Furthermore, like the Original Stadium Project, the Modified Project would not conflict with the provisions of an adopted habitat conservation plan, natural conservation community plan, or other approved local, regional, or State habitat conservation plan, because there are no known locally-designated natural communities on the Project Site. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR), no impacts with respect to sensitive species, sensitive habitats, wildlife movement corridors, or habitat conservation plans would occur under the Modified Project. No mitigation measures are required.

The City of Los Angeles Protected Tree Ordinance (Chapter IV, Article 6 of the LAMC) regulates the relocation or removal of all California native oak trees (excluding scrub oak), California black walnut trees, Western sycamore trees, and California Bay trees of at least 4 inches in diameter at breast height. These native tree species are defined as protected by the City of Los Angeles. Native trees that have been planted as part of a tree planting program are exempt from this Ordinance and are not considered protected. The Ordinance prohibits, without a permit, the removal of any regulated protected tree, including “acts which inflict damage upon root systems or other parts of the tree...” and requires that all regulated protected trees that are removed be replaced on at least a two-to-one basis with trees that are of a protected variety. The City also requires that a report be prepared by a tree expert discussing the subject tree(s), their preservation, effects of the proposed construction, and mitigation measures pursuant to the removal or replacement thereof.

The Project Site includes a number of ornamental trees within the site interior and along Exposition Park Drive (Christmas Tree Lane) and South Coliseum Drive (Hoover Street), both of which are private roadways. In addition, ten on-site street trees are located within the City right-of-way along South Figueroa Street. Subsequent to the preparation of the Certified EIR, a *Tree Report—Interior Property Trees, Los Angeles Memorial Sports Arena Redevelopment Project* (Interior Tree Report) and *Tree Report—City of Los Angeles Rights-of-Way Trees, Los Angeles Memorial Sports Arena Redevelopment Project* (Street Tree Report) were prepared for the Modified Project by Carlberg Associates (August 2015). These reports are included in Appendix E and Appendix F of this Addendum, respectively. According to the Interior Tree Report, a total of 205 trees are located within the Project Site and along the previously described private roadways within Exposition Park. The interior

trees include ten Coast live oaks (*Quercus agrifolia*) and seven California sycamores (*Platanus racemosa*). Based on a review of historic aerial photographs of the Project Site, the Interior Tree Report determined that the Coast live oaks and California sycamores on the Project Site were planted as part of a tree planting program, and as such, are not considered protected under the City of Los Angeles Protected Tree Ordinance. The Modified Project would remove approximately 177 of the 205 interior trees, including 10 of the Coast live oaks and six of the California sycamores. The specific locations of the existing trees, as well as the trees to be removed, are identified on page 19 of the Interior Tree Report included in Appendix E of this Addendum. As shown therein, and as further discussed in Section IV.E.b, Historic Resources, on page 63, as part of the landscaping program, the street trees bordering South Coliseum Drive would be enhanced to maintain the tree line along Christmas Tree Lane and maintain a park-like setting on the western edge of the Project Site across from the Coliseum. Because the on-site Coast live oaks and California sycamores were planted as part of a tree planting program, the proposed tree removals would not conflict with the City of Los Angeles Protected Tree Ordinance. Additionally, as discussed above in Section IV.A, Aesthetics, on page 34, as part of a coordinated landscape plan, the Modified Project would provide approximately 169 new on-site trees. Accordingly, following development of the Modified Project, the number of interior site trees would be substantially similar to existing conditions, though the type and location of trees would be altered.

With regard to street trees, according to the Street Tree Report, the ten existing street trees along the Project Site's South Figueroa Street frontage are Mexican fan palms (*Washingtonia robusta*). The specific locations of these trees are identified on page 7 of the Street Tree Report included in Appendix F of this Addendum. As stated in the Street Tree Report, demolition, site grading, and construction activities under the Modified Project would not affect the ten identified street trees, and the street tress would be retained in the Modified Project design.

Based on the analysis above, impacts with respect to potential conflicts with local policies or ordinances protecting biological resources, including the City of Los Angeles Protected Tree Ordinance and City of Los Angeles Street Tree Division requirements, would be less than significant under the Modified Project. No mitigation measures are required.

Although unlikely, trees on the Project Site that are proposed for removal could potentially provide nesting sites for migratory birds. Construction activities under the Modified Project would be required to comply with the Migratory Bird Treaty Act and the California Department of Fish and Game Code. Specifically, in accordance with the Migratory Bird Treaty Act, tree removal activities would take place outside of the nesting season (February 15–August 15), to the extent feasible. If vegetation removal activities

must occur during the nesting season, a biological monitor would be present during the removal activities to ensure that no active nests would be impacted. If active nests are found, a 200-foot buffer radius (500 feet for raptors) would be established until the fledglings have left the nest. Through compliance with this existing regulatory requirement, potential impacts to nesting raptors would be less than significant under the Modified Project. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to biological resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

E. Cultural Resources

(a) Archaeological and Paleontological Resources

Potential impacts to archaeological and paleontological resources were not assessed in detail in the Certified EIR. Significant impacts to archaeological resources could occur if a project were to cause a substantial adverse change in the significance of an archaeological resource. Section 15064.5(a)(3)(D) of the CEQA Guidelines generally defines archaeological resources as any resource that “has yielded, or may be likely to yield, information important in prehistory or history.” Archaeological resources are features, such as tools, utensils, carvings, fabric, building foundations, etc., that document evidence of past human endeavors and that may be historically or culturally important to a significant earlier community. Significant impacts to paleontological resources could occur if a project were to directly or indirectly destroy a unique paleontological resource. Paleontological resources are the fossilized remains of organisms that have lived in a region in the geologic past and whose remains are found in the accompanying geologic strata. This type of fossil record represents the primary source of information on ancient life forms, since the majority of prehistoric species are extinct.

The Project Site is located within an urbanized area of the City of Los Angeles and has been subject to disturbance and excavation in the past, including through the development of the Sports Arena in the late 1950s and subsequent site improvements. Any archaeological and/or paleontological resources that may have existed near the surface of the Project Site are likely to have been disturbed and/or previously removed. The existing Sports Arena is currently constructed within a large excavated depression that extends approximately 25 feet below grade level. The stadium proposed to be developed under the Modified Project would be constructed within a portion of the footprint area currently occupied by the Sports Arena, although the subterranean depression would need to be reconfigured to accommodate the proposed stadium foundation, resulting in a slightly larger footprint. Following demolition of the Sports Arena, grading and excavation would

also be required to install the building pads for the proposed Ancillary Uses. As such, while unlikely, the potential exists for previously undiscovered archeological and/or paleontological resources to be encountered during construction of the Modified Project.

As would have been the case with construction of the Original Stadium Project analyzed in the Certified EIR, if an archaeological resource is discovered during Modified Project construction activities, work in the area would cease and deposits would be treated in accordance with applicable federal, State, and local guidelines, including those set forth in California Public Resources Code (PRC) Section 21083.2. Any discovery of human remains would be treated in accordance with Section 5097.98 of the PRC and Section 7050.5 of the Health and Safety Code. Therefore, through compliance with existing regulations, impacts with respect to archaeological resources would be less than significant under the Modified Project. No mitigation measures are required.

If a paleontological resource is discovered during construction of the Modified Project, Project Design Feature E-1 would be implemented to reflect best management practices to ensure that potential impacts would be less than significant. Project Design Feature E-1 has been incorporated into the Modified Project's MMP included as Appendix A to this Addendum. With the implementation of Project Design Feature E-1, impacts with respect to paleontological resources would be less than significant under the Modified Project.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to archaeological and paleontological resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(i) Project Design Features

The Modified Project would implement the following Project Design Feature related to paleontological resources :

PDF E-1: A qualified paleontologist shall be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the older Quaternary Alluvium may occur. The services of a qualified paleontologist shall be secured by contacting the Natural History Museum of Los Angeles County. The frequency of inspections shall be based on consultation with the consulting paleontologist and will depend on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and,

where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains.

If a potential fossil is found, the paleontologist shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation and, if necessary, salvage. At the paleontologist's discretion and to reduce any construction delay, the grading and excavation contractor shall assist in removing rock samples for initial processing. Any fossils encountered and recovered shall be prepared to the point of identification and catalogued before they are donated to their final repository. Any fossils collected should be donated to a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County. Accompanying notes, maps, and photographs shall also be filed at the repository. If fossils are found, following the completion of the above tasks, the paleontologist shall prepare a report summarizing the results of the monitoring and salvaging efforts, the methodology used in these efforts, as well as a description of the fossils collected and their significance. The report shall be submitted by the applicant to the lead agency, the Natural History Museum of Los Angeles County, and representatives of other appropriate or concerned agencies to signify the satisfactory completion of the Project and required mitigation measures.

(b) Historic Resources

The Certified EIR for the Original Stadium Project concluded that impacts with respect to historic resources would be significant and unavoidable even with implementation of mitigation (refer to Section IV.D, Historic Resources, of the Certified EIR).

According to CEQA Guidelines, a project has the potential to impact a historic resource when the project involves a "substantial adverse change" in the significance of an historical resource. Substantial adverse change is defined as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired."[8] The Guidelines continue to state that "[t}he significance of an historical resource is materially impaired when a project:… [d]emolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources…

[8] *CEQA Guidelines Section 15064.5(b)(1).*

local Register of historic resources… or its identification in a historic resources survey."[9] Based on this guidance, the City of L.A. CEQA Thresholds Guide states that a substantial adverse change in the significance of a historic resource would occur if a project results in:

- Demolition of a significant resource;
- Relocation that does not maintain the integrity and (historical/architectural) significance of a significant resource;
- Conversion, rehabilitation, or alteration of a significant resource which does not conform to the Secretary of Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings; or
- Construction that reduces the integrity or significance of important resources on the site or in the vicinity.

As set forth in the Certified EIR, the Los Angeles Memorial Sports Arena was constructed in 1959, after more than two decades of planning by various agencies and individuals, to provide the City of Los Angeles with a world-class facility for a variety of indoor sporting and other events. Designed by Welton Becket and Associates, the Sports Arena has hosted many notable civic and sporting events, including the 1960 Democratic National Convention that nominated John F. Kennedy as the Democratic Party's candidate for President, professional and college basketball games, and events at the 1984 Olympic Games. The Sports Arena is now more than 50 years of age and, based on an evaluation by ICF Jones & Stokes included in the Certified EIR, appears eligible for the California Register of Historical Resources under Criteria 1 (Pub. Res. Code Section 5024.1, Title 14 CCR, Section 44852) for its association with events that have made a significant contribution to Los Angeles history. Because the Original Stadium Project proposed the demolition of the Sports Arena, Mitigation Measure MM D-1 was included in the Certified EIR, which requires preparation of a report documenting the architectural and historical features of the Sports Arena. Nonetheless, because the Original Stadium Project would involve the loss of a facility that has association with events that have made a significant contribution to Los Angeles history, the Certified EIR concluded that impacts to historic resources would remain significant and unavoidable following the implementation of mitigation. As the Modified Project would also result in the demolition of the Sports Arena, historic resources impacts associated with its demolition would continue to be significant and unavoidable.

---

[9] *CEQA Guidelines Section 15064.5(b)(2).*

The Modified Project proposes a stadium with a larger footprint and massing than under the Original Stadium Project. In addition, the Modified Project also would include Ancillary Uses that were not part of the Original Stadium Project. As such, a Historic Resources Technical Report (Modified Project Historic Report) was prepared by Historic Resources Group to analyze the Modified Project's potential impacts to historic resources in the vicinity of the Project Site and is included in Appendix G of this Addendum. As shown in Table 8 on page 66, the Modified Project Historic Report documented several historic resources within the vicinity of the Project Site located within Exposition Park. Due to their close proximity to the Project Site, the evaluation focused on the Coliseum located to the west of the Project Site and North and South Coliseum Drives and Christmas Tree Lane located to the north of the Project Site. Specifically the Modified Project Historic Report evaluated the potential for the Modified Project to affect the integrity of those resources.

The Modified Project Historic Report reiterates the Coliseum Commission's determination from the Certified EIR that removal of the Sports Arena would result in a significant impact to an historic resource that cannot be mitigated to a less-than-significant level. With regard to the Coliseum to the west, the Modified Project Historic Report discusses its designation as a National Historic Landmark, a designated State Historical Landmark, and its listing on the National Register of Historic Places. The Modified Project Historic Report explains that while the Modified Project would not physically alter the Coliseum structure, it would have the potential to affect aspects of the Coliseum's historic integrity. Specifically, the Modified Project Historic Report identifies the Coliseum's park setting characterized by landscape areas, access roads, sidewalks and plazas as features that contribute to the Coliseum's historic integrity.

Based on review and analysis of the Modified Project's plans and comparison of those plans to the Coliseum's historic setting and the existing physical environment with the Sports Arena, the Modified Project Historic Report determined that the Modified Project would not alter the setting in the vicinity of the Coliseum such that the Coliseum would no longer convey its historic significance. Specifically, the Modified Project Historic Report recognizes that the Modified Project would have an increased height and footprint as compared to the existing Sports Arena, and a more contemporary architectural design, which would alter the existing setting of the Coliseum. However, the Modified Project Historic Report determined that following development of the Modified Project the general configuration and orientation of the Coliseum would remain discernible, the primary east-facing façade would remain intact and unobstructed, and trees and landscaping along the Modified Project's north and northwestern edges would provide screening when viewed from the Coliseum that would reduce the perception of the Modified Project's height and mass. The proposed building heights would be visually compatible with and within the context of the adjacent Coliseum, which reaches a height of approximately 75 feet above

Table 8
Historic Resources Within Project Vicinity

Resource	Date Built	Status/Notes
Los Angeles Memorial Sports Arena	1959	Evaluated as eligible for the California Register in the 2010 *Los Angeles Memorial Sports Arena Redevelopment Project Draft Environment Impact Report*.
Los Angeles Memorial Coliseum	1921; 1932	National Historic Landmark, State Historic Landmark #960, listed in the National Register of Historic Places, listed in the California Register of Historical Resources. North and South Coliseum Drives and the Christmas Tree Lane median were specifically called out as character-defining features of the Coliseum setting.
Exposition Park Historic District	1910–1932	Identified as eligible for the National Register by the Office of Historic Preservation on June 15, 1993. The Historic District as described included seven contributing resources: the 1910–1917 Beaux Arts civic group at the north end of the park (Natural History Museum, Exposition Building, State Armory, Rose Garden) and the 1921–1932 recreation group to the south of the civic group (Coliseum, Swimming Stadium, Exposition Clubhouse). A 2001 Historic Property Survey Report (HPSR) prepared for a Section 106 review identified significant alteration and reduced integrity of the Historic District since 1993
Natural History Museum (Los Angeles County Museum of History Science and Art)	1913	Listed in the National Register of Historic Places in 1975.
Wallis Annenberg Building (State Armory)	1914	Listed in the California State Historic Resources Inventory (HRI) with a status code of 7N. Needs to be reevaluated.
Exposition Park Rose Garden	1913–1932	Listed in the National Register of Historic Resources in 1991.
Exposition Club House	1922–1926	Found eligible for the National Register in 1994 through Section 106 review. Designated Los Angeles Historic-Cultural Monument #127 in 1974.
Los Angeles Swimming Stadium	1931	Listed in the California State Historic Resources Inventory (HRI) with a status code of 2S2, or "Individual property determined eligible for the National Register by a consensus through Section 106 process. Listed in the California Register."

Source: Historic Resources Group, 2015.

grade at the Coliseum Bowl and a height of 124 at the top of the peristyle.[10] The Modified Project was specifically designed to respect the height of the Coliseum, so that its maximum height (115 feet) occurs at the edge furthest from the Coliseum (southeast corner), transitioning down to its lowest height of approximately 75 feet at the edge closest to the Coliseum. Furthermore, the roof canopy skin, which would consist of a translucent, ETFE material, would moderate the perceived height of the stadium because it would be permeable to light and would not be perceived as solid. The new stadium would also include signage to support stadium operations (refer to Appendix C of this Addendum). The proposed signage plan would be designed to be consistent with the character of a sports and entertainment venue. Based on its assessment of the Modified Project's massing, height, and signage program in the context of the Coliseum, the Modified Project Historic Report concluded that the Modified Project would not adversely impact the historic significance of the Coliseum. Specifically, the Modified Project Historic Report concludes that the Coliseum's historic significance would not be materially impaired by the Modified Project, and the change in setting under the Modified Project would result in a less than significant impact to the historic significance of the Coliseum.

With regard to North and South Coliseum Drives and Christmas Tree Lane to the north of the Project Site, the Modified Project Historic Report discusses their eligibility for the National Register, due to their contribution to the setting of the Coliseum, as an important view corridor to the Coliseum, and as an example of Beaux Arts landscape and roadway planning. The street pattern, sidewalks, rows of trees, and central green space are critical elements in the formal, park-like setting for the Coliseum. As detailed in the Modified Project Historic Report, after implementation of the Modified Project, the street pattern, sidewalks, rows of trees, and central green space of North and South Coliseum Drives and Christmas Tree Lane would remain intact. Specifically, the street edge along Coliseum Drive would be retained under the Modified Project and the historic configuration of street trees would be enhanced through the Modified Project's landscaping program. Accordingly, because the historic configuration of street pattern, street trees and sidewalks would be maintained by the Modified Project, the Modified Project Historic Report concluded that the Modified Project would avoid potential impacts to the Coliseum Drives and Christmas Tree Lane, which would further avoid potential impacts to the Coliseum's historic setting.

With regard to other identified historic resources in the Project Site vicinity, the Modified Project Historic Report concludes that the Modified Project would not affect any other identified historic resources within the area. All of the other historic buildings and

---

[10] *The Olympic Torch spire atop the central arch of the Coliseum peristyle reaches a height of approximately 124 feet above grade.*

structures identified in the Modified Project Historic Report are located approximately 700 feet or more from the Project Site and have little or no relation to the Project Site. Thus, construction of the Modified Project would not alter important spatial relationships or impede important views of these resources.

In summary, consistent with the conclusion in the Certified EIR for the Original Stadium Project (refer to IV.D. Historic Resources, of the Certified EIR), impacts with respect to historic resources would continue be significant and unavoidable under the Modified Project due to the demolition of the Sports Arena. In addition, as set forth in the Modified Project Historic Report, impacts to other historic resources within the Project vicinity would be less than significant, as the Modified Project would not demolish, relocate, alter, or involve construction that reduces the integrity or significance of other nearby historic resources, including the Coliseum, North and South Coliseum Drives, and Christmas Tree Lane. Therefore, the Modified Project would not result in any new significant impacts with respect to historic resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(i) Mitigation Measures

As with the Original Stadium Project, impacts under with Modified Project would continue to be significant after implementation of the following mitigation measure included in the Certified EIR, which have been revised as follows to reflect recommendations in the Modified Project Historic Report:

EIR Mitigation Measure MM D-1: Prior to the issuance of a demolition permit, a report documenting the architectural and historical features of the Sports Arena shall be prepared and offered to the Southern California Information Center at California State University, Fullerton, and the City. The report shall include the following:

a) A written report according to the Historic American Building Survey (HABS) narrative format, which includes historical and descriptive information, including site history, historic context, a significance statement, and character-defining features;

b) Duplicates of historic photographs, if available;

c) Duplicates of ~~original~~ existing drawings including plans, elevations, and sections, if available; and

d) Large format (4-inch by 5-inch negative or larger), archival ~~black and white 35-millimeter~~ photographs based on HABS guidelines, and 35 millimeter photographs of additional spaces and features not documented in large format. The photographs shall be keyed to a floor and site plan to show the location of each photograph

taken. Views shall include the setting, important site features including select landscape, all exterior elevations, detailed views of significant exterior architectural features, and interior views of significant spaces and features.

F. Geology and Soils

Potential impacts to geology and soils were not assessed in detail in the Certified EIR. Significant impacts related to geology and soils could occur if a project were to cause or accelerate geologic hazards, including erosion, which would result in substantial damage to structures or infrastructure, or expose people to substantial risk of injury, or if a project were to adversely affect a distinct and prominent geologic or topographic feature. The following analysis is based on the Preliminary Geotechnical Engineering Report (Geotechnical Report) prepared for the Modified Project by Langan Engineering and Environmental Services, dated August 28, 2015, which is included in Appendix H of this Addendum. The Geotechnical Report provides an assessment of the geotechnical and geological aspects of the Project Site, including existing site conditions, and provides preliminary geotechnical, seismic, and foundation recommendations for the Modified Project. The Geotechnical Report is based on reviews of regional geologic hazard and seismicity maps, subsurface information, and previous geotechnical investigations performed in the Project Site area (including readily available geotechnical investigation reports) obtained from the City of Los Angeles Department of Building and Safety (LADBS), as well as a subsurface field investigation conducted on-site in June 2015. The field investigation consisted of drilling two borings on the Project Site to depths of 101.5 and 101 feet below existing grade (elevation 78.5 and 79),[11] respectively. The locations of the borings are shown in Figure 13 of the Geotechnical Report included in Appendix H of this Addendum.

The Project Site is located within the Los Angeles Basin of the Peninsular Ranges Geomorphic Province of Southern California. The Los Angeles Basin's structural history includes extension and strike-slip faulting, followed by oblique contraction via thrusting and strike-slip faulting. No known active faults have been identified on the Project Site. The closest known active faults capable of producing ground shaking at the Project Site are the Puente Hills Blind Thrust Fault, located approximately 0.3 mile southwest of the Project Site, the Newport-Inglewood Fault, located approximately 2.7 miles west of the Project Site, the Elysian Park (Upper) Blind Thrust Fault, located approximately 2.9 miles northeast of the Project Site, and the Santa Monica Fault, located approximately 3.9 miles northwest of the Project Site. Due to the Project Site's proximity to several nearby active faults,

[11] *All elevations referenced herein are in feet with respect to the North American Vertical Datum (NAVD).*

moderate to strong ground shaking could occur from an earthquake on any nearby fault(s), as is typical throughout Southern California. The Modified Project would comply with the current seismic design provisions of the 2013 California Building Code to minimize seismic impacts. The 2013 California Building Code incorporates the latest seismic design standards for structural loads and materials as well as provisions from the National Earthquake Hazards Reduction Program (NEHRP) to mitigate losses from an earthquake and provide for the latest in earthquake safety. Additionally, construction of the Modified Project would be required to adhere to the seismic safety requirements contained in the Los Angeles Building Code (LAMC, Chapter IX, Article 1). The Los Angeles Building Code incorporates by reference the California Building Code, with City amendments for additional requirements. The LADBS is responsible for implementing the provisions of the Los Angeles Building Code. The Modified Project would also be required to comply with the site plan review and permitting requirements of the LADBS, including the recommendations provided in a final, site-specific geotechnical report subject to LADBS review and approval, pursuant to Project Design Feature F-1. The final, site-specific geotechnical report would incorporate the recommendations presented in the Geotechnical Report into the final design of the Modified Project. These recommendations are outlined in Project Design Feature F-1. Through compliance with regulatory requirements and the site-specific geotechnical recommendations outlined in Project Design Feature F-1, the Modified Project would not cause or accelerate geologic hazards related to strong seismic ground shaking, which would result in substantial damage to structures or infrastructure, or expose people to substantial risk of injury. Impacts related to seismic ground shaking would be less than significant, and no mitigation measures are required.

The Project Site is not within a mapped Alquist-Priolo Earthquake Fault Zone as defined by the Alquist-Priolo Earthquake Fault Zoning Act. Geologic review does not indicate the presence of active surface faulting within or directly adjacent to the Project Site. As such, the potential for surface rupture due to faulting occurring beneath the Project Site is considered low. Impacts with respect to fault rupture would be less than significant, and no mitigation measures are required.

According to the California Geologic Survey, the Project Site is not within a mapped liquefaction potential investigation zone. As such, the potential for liquefaction to occur at the Project Site is considered low. Therefore, impacts related to liquefaction and seismically-induced ground deformations would be less than significant. Additionally, with adherence to the recommended parameters for shallow foundations outlined in the Geotechnical Report, which are outlined in Project Design Feature F-1 and would be incorporated into the final, site-specific geotechnical report prepared for the Modified Project subject to LADBS review and approval, impacts related to settlement and cyclic densification of unsaturated sands and gravels due to earthquake ground motions would also be less than significant. Therefore, no mitigation measures are required.

Based on the California Geologic Survey and the City of Los Angeles' Safety Element, the Project Site is not within a mapped Earthquake-Induced Landslide Hazard Zone or a mapped landslide area according to the landslide inventory and hillside area map. As discussed below, the Project Site and the immediately surrounding area are generally flat in nature, and there are no unique geologic or topographic features located on the Project Site, such as hilltops, ridges, hillslopes, canyons, ravines, rock outcrops, water bodies, streambeds, or wetlands. Therefore, impacts related to landslides and landform alteration would be less than significant, and no mitigation measures are required.

The Project Site consists predominantly of previously developed, impervious surface area. As evaluated in Section IV.I, Hydrology and Water Quality, on page 95 of this Addendum, Modified Project-related construction activities would occur in accordance with erosion control requirements, including grading and dust control measures, imposed by the City pursuant to grading permit regulations. As part of these requirements, the Modified Project would adhere to Best Management Practices (BMPs) prescribed as part of a Storm Water Pollution Prevention Plan (SWPPP) pursuant the National Pollutant Discharge Elimination System (NPDES). Through compliance with applicable regulatory requirements that include the implementation of BMPs, impacts related to erosion and sedimentation would be less than significant, and no mitigation measures are required.

The Project Site is generally flat at about elevation (el) 180 feet,[12] with the exception of the sunken court and seating within the Sports Arena structure. The proposed stadium would be constructed within a portion of the excavation and footprint area currently occupied by the Sports Arena, which currently extends to a depth of approximately 25 feet below grade level (approximately el 155). The excavation areas following removal of the Sports Arena not occupied by the proposed stadium footprint would be backfilled to existing grade. Based on the information provided in the Geotechnical Report, the excavation required for the proposed development would not extend deeper than the current below-grade areas of the Sports Arena. Historical groundwater was reported to be 45 to 55 feet below the ground surface within the Project Site area, which is well below the lowest proposed grade development involved under the Modified Project. Furthermore, groundwater was not encountered within the maximum 101.5-foot depth (el 78.5) explored in the deepest boring drilled for the Geotechnical Report. Additionally, based on the 2015 Phase I ESA performed for the Project Site, which is discussed in Section IV.H, Hazards and Hazardous Materials, on page 91 of this Addendum, groundwater was measured in a monitoring well located approximately one mile northwest of the Project Site at approximately 162 feet below ground surface (el 41.5). Therefore, it is not expected that groundwater would be encountered during Modified Project construction. Nonetheless, the

[12] *Ibid.*

potential exists for shallower, perched water to be encountered at the Project Site depending on seasonal rainfall. Thus, while not anticipated, temporary construction dewatering may be required. Should it be required, construction dewatering would be performed using conventional gravity routing and collection in sump pits, with pumping performed as needed to dispose of any water accumulated in these areas, as outlined in Project Design Feature F-1. Additionally, construction dewatering would be subject to NPDES permit requirements. Through compliance with existing regulations and the project-specific design measures outlined in Project Design Feature F-1, which would be incorporated into the Modified Project's final geotechnical report subject to LADBS review and approval, impacts related to groundwater would be less than significant, and no mitigation measures are required.

According to the Geotechnical Report, the Project Site is underlain by engineered fill and alluvial soils. The fill stratum generally extended to depths ranging from approximately 7 to 10 feet (el 173 to 170) within the borings explored; however, based on a review of previous compaction reports, fill depths are anticipated to be as deep as 25 feet below existing grade (approximately el 155). The fill is subsequently underlain by alluvial deposits, which are generally comprised of medium dense to dense sands and silty sands with variable amounts of clay, gravel, and cobbles. Medium dense to dense sand and silty sands with various amounts of gravel and cobbles extend to depths up to approximately 25 feet below the existing Sports Arena basement level (approximately el 131.5), and subsequently underlain by sand and silty sand layers with interbedded layers of silt and clay. Expansion and corrosion testing indicated that the soils are non-expansive and non-corrosive The Geotechnical Report concluded that the integrity of the soils underlying the Project Site is such that the Modified Project could be adequately supported provided that the Modified Project complies with the site plan review and permitting requirements of the LADBS, including the recommendations provided in a final, site-specific geotechnical report subject to LADBS review and approval, pursuant to Project Design Feature F-1. The final, site-specific geotechnical report would incorporate the recommendations presented in the Geotechnical Report into the final design of the Modified Project, as outlined in Project Design Feature F-1. No soil or geologic conditions were encountered that would pose a substantial safety risk during Modified Project construction or operation. Through compliance with applicable regulatory requirements and site-specific geotechnical recommendations that would be incorporated into the final plans, impacts related to soil stability would be less than significant, and no mitigation measures are required.

The Project Site is not within a Methane Zone or Methane Buffer Zone identified by the City.[13] Therefore, no further analysis of issues related to methane are required.

---

[13] *City of Los Angeles Department of City Planning, Zone Information and Map Access System (ZIMAS), Parcel Profile Report, http://zimas.lacity.org/, accessed June 4, 2015.*

Based on the analysis above, the Modified Project would not cause or accelerate geologic hazards which would result in substantial damage to structures or infrastructure, or expose people to substantial risk of injury. The Modified Project would not constitute a geologic hazard to other properties by causing or accelerating instability from erosion, or accelerate natural processes of wind and water erosion and sedimentation, resulting in sediment runoff or deposition which would not be contained or controlled on-site. Finally, the Modified Project would not destroy, permanently cover, or materially and adversely modify any distinct or prominent geologic or topographic features. Therefore, based on the analysis above and through the implementation of the Project Design Feature F-1 described below, impacts related to geology and soils would be less than significant, and no mitigation measures are required. Accordingly, the Modified Project would not result in any new significant environmental impacts to geology and soils, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(a) Project Design Features

The Modified Project would implement the following Project Design Feature related to geology and soils:

PDF F-1: A final design-level geotechnical, geologic, and seismic hazard investigation report that complies with all applicable State and local code requirements shall be prepared for the Modified Project by a qualified geotechnical engineer and certified engineering geologist and shall be submitted the Los Angeles Department of Building and Safety, consistent with City of Los Angeles Building Code requirements. The site-specific geotechnical report shall be prepared to the written satisfaction of the City of Los Angeles Department of Building and Safety. The site-specific geotechnical report shall address each of the recommendations provided in the *Preliminary Geotechnical Engineering Report, Los Angeles Football Club Stadium, Los Angeles, California* (Geotechnical Report), prepared by Langan Engineering and Environmental Services, July 24, 2015, including, but not limited to the following, and as may be amended in accordance with future regulatory requirements:

- Shallow foundations bearing on alluvial soils at the proposed stadium foundation elevation or engineered fill shall be designed with an allowable bearing pressure of 6,000 pounds per square foot (psf) or 3,000 psf, respectively. An increase of 33 percent can be used for temporary or transient loading such as seismic or wind. The minimum lateral dimension of isolated footings shall not be less than 48 inches and shall be embedded at least 24 inches below surrounding grade. In order to minimize

differential settlement between the proposed Ancillary Uses and Northwest Plaza structures and the stadium structure, expansion joints shall be installed between any structural connection features.

- Should portions of the proposed structures require the additional support of deep foundation systems due to higher, concentrated compression and/or uplift loads, deep foundations shall consist of drilled piles (i.e., Cast-in-Drilled-Hole (CIDH), or Augered Cast-in-Place (ACIP)) piles) that are sized in accordance with the sizing parameters provided in Section 6.2.2 of the Geotechnical Report. A pre-construction test pile and pile load test program shall be implemented with a minimum of four (4) test piles as outlined in Section 6.2.2 of the Geotechnical Report.
- The lowest proposed floor slab shall be designed as a slab-on-grade bearing following the recommendations outlined in Section 6.3 of the Geotechnical Report.
- Below-grade walls shall be designed to resist soil and surcharge pressures using the parameters provided in Section 6.4 of the Geotechnical Report.
- Damp-proofing (such as Grace Water Shield water barrier membrane or equivalent) shall be utilized in below-grade closed areas that may house equipment, finishes, or occupants that could be adversely impacted by moisture intrusion.
- A perimeter foundation drain shall be installed to collect and route any accumulated water to the site drainage system.
- Trees with deep-rooted or widespread rooted systems or vegetation shall not be planted within 30 feet of below-grade walls.
- Utility subgrade shall be confirmed to be free of standing water, firm, and unyielding prior to placement of bedding material. Utility trenches above pipe bedding shall be backfilled in accordance with the recommendations provided in the Geotechnical Report for fill compaction requirements using either previously excavated soil (if suitable), or with approved imported material.
- After completion of excavation, including removal of all below grade remnants, stripping, grubbing, removal of asphalt, base course material, the soil subgrade shall be compacted in-place by proofrolling with at least 6 passes of a vibratory roller compactor having a minimum static drum weight of 5 tons. Any areas exhibiting rutting or pumping shall be removed and replaced with compacted engineered fill material. All fills should be selected

and placed in accordance with the placement and compaction criteria discussed in Section 7.3 of the Geotechnical Report.

- Temporary excavations shall be constructed in accordance with Cal/OSHA requirements. Temporary slopes may be excavated at a 2H:1V (horizontal to vertical). Steeper slopes may be excavated with a maximum slope of 1.5H:1V (horizontal to vertical) may be excavated where acceptable by Cal/OSHA and the inspecting Geotechnical Engineer.
- If perched groundwater is encountered during Modified Project construction, temporary construction dewatering, where required, shall be performed using conventional gravity routing and collection in sump pits, with pumping performed as needed to dispose of any water accumulated in these areas.
- All new construction work shall be performed so as not to adversely impact or cause loss of support to structures, hardscape, and landscape elements, paving, or utilities to remain. A pre-construction condition documentation comprised of photographic and videographic documentation of accessible and visible areas of neighboring landscaped, and hardscaped areas including pavements and sidewalks shall be performed prior to initiating construction activities at the Project Site and submitted to the Los Angeles Department of Building and Safety.

G. Greenhouse Gas Emissions

Since the certification of the Certified EIR in 2011, numerous regulatory changes have occurred that are pertinent to the study of greenhouse gas (GHG) impacts under CEQA. To inform the analysis of the Modified Project's potential GHG impacts, a summary of the current regulatory framework surrounding GHG emissions is included in Appendix J of this Addendum.

The Certified EIR for the Original Stadium Project concluded that impacts with respect to GHG emissions would be less than significant under the Original Stadium Project (refer to Section IV.C, Greenhouse Gas Emissions, of the Certified EIR). The thresholds on which this analysis was based are stated on pages IV.C-10–IV.C-11 of the Certified EIR. The Certified EIR's conclusion was based on the following:

- GHGs emitted during construction of the Original Stadium Project would represent a nominal percent of the State's total GHG emissions in 2008;
- The proposed stadium would be an outdoor venue which would significantly reduce the amount of stationary source GHG emissions associated with heating

and air conditioning (as compared to an indoor stadium such as the Los Angeles Memorial Sports Arena that currently exists on the Project Site);

- The Original Stadium Project would replace an existing venue that is over 50 years old with a state-of-the art venue that would result in significantly increased energy efficiencies at the Project Site; and

- The Original Stadium Project would not result in an increase in peak (i.e., event day) vehicle trips as compared to existing conditions under operation of the Sports Arena.

These characteristics also are true for the Modified Project. However, the Modified Project includes up to approximately 105,900 square feet of ancillary facility floor area (up to approximately 119,000 gross square feet) that were not part of the Original Stadium Project. Additionally, while peak day attendance under the Modified Project is expected to be within peak historic attendance levels at the Sports Arena, based on preliminary programming data provided by LAFC, annual attendance in the Modified Project's stadium could increase compared to existing conditions. These annual attendance estimates are relevant for determining the Modified Project's GHG impacts as they relate to mobile source emissions and vehicle miles traveled (VMT). Accordingly, additional analysis was conducted to determine whether the Modified Project would result in new significant impacts with respect to GHG emissions that were not previously identified in the Certified EIR. The analysis is based on VMT estimates provided by Fehr & Peers Transportation Consultants, which are included in Appendix K of this Addendum.

(a) Significance Thresholds for the Modified Project

Project-level significance thresholds for GHG emissions have not yet been adopted by the California Air Resources Board (CARB), the South Coast Air Quality Management District (SCAQMD), or the City of Los Angeles. Rather, assessing the significance of a project's contribution to cumulative global climate change involves developing an inventory of project GHG emissions and considering project consistency with applicable emission reduction strategies and goals, such as those set forth by Assembly Bill (AB) 32. Based on the foregoing, a project that generates GHG emissions, either directly or indirectly, would have a significant impact if:

- The project's reduction in emissions does not constitute an equivalent or larger break from "business-as-usual" (BAU) than has been determined by CARB to be necessary to meet the state AB 32 goals (i.e., 16 percent, as discussed below); or

- The project conflicts with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

An illustrative method to determine consistency with AB 32 that has the benefit of being based on a quantification of emissions is to compare a project's emissions, as proposed, to that project's emissions if it were to be built using BAU design, methodology, and technology. If a project constitutes an equivalent or larger break from BAU than has been determined by CARB to be necessary to meet AB 32's goals for 2020 (approximately 16 percent, as established in CARB's *Supplemental FED to the Climate Change Scoping Plan*),[14] then that project can be considered consistent with AB 32. As such, the project is considered to have a less-than-significant impact on the environment due to its GHG emissions. While not project-specific, 16 percent is considered the average level of emissions reduction performance that would need to be achieved across all sectors of the economy to meet AB 32 goals (i.e., applied to both new and existing GHG emissions sources). The following analysis uses this "break from BAU" method to determine the Modified Project's consistency with AB 32. This approach also mirrors the concepts used in the CARB's *Climate Change Scoping Plan* for the implementation of AB 32.[15]

Consistent with CARB and SCAQMD guidance for defining BAU,[16] this analysis provides a quantitative estimate of the following GHG emissions inventories:

- Baseline—This scenario consists of historic operations at the Sports Arena at the time of the Certified EIR.
- BAU—This scenario consists of the Modified Project's land uses and program assuming compliance with State mandates that were accounted for in the *Supplemental FED to the Climate Change Scoping Plan* (i.e., 2008 Title 24), and with a minimal trip reduction credit taken for transit accessibility.[17]
- Modified Project As Proposed—This scenario consists of the Modified Project assuming compliance with current State mandates and Project Design Features (described in Section IV.G.b.ii on page 80), and with a 15-percent trip-reduction credit taken, based on the current transit services available at the Project Site,

---

[14] *CARB, Supplement to the AB 32 Scoping Plan FED, Table 1.2-2, Updated 2020 Business-as-Usual Emissions Forecast, www.arb.ca.gov/cc/scopingplan/document/final_supplement_to_sp_fed.pdf.*

[15] *The Scoping Plan defines "business-as-usual" as emissions in the absence of greenhouse gas reduction measures (i.e., the 2020 "business-as-usual" emissions inventory was forecast based on the 2002 to 2004 statewide average annual emissions and does not take credit for, inter alia, reduction from 2005 Title 24, Assembly Bill 1493 greenhouse gas emissions reduction standards for vehicles, the California Low Carbon Fuel Standard, or full implementation of the Renewables Portfolio Standard).*

[16] *SCAQMD, Draft Guidance Document-Interim CEQA GHG Significance Threshold, Attachment E, October 2008.*

[17] *See Fehr & Peers, Draft Memorandum, Vehicle Miles Traveled Analysis for the Los Angeles Football Club Stadium Project, August 17, 2015, included in Appendix K of this Addendum.*

which include the Exposition Line Light Rail transit line, which was planned but not yet operational at the time the Certified EIR was prepared, as discussed in the Certified EIR.[18]

Furthermore, the CEQA Guidelines were subsequently amended after certification of the Certified EIR to specify that compliance with a GHG emissions reduction plan renders a cumulative impact insignificant.[19]

Per CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project will comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project. To qualify, such a plan or program must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency. Examples of such programs include a "water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plan, [and] plans or regulations for the reduction of greenhouse gas emissions." Put another way, CEQA Guidelines Section 15064(h)(3) allows a lead agency to make a finding of non-significance for GHG emissions if a project complies with a plan, program, or regulation that will reduce GHG emissions.[20][21]

---

[18] *Ibid.*

[19] *Note that "the effects of greenhouse gas emissions are cumulative, and should be analyzed in the context of California Environmental Quality Act's requirements for cumulative impact analysis." Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources (April 13, 2009) (regarding Senate Bill 97 amendments to CEQA Guidelines)*

[20] *See, for example, San Joaquin Valley Air Pollution Control District, CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation, APR—2030 (June 25, 2014), in which the SJVAPCD "determined that GHG emissions increases that are covered under ARB's Cap-and-Trade regulation cannot constitute significant increases under CEQA…." Further, the South Coast Air Quality Management District (SCAQMD) has taken this position in CEQA documents it produced as a lead agency. The SCAQMD has prepared three Negative Declarations and one Draft Environmental Impact Report that demonstrate the SCAQMD has applied its 10,000 $MTCO_2e$/year significance threshold in such a way that GHG emissions covered by the Cap-and-Trade Program do not constitute emissions that must be measured against the threshold. See, SCAQMD, Final Negative Declaration for: Ultramar Inc. Wilmington Refinery Cogeneration Project, SCH No. 2012041014 (October 2014) (available at www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2014/ultramar_neg_dec.pdf?sfvrsn=2); SCAQMD, Final Negative Declaration for: Phillips 66 Los Angeles Refinery Carson Plant—Crude Oil Storage Capacity Project, SCH No. 2013091029 (December 2014) (available at www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2014/phillips-66-fnd.pdf?sfvrsn=2); Final Mitigated Negative Declaration for: Toxic Air Contaminant Reduction for Compliance with SCAQMD Rules 1420.1 and 1402 at the Exide Technologies Facility in Vernon, CA, SCH No. 2014101040 (December 2014) (available at www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2014/exide-mnd_final.pdf?sfvrsn=2);*

(Footnote continued on next page)

Consistent with CEQA Guidelines Section 15064(h)(3), this analysis also provides a qualitative estimate of the Modified Project's compliance with plans, programs, and regulations that reduce a project's GHG emissions either directly or indirectly, including: the California Green Building Standards Code; the Southern California Associations of Governments' (SCAG) 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (2012–2035 RTP/SCS); the City of Los Angeles Green Building Code (2013); and *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming*. In addition, this analysis provides a qualitative assessment of the Modified Project's compliance with the California Cap-and-Trade Program and applicable executive orders related to climate change. See also Sections IV.C., Air Quality; IV.J, Land Use and Planning; and IV.P, Utilities and Service Systems, of this Addendum for additional relevant analyses of the Modified Project's consistency with other regulatory plans and policies that are pertinent to the general concepts of "smart growth," environmental sustainability, and the efficient use of resources.

(b) Modified Project Impacts

(i) Consistency with AB 32

GHG emissions associated with the three scenarios described above in Section IV.G.a on page 76 of this Addendum, (i.e., Baseline, BAU, and Modified Project as Proposed) were calculated using CalEEMod, the model recommended by the SCAQMD for calculating emissions from land use projects. Model results are provided in Appendix I of this Addendum. As summarized and shown in Table 9 on page 80, the Modified Project would result in an increase in annual GHG emissions in comparison to operation of the existing Sports Arena due to the increase in annual attendance at the Modified Project's stadium, as well as the daily operation of the proposed Ancillary Uses. However, with implementation of the Project Design Features described below, as well as current State mandates, the Modified Project would result in an annual total of approximately 12,496 metric tons of carbon dioxide equivalent (CO_2e), representing an approximate 25 percent reduction from the BAU scenario. Thus, the Modified Project would result in a net decrease in GHG emissions that represents a substantial break from BAU (i.e., greater than 16 percent). Additionally, the Modified Project's features and GHG reduction

---

Draft Environmental Impact Report for the Breitburn Santa Fe Springs Blocks 400/700 Upgrade Project, SCH No. 2014121014 (April 2015) (available at www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2015/deir-breitburn-chapters-1-3.pdf?sfvrsn=2).

[21] *CARB adopted a California Cap-and-Trade Program pursuant to its authority under AB 32. The Cap-and-Trade Program (17 CCR §§ 95800 to 96023) is designed to reduce GHG emissions from major sources (deemed "covered entities") by setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve AB 32's emission-reduction mandate of returning to 1990 levels of emissions by 2020.*

Table 9
Annual GHG Emissions Summary
(Metric Tons of Carbon Dioxide Equivalent)

Scope	Baseline (Sports Arena)	BAU Project	Modified Project as Proposed[a]	Modified Project's Break from BAU
Area	<1	<1	<1	0%
Energy	2,700	2,476	2,154	-13%
Mobile	2,846	13,862	10,004	-28%
Waste	2	127	76	-40%
Water	30	132	113	-15%
Construction	0	149	149	0%
Total	**5,578**	**16,746**	**12,496**	**-25%**

BAU = Business As Usual

[a] *The difference between the Modified Project as Proposed against the Baseline (Sports Arena) is also less than the SCAQMD's significance threshold of 10,000 metric tons of Carbon Dioxide Equivalent for stationary source projects where SCAQMD is the lead agency (i.e., 12,496 CO_2e – 5,578 CO_2e = 6,918 CO_2e).*

Source: Eyestone Environmental, 2015. Calculation worksheets are included in Appendix I of this Addendum.

measures described below make it consistent with AB 32. Therefore, impacts with respect to AB 32 consistency and the Modified Project's break from BAU would be less than significant. No mitigation measures are required.

(ii) Consistency with Plans, Programs, and Regulations for Reducing GHG Emissions

The Modified Project would incorporate sustainability as part of its key design and would serve to reduce GHG emissions in comparison to BAU. In so doing, the Modified Project would comply with Title 24 of the California Code of Regulations, including Part 6 (Energy Efficiency Standards for Residential and Nonresidential Buildings) and Part 11 (California Green Building Standards Code, commonly referred to as the CALGreen Code), as well as the City of Los Angeles Green Building Code (2013), which incorporates the CALGreen Code into Chapter IX of the Los Angeles Municipal Code (LAMC). The 2013 CALGreen Code (applicable to the Modified Project) is anticipated to be 30 percent more efficient than the 2008 Title 24 (applicable to the Original Stadium Project and BAU) for

nonresidential construction.[22] In accordance with Project Design Feature G-2, energy efficiency would be achieved through building design and through the incorporation of energy-efficient heating, ventilation, and air conditioning (HVAC) systems, lighting, and appliances.

In accordance with Project Design Feature G-1, the Modified Project would also be designed to be capable of achieving at least Silver certification under the U.S. Green Building Council's LEED-BD+C or LEED-ND Rating System (v.3), or equivalent green building standards. Achieving LEED Silver would reduce energy consumption associated with lighting by a minimum of 20 percent in comparison to BAU. As discussed in Section IV.P, Utilities and Service Systems, on page 171, the Modified Project would also implement numerous water conservation measures in accordance with LADWP requirements for new development in the City of Los Angeles (e.g., high-efficiency fixtures and appliances, weather-based irrigation systems, drought-tolerant landscaping). See Project Design Feature P-1 and EIR Mitigation Measure MM I.2-1 in Section IV.P.b, Utilities and Service Systems—Water, on page 176. Furthermore, as described in Section IV.P.c, Utilities and Service Systems—Solid Waste, of this Addendum, Mitigation Measure MM I.4-2 from the Certified EIR (as revised) states that the Applicant shall demonstrate through annual compliance reports submitted to the City of Los Angeles Department of Public Works, Bureau of Sanitation, an annual operational diversion rate of at least 40 percent. Additionally, pursuant to Mitigation Measure MM I.4-2 from the Certified EIR (as revised), the Modified Project would divert a minimum of 75 percent of construction related solid waste and demolition debris from area landfills. Additionally, Modified Project construction materials would utilize post-consumer recycled content pursuant to Project Design Feature P-2. Pursuant to Project Design Feature P-3, during operation, the Modified Project would implement a composting program and would utilize bio-based materials. Each of these features would help to further reduce GHG emissions by reducing the amount of energy that would have otherwise been consumed to extract and process virgin source materials. The Modified Project also includes numerous energy reduction features as set forth in Section IV.P.d, Utilities and Service Systems—Energy, on page 195. See Project Design Features P-4 and P-5 and EIR Mitigation Measures MM I.3-1 through MM I.3-19. Such features include the use of energy efficient appliances, building materials, and heating and cooling systems.

As discussed in Section IV.J, Land Use and Planning, on page 101 of this Addendum, SCAG's 2012–2035 RTP/SCS, adopted in April 2012, presents a long-term

---

[22] *California Energy Commission, Energy Commission Approves More Efficient Buildings for California's Future, May 31, 2012, www.energy.ca.gov/releases/2012_releases/2012-05-31_energy_commission_approves_more_efficient_buildings_nr.html, accessed August 10, 2015.*

transportation vision through the year 2035 for its six county region. The mission of the 2012–2035 RTP/SCS is to provide "leadership, vision and progress which promote economic growth, personal well-being, and livable communities for all Southern Californians."[23] The 2012–2035 RTP/SCS emphasizes sustainability and integrated planning, and identifies mobility, economy, and sustainability as the three principles most critical to the future of the region. In so doing, the 2012–2035 RTP/SCS provides goals and policies that are inherently related to the reduction of GHG emissions.

The 2012–2035 RTP/SCS establishes High-Quality Transit Areas, which are described as generally walkable transit villages or corridors that are within 0.5 mile of a well-serviced transit stop or a transit corridor with 15-minute or less service frequency during peak commute hours.[24] Local jurisdictions are encouraged to focus housing and employment growth within High-Quality Transit Areas. The Project Site is located within a High-Quality Transit Area as designated by the 2012–2035 RTP/SCS.[25] Furthermore, the Modified Project is designed with a mix of land uses (e.g., stadium, retail, office, and restaurants) that would capture internal vehicular trips at the Project Site, thereby reducing VMT. The Project Site is also located on a previously developed urban site where substantial existing infrastructure is in place. In accordance with Project Design Feature G-3, the Modified Project would include numerous features to reduce vehicular traffic, including preferential parking for alternative-fueled vehicles and carpools, encouraging the use of mass transit, and encouraging pedestrian and bicycling as viable means of accessing the Project Site by employees and visitors. Specifically, with regard to preferential parking for alternative-fueled vehicles, ten percent of the parking spaces provided in the Modified Project's VIP parking lot on the Project Site would be constructed to accommodate the future placement of facilities for the recharging of electric vehicles pursuant to Project Design Feature G-3. These measures would reduce vehicle miles traveled and usage of petroleum based fuels. The Project Site location provides convenient pedestrian access to several stops on the Exposition Line Light Rail Line, including the Expo Park/USC Station (0.35 mile from the Project Site) and the Expo/Vermont Station (0.7 mile from the Project Site), as well as the 37th Street/USC Silver Line Bus Rapid Transit (BRT) Station on the Harbor Transitway (located approximately 0.37 mile from the Project Site). The Project Site is also served by seven bus lines operated by Metro and the Los Angeles Department of Transportation (LADOT) within 0.25 mile of the Project Site. The availability and accessibility of public transit in the Project area is evidenced by the Project Site's location within a designated High-Quality

Transit Area. By focusing new development within a designated High-Quality Transit Area, the Modified Project would be consistent with regional growth strategies promoted in the 2012–2035 RTP/SCS, which represent widely recognized "smart growth" planning strategies that promote higher density, infill development with access to public transit in an effort to reduce urban sprawl and its associated environmental effects. Overall, and as discussed further in Section IV.J, Land Use and Planning, on page 101 of this Addendum, the Modified Project would be consistent with the 2012–2035 RTP/SCS, which is a relevant regional plan adopted for the purpose of reducing GHG emissions.

California's Cap-and-Trade Program

The *Climate Change Scoping Plan* identifies a cap-and-trade program as one of the strategies for California to reduce GHG emissions. According to CARB, a cap-and-trade program will help put California on the path to meet its goal of reducing GHG emissions to 1990 levels by the year 2020 and ultimately achieving an 80-percent reduction from 1990 levels by 2050. Under cap-and-trade, an overall limit on GHG emissions from capped sectors is established, and facilities subject to the cap will be able to trade permits to emit GHGs within the overall limit.

Under the approved Cap-and-Trade Program, CARB issues allowances equal to the total amount of allowable emissions over a given compliance period[26] and distributes these to regulated entities. Covered entities are allocated free allowances in whole or part (if eligible), and may buy allowances at auction, purchase allowances from others, or purchase offset credits. The Cap-and-Trade Program provides a firm cap, ensuring that the 2020 statewide emission limit will not be exceeded. An inherent feature of the Cap-and-Trade Program is that it does not guarantee GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are only guaranteed on an accumulative basis. As summarized by CARB in the First Update:

> *The Cap-and-Trade Regulation gives companies the flexibility to trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more have to turn in more allowances or other compliance instruments. Companies that can cut their*

[26] *A "compliance period" is the time frame during which the compliance obligation is calculated. The years 2013 and 2014 are the first compliance period, the years 2015–2017 are the second compliance period, and the third compliance period is from 2018–2020.*

> *GHG emissions have to turn in fewer allowances. But as the cap declines, aggregate emissions must be reduced.*[27]

In other words, a covered entity theoretically could increase its GHG emissions every year and still comply with the Cap-and-Trade Program if there is a reduction in GHG emissions from other covered entities. Such a focus on aggregate GHG emissions is considered appropriate because climate change is a global phenomenon, and the effects of GHG emissions are considered cumulative.

The Cap-and-Trade Program works with other direct regulatory measures and provides an economic incentive to reduce emissions.[28] If California's direct regulatory measures reduce GHG emissions more than expected, then the Cap-and-Trade Program will be responsible for relatively fewer emissions reductions. If California's direct regulatory measures reduce GHG emissions less than expected, then the Cap-and-Trade Program will be responsible for relatively more emissions reductions. Thus, the Cap-and-Trade Program assures that California will meet its 2020 GHG emissions reduction mandate:

> *The Cap-and-Trade Program establishes an overall limit on GHG emissions from most of the California economy—the "capped sectors." Within the capped sectors, some of the reductions are being accomplished through direct regulations, such as improved building and appliance efficiency standards, the [Low Carbon Fuel Standard] LCFS, and the 33 percent [Renewables Portfolio Standard] RPS. Whatever additional reductions are needed to bring emissions within the cap is accomplished through price incentives posed by emissions allowance prices. Together, direct regulation and price incentives assure that emissions are brought down cost-effectively to the level of the overall cap.*[29] *[…]*
>
> *[T]he Cap-and-Trade Regulation provides assurance that California's 2020 limit will be met because the regulation sets a firm limit on 85 percent of California's GHG emissions.*[30]

[28] *Id.*

[29] *Id., at p. 88.*

[30] *Id., at pp. 86–87. See also CARB's 2013 Annual Compliance Obligation of the Cap-and-Trade Program reported 100 percent compliance for entities subject to the program, www.arb.ca.gov/cc/capandtrade/2013compliancereport.xlsx.*

In sum, the Cap-and-Trade Program will achieve aggregate, rather than site-specific or project-level, GHG emissions reductions. Also, due to the regulatory architecture adopted by CARB in AB 32, the reductions attributed to the Cap-and-Trade Program can change over time depending on the State's emissions forecasts and the effectiveness of direct regulatory measures. As of January 1, 2015, the Cap-and-Trade Program covered approximately 85 percent of California's GHG emissions.

The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California whether generated in-state or imported.[31] Accordingly, GHG emissions associated with CEQA projects' electricity usage would be capped in the aggregate and steadily reduced by the Cap-and-Trade Program.

The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and from combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period.[32] While the Cap-and-Trade Program technically covered fuel suppliers as early as 2012, they did not have a compliance obligation (i.e., they were not fully regulated) until 2015.[33]

The Cap-and-Trade Program covers the GHG emissions associated with the combustion of transportation fuels in California, whether refined in-state or imported. The point of regulation for transportation fuels is when they are "supplied" (i.e., delivered into commerce). Accordingly, as with stationary source GHG emissions and GHG emissions attributable to electricity use, virtually all, if not all, of GHG emissions from CEQA projects associated with vehicle-miles traveled (VMT) would be capped in the aggregate and steadily reduced by the Cap-and-Trade Program.

As demonstrated above, GHG emissions attributable to electricity use and VMT, as well as stationary source GHG emissions, would be reduced by the Cap-and-Trade Program. As such, these GHG emissions are reduced by an existing regulatory scheme designed to address the cumulative problem of climate change. Accordingly, the Modified Project's GHG emissions in these categories, which are reduced by the Cap-and-Trade Program, would not be considered cumulatively considerable per the guidance provided in CEQA Guidelines Section 15064(h)(3).

[33] *Id., at § 95851(b) (emphasis added).*

Executive Orders S-3-05 and B-30-15

At the state level, Executive Orders S-3-05 and B-30-15 are orders from the State's Executive Branch for the purpose of reducing GHG emissions. Executive Order S-3-05's goal to reduce GHG emissions to 1990 levels by 2020 was codified by the Legislature as the 2006 Global Warming Solutions Act (AB 32). As analyzed above, the Modified Project is consistent with AB 32. Therefore, the Modified Project does not conflict with this component of Executive Order S-3-05. The Executive Orders also establish goals to reduce GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050. These goals have not been codified.[34] However, studies have shown that, in order to meet the 2030 and 2050 targets, aggressive technologies in the transportation and energy sectors, including electrification and the decarbonization of fuel, will be required. In its *Climate Change Scoping Plan*, CARB acknowledged that the "measures needed to meet the 2050 target are too far in the future to define in detail."[35] In the First Update, however, CARB generally described the type of activities required to achieve the 2050 target: "energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and rapid market penetration of efficiency and clean energy technologies that requires significant efforts to deploy and scale markets for the cleanest technologies immediately."[36] Due to the technological shifts required and the unknown parameters of the regulatory framework in 2030 and 2050, quantitatively analyzing the Modified Project's impacts further relative to the 2030 and 2050 goals is speculative for purposes of CEQA.[37] Moreover, CARB has not calculated and released the BAU emissions projections for 2030 or 2050, which are necessary data points for quantitatively analyzing a CEQA project's consistency with these targets.

Although the Modified Project's emissions levels in 2030 and 2050 cannot be reliably quantified, statewide efforts are underway to facilitate the State's achievement of that goal and it is reasonable to expect the proposed Modified Project's emissions level to

---

[34] *Senate Bill (SB) 32, which currently is being considered by the State Assembly, would codify Governor Schwarzenegger's Executive Order S-3-05 goal of cutting GHG emissions to 80 percent below 1990 levels by 2050. In addition, on June 1, 2015, the California Senate amended SB 32 to also codify the interim goal set forth in Executive Order B-30-15 for GHG emissions levels to be 40 percent below 1990 levels by 2030, and to authorize CARB to adopt an additional interim GHG emissions level target for 2040.*

[35] *CARB, Scoping Plan, p. 117, December 2008.*

[36] *CARB, First Update, p. 32, May 2014. Website www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf, accessed March 2, 2015.*

[37] *See 14 Cal. Code Regs § 15145 ("If, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact.").*

decline as the regulatory initiatives identified by CARB in the First Update are implemented, and other technological innovations occur. Stated differently, the Modified Project's emissions total at build-out presented in Table 9 on page 80, represents the maximum emissions inventory for the Modified Project as California's emissions sources are being regulated (and foreseeably expected to continue to be regulated in the future) in furtherance of the State's environmental policy objectives. As such, given the reasonably anticipated decline in Modified Project emissions once fully constructed and operational, the Modified Project is considered to be consistent with the Executive Orders.

The *Climate Change Scoping Plan* recognizes that AB 32 establishes an emissions reduction trajectory that will allow California to achieve the more stringent 2050 target: "These [greenhouse gas emission reduction] measures also put the state on a path to meet the long-term 2050 goal of reducing California's greenhouse gas emissions to 80 percent below 1990 levels. This trajectory is consistent with the reductions that are needed globally to stabilize the climate."[38] Also, CARB's First Update "lays the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80 percent below 1990 levels by 2050," and many of the emission reduction strategies recommended by CARB would serve to reduce the proposed Modified Project's post-2020 emissions level to the extent applicable by law:[39,40] These emission reduction strategies include the following:

- **Energy Sector:** Continued improvements in California's appliance and building energy efficiency programs and initiatives, such as the State's zero net energy building goals, would serve to reduce the proposed Modified Project's emissions levels.[41] Additionally, further additions to California's renewable resource portfolio would favorably influence the proposed Modified Project's emissions levels.[42]

- **Transportation Sector:** Anticipated deployment of improved vehicle efficiency, zero emission technologies, lower carbon fuels, and improvement of existing

---

[38] *Climate Change Scoping Plan at 15.*

[39] *CARB, First Update, p. 4, May 2014. See also id. at pp. 32–33 [recent studies show that achieving the 2050 goal will require that the "electricity sector will have to be essentially zero carbon; and that electricity or hydrogen will have to power much of the transportation sector, including almost all passenger vehicles."]*

[40] *CARB, First Update, Table 6: Summary of Recommended Actions by Sector, pp. 94–99, May 2014.*

[41] *CARB, First Update, pp. 37–39, 85, May 2014.*

[42] *CARB, First Update, pp. 40–41, May 2014.*

transportation systems all will serve to reduce the proposed Modified Project's emissions levels.[43]

- **Water Sector:** The proposed Modified Project's emissions levels will be reduced as a result of further desired enhancements to water conservation technologies.[44]

- **Waste Management Sector:** Plans to further improve recycling, reuse and reduction of solid waste will beneficially reduce the proposed Modified Project's emissions levels.[45]

The Cap-and-Trade Program is designed to reduce GHG emissions from major sources (deemed "covered entities") by setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve AB 32's emission-reduction mandate of returning to 1990 levels of emissions by 2020. Although the Cap-and-Trade Program would remain in effect in post-2020, it is not currently scheduled to extend beyond 2020 in terms of additional GHG emissions reductions.[46] However, CARB has expressed its intention to extend the Cap-and-Trade Program beyond 2020 in conjunction with setting a mid-term target. The "recommended action" in the First Update for the Cap-and-Trade Program is: "Develop a plan for a post-2020 Cap-and-Trade Program, including cost containment, to provide market certainty and address a mid-term emissions target."[47] The "expected completion date" for this recommended action is 2017.[48]

In addition to CARB's First Update, in January 2015, during his inaugural address, Governor Jerry Brown expressed a commitment to achieve "three ambitious goals" that he would like to see accomplished by 2030 to reduce the State's GHG emissions: (1) increasing the State's Renewable Portfolio Standard from 33 percent in 2020 to 50 percent in 2030; (2) cutting the petroleum use in cars and trucks in half; and (3) doubling the efficiency of existing buildings and making heating fuels cleaner.[49] These expressions of Executive Branch policy may be manifested in adopted legislative or regulatory action

[47] *CARB, First Update to the Climate Change Scoping Plan: Building on the Framework, at 98 (May 2014).*

[48] *Id.*

[49] *Transcript: Governor Jerry Brown's January 5, 2015, Inaugural Address, www.latimes.com/local/political/la-me-pc-brown-speech-text-20150105-story.html#page=1, accessed March 2, 2015.*

through the state agencies and departments responsible for achieving the State's environmental policy objectives, particularly those relating to global climate change.

Further, recent studies show that the State's existing and proposed regulatory framework will allow the State to reduce its GHG emissions level to 40 percent below 1990 levels by 2030, and to 80 percent below 1990 levels by 2050.[50] Even though these studies do not provide an exact regulatory and technological roadmap to achieve the 2030 and 2050 goals, they demonstrated that various combinations of policies could allow the statewide emissions level to remain very low through 2050, suggesting that the combination of new technologies and other regulations not analyzed in the studies could allow the State to meet the 2050 target.

Given the proportional contribution of mobile source-related GHG emissions to the State's inventory, recent studies also show that relatively new trends, such as the increasing importance of web-based shopping, the emergence of different driving patterns by the "millennial" generation and the increasing effect of Web-based applications on transportation choices, are beginning to substantially influence transportation choices and the energy used by transportation modes. These factors have changed the direction of transportation trends in recent years, and will require the creation of new models to effectively analyze future transportation patterns and the corresponding effect on GHG emissions. Therefore, the Modified Project's post-2020 emissions trajectory is expected to follow a declining trend, consistent with the 2030 and 2050 targets.

(iii) Conclusion

Given the Modified Project's consistency with State, regional, and local GHG emission reduction goals and objectives, the Modified Project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs, as was the case with the Original Stadium Project. Furthermore, the Modified Project would comply with plans, programs, and regulations that reduce GHG

---

[50] *Energy and Environmental Economics (E3), "Summary of the California State Agencies' PATHWAYS Project: Long-term Greenhouse Gas Reduction Scenarios" (April 2015); Greenblatt, Jeffrey, Energy Policy, "Modeling California Impacts on Greenhouse Gas Emissions" (Vol. 78, pp. 158–172). The California Air Resources Board, California Energy Commission, California Public Utilities Commission, and the California Independent System Operator engaged E3 to evaluate the feasibility and cost of a range of potential 2030 targets along the way to the state's goal of reducing GHG emissions to 80% below 1990 levels by 2050. With input from the agencies, E3 developed scenarios that explore the potential pace at which emission reductions can be achieved as well as the mix of technologies and practices deployed. E3 conducted the analysis using its California PATHWAYS model. Enhanced specifically for this study, the model encompasses the entire California economy with detailed representations of the buildings, industry, transportation, and electricity sectors.*

emissions. Indeed, many Modified Project-related emissions would be capped in the aggregate and steadily reduced by the Cap-and-Trade Program, such as energy, mobile, and construction emissions. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project, impacts with respect to GHG emissions under the Modified Project would be less than significant and not cumulatively considerable. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to GHG emissions, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(c) Project Design Features

The Modified Project would implement the following Project Design Features related to GHG emissions:

PDF G-1: The Modified Project shall be designed to be capable of achieving at least Silver certification under the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED)-BD+C or LEED-ND Rating System (v.3), or equivalent green building standards.

PDF G-2: The Modified Project shall comply with the required measures of the 2013 Los Angeles Green Building Code and shall implement additional efficiency measures to achieve a reduction in energy consumption that is greater than 25 percent relative to the ASHRAE 90.1-2007 standard, but no less than minimum compliance with the 2013 California energy efficiency standards (Title 24, Part 6). Energy efficiency shall be achieved through building design and through the incorporation of energy-efficient heating, ventilation, and air conditioning (HVAC) systems, lighting, and appliances.

PDF G-3: The Modified Project shall include the following measures to promote the use of alternative modes of travel and reduce vehicle miles traveled:

- Transit accessibility improvements to facilitate transit use (e.g., wayfinding signage, walkways, etc.)
- Ten percent of the parking spaces provided in the Modified Project's VIP parking lot on the Project Site shall be constructed to accommodate the future placement of facilities for the recharging of electric vehicles
- Reduced price Metro transit passes for project employees
- Printed transit information on tickets

In addition, refer to the Project Design Features and Mitigation Measures in Section IV.P, Utilities and Service Systems, on page 171 of this Addendum, which would indirectly reduce GHG emissions by reducing the Modified Project's resource consumption and waste generation.

H. Hazards and Hazardous Materials

The Certified EIR for the Original Stadium Project concluded that impacts with respect to hazards and hazardous materials would be less than significant under the Original Stadium Project through compliance with applicable regulatory requirements (refer to Section V, General Impact Categories, of the Certified EIR). Significant impacts with respect to hazards and hazardous materials could occur if a project were to expose people or structures to substantial risk resulting from the release of a hazardous material, or from exposure to a health hazard, in excess of regulatory standards. The Certified EIR analyzed the demolition of the existing Sports Arena and stated that there is a potential for the Sports Arena to contain asbestos containing materials (ACMs) and lead. Subsequent to the preparation of the Certified EIR, an ACM Survey was conducted for the Sports Arena in January 2012 (see Appendix L of this Addendum), which confirmed that ACMs are present in some ceiling materials, roofing materials, ceiling tiles, floor tiles and mastic, and insulation.

As stated in the Certified EIR, on-site ACMs must be removed by licensed contractors using specific control methods prescribed in SCAQMD Rule 1403, which would ensure that impacts related to ACMs would be less than significant. As with the Original Stadium Project, construction of the Modified Project would involve demolition of the Sports Arena and compliance with SCAQMD Rule 1403, which would ensure impacts would be less than significant for the Modified Project. With regard to lead-based paint, prior to issuance of a demolition permit, the Applicant would be required to submit verification to the City of Los Angeles Department of Building and Safety that a lead-based paint survey has been conducted for the Sports Arena. If lead-based paint is found, the Applicant must comply with all procedural requirements and regulations for proper lead removal and disposal, which would ensure that impacts related to lead-based paint would be less than significant. Construction of the Modified Project would conform to these requirements. Furthermore, similar to the Original Stadium Project, fuel and oils associated with construction equipment, as well as coatings, paints, adhesives, and caustic or acidic cleaners could be used, handled, and stored on the Project Site during construction of the Modified Project. Like with the Original Stadium Project, all potentially hazardous materials associated with construction of the Modified Project would be used and stored in accordance with applicable regulatory requirements and manufacturers' instructions. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR), impacts with

respect to handling ACM, lead-based paint, and hazardous materials during construction would be less than significant under the Modified Project through compliance with existing regulatory requirements. No mitigation measures are required.

The Certified EIR also analyzed potential impacts related to hazards and hazardous materials during operation of the Original Stadium Project. As stated therein, minor amounts of hazardous materials such as motor oil, paints, solvents, pesticides, herbicides and fertilizers may be used at the Project Site. However, the use and disposal of such materials would be in compliance with the State Health and Safety Code, the LAMC, and the Uniform Fire Code (UFC). Therefore, the Certified EIR concluded that operation of the Original Stadium Project would not result is any significant impacts associated with hazards or hazardous materials. The general use of the stadium and the types and quantities of hazardous materials that could be used and stored in association with stadium operations would not change with the design and use modifications proposed under the Modified Project. The Modified Project also would provide Ancillary Uses to the proposed stadium analyzed in the Certified EIR, including office and conference facilities, a museum, and retail and restaurant uses. These types of land uses are not typically associated with the use and handling of substantially hazardous materials. Rather, the types and quantities of hazardous materials that could be used during operation of the Ancillary Uses would be similar to those analyzed in the Certified EIR (e.g., motor oil, paints, solvents, pesticides, herbicides and fertilizers), and would be characteristic of typical commercial land uses. Furthermore, consistent with the Certified EIR's analysis, all potentially hazardous materials associated with operation of the Modified Project would be contained, stored, and used in accordance with manufacturers' instructions and handled in compliance with applicable federal, State, and local regulations. Any associated risk would be adequately reduced to a less-than-significant level through compliance with these standards and regulations. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR), impacts with respect to the use, handling, and storage of hazardous materials would be less than significant under the Modified Project through compliance with existing regulatory requirements. No mitigation measures are required.

Subsequent to the preparation of the Certified EIR, a Phase I Environmental Site Assessment (Phase I ESA) dated August 26, 2015 was conducted for the Project Site. The Phase I ESA is included in Appendix M of this Addendum. To identify potential on-site hazards, the Phase I ESA included interviews with property owner representatives, a review of environmental records, a site reconnaissance, historical reviews, and interviews with public agency personnel. The Phase I ESA identified the following environmental concerns on the Project Site:

- Various containers of paint, oil, coolant, gasoline, and propane, as well as batteries and tires, that would be removed and disposed of in conjunction with demolition activities;

- Exterior evaporate Chillers that contain ACMs (not previously identified in the ACM Survey discussed above) located north of the VIP Parking Lot;

- Leaking piping containing glycol located underneath the Sports Arena floor; and

- The potential presence of a historical gasoline tank on the Project Site related to development prior to construction of the Sports Arena. No records were found related to the potential gasoline tank; therefore, it is unknown if it was an above-ground storage tank (AST) or underground storage tank (UST). According to the Phase I ESA, the approximate location of the tank was near the southern boundary line of the Project Site.

No significant stains or spills were observed in the areas where hazardous materials are stored on-site, and all materials appeared to be property stored and maintained. During demolition activities under the Modified Project, hazardous materials on the Project Site would be handled, transported, and disposed of in accordance with manufacturers' instructions and applicable federal, state, and local regulations. The Chillers, glycol, and glycol-related materials would also be removed and disposed of in accordance with applicable regulations. As stated above, on-site ACMs must be removed by licensed contractors using specific control methods prescribed in SCAQMD Rule 1403, which would ensure that impacts related to ACMs would be less than significant. With regard to the potential historical gasoline storage tank on-site, the Phase I ESA recommended that a geophysical survey be conducted to further evaluate the area for a possible tank excavation. Accordingly, Mitigation Measures MP-H-1 and MP-H-2[51] are recommended below. Mitigation Measures MP-H-1 and MP-H-2 have been incorporated into the Modified Project's MMP included as Appendix A to this Addendum. With the implementation of these measures, the Modified Project's potential impacts with respect to hazards and hazardous materials would be less than significant. Additionally, the Project Site is not within a Methane Zone or Methane Buffer Zone identified by the City,[52] so no further analysis of issues related to methane are required.

Based on the above, with implementation of Mitigation Measures MP-H-1 and MP-H-2, the Modified Project would not result in any new significant impacts with respect to

---

[51] *New mitigation measures that are recommended for the Modified Project in this Addendum are noted with the prefix "MP."*

[52] *City of Los Angeles Department of City Planning, Zone Information and Map Access System (ZIMAS), Parcel Profile Report, http://zimas.lacity.org/, accessed June 4, 2015.*

hazards and hazardous materials, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(a) Mitigation Measures

The Modified Project would implement the following Mitigation Measures to mitigate potential impacts to hazards and hazardous materials to a less-than-significant level:

Mitigation Measure MP-H-1: Prior to the issuance of a demolition permit, a geophysical survey shall be prepared in the area of the identified potential historical gasoline tank (i.e., near the southern boundary line of the Project Site). If a storage tank is identified during the geophysical survey or uncovered during subsequent construction and/or demolition activities, the tank shall be removed (abandoned) in accordance with applicable federal, state, and local laws, to the satisfaction of the California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR), the South Coast Air Quality Management District (SCAQMD), the Los Angeles Regional Water Quality Control Board (RWQCB), and/or the City of Los Angeles Fire Department (LAFD), as applicable. Soil sampling of the tank excavation site shall be completed by personnel appropriately trained in accordance with the Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response Standard (HAZWOPER). If contamination is detected above acceptable regulatory levels, remediation activities shall be conducted. The remediation could consist of excavation and disposal of impacted soil; in-situ treatment; and/or vapor extraction. If necessary, remedial efforts shall be conducted under the oversight of regulatory agencies including, but not limited to, the Department of Toxic Substances Control (DTSC); the LAFD; and the RWQCB.

Mitigation Measure MP-H-2: If soil contamination is identified during the soil sampling procedures outlined in Mitigation Measure MP-H-1, prior to issuance of a permit(s) for activities involving construction dewatering, evidence shall be provided to the Los Angeles Department of Building and Safety that a valid National Pollutant Discharge Elimination System (NPDES) or Industrial Waste Discharge Permit is in place. The NPDES or Industrial Waste Discharge Permit shall include provisions for evaluating the groundwater for potential contamination and, if necessary, the need for treatment of dewatering discharge.

I. Hydrology and Water Quality

The following analysis is based on the Hydrology and Water Quality analysis provided in Section IV.E of the Certified EIR, and on the Hydrology and Water Quality Technical Memorandum (Hydrology Report) prepared for the Modified Project by Langan Engineering and Environmental Services, dated September 2, 2015, which is included in Appendix N of this Addendum. The Hydrology Report identifies potential surface water and groundwater hydrology and water quality impacts that may be associated with the Modified Project and determines whether the Modified Project would result in new significant impacts not previously identified in the Certified EIR.

(a) Construction

The Certified EIR for the Original Stadium Project concluded that impacts with respect to hydrology and water quality would be less than significant during construction of the Original Stadium Project through compliance with applicable regulatory requirements (refer to Section IV.E, Hydrology and Water Quality, of the Certified EIR). Mitigation Measures E-1 and E-3 are included in the Certified EIR to further ensure implementation of the applicable regulatory requirements that support this conclusion (i.e., compliance with a SWPPP and NPDES waste discharge requirements, respectively). The thresholds on which this analysis was based are stated on pages IV.E-8–IV.E-9 of the Certified EIR.

With regard to surface water hydrology and water quality impacts during construction, the Original Stadium Project was required to prepare and implement a SWPPP, as reflected in Mitigation Measure E-1 in the Certified EIR. The SWPPP would be prepared and implemented in compliance with the Construction General Permit administered by the State Water Resources Control Board (SWRCB).[53] The SWPPP would include temporary controls, or BMPs, to address construction impacts to hydrology and water quality, particularly during soil disturbing activities when soils are exposed to wind, rain, and concentrated flows that cause erosion, and that would minimize the transmission of sediment into the storm drain system. The SWPPP control measures would be designed to convey the 25-yr and 50-yr rainfall events from the Project Site. Additionally, the SWPPP would also address proper usage and storage of common construction materials such as vehicle fluids (e.g., oil, grease, etc.), asphalt concrete and Portland cement concrete, paints, solvents and thinners, metals and plated products and fertilizers. Finally, the SWPPP would address construction related waste such as wastewater from vehicle cleaning operations, trash from material packaging, employee's

[53] *Construction General Permit Water Quality Order 2009-0009-DWQ as amended by Order No. 2012-0006-DWQ.*

meal breaks, slurries from sawing and grinding operations, wastewater/waste from concrete washout operations and sanitary waste. The Certified EIR concluded that following the implementation of Mitigation Measure E-1, which requires implementation of a SWPPP, impacts to surface water hydrology and water quality during construction would be less than significant under the Original Stadium Project.

Construction activities under the Modified Project would be substantially similar to those of the Original Stadium Project in terms of the amount of ground disturbance and the types of pollutants that could be introduced to the Project Site. As is the case for the Original Stadium Project, potential impacts to surface water quality and hydrology would be mitigated to a less-than-significant level through preparation and implementation of a SWPPP. Mitigation Measure E-1 from the Certified EIR has been incorporated into the Modified Project's MMP included as Appendix A to this Addendum. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.E, Hydrology and Water Quality, of the Certified EIR), construction-related impacts with respect to surface water hydrology and water quality under the Modified Project would be less than significant through implementation of a SWPPP prepared to the satisfaction of LADBS, as reflected in Mitigation Measure E-1 of the Certified EIR. No additional mitigation measures are required.

As it relates to impacts to groundwater during construction, the Certified EIR stated that the Project Site is not an area that provides substantial groundwater recharge. Furthermore, the project contractor would be required to comply with existing regulatory requirements pertaining to water quality that would ensure that the Original Stadium Project would not result in any significant impacts to groundwater. Such requirements include the preparation and implementation of a SWPPP as reflected in Mitigation Measure E-1 in the Certified EIR, and compliance with NPDES waste discharge requirements for construction dewatering, which is reflected in Mitigation Measure E-3 in the Certified EIR. Therefore, the Certified EIR concluded that the Original Stadium Project would not adversely affect groundwater conditions with implementation of the aforementioned mitigation measures.

As discussed in the Hydrology Report, and consistent with the analysis in the Certified EIR, appreciable groundwater recharge does not occur on the Project Site. Furthermore, as discussed above, the Modified Project's SWPPP would include BMPs for the proper handling, storage, and disposal of hazardous materials during construction to avoid subsurface contamination. With regard to the potential for encountering groundwater during construction, as discussed in the Hydrology Report, the proposed stadium under the Modified Project would be constructed within a portion of the excavation and footprint area currently occupied by the Sports Arena, consistent with the Original Stadium Project. The

basement level of the Sports Arena currently extends to a depth of approximately 25 feet below grade level (approximately el 155).[54] The excavation areas following removal of the Sports Arena not occupied by the proposed stadium footprint would be backfilled to existing grade. As discussed above in Section IV.F, Geology and Soils, of this Addendum (see page 69), based on the information provided in the Geotechnical Report, the excavation required for the proposed development would not extend deeper than the current below-grade areas of the Sports Arena. Both historical groundwater levels and recently monitored groundwater levels are well below the lowest proposed grade of the Modified Project (refer to Section IV.F, Geology and Soils, on page 69). Therefore, it is not expected that groundwater would be encountered during construction of the Modified Project. Nonetheless, the potential exists for shallower, perched water to be encountered at the Project Site depending on seasonal rainfall. Therefore, while not anticipated, temporary construction dewatering may be required. Construction dewatering, if required, would be performed using conventional gravity routing and collection in sump pits, with pumping performed as needed to dispose of any water accumulated in these areas, in accordance with Project Design Feature F-1 in Section IV.F, Geology and Soils. Additionally, Mitigation Measure E-3 from the Certified EIR has been incorporated into the Modified Project's MMP included as Appendix A to this Addendum, which requires that construction dewatering comply with applicable NPDES permit requirements. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.E, Hydrology and Water Quality, of the Certified EIR), construction-related impacts with respect to groundwater under the Modified Project would be less than significant through compliance with Mitigation Measures E-1 and E-3 of the Certified EIR. No additional mitigation measures are required.

Based on the analysis above, through the implementation of mitigation measures identified in the Certified EIR, construction of the Modified Project would not result in any new significant impacts with respect to hydrology and water quality, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(b) Operation

The Certified EIR for the Original Stadium Project concluded that impacts with respect to hydrology and water quality would be less than significant during operation of the Original Stadium Project through compliance with applicable regulatory requirements (refer to Section IV.E, Hydrology and Water Quality, of the Certified EIR). Mitigation Measure E-2 is included in the Certified EIR to further ensure implementation of the applicable regulatory

[54] *With respect to NAVD.*

requirements that support this conclusion (i.e., compliance with Standard Urban Stormwater Mitigation Plan (SUSMP) requirements). The thresholds on which this analysis was based are stated on pages IV.E-8–IV.E-9 of the Certified EIR.

With regard to surface water quality, the Certified EIR stated that the Original Stadium Project would have the potential to introduce additional contaminants that could impact the urban runoff flows on the Project Site, such as petroleum products, paints and solvents, detergents, fertilizers, and pesticides. As reflected in Mitigation Measure E-2 in the Certified EIR, the Original Stadium Project would be required to prepare and implement a SUSMP in accordance with the Los Angeles County RWQCB MS4 Program, which would reduce surface water quality impacts to a less-than-significant level. The Modified Project would introduce similar types of pollutants to the Project Site as the Original Stadium Project. As is typical of commercial developments with restaurant uses, anticipated pollutants would include pathogens, nutrients, pesticides, sediments, trash and debris, oxygen demanding substances and oil and grease. Like the Original Stadium Project, the Modified Project would be subject to Mitigation Measure E-2 in the Certified EIR and would be required to prepare and implement a SUSMP with permanent on-site BMPs to reduce the quantity and improve the quality of rainfall runoff from the Project Site. Additionally, the Modified Project would be required to comply with the City's Low Impact Development (LID) Ordinance (Ord. No. 181899), which expanded the applicability of SUSMP requirements by imposing rainwater LID strategies on projects that require building permits. The LID Ordinance was adopted in November 2011 and officially became effective on May 12, 2012.[55] LID consists of site design approaches and BMPs that are designed to address runoff and pollution at the source. The goal of these LID practices is to remove nutrients, bacteria, and metals from stormwater while also reducing the quantity and intensity of stormwater flows. The LID ordinance requires rainwater from a 0.75-inch rainstorm to be captured, infiltrated, and/or used on-site at most developments and redevelopments where more than 500 square feet of hardscape is added. In so doing, the City's LID Manual prioritizes the following BMPs: infiltration systems, stormwater capture and use, high efficient biofiltration/bioretention systems, or a combination of the above. The Modified Project would incorporate one or more of these BMPs to achieve compliance with LID Ordinance requirements. Because runoff from the Project Site is currently untreated, implementation of the Modified Project would result in a beneficial impact with regard to surface water quality as compared to existing conditions. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.E, Hydrology and Water Quality, of the Certified EIR), operational impacts with respect to surface water quality under the Modified Project would be less than significant (and in fact

---

[55] *LA Stormwater, Low Impact Development (LID) 2-Sided Brochure, www.lastormwater.org/wp-content/files_mf/lidbrochure4.19.12.pdf, accessed May 2, 2014.*

beneficial) through implementation of applicable regulatory requirements, including compliance with a SUSMP prepared to the satisfaction of LADBS, as reflected in Mitigation Measure E-2 of the Certified EIR, and the City's LID Ordinance. Mitigation Measure E-2 has been incorporated into the Modified Project's MMP included as Appendix A to this Addendum. No additional mitigation measures are required.

With regard to surface water hydrology, as stated in the Certified EIR, the Project Site in its existing state is mostly impervious. Stormwater that is not absorbed in the pervious areas is collected as runoff and is conveyed via sheet flow to the City storm drainage systems in Hoover Street and Martin Luther King, Jr. Boulevard. The Sports Arena roof, the eastern depressed areas, and some structured areas collect stormwater runoff into a building drainage system and utilize pumps to convey the stormwater to the existing surface drainage system. The Certified EIR concluded that permeable areas would slightly increase as compared to the existing conditions under the Original Stadium Project, thereby improving runoff conditions by reducing the flow to the storm drain system. Therefore, because stormwater runoff conditions would be improved compared to existing conditions, the Certified EIR determined that surface water hydrology impacts under the Original Stadium Project would be less than significant. The Hydrology Report analyzes post-development stormwater flows based on the Modified Project design. The amount of impervious surface area on-site would be approximately the same under the Modified Project as compared to existing conditions. As shown in Table 10 on page 100, peak flow rates from the Project Site would not increase under the Modified Project during a 25- or 50-year storm event. Therefore, the Modified Project would not create nor contribute to stormwater runoff levels that would exceed the capacity of the existing storm water drainage systems. Accordingly, consistent with the Certified EIR's conclusions for the Original Stadium Project, the Modified Project's potential surface water hydrology impacts would be less than significant. No mitigation measures are required.

The Certified EIR also analyzed the Original Stadium Project's potential operational impacts on groundwater. As stated therein, the Project Site is not an area that provides substantial groundwater recharge, and the Original Stadium Project would not affect this condition. Furthermore, the Project Site is not a source of groundwater pumping for potable water usage. Therefore, the Certified EIR concluded that impacts related to groundwater would be less than significant during operation of the Original Stadium Project. Similar to the Original Stadium Project, the Modified Project would be serviced by the municipal water and sewer system, and no production wells would be installed. As stated above, the amount of impervious surface area on-site would be approximately the same under the Modified Project as compared to existing conditions. The Modified Project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge since limited groundwater recharge currently occurs on-site. Furthermore, the Modified Project would implement BMPs pursuant to SUSMP

Table 10
Modified Project Peak Stormwater Flowrates

Site Condition	Rational Method Runoff Coefficient	Q25 (cfs)	Q50 (cfs)
Existing	0.88 (25-yr); 0.89 (50-yr)	38.1	43.8
Proposed	0.88 (25-yr); 0.89 (50-yr)	38.1	43.8

Q25 = peak runoff rate during 25-year storm event
Q50 = peak runoff rate during 50-year storm event
cfs = cubic feet per second
Source: Langan Engineering and Environmental Services, Inc., 2015.

requirements (pursuant to Certified EIR Mitigation Measure E-2) and the City's LID Ordinance to control and mitigate surface pollutants. Therefore, consistent with the conclusions in the Certified EIR, the Modified Project would result in less than significant impacts associated with groundwater hydrology and quality.

Based on the analysis above, through the implementation of mitigation measures identified in the Certified EIR, operation of the Modified Project would not result in any new significant impacts with respect to hydrology and water quality, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(c) Mitigation Measures

The following mitigation measures were included in the Certified EIR to reflect the regulatory requirements that would ensure that the Original Stadium Project's hydrology and water quality impacts would be less than significant. These Mitigation Measures would continue to be implemented as part of the Modified Project, as revised, and have been incorporated into the MMP for the Modified Project included in Appendix A of this Addendum:

EIR Mitigation Measure MM E-1: The ~~Project~~ Applicant shall ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared and implemented during construction. The SWPPP shall be prepared to the satisfaction of the City of Los Angeles Department of Building and Safety prior to the issuance of building permits.

EIR Mitigation Measure MM E-2: The ~~Project~~ Applicant must prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program. The SUSMP shall be submitted and prepared to the

satisfaction of the City of Los Angeles Department of Building and Safety.

EIR Mitigation Measure MM E-3: The ~~Project~~ Applicant must comply with LARWQCB's General NPDES Permit and General Waste Discharge Requirements (WDRs) (Order No. R4-2003-0111, NPDES No. CAG994004) governing construction-related dewatering discharges (the "General Dewatering Permit").

J. Land Use and Planning

(a) Consistency with Regulatory Framework

The Certified EIR for the Original Stadium Project concluded that impacts related to consistency with applicable land use plans and policies would be less than significant under the Original Stadium Project (refer to Section IV.F, Land Use, of the Certified EIR). The thresholds on which this analysis was based are stated on page IV.F-13 of the Certified EIR. Specifically, the Certified EIR determined that the Original Stadium Project would be consistent with the underlying General Plan and zoning designations on the Project Site, the Exposition/University Park Redevelopment Plan,[56] the California Museum of Science and Industry (CMSI)/Exposition Park Master Plan, and applicable regional plans and regulations. Although impacts would be less than significant, the Certified EIR included Mitigation Measure F-1 to reinforce requirements for permits and discretionary approvals to ensure land use consistency. Consistent with the Original Stadium Project, the proposed stadium under the Modified Project would have a maximum seating capacity of approximately 22,000 attendees and would host MLS games, USC field events, open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. The general use of the stadium would not change with the design modifications proposed under the Modified Project. The Modified Project would also provide additional Ancillary Uses to the Original Stadium Project including conference facility and office space, a museum, and retail and restaurant uses. The Modified Project would also require the following discretionary approvals that were not specifically considered in the Certified EIR's analysis of the Original Stadium Project:

---

[56] *On December 29, 2011, the California Supreme Court issued its decision in the* California *Redevelopment Association v. Matosantos case. The decision upheld the recently enacted State law, Assembly Bill (AB)X1 26, dissolving all California redevelopment agencies, including the Community Redevelopment Agency of the City of Los Angeles. The dissolution of the agencies became effective February 1, 2012. ABX1 26, however, did not dissolve the redevelopment plans. Therefore, the Exposition/University Park Redevelopment Plan and its requirements for development are still in effect and are overseen by a Designated Local Authority (DLA).*

- Amendment of the Coliseum District Specific Plan to expressly allow development standards for Modified Project (e.g., seating capacity, FAR, height, signage, parking and uses);
- Director's Review (pursuant to Coliseum District Specific Plan);
- Alcohol Use Approval to expressly allow all establishments that would sell and serve alcohol (pursuant to Coliseum District Specific Plan);
- Sign District/Supplemental Use District (Zone Change) for Signage;
- Possible Board of Police Commissioners permit for extended interior construction hours;
- Possible approval of a property and/or project agreement by the Coliseum Commission authorizing the development of the Modified Project on the Project Site; and
- Possible approval of a Non-Disturbance Agreement or other agreements for LAFC's operation of the Modified Project by the State of California (California Science Center—Sixth District Agricultural Association), including use of State-owned properties in Exposition Park for signage, parking, and construction staging.

The following analysis focuses on the potential for the Modified Project's Ancillary Uses and additional discretionary approvals to result in new significant impacts with respect to land use consistency that were not previously identified in the Certified EIR.

As stated in the Certified EIR, the Project Site is subject to the following state, regional, and local land use regulatory authorities, plans, and policies: (1) State—CMSI/ Exposition Park Master Plan; (2) Regional—Southern California Association of Governments' (SCAG) Regional Comprehensive Plan and Guide (RCPG), 2008 Regional Comprehensive Plan (RCP), and Compass Growth Vision; South Coast Air Quality Management District's (SCAQMD) Air Quality Management Plan (AQMP); Regional Water Quality Control Board (RWQCB); and Metropolitan Transportation Authority's (MTA) Congestion Management Plan (CMP); and (3) Local—the City of Los Angeles' General Plan, South Los Angeles Community Plan, Exposition/University Park Redevelopment Plan, and Planning and Zoning Code. The Project Site is also regulated by the City of Los Angeles' Coliseum District Specific Plan. Additionally, since certification of the Certified EIR, SCAG adopted its 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (2012–2035 RTP/SCS), which also pertains to the Project Site. The AQMP was also updated in 2012. Finally, while the Certified EIR addressed the Project Site's location within the Los Angeles State Enterprise Zone, the California State Enterprise Zone program has since ended and is no longer applicable to the Project Site. The Modified

Project's consistency with the applicable land use plans and policies noted above is addressed below.

(i) State

As stated in the Certified EIR, the CMSI/Exposition Park Master Plan (Master Plan) includes goals and objectives oriented around developing, preserving, and restoring the following areas within Exposition Park: (1) the CMSI; (2) the Science Museum School; (3) the Science Educational Resource Center; (4) the California African-American Museum; (5) park landscaping and open space areas; (6) parking and circulation facilities; and (7) ancillary infrastructure improvement areas. The Master Plan does not include any goals or objectives related to specific alterations or renovation of the Sports Arena, and makes no specific reference with respect to goals or objectives for the long-term use of the Sports Arena. Notwithstanding, the Certified EIR determined that the Original Stadium Project would be consistent with the six general objectives of the Master Plan because it would: reinforce Exposition Park's role as a major regional community resource in the southern California region by replacing the underutilized Sports Arena with a modern, world-class sports complex; provide enhanced landscape and pedestrian circulation areas; implement a traffic management plan to minimize traffic and parking impacts on days when major events are scheduled; be compatible in scale, height, materials, architectural quality and site orientation within the context of Exposition Park as well as the surrounding built environment; and provide provisions for coordinated marketing, security, maintenance arrangements, parking, transit access, and programming with Exposition Park management, as needed for the redeveloped Project Site. The Modified Project's proposed modifications to the Original Stadium Project would not change these conclusions.

Specifically, the Modified Project would continue to reinforce Exposition Park's role as a major regional community resource in southern California by replacing the Sports Arena with a modern, world-class sports complex, and would involve substantially similar features to the Original Stadium Project that the Certified EIR concluded would be consistent with the Master Plan. In addition, the Modified Project would include enhanced landscape and pedestrian improvements as compared to the Original Stadium Project, including: (1) the Northwest Plaza, which would be designed to provide a welcoming pedestrian environment with a mix of hardscape and landscaped areas, and could include water features, public art, and seating areas; and (2) the Figueroa Street pedestrian improvements, which would include a broad pedestrian sidewalk featuring enhanced landscape and streetscape, providing sufficient space for patrons to circulate and queue on event days, and, an inviting and safe pedestrian environment on non-event days. The Modified Project's proposed Ancillary Uses would provide additional amenities to support stadium operations, including year-round restaurant and retail uses, which would enable the creation of a state-of-the-art sports and entertainment complex that is better able to

compete with similar, modern facilities. The Ancillary Uses would therefore further promote the Modified Project's consistency with Master Plan Objective 1, to reinforce the park as a regional and community resource, and Objective 3, to develop employment and cultural opportunities within the park to benefit area residents. Further, as discussed in Section IV.A, Aesthetics, on page 34 of this Addendum, the scale, mass, and height of the proposed stadium and Ancillary Uses would be compatible with surrounding uses within and adjacent to Exposition Park, and therefore the Modified Project would continue to be consistent with Master Plan Objective 5. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project, the Modified Project would be consistent with the general objectives of the Master Plan, and impacts would be less than significant. No mitigation measures are required.

(ii) Regional

As stated in the Certified EIR, the Project Site is located within SCAG's planning region. SCAG is the federally designated Metropolitan Planning Organization for six Southern California counties, including the County of Los Angeles. As such, SCAG is mandated to create regional plans that address transportation, growth management, hazardous waste management, and air quality. SCAG plans that currently apply to the Project Site include the 2012–2035 RTP/SCS, the Compass Growth Vision, and the 2008 RCP.

SCAG's 2012–2035 RTP/SCS, adopted in April 2012, presents a long-term transportation vision through the year 2035 for its six county region. The mission of the 2012–2035 RTP/SCS is to provide "leadership, vision and progress which promote economic growth, personal well-being, and livable communities for all Southern Californians."[57] The 2012–2035 RTP/SCS emphasizes sustainability and integrated planning, and identifies mobility, economy, and sustainability as the three principles most critical to the future of the region. As part of this approach, the 2012–2035 RTP/SCS establishes High-Quality Transit Areas, which are described as generally walkable transit villages or corridors that are within 0.5 mile of a well-serviced transit stop or a transit corridor with 15-minute or less service frequency during peak commute hours.[58] Local jurisdictions are encouraged to focus housing and employment growth within High-Quality Transit Areas. The Project Site is located within a High-Quality Transit Area as designated by the 2012–2035 RTP/SCS.[59]

---

[57] *SCAG 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy, pp. viii, available at http://rtpscs.scag.ca.gov/Pages/2012-2035-RTP-SCS.aspx, accessed August 13, 2015.*

[58] *Ibid, pp. 114.*

[59] *Ibid, Exhibit 4.9: High-Quality Transit Areas (HQTA) SCAG Region, pp. 136.*

The Certified EIR did not include a discussion of the Original Stadium Project's consistency with the 2012–2035 RTP/SCS since the 2012–2035 RTP/SCS was adopted after the certification of the Certified EIR. However, the Certified EIR included an analysis of the Original Stadium Project's consistency with SCAG's 2008 Regional Transportation Plan (RTP), which preceded the 2012–2035 RTP/SCS (see Table IV.F-1 in the Certified EIR). The Certified EIR explained that the Project Site is already well served by regional and local transit lines. In addition, the Certified EIR explained that the Original Stadium Project would comply with Title 20 and Title 24 standards pertaining to water and energy efficiency standards. Therefore, the Certified EIR concluded that the Original Stadium Project would be consistent with the goals of the 2008 RTP to maximize mobility and accessibility for all people and goods in the region; preserve and ensure a sustainable regional transportation system; protect the environment, improve air quality and promote energy efficiency; and encourage land use and growth patterns that complement transportation investments, among others.

Like the Original Stadium Project, the Modified Project represents an infill development within an existing urbanized area that would concentrate new development in proximity to public transit opportunities (e.g., Expo Light Rail, Harbor Transitway BRT station), thereby minimizing vehicle trips, vehicle miles traveled (VMT), and resulting air pollution. The availability and accessibility of public transit in the Project area is evidenced by the Project Site's location within a designated High-Quality Transit Area. By focusing new development within a designated High-Quality Transit Area, the Modified Project would be consistent with regional growth strategies promoted in the 2012–2035 RTP/SCS, which represent widely recognized "smart growth" planning strategies that promote higher density, infill development with access to public transit in an effort to reduce urban sprawl and its associated environmental effects. Furthermore, the Modified Project would provide bicycle parking for a minimum of 440 bicycles (two percent of the proposed stadium seating capacity) to encourage bicycling to events at the stadium. Also like the Original Stadium Project, the Modified Project would revitalize an urban infill site that is already equipped with the infrastructure to support a major sports and entertainment venue by replacing the underutilized Sports Arena with a modern, world-class sports complex. In addition, the Modified Project would include enhanced landscape and pedestrian improvements as compared to the Original Stadium Project, including the Northwest Plaza, which would be designed to provide a welcoming pedestrian environment with a mix of hardscape and landscaped areas, and could include water features, public art, and seating areas, as well as other public open space areas around the Project Site. As discussed in Section IV.G, Greenhouse Gas Emissions, on page 75 of this Addendum, the Modified Project would incorporate "Green" principles throughout the development to comply with the City of Los Angeles Green Building Code (Chapter IX, Article 9, of the LAMC) and the sustainability intent of the U.S. Green Building Council's LEED® program. These include energy conservation, water conservation, and waste reduction features that exceed the requirements and commitments applicable to the Original Stadium Project. Therefore,

consistent with the conclusions in the Certified EIR for the Original Stadium Project (which pertained to 2008 RTP consistency), the Modified Project would be consistent with the applicable goals and principles set forth in the 2012–2035 RTP/SCS. Impacts would be less than significant, and no mitigation measures are required.

As discussed in the Certified EIR, SCAG's Compass Growth Vision, adopted in 2004, encourages better relationships between housing, transportation, and employment. The Compass Growth Vision is driven by four key principles: (1) Mobility –Getting where we want to go, (2) Livability—Creating positive communities, (3) Prosperity—Long-term health for the region, and (4) Sustainability—Preserving natural surroundings. SCAG's 2004 Growth Vision Report identified 2% Strategy Opportunity Areas, which represented areas of the region that were targeted for growth, where projects, plans, and policies consistent with the key principles would best serve the goals of the Compass Growth Vision to improve mobility for all residents, foster livability in all communities, enable prosperity for all people, and promote sustainability for future generations. Since certification of the Certified EIR, the 2% Strategy Opportunity Areas have been effectively replaced with the High-Quality Transit Areas established in the 2012–2035 RTP/SCS, as discussed above. The Certified EIR stated that the Original Project would provide an updated public venue for outdoor recreational opportunities or civic events in response to changing community needs and market conditions, revitalizing the Project Site and providing enhanced landscape and community use options when compared to the existing Sports Arena facility and site conditions. In addition, the Certified EIR stated that the Original Stadium Project would provide employment opportunities and would comply with Title 20 and Title 24 standards pertaining to water and energy efficiency standards. Therefore, the Certified EIR concluded that the Original Stadium Project would be consistent with the Compass Growth Vision principles. The Modified Project builds upon the energy conservation features previously identified in the Certified EIR and would comply with Title 24 of the California Code of Regulations, including Part 6 (Energy Efficiency Standards for Residential and Nonresidential Buildings) and Part 11 (California Green Building Standards Code, commonly referred to as the CALGreen Code), as well as the City of Los Angeles Green Building Code (2013), which incorporates the CALGreen Code into Chapter IX of the Los Angeles Municipal Code (LAMC), in effect at the time of the Modified Project's permit application. The Modified Project would also be designed to be capable of achieving at least Silver certification under the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED)-BD+C or LEED-ND Rating System (v.3), or equivalent green building standards. For the reasons discussed above in relation to consistency with the 2012–2035 RTP/SCS, the Modified Project would also be consistent with the principles set forth in the Compass Growth Vision, consistent with the conclusions in the Certified EIR for the Original Stadium Project. Impacts would be less than significant, and no mitigation measures are required.

As discussed in the Certified EIR, SCAG's Regional Comprehensive Plan (RCP) was adopted by SCAG in October of 2008 and serves as an advisory document for (voluntary) use by local governments in the SCAG region as an informational resource, and as a reference document for their use in developing plans and addressing local issues of regional significance. The 2008 RCP replaced SCAG's 1996 Regional Comprehensive Plan and Guide (RCPG). Because of its advisory nature, the RCP is not used in SCAG's Intergovernmental Review process for regionally significant projects. Rather, SCAG reviews new major regional projects based on consistency with the 2012–2035 RTP/SCS and Compass Growth Vision, described above. As stated in the Certified EIR, according to SCAG, the Original Stadium Project was not considered regionally significant pursuant to SCAG Intergovernmental Review (IGR) Criteria and Section 15206 of the CEQA Guidelines. Since consistency with the 2008 RCP was not required, a consistency analysis was not provided in the Certified EIR, though, as discussed above, the Certified EIR did address the Original Stadium Project's consistency with the 2008 RTP (which preceded the 2012–2035 RTP/SCS and was in effect at the time of the Certified EIR) and the Compass Growth Vision. The changes proposed by the Modified Project would not make the Modified Project regionally significant pursuant to SCAG and CEQA criteria. Although an analysis of consistency with the RCP is not required, as was the case at the time the Certified EIR was prepared, it is noted that the Modified Project would be substantially consistent with the applicable goals and policies set forth in the RCP for the reasons discussed above in relation to consistency with the 2012–2035 RTP/SCS.

As stated in the Certified EIR, the Original Stadium Project is subject to the requirements of the SCAQMD's AQMP. The AQMP was prepared to comply with the federal and State Clean Air Acts and amendments, to accommodate growth, to reduce the high levels of pollutants in the air basin, to meet federal and State air quality standards, and to minimize the fiscal impact that pollution control measures have on the local economy. A project is considered consistent with the AQMP if it is consistent with the population, housing, and employment assumptions that form the basis of the AQMP. The Certified EIR determined that the Original Stadium Project would be consistent with the 2007 AQMP in effect at the time the Certified EIR was prepared because it would be consistent with applicable population, housing, and employment projections. As analyzed in Section IV.C, Air Quality, on page 49, the Modified Project would also be consistent with the 2012 AQMP, which was adopted subsequent to the preparation of the Certified EIR, and its applicable population, housing, and employment projections. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project, impacts would be less than significant and no mitigation measures are required.

As discussed in the Certified EIR, the Original Stadium Project is subject to the requirements of the Los Angeles Regional Water Quality Control Board (RWQCB). The Certified EIR determined that the Original Stadium Project would be consistent with

RWQCB requirements during construction and operation (e.g., requirements pursuant to the National Pollution Discharge Elimination System (NPDES) statewide General Construction Activity Permit). As analyzed in Section IV.I, Hydrology and Water Quality, on page 95 of this Addendum, the Modified Project would also be consistent with applicable RWQCB requirements, consistent with the conclusions in the Certified EIR for the Original Stadium Project. Additionally, the Modified Project would be required to comply with the City's Low Impact Development (LID) Ordinance (Ord. No. 181899), which expanded the applicability of SUSMP requirements by imposing rainwater LID strategies on projects that require building permits. The LID Ordinance was adopted in November 2011 and officially became effective on May 12, 2012.[60] Therefore, impacts would be less than significant and no mitigation measures are required.

Finally, the Certified EIR explained that the Original Stadium Project is subject to the requirements of the Los Angeles County Metropolitan Transportation Authority's (Metro) Congestion Management Program (CMP). The CMP requires that, when an environmental impact report is prepared for a project, traffic and public transit impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use those facilities. The Certified EIR determined that the Original Stadium Project would be consistent with the CMP because it would not significantly impact any CMP roadway segments or freeway on-/off-ramps. As analyzed in Section IV.O, Traffic/Transportation/ Parking, on page 149 of this Addendum, the Modified Project would also be consistent with the CMP and would not significantly impact any CMP roadway segments, freeway on-/off-ramps, or transit facilities. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project, impacts would be less than significant and no mitigation measures are required.

(iii) Local

The City of Los Angeles General Plan Framework Element (General Plan Framework), adopted in December 1996 and readopted in August 2001, sets forth general guidance regarding land use issues for the entire City of Los Angeles (City) and defines citywide policies regarding land use. The General Plan Framework defines citywide policies that influence the Community Plans and most of the City's General Plan Elements. The policies are organized by chapters that address land use, housing, urban form and neighborhood design, open space and conservation, economic development, transportation, and infrastructure and public services.

---

[60] *LA Stormwater, Low Impact Development (LID) 2-Sided Brochure, www.lastormwater.org/wp-content/ files_mf/lidbrochure4.19.12.pdf, accessed May 2, 2014.*

The Land Use Chapter of the General Plan Framework provides primary objectives to support the viability of the City's residential neighborhoods and commercial and industrial districts and to encourage sustainable growth in appropriate locations. The Land Use Chapter establishes land use categories which are broadly described by ranges of intensity/density, heights, and lists of typical uses. The designated land use categories are Neighborhood Districts, Community Centers, Regional Centers, Downtown Center, Mixed-Use Boulevards, and Industrial Districts. These land use categories do not connote land use entitlements or affect existing zoning for properties in the City and are intended to serve as a guideline for the Community Plans.[61] The Project Site is located adjacent to and partially within a designated Regional Center that generally corresponds with Figueroa Street.[62] A Regional Center is defined as:

> *…a focal point of regional commerce, identity and activity and containing a diversity of uses such as corporate and professional offices, residential, retail commercial malls, government buildings, major health facilities, major entertainment and cultural facilities, and supporting services. Generally different types of Regional Centers will fall within the range of floor area ratios from 1.5:1 to 6.0:1. Some will only be commercially oriented; others will contain a mix of residential and commercial uses. Generally, Regional Centers are characterized by 6- to 20-stories (or higher). Regional Centers are usually major transportation hubs.*

The Land Use Chapter also indicates that Martin Luther King, Jr. Boulevard adjacent to the Project Site is designated as a Mixed Use Boulevard.[63] Mixed Use Boulevards are described as connections between the City's neighborhood districts and community, regional, and Downtown centers. Mixed-use development is encouraged along these boulevards, with the scale, density and height of development compatible with the surrounding areas. Additionally, the Framework Element designates the Project Site as being located within a Pedestrian-Oriented District that generally corresponds with Figueroa Street.[64] Pedestrian-Oriented Districts are defined as "commercial and mixed-use

---

[61] *As indicated in Chapter 1 of the General Plan Framework, the General Plan Framework neither overrides nor supersedes the Community Plans. It guides the City's long-range growth and development policy, establishing citywide standards, goals, policies and objectives for citywide elements and Community Plans. The General Plan Framework is flexible, suggesting a range of uses within its land use definitions. Precise determinations are made in the Community Plans.*

[62] *General Plan Framework, Figure 3-2, Long Range Land Use Diagram—South Los Angeles, http://planning.lacity.org/cwd/framwk/chapters/03/F32SLAMp.pdf, accessed August 14, 2015.*

[63] *Ibid.*

[64] *General Plan Framework, Figure 8-2, Citywide Pedestrian and Transit-Related Priorities, http://cityplanning.lacity.org/cwd/framwk/chapters/08/fig8-2.htm, accessed August 14, 2015.*

districts that promote pedestrian activity. Such districts can become community-oriented focal points that are differentiated from the prevailing pattern of development and reduce the use of the automobile."[65]

The Certified EIR did not include a detailed analysis of the Original Stadium Project's consistency with the General Plan Framework. Therefore, the following discussion focuses on the Modified Project's consistency with the various land use designations established for the Project Site and the vicinity in the General Plan Framework. As described above, each of these designations supports an overall vision of high-density, mixed-use, and pedestrian-oriented development in the Project Site vicinity, particularly along the Figueroa Street corridor. The Modified Project would implement the intent of the General Plan Framework Land Use Element by revitalizing the Project Site and providing enhanced landscape and community use options when compared to the existing Sports Arena facility. Specifically, the Modified Project would replace the underutilized Sports Arena with a modern, world-class sports complex with direct access from Figueroa Street; provide enhanced landscape and pedestrian circulation areas including pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas and potentially including water features, public art, and seating areas; and provide a mix of land uses that would support stadium operations, including year-round restaurant and retail uses, thereby enabling the creation of a state-of-the-art sports and entertainment complex that can serve as a major regional destination. Further, as discussed in Section IV.A, Aesthetics, on page 34 of this Addendum, the scale, mass, and height of the proposed stadium and Ancillary Uses would be compatible with surrounding uses within and adjacent to Exposition Park. Therefore, the Modified Project would be consistent with the intent of the General Plan Framework Land Use Element. Impacts would be less than significant and no mitigation measures are required.

The South Los Angeles Community Plan functions as the Land Use Element of the City's General Plan that is applicable to the Project Site. As discussed in the Certified EIR, the South Los Angeles Community Plan designates the Project Site and all of Exposition Park as Open Space (OS), and also identifies Exposition Park as a "major opportunity site." The OS designation permits parks, community centers and public serving facilities under the ownership or operation of a public agency. The Project Site is owned by the Sixth District Agricultural Association, a state agency. The Certified EIR determined that the Original Stadium Project would be consistent with the Open Space (OS) designation by providing a publicly oriented facility, and that it would be consistent with relevant policies set forth in the South Los Angeles Community Plan related to preserving recreational

---

[65] *General Plan Framework, Chapter 3, Land Use.*

facilities and park space, and fostering public appreciation of historic resources in Exposition Park, specifically the Coliseum.

As compared to the Original Stadium Project, the Modified Project's stadium component would be similarly consistent with the South Los Angeles Community Plan. In addition, the Modified Project and its proposed Ancillary Uses would promote consistency with other South Los Angeles Community Plan policies. Specifically, the Modified Project's proposed museum would be consistent with the definition of Open Space in the Community Plan to provide for educational opportunities and cultural values. In addition, by developing a state-of-the-art sports and entertainment complex while preserving significant open space and public gathering areas, the Modified Project would be consistent with the definition of Open Space in the Community Plan to preserve and create community identity. The Modified Project's restaurant, retail, conference and office space uses, which are all ancillary facilities supporting the stadium, would also be consistent with the South Los Angeles Community Plan's principles for the "major opportunity site" of Exposition Park, which includes providing the opportunity for a variety of jobs and job training for community residents and allowing development that is reflective of community needs. By providing increased job opportunities within Exposition Park in uses that would operate seven-days a week, the Modified Project's Ancillary Uses would help address the community's need for increased local jobs, while providing a variety of jobs and job training for area residents. In addition, as compared the Original Stadium Project, the Modified Project would provide enhanced pedestrian improvements and open space areas, including approximately 143,000 square feet of improved public open space around the Project Site that would include pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas and potentially including water features, public art, and seating areas. These features would further South Los Angeles Community Plan Objective 5-1 to develop new open space areas in Exposition Park. Additionally, as discussed in Section IV.E, Cultural Resources, on page 61 of this Addendum, impacts to historic resources, including the adjacent Coliseum, would be less than significant and would not change under the Modified Project. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project, the Modified Project would remain consistent with the South Los Angeles Community Plan. Impacts would be less than significant and no mitigation measures are required.

As discussed in the Certified EIR, the Project Site and all of Exposition Park are located within the Exposition/University Park Redevelopment Plan. Specifically, the Project Site is located within the Redevelopment Plan's Exposition Sub Area. As explained in the Certified EIR, real property that is owned or controlled by the State of California or the Coliseum Commission, including the Project Site, is not subject to the requirements and

policies of the Redevelopment Plan.[66] Nevertheless, the Certified EIR analyzed the Original Stadium Project's consistency with the Redevelopment Plan and determined it would be consistent with the Project Site's Public Use designation because it would replace the underutilized Sports Arena with a modern, world-class sports complex that is consistent with the site's history and would result in the development of a public venue for public, private and civic use. Further, because it would foster economic growth along the Figueroa Corridor, the Certified EIR determined that the Original Stadium Project would be consistent with the goals identified in the Community Redevelopment Agency of the City of Los Angeles' Five Year Implementation Plan. Finally, the Certified EIR examined the applicable Redevelopment Plan goals to the Project Site, including goals related to the elimination of blight and to conserve, rehabilitate, and redevelop the Expanded Project Area and provide for well-planned community uses and facilities, and determined that the Original Stadium Project would be generally consistent with those goals.

Like the Original Stadium Project, the Modified Project is located on the Project Site owned by the Sixth District Agricultural Association (State of California) and controlled by the Coliseum Commission, and accordingly the Modified Project is not subject to the requirements of the Exposition/University Park Redevelopment Plan. Nevertheless, an analysis of Redevelopment Plan consistency is provided herein consistent with the Certified EIR analysis. The modifications proposed under the Modified Project would not change the Certified EIR's consistency analysis with the Redevelopment Plan. The Modified Project would continue to provide a world-class sports complex for public, private and civic use that is consistent with the Project Site's history. Further, the addition of the Modified Project's Ancillary Uses would provide for a more cohesive and successful development that is comparable to other recently-constructed MLS venues, and would further applicable goals related to fostering economic growth on the Figueroa Corridor, the elimination of blight, the redevelopment of the Project Area, and the provision of uses and facilities serving the community. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project, the Modified Project would be consistent with the Redevelopment Plan. Impacts would be less than significant and no mitigation measures are required.

As stated in the Certified EIR, the Project Site is zoned OS-1XL (Open Space, Extra Limited Height District 1) under the City's Planning and Zoning Code, as is the majority of

---

[66] *Exposition Park was added to the Hoover Redevelopment Plan Area in 1983, and in 1984 the Community Redevelopment Agency of the City of Los Angeles (CRA/LA) prepared a Master Plan for Exposition Park. However, the Master Plan was contested and was never formally adopted. In 1985, the CRA/LA and the State of California reached a settlement agreement that voided CRA/LA consultation, review, or control over State of California or Coliseum Commission properties within Exposition Park. (EPICC EIR, CRA/LA, 1999).*

Exposition Park. The Certified EIR determined that the Original Stadium Project would be consistent with allowable uses in the OS zone, which include park and recreation facilities and athletic fields. In addition, the Certified EIR determined that the Original Stadium Project would exceed the limitations of height district 1XL, and would need to seek discretionary relief from the Department of City Planning. The Certified EIR concluded that following the approval of discretionary land use entitlements from the City, the Original Stadium Project would be consistent with the applicable provisions of the Planning and Zoning Code, and no land use impact would occur.

In addition to the Project Site's zoning designation of OS-1XL, the Project Site is also located within the boundaries of the Coliseum District Specific Plan (Specific Plan). The Specific Plan provides additional land use regulations applicable to the site of the existing Sports Arena as well as the adjacent site of the Coliseum and immediately surrounding ancillary areas. As explained in Section 3.B of the Specific Plan, "[w]henever this Specific Plan contains provisions that establish regulations... which are different from, more restrictive or more permissive than what would be allowed pursuant to the provisions contained in the LAMC [Los Angeles Municipal Code], this Specific Plan shall prevail and supersede the applicable provisions of the LAMC and those relevant ordinances." Therefore, the land use regulations of the Specific Plan supersede those of the LAMC, including those of the OS-1XL zone.

The Specific Plan currently permits a variety of uses in the Specific Plan area, including the operation of sports, entertainment and public gathering facilities, the sale of concessions and alcoholic beverages for consumption on-site, the sale of merchandise and other retail uses, offices, restaurants, bars, cafes and outdoor eating areas, and museums and parking facilities. The Modified Project proposes a Specific Plan Amendment, an entitlement request that was not included as part of the Original Stadium Project. The proposed Specific Plan amendment would slightly modify the boundaries of the Specific Plan to align the northern and eastern Project Site boundaries with the southern and western edges of the South Coliseum Drive and Figueroa Street rights-of-way, respectively, and would expressly allow development standards for the Modified Project (e.g., seating capacity, FAR, height, signage, parking and uses). Specifically, the proposed Specific Plan Amendment would expressly permit the development of an approximately 22,000 seat soccer stadium and approximately 119,000 gross square feet (approximately 105,900 square feet of floor area) of ancillary facilities as described in Section III, Project Description, on page 4. The total amount of development would not be permitted to exceed approximately 641,000 gross square feet. The maximum height of the stadium would not be permitted to exceed 115 feet above grade, and the maximum height of the associated ancillary facilities would be limited to approximately 75 feet above grade. In accordance with existing Specific Plan requirements, front, side, or rear yards or building setbacks would not be required.

The proposed Specific Plan amendment would also clarify the applicability of certain Specific Plan provisions to the Project Site. Although the Specific Plan area encompasses the Project Site, many of the purposes, definitions, permitted uses, design regulations, on-site alcohol regulations, and signage provisions currently stated in the Specific Plan either contemplate development at the adjacent Coliseum property, or do not clearly establish parameters for redevelopment of the Sports Arena. Further, the boundaries of various zones within the Specific Plan do not currently reflect the boundaries of the Coliseum property and the Project Site. The proposed Specific Plan Amendment would provide for the proposed development and operation of the Modified Project, as well as updated internal boundaries that appropriately distinguish between the Coliseum property and the Project Site, along with immediately surrounding areas and parking lots that serve both properties and Exposition Park.

Although the Modified Project is proposing an amendment to the Specific Plan to clarify certain provisions and to provide applicable development parameters for the Project Site, the Modified Project is compatible with the Specific Plan's generally permitted uses described above. Specifically, the Modified Project would include the operation of a sports, entertainment and public gathering facility; the sale of alcoholic beverages for consumption on-site; retail uses; offices; restaurants, bars, cafes and outdoor eating areas; a museum, exhibitions, cultural facilities; and other related uses. The Modified Project's application of these uses to the Project Site is generally consistent with the intent of the Specific Plan to provide for sports and cultural destination uses, along with ancillary facilities that support those uses within the Specific Plan area. Thus, with approval of the proposed Specific Plan Amendment, the Modified Project would be fully consistent with the Specific Plan, including all uses and facilities, development parameters, design regulations, and internal Specific Plan boundaries. Because the Specific Plan supersedes the LAMC, consistent with the conclusions in the Certified EIR for the Original Stadium Project, the Modified Project would also be consistent with the LAMC. Further, pursuant to Section 6 of the Specific Plan, the City Planning Director must review all projects for compliance with the Specific Plan before any demolition, grading, foundation, building, sign or use of land permit can be issued. As discussed above, the Applicant has requested this compliance review for the proposed Modified Project, which will further confirm that the Modified Project is consistent with the Specific Plan, as amended. Therefore, impacts would be less than significant and no mitigation measures are required.

The Original Stadium Project did not include a detailed signage program. However, the Certified EIR stated that in the absence of any specific programmatic goals for signage, signage under the Original Stadium Project would be developed in a manner that is consistent with and adheres to all of the applicable codes of the LAMC, the design guidelines of the South Los Angeles Community Plan, as it pertains to signage, and the rules and regulations set forth in the Specific Plan. Since the certification of the Certified

EIR, the City has modified its policy regarding signage and now authorizes signage through a Supplemental Use Sign District (SUD) rather than being authorized through a Specific Plan. Therefore, as discussed in Section III, Project Description, on page 4 of this Addendum, the Modified Project is also requesting approval of an SUD to allow for the types and amounts of signage that would be included in the proposed development. Consistent with the signage program allowed under the existing Specific Plan, the proposed SUD would encompass the Project Site as well as all of the Specific Plan area. As part of the proposed Specific Plan Amendment, the existing signage authorized in the Specific Plan, which includes some signage for the Project Site, the Coliseum, and surrounding areas, would be removed from the Specific Plan and relocated into the proposed SUD, along with modifications to permit the Modified Project's signage program. Signage rights previously allowed by the Specific Plan for the Coliseum and other areas in the Specific Plan area that are unrelated to the Modified Project's signage program would not change under the proposed SUD. These actions would be consistent with the City's current policy mechanisms for regulating signage and would not represent a significant land use consistency impact. With approval of the proposed SUD, the Modified Project would be consistent with applicable land use plans and regulations related to signage. Impacts would be less than significant and no mitigation measures are required. For an analysis of the potential aesthetic impacts of the proposed signage program, refer to Section IV.A, Aesthetics, of this Addendum.

Because the Modified Project's Ancillary Uses include up to 2,550 square feet of fast food restaurant floor area, analysis of the Modified Project's consistency with applicable City land use regulations concerning fast food restaurants is required. City of Los Angeles Ordinance No. 180103 imposes interim regulations on the issuance of all permits related to the establishment of new fast food restaurants on commercial or industrial zoned properties located on streets designated as Major Highway Class I, Major Highway Class II and Secondary Highway in the West Adams–Baldwin Hills–Leimert Community Plan area and portions of the South Los Angeles and Southeast Los Angeles Community Plan areas, including the Project Site. Ordinance No. 180103 only applies to stand-alone fast food restaurants. The fast food restaurant components of the Modified Project would be integrated with the stadium and other Ancillary Uses as part of a cohesive development, and would not include a stand-alone fast food establishment. Therefore, the Modified Project would not be inconsistent with Ordinance No. 180103. Impacts would be less than significant and no mitigation measures are required.

In addition, because the Modified Project would include on-site alcohol sales and service for a full line of alcoholic beverages, analysis of the Modified Project's consistency with applicable City land use regulations concerning alcohol sales is necessary. As discussed above, the Specific Plan currently allows for the sale and service of alcoholic beverages for on-site consumption on the Project Site and other areas in the Specific Plan,

subject to compliance with operational conditions set forth in the Specific Plan. Further, pursuant to Section 9 of the Specific Plan, each establishment selling alcoholic beverages in the Specific Plan area must obtain an Alcohol Use Approval from the Director determining their compliance with the Specific Plan. While the proposed Specific Plan Amendment would modify the existing zones established within the Specific Plan for alcohol consumption, it would not modify the Specific Plan's operational conditions for establishments selling alcoholic beverages. The Modified Project would comply with these requirements, and establishments selling alcoholic beverages would be required to obtain an Alcohol Use Approval from the Director as required by the Specific Plan. Because the Specific Plan supersedes other provisions of the LAMC, further analysis of other LAMC provisions related to alcohol sales and service is not required. In addition, City Ordinance No. 171681 prohibits off-site alcohol sales in the South Los Angeles area. However, the Modified Project's proposed sale and service of a full line of alcoholic beverages would be for on-site consumption only, which is permitted by the Specific Plan. Off-site alcohol sales would not be permitted. Therefore, the Modified Project would not be inconsistent with Ordinance No. 171681. Impacts would be less than significant and no mitigation measures are required.

As described above, the Certified EIR concluded that the Original Stadium Project would be consistent with the underlying General Plan and zoning designations, the Redevelopment Plan, the Master Plan, and applicable regional plans and regulations. Therefore the Certified EIR concluded that impacts to operational land use compatibility and consistency with the applicable land use plans and the zoning code would be less than significant and that no mitigation measures are required. Similarly, as described above, the Modified Project also would be consistent with all applicable land use plans and the zoning code with the approval of the proposed Specific Plan Amendment, the SUD, and the Alcohol Use Approval under the Specific Plan. Therefore, the Modified Project's potential impacts to operational land use compatibility and consistency with applicable land use plans and the zoning code would be less than significant. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to land use consistency, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(b) Mitigation Measures

The following mitigation measure was included in the Certified EIR to further reduce the Original Stadium Project's less-than-significant impacts with respect to land use consistency. This Mitigation Measure would continue to be implemented as part of the Modified Project and has been incorporated into the MMP for the Modified Project included

in Appendix A of this Addendum, but has been revised as follows to be consistent with the Modified Project:

EIR Mitigation Measure F-1: The Los Angeles Memorial Coliseum Commission shall obtain all applicable permits from the Building and Safety Department (and other state and municipal agencies, as may be required) for Project construction actions~~ associated with implementation of either Option 1 or Option 2 including, but not limited to a height variance~~.

(b) Land Use Compatibility

The Certified EIR for the Original Stadium Project concluded that impacts related to land use compatibility during construction would be significant and unavoidable under the Original Stadium Project (refer to Section IV.F, Land Use, of the Certified EIR). The thresholds on which this analysis was based are stated on page IV.F-13 of the Certified EIR. The analysis in the Certified EIR concluded that construction of the Original Stadium Project would cause temporary and intermittent impacts to adjacent land uses due to temporary increases in air emissions (including fugitive dust), noise, and traffic congestion. These potential effects are discussed in their respective sections of the Certified EIR, and mitigation measures are recommended to further reduce construction-related impacts to adjacent land uses. Nonetheless, the Certified EIR concluded that from a land use compatibility standpoint, construction impacts would be significant and unavoidable, although the extent of impacts would be temporary and sporadic and would only persist through the construction period. The potential environmental impacts from construction of the Modified Project are discussed in their respective sections of this Addendum, and it has been determined that the Modified Project would not result in new construction-related significant impacts or increase the severity of construction-related significant impacts that were previously evaluated and disclosed in the Certified EIR. From a land use compatibility standpoint, since construction activities under the Modified Project would be substantially similar to those under the Original Stadium Project in terms of overall scope, duration, and activities, land use compatibility impacts associated with construction of the Modified Project would be substantially the same as the Original Stadium Project. Accordingly, potential impacts would continue to be significant and unavoidable, but the changes proposed under the Modified Project would not increase the severity of those impacts analyzed in the Certified EIR.

The Certified EIR for the Original Stadium Project concluded that impacts related to land use compatibility during operation would be less than significant under the Original Stadium Project (refer to Section IV.F, Land Use, of the Certified EIR). The thresholds on which this analysis was based are stated on page IV.F-13 of the Certified EIR. The

analysis in the Certified EIR concluded that demolition of the Sports Arena and construction of the Original Stadium Project would maintain the existing, general-purpose use of the Project Site as a venue for sporting and entertainment events, cultural events, and civic events. The Certified EIR further states that the Project Site would continue to function as an integral part of the Exposition Park Master Plan as a public entertainment and civic space. Consistent with the Original Stadium Project, the proposed stadium under the Modified Project would have a maximum seating capacity of approximately 22,000 attendees and would host MLS games, USC field events, open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. The general use of the stadium would not change with the design modifications proposed under the Modified Project. The Modified Project would also provide additional Ancillary Uses to the proposed stadium analyzed in the Certified EIR, including conference facility and office space, a museum, and retail and restaurant uses. These types of land uses are consistent and compatible with other land uses within and around Exposition Park. For example, land uses within Exposition Park include museums and athletic facilities with associated office/administration, conference, retail, and restaurant spaces. Retail and restaurant uses are also located adjacent to the Project Site on the east side of Figueroa Street. Additional conference facility, office, retail, and restaurant uses are located within and adjacent to the USC main campus north of Exposition Park. Furthermore, similar to the Original Stadium Project, the Modified Project would not adversely alter the neighborhood or community through ongoing disruption, division, or isolation since the Project Site has historically been developed as a major sports, entertainment, and cultural venue since the late 1950s, a function that would be continued and expanded upon under the Modified Project. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.F, Land Use and Planning, of the Certified EIR), impacts with respect to land use compatibility during operation would be less than significant under the Modified Project. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to land use compatibility, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

K. Mineral Resources

The Certified EIR for the Original Stadium Project concluded that no impacts to mineral resources would occur under the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR). Significant impacts to mineral resources could occur if a project were to result in the loss of availability of a mineral resource or a mineral resource recovery site. The eastern portion of the Project Site is located within a

Mineral Resource Zone (MRZ) designated by the State Geologist.[67] This area, designated as MRZ-2, corresponds with the current and ancestral Los Angeles River basin, which yields the potential for sand and gravel extraction but has been largely redeveloped with existing land uses.[68] Notwithstanding its location within an MRZ, no mineral extraction operations currently occur on the Project Site or within the Project vicinity. Additionally, the Project Site does not overlie any oil fields or contain any oil wells.[69] The stadium proposed to be developed under the Modified Project would be constructed within a portion of the footprint area currently occupied by the Sports Arena, although the subterranean excavation would need to be reconfigured to accommodate the proposed stadium foundation, resulting in a slightly larger footprint. In addition, surface grading would be required to install the building pads for the proposed Ancillary Uses. However, no mineral extraction operations have occurred or currently occur within the Project Site, or are proposed under the Modified Project. In addition, such operations would not be consistent with the existing and planned use of the Project Site within Exposition Park, which is a regional destination for sports, entertainment, cultural, social, and civic events in the urban core of Los Angeles. Thus, the Modified Project would not result in the loss of availability of a mineral resource or a mineral resource recovery site. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR), no impacts with respect to mineral resources would occur under the Modified Project. No mitigation measures are required. Accordingly, the Modified Project would not result in any new significant impacts with respect to mineral resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

L. Noise

The following analysis of potential noise impacts is based on the analysis provided in Section IV.G, Noise, of the Certified EIR, and on the Noise Study prepared for the Modified Project by Acoustical Engineering Services (AES), dated August, 2015, which is included in Appendix O of this Addendum. The Noise Study evaluates the noise sources associated with the Modified Project and determines whether the Modified Project would result in new significant noise impacts not previously identified in the Certified EIR.

The Certified EIR for the Original Stadium Project concluded that impacts with respect to construction noise would be significant and unavoidable even with implementation of mitigation (refer to Section IV.G, Noise, of the Certified EIR). With regard to operational noise, the Certified EIR determined that noise associated with stadium events would be significant and unavoidable and that no feasible mitigation would reduce impacts below the applicable thresholds of significance, and that noise associated with traffic and parking lots would be less than significant.

Based upon the criteria established in the City of Los Angeles L.A. CEQA Thresholds Guide, the Certified EIR indicated that the Project would have a significant impact on noise levels from construction if:

- Construction activities lasting more than one day would exceed existing ambient exterior noise levels by 10 dBA or more at a noise-sensitive use;
- Construction activities lasting more than 10 days in a three month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise-sensitive use; or
- Construction activities would exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, or at any time on Sunday.

The City of Los Angeles has not adopted any thresholds for groundborne vibration impacts. Therefore, the analysis in the Certified EIR used the Federal Railroad Administration's vibration impact threshold where an impact is considered significant if groundborne vibration from project construction activities exceeds 80 VdB at residences and buildings where people normally sleep.

Based upon the criteria established in the City of Los Angeles L.A. CEQA Thresholds Guide, the Certified EIR also indicated that the Original Stadium Project would have a significant impact on noise levels from Original Stadium Project operations if the project would increase the ambient noise levels by 3 dBA CNEL at the property line of homes where the resulting noise level would be at least 70 dBA CNEL or at the property line of commercial buildings where the resulting noise level would be at least 75 dBA CNEL. In addition, any long-term increase of 5 dBA CNEL or more was considered by the Certified EIR to cause a significant operational noise impact. The CNEL thresholds are generally used to evaluate noise impacts with respect to the off-site traffic noise, as the City of Los Angeles Noise Regulation (Chapter XI of the Los Angeles Municipal Code) does not apply to vehicles traveling on public roadways. In addition to the CNEL threshold, consistent with the City's Noise Regulation, the analysis of the Modified Project's potential

noise impacts uses an increase of 5 dBA measured in hourly L_{eq} as a threshold of significance to evaluate potential operational noise impacts at off-site sensitive receptors.

(a) Noise and Vibration Background

The Project Site is located in a highly urbanized environment. Primary noise sources in the vicinity include events at the Coliseum and the existing Sports Arena, traffic on the elevated Harbor Freeway (Interstate 110) located to the east of the Project Site, traffic on adjacent surface streets and the Exposition Light Metro Light Rail along Exposition Boulevard, which was planned but not yet operational at the time the Certified EIR was prepared. The passive recreational open spaces and outdoor play areas of the Exposition Park educational and museum facilities are also sources of noise in the vicinity of the Project Site.

To establish baseline noise conditions within the vicinity of the Project Site, existing daytime noise levels were documented in the Certified EIR by taking noise measurements at four locations during a non-event weekday. The monitoring locations are illustrated in Figure IV.G-1 on page IV.G-7 of the Certified EIR. The Project vicinity has not changed substantially since preparation of the Certified EIR. As such, the ambient noise levels in the immediate vicinity of the Project Site would be substantially similar to those recorded at the time of the Certified EIR was completed. Additional ambient noise measurements were conducted on May 28, 2015 for Receptor Location 3 (representing the land uses east of the Project Site across Figueroa Street), which confirmed that there are have been no substantial changes in the ambient noise levels identified in the Certified EIR (refer to the Noise Study in Appendix O of this Addendum). Therefore, the baseline ambient noise levels from the Certified EIR are used for the Modified Project noise analysis. Table 11 on page 122 provides the measured ambient noise levels at the receptor locations. As indicated therein, noise levels within the Project Site vicinity range from 57.9 dBA at the northern boundary of the Project Site (Receptor Location 2) to up to 76.3 dBA south of the Project Site along Martin Luther King, Jr. Boulevard (Receptor Location 4).

The noise-sensitive receptors within the vicinity of the Project Site include residential uses located east of Figueroa Street (which are accessed from S. Flower Drive), and residential uses located south of Martin Luther King, Jr. Boulevard between Figueroa Street and Menlo Avenue. Noise-sensitive uses in Exposition Park also include museums and the educational facilities. To provide a conservative analysis of construction noise impacts, the open space areas in Exposition Park west and north of the Sports Arena (Receptor Locations 1 and 2, respectively) were considered noise-sensitive uses. As the area within Exposition Park to the north of the Sports Arena (i.e., open space area within Christmas Tree Lane) currently includes outdoor events and gatherings, it is not considered sensitive to noise from the Modified Project's operational outdoor events and gatherings.

Table 11
Existing Ambient Noise Levels

Receptor Location[a]	Description of Receptor	Measured Ambient Noise Levels, dBA L_{eq}
1[a]	Near Southwest corner of Project Site (representing the Ralph M. Parsons Pre-School located within the Expo-Center)	60.4
2[b]	Northern-central boundary of Project Site (representing the open space area north of the Sports Arena)	57.9
3[c]	Residential uses east of Figueroa Street (which are accessed from S. Flower Drive), east of Project Site	67.4
4	Residential use on Martin Luther King, Jr. Boulevard (west of Figueroa Street), south of Project Site	76.3

[a] *The four receptor locations are the same as those set forth in the Certified EIR. Note that the Certified EIR inadvertently switched the order of Receptor Locations 1 and 2 in the construction noise analysis provided in Table IV.G-6 on page IV.G-12.*

[b] *Receptor Location 2 at the Northern-central boundary of the site is evaluated for the construction noise impact analysis only as this location is regularly used for events and gatherings and is thus, not a noise-sensitive receptor relative to outdoor events and gatherings within the Project Site.*

[c] *Tables IV.G-6 and IV.G-8 of the Certified EIR described the land uses represented by Receptor Location 3 as residential uses located on the east side of Figueroa Street because they are visible from Figueroa Street. However, these residential uses are located on S. Flower Drive (east of Figueroa Street).*

Source: Los Angeles Memorial Sports Arena Redevelopment Project, Draft Environmental Impact Report, November 2010.

With regard to existing groundborne vibration, the typical sources of groundborne vibration in the vicinity of the Project Site are roadway truck traffic and buses. These vehicles typically generate groundborne vibration velocity levels of approximately 63 vibration decibels (VdB), with levels reaching 72 VdB where the vehicles pass over bumps in the road.

(b) Construction Noise and Vibration Impacts

(i) On-Site Construction Activities

As set forth in the Certified EIR, construction of the Original Stadium Project would generate noise from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction; paving and asphalting; construction workers traveling to and from the Project Site; and delivery and hauling of construction supplies and debris to and from the Project Site. As set forth in the Certified EIR, under the Original Stadium Project, off-site construction noise levels would

range from 67.9 dBA L_{eq} near the southwest corner of the Project Site to 83.1 dBA L_{eq} at the northern boundary of the Project Site. When compared with the existing ambient noise environment, construction activities associated with the Original Stadium Project would result in a temporary or periodic increase in noise levels at the off-site noise sensitive receptor locations near the southwestern corner of the Project Site (Receptor Location 1) and near the northern boundary of the Project Site (Receptor Location 2). While Mitigation Measures MM G-1 through MM G-4 would reduce the impacts to the maximum extent feasible, such impacts would remain significant and unavoidable.

It is anticipated that the types of construction equipment that would be used for construction of the Modified Project would be similar to those used for the Original Stadium Project. A detailed construction noise model was created in the Noise Study included in Appendix O of this Addendum to calculate the construction-period noise levels at the off-site sensitive receptors, using the construction equipment reference noise levels provided by the Federal Highway Administration (FHWA).[70] The average (hourly L_{eq}) noise level associated with each construction phase is calculated based on the anticipated quantity and type of equipment that would be used during each construction phase. Table 12 on page 124 provides the estimated construction noise levels for various construction phases at the Project Site's off-site noise-sensitive receptors. To represent the maximum construction noise levels at the off-site sensitive receptors, all construction equipment was assumed by the Noise Study to operate simultaneously and was assumed to be located at the construction area nearest to the affected receptors. As indicated in Table 12, the estimated construction-related noise would exceed the significance threshold (existing ambient plus 5 dBA) at the noise-sensitive uses located near the southwest corner of the Project Site (Receptor Location 1) and at the northern boundary of the Project Site (Receptor Location 2), similar to the Original Stadium Project. Mitigation Measures G-1 through G-4 set forth in the Certified EIR would reduce these impacts to the maximum extent feasible. However, as with the Original Stadium Project, such impacts would continue to be significant and unavoidable.

(c) Off-Site Construction Noise

As set forth in the Certified EIR, the projected haul route that would be used by haul and delivery trucks for the Original Stadium Project was anticipated to be east/west bound on Martin Luther King, Jr. Boulevard to/from the Project Site utilizing the Interstate 110 (I-110) Freeway. In addition, a secondary haul truck route for the Modified Project may use Figueroa Street to Martin Luther King, Jr. Boulevard and then to the I-110 Freeway. The Certified EIR concluded that the noise levels generated by construction trucks would be

Table 12
Estimated Project Construction Noise Levels

Receptor Location	Approximate Distance to Project Construction Area (feet)	Estimated Construction Noise Levels by Phases, dBA L_{eq}					Significance Threshold[a] dBA L_{eq}
		Abatement/ Soft Demolition	Structure Demolition	Grading	Building Construction	Site Finishes	
1—Near Southwest Corner of Project Site	400	60.0	69.0	70.6	67.6	66.1	65.4
2—Near Northern-central Boundary of Project Site	50	78.0	82.7	84.5	82.6	82.7	62.9
3—Residential uses East of Figueroa Street	250[b]	64.1	70.2	72.1	69.7	70.8	72.4
4—Residential uses on Martin Luther King, Jr. Boulevard	325[c]	61.8	69.8	71.8	68.3	75.4	81.3

[a] *Significance threshold is equal to the measured ambient noise levels plus 5 dBA.*

[b] *Construction activities for most of the construction phases would be a minimum 250 feet from Receptor Location 3. However construction for the site finishing phase would occur within approximately 215 feet from Receptor Location 3. This distance was accounted for in the data within this table.*

[c] *Construction for the site finishing phase would occur within approximately 115 feet from Receptor Location 4. This distance was accounted for in the data within this table.*

Source: AES, 2015.

substantially similar to the existing noise levels generated by other buses, trucks, and automobiles along the haul route and as such, determined that off-site construction noise impacts would be less than significant.

As discussed in detail in the Noise Study, to present a worst-case scenario for the Modified Project, the off-site construction noise analysis is based on the construction phase with the maximum number of construction trucks. Based on an 11-hour work day and even distribution of haul trucks, there would be approximately 36 haul truck trips and 35 worker trips (based on the A.M. peak hour). The estimated noise level from Project construction-related truck and worker traffic would be 67.6 dBA L_{eq} at the residential uses along Martin Luther King, Jr. Boulevard (between the Project Site and the I-110 freeway) and 60.7 dBA at the residential uses east of Figueroa Boulevard. These noise levels would be below existing ambient noise levels for both the projected haul route and the secondary haul route. Therefore, similar to the Original Stadium Project, noise impacts associated with off-site construction under the Modified Project would be less than significant. No mitigation measures are required.

(d) Construction Vibration

As set forth in the Certified EIR, vibration levels associated with construction of the Original Stadium Project could reach as high as approximately 87 VdB within 25 feet of the Project Site from the operation of construction equipment. The nearest sensitive uses would not experience construction related vibration levels above 78.1 VdB. Consequently, the vibration level that would be experienced by these uses would not exceed the Federal Transit Administration's (FTA) vibration impact thresholds, and construction vibration impacts would be considered less than significant.

The vibration analysis for the Modified Project provided in this Addendum conservatively used the closest distance to construction activity and the construction phase with the equipment mix that would result in the greatest potential vibration. Under the Modified Project, the closest receptor to construction activities would continue to be Receptor Location 2 north of the Project Site. Based on an approximate distance of 50 feet, the construction-related vibration level at this location would be approximately 78 VdB, similar to the Original Stadium Project. This vibration level is less than the FTA's vibration impact threshold. Therefore, ground-borne vibration impacts associated with Modified Project construction would also be less than significant, consistent with the analysis of the Original Stadium Project. No mitigation measures are required.

(e) Operational Noise

(i) Stadium Use

Operational noise sources contemplated and evaluated under the Certified EIR included crowd noise (particularly yells and cheers at high attendance events), a public address system (amplified public announcements and/or play-by-play announcements), amplified concert music, traffic-related noise, and helicopters and other aircraft covering the events. As set forth in the Certified EIR, the noise levels during soccer games and related sporting events would be substantially similar to the peak noise generating events currently occurring at the Coliseum. However, noise levels generated during concert and related events that would involve the use of amplified music and announcements would be increased compared to existing conditions and could have the potential to adversely impact neighboring uses to the east and south of the Project Site. Accordingly, the Certified EIR determined that concert noise would exceed ambient conditions by five decibels at adjacent residential adjacent areas during off-peak traffic times when ambient noise levels in surrounding communities are lower. Therefore, operational noise impacts from stadium events were determined to be significant. The Certified EIR concluded that no feasible mitigation has been identified to reduce the noise level below the applicable significance threshold, and therefore that impacts from stadium events would be significant and unavoidable.

Under the Modified Project, noise impacts associated with the stadium use including MLS soccer games, concerts, and community events would be similar to those analyzed in the Certified EIR for the Original Stadium Project. Thus, noise associated with the stadium use, including crowd noise including yelling and cheering at high attendance events and the public address system, would also exceed the ambient levels at the off-site sensitive uses by 5 dBA or more. Therefore, as with the Original Stadium Project, impacts associated with stadium operations under the Modified Project (i.e. related to concerts, crowd noise including yelling and cheering, a public address system, amplified music, and announcements) would also be significant. No feasible mitigation measures have been identified to reduce the noise level below the applicable significance threshold, and therefore impacts would remain significant and unavoidable.

While not specifically discussed in the Certified EIR for the Original Stadium Project, during existing events held at the Sports Arena, crowds gather in the parking areas and outdoor spaces immediately surrounding the Sports Arena before or after an event when entering and exiting the stadium. The Modified Project's use of outdoor spaces is anticipated to be similar to the existing conditions on an event day. As part of the Noise Study, an analysis was conducted of use of the Modified Project's outdoor spaces including the Northwest Plaza (e.g., the outdoor dining/seating areas), rooftop terraces (e.g., seating areas, gathering spaces, water features (such as a reflection pool or pool), and art), and the outdoor spaces along the northern and eastern side of the Project Site with people gathering and talking before or after an event. The Noise Study estimated that up to 22,000 people could gather within these outdoor spaces, which is the maximum capacity of the Modified Project stadium. As discussed in Section IIII.C, Modified Project Description, above, and pursuant to Project Design Feature O-4 in Section IV.O, Traffic/Transportation/ Parking, on event days the Ancillary Uses proposed as part of the Modified Project would be open only to ticket-holding game/event patrons during a period of time before, during and after the game/event. Therefore, 22,000 represents a maximum number of people who could gather within the outdoor spaces at the Project Site on an event day. While a total of 22,000 people were analyzed, this represents a conservative worst-case analysis because all game/event patrons are not anticipated to utilize the outdoor spaces at once.

Reference noise levels of 75 dBA and 71 dBA (L_{eq} at a distance of 3.3 feet) for a male and a female speaking in a loud voice, respectively, were used for analyzing noise from the use of these outdoor areas surrounding the Modified Project.[71] In order to analyze a typical noise scenario, it was assumed that up to 50 percent of the people (half of which would be male and the other half female) would be talking at the same time. Table 3 of the

[71] *Handbook of Acoustical Measurements and Noise Control, Table 16.1, Cyril M. Harris, Third Edition, 1991.*

Noise Study presents the estimated noise levels from simultaneous use of the outdoor spaces at the off-site sensitive receptors. As indicated in the Table 3 of the Noise Study, the estimated noise levels at the off-site sensitive uses would be below the significance threshold of 5 dBA L_{eq} above ambient noise levels. Thus, potential impacts associated with the use of the outdoor spaces during an event day would be less than significant and no mitigation measures would be required.

Use of Project Site During Non-Event Days

The Modified Project includes approximately 105,900 square feet of Ancillary Use floor area, including office and conference facility space, a "World Football" museum, a team store and other retail space, and restaurants (including outdoor dining). Most of the Ancillary Uses would be centered around the stadium's main entry plaza at the northwest corner of the Project Site (Northwest Plaza), which would also contain outdoor seating and gathering space, and thus would be shielded from the off-site residential uses to the east and south of the Project Site. In addition, the Modified Project would provide a 40- to 70-foot setback along Figueroa Street to activate the pedestrian realm. This area would be developed as a broad, landscaped sidewalk to provide sufficient space for patrons to circulate and queue on event days, and to provide an inviting and safe pedestrian environment on non-event days. Additionally, up to 3,975 sf of retail and restaurant use floor area could be located along the stadium's Figueroa Street frontage.

Noise sources at the Northwest Plaza (e.g., the outdoor dining/seating areas), rooftop terraces (e.g., seating areas, gathering spaces, water features (such as a reflection pool or pool), and art) and the outdoor spaces along the northern and eastern side of the Project Site would include people gathering and talking and the use of an outdoor amplified sound system. Use of the outdoor areas could occur seven days a week with potential hours of operation until 2:00 A.M. For an event day an analysis was conducted of 22,000 people gathering in these outdoor spaces. To provide a conservative analysis, the analysis of a non-event day added the use of an outdoor amplified sound system to the analysis of people gathering in the outdoor spaces on an event day. Consistent with the event day analysis, it was estimated that up to 22,000 people could gather at the outdoor spaces, which is substantially higher than the number of people anticipated on the Project Site on non-event days. The same assumptions regarding reference noise levels and persons talking that were used in the event day outdoor gathering noise analysis above were used for the non-event day. In addition, in accordance with Project Design Feature L-1, the amplified program sound system would be designed so as not to exceed a maximum noise level of 85 dBA L_{eq} and 75 dBA L_{eq} at a distance of 50 feet within the Northwest Plaza and the Figueroa Street frontage, respectively. Table 13 on page 128 presents the estimated noise levels from simultaneous use of the outdoor spaces at the off-site sensitive receptors with the amplified program sound system described above. As indicated in Table 13, the

Table 13
Noise Levels from Outdoor Areas During Non-Event Day

Receptor Location[a]	Existing Ambient Noise Levels, dBA L_{eq}	Estimated Noise Levels from Outdoor Uses dBA L_{eq}	Ambient Plus Outdoor Uses Noise Levels, dBA L_{eq}	Significance Threshold,[b] dBA L_{eq}
1—Near Southwest Corner of Project Site	60.4	62.9	64.9	65.4
3—Residential Uses East of Figueroa Street	67.4	69.7	71.7	72.4
4—Residential uses South of Martin Luther King, Jr. Boulevard	76.3	63.8	76.5	81.3

[a] *Receptor Location 2 to the north of the Project Site is not a sensitive receptor relative to operations as this receptor currently includes outdoor events and gatherings.*

[b] *Significance threshold is equal to the measured ambient noise levels plus 5 dBA.*

Source: AES, 2015.

estimated noise levels at the off-site sensitive uses on non-event days would be below the significance threshold of 5 dBA L_{eq} above ambient noise levels. Thus, potential impacts associated with the use of the outdoor spaces on non-event days, along with an amplified program sound system complying with Project Design Feature L-1, would be less than significant and no mitigation measures would be required.

VIP Parking Lot

As set forth in the Certified EIR, the Original Stadium Project would not increase the maximum size of the events currently held at the existing Sports Arena. Combined with the Coliseum, the Project Site currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new event/soccer stadium facility are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people (or motor vehicles) for individual events at the Sports Arena. Accordingly, parking related noise would not be increased as a result of the Original Stadium Project as compared to existing conditions. Thus, parking-related noise impacts under the Certified EIR were concluded to be less than significant.

Under the Modified Project, the existing VIP parking lot west of the stadium would be reconfigured and re-landscaped to provide a secure, VIP parking lot with up to approximately 250 parking spaces. The parking lot would be surrounded by a perimeter

fence and gates and accessed from South Coliseum Drive, similar to existing conditions. The proposed VIP parking lot would be similar to that set forth under the Original Stadium Project, and for the reasons described above and in the Certified EIR, would result in less than significant noise impacts. No mitigation measures are required.

Loading Dock Activities

While not specifically evaluated in the Certified EIR for the Original Stadium Project, noise associated with the loading dock activities would not increase the ambient noise levels at the off-site noise sensitive uses due to the sound attenuation provided by the relatively long distances and intervening structures between the sensitive off-site uses and the loading dock. As such impacts associated with use of the loading dock under the Original Stadium Project would be less than significant. The Modified Project could include both above-grade and below-grade loading docks, which would be located within the northwest portion of the Project Site along the southern and western perimeters of the Ancillary Uses, respectively. The nearest residences to the south and to the east would be at least approximately 615 feet and 900 feet, respectively, from the above-grade loading dock (which has the greater potential to generate noise that could be heard at nearby sensitive receptors). As stated in the Noise Study, noise levels would be approximately 65 dBA L_{eq} at a distance of 100 feet, based on measured noise levels from other loading dock facilities. Based on this reference noise level, distance attenuation, and intervening structures, loading dock noise levels at Receptor Location 4 (to the south) and Receptor Location 3 (to the east) would be approximately 39 dBA L_{eq} and 36 dBA, respectively, which would be well below the measured ambient noise levels. Furthermore, the above-grade loading dock would be shielded from the off-site sensitive receptors to the east (Receptor Location 3) by the new stadium structure and the off-site sensitive receptors to the south (Receptor Location 4) by part of the Ancillary Uses structure. Additionally, the majority of the loading activities would occur at the below-grade loading docks. Therefore, noise impacts associated with loading dock operations under the Modified Project would be less than significant and no mitigation measures would be required.

(e) Off-Site Traffic

As discussed above and in the Certified EIR, the Original Stadium Project would not increase the maximum size of the events currently held at the Project Site in the existing Sports Arena. Accordingly, the number of vehicles and vehicular-related noise would not be increased as a result of the Original Stadium Project. Thus, traffic noise impacts evaluated the Certified EIR were concluded to be less than significant.

As set forth in the Modified Project Transportation Report included as Appendix P-1 of this Addendum, similar to the Original Stadium Project, the Modified Project would not generate substantial additional traffic on an event day. Therefore, as with the Original

Stadium Project, noise impacts from off-site traffic on event days would be less than significant under the Modified Project.[72] However, the proposed Ancillary Uses do not currently exist on the Project Site and were not included as part of the Original Stadium Project. Therefore, noise impacts associated with the off-site traffic generated from the Ancillary Uses on a non-event day have been analyzed based on the traffic volumes provided in the Modified Project Transportation Report. As provided in the Modified Project Transportation Report, the Ancillary Uses are estimated to generate approximately 2,615 daily trips on a non-event day. As such, Modified Project-related traffic would increase the existing traffic volumes along the roadway segments in the vicinity of the Project Site when compared with "Future (2018) Without Project" conditions set forth in the Modified Project Transportation Report (see Appendix P-1 of this Addendum). This increase in roadway traffic was analyzed to determine if any traffic-related noise impacts would result from the Ancillary Uses.

Twenty (20) roadway segments were selected to evaluate potential traffic noise impacts. These segments were selected based on proximity to noise-sensitive uses along the roadway segments and potential increases in traffic volumes from the Modified Project. Traffic noise levels were calculated using the Federal Highway Administration (FHWA) Traffic Noise Model (TNM) and traffic volume data from the Modified Project Transportation Report. The TNM traffic noise prediction model calculates the hourly L_{eq} noise levels based on specific information including the hourly traffic volume, vehicle type mix, vehicle speed, and lateral distance between the noise receptor and the roadway. To calculate the 24-hour CNEL levels, the hourly L_{eq} levels were calculated during daytime hours (7:00 A.M. to 7:00 P.M.), evening hours (7:00 P.M. to 10:00 P.M.), and nighttime hours (10:00 P.M. to 7:00 A.M.). To determine the Modified Project-related noise impacts, the roadway noise conditions under "Future (2018) Without Project" conditions set forth in the Modified Project Transportation Report (see Appendix P-1 of this Addendum) were calculated and compared to noise levels that would occur with implementation of "Future (2018) Plus Project" conditions set forth in the Modified Project Transportation Report.

Table 5 of the Noise Study provides the calculated off-site roadway noise levels in the vicinity of the Project Site for the Future (2018) Without Project and Future (2018) Plus Project conditions. The calculated CNEL levels are applicable to the front of the roadways and do not account for the presence of any physical sound barriers or intervening structures. As shown in Table 5, traffic from the Ancillary Uses would result in a maximum increase of up to 0.1 dBA (CNEL) at some of the roadway segments. The 0.1-dBA

[72] *As discussed in Section III.C, Modified Project Description, above, on event days the Ancillary Uses proposed as part of the Modified Project would be open only to ticket-holding game/event patrons during a period of time before, during and after the game/event. Therefore, the traffic associated with an event day would be substantially similar to that of the Original Stadium Project.*

increase in traffic noise levels is considered negligible and would be well below the 3-dBA significance threshold (applicable when noise level falls within the normally unacceptable category; i.e., 70 CNEL or greater at noise-sensitive uses). Therefore, off-site traffic noise impacts associated with the Ancillary Uses would be less than significant. Thus, similar to the Original Stadium Project, noise impacts associated with off-site roadways under the Modified Project would be less than significant. No mitigation measures are required.

The Modified Project and related projects in the area would produce traffic volumes (off-site mobile sources) that would generate roadway noise. Cumulative noise impacts due to off-site traffic were analyzed by comparing the projected increase in traffic noise levels from Existing conditions to Future Plus Project conditions to the applicable significance criteria. Future cumulative conditions include traffic volumes from future ambient growth, related projects, and the Modified Project. The calculated traffic noise levels under Existing and Future Plus Project conditions are presented in Table 6 of the Noise Study. As shown therein, cumulative traffic volumes would result in a maximum increase of 0.6 dBA CNEL along Figueroa Street (north of Exposition Avenue). The estimated cumulative noise increase would be below the 3-dBA significance threshold. Therefore, cumulative noise impacts due to off-site mobile noise sources associated with the Modified Project, future growth, and related projects would be less than significant. No mitigation measures are required.

(f) Conclusion

In summary, consistent with the conclusion in the Certified EIR for the Original Stadium Project (refer to IV.G, Noise, of the Certified EIR), impacts with respect to construction noise and operational stadium event noise (i.e., related to concerts, crowd noise including yelling and cheering, a public address system, amplified music, and announcements) would continue be significant and unavoidable under the Modified Project. In addition, as set forth above, impacts associated with the outdoor uses on a non-event day, including use of the Northwest Plaza and the Figueroa Street frontage, and traffic and parking noise would be less than significant under the Modified Project. Therefore, the Modified Project would not result in any new significant impacts with respect to noise, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(g) Mitigation Measures

The Certified EIR included code required measures and mitigation measures to mitigate the Original Stadium Project's noise impacts to the extent feasible. These code required measures and mitigation measures would continue to be implemented as part of the Modified Project and have been incorporated into the MMP included with this Addendum (see Appendix A of this Addendum), with the revisions indicated below to reflect

the design characteristics of the Modified Project. It should be noted that the exterior construction hour restrictions established for the Original Stadium Project by code required measure CR G-2 in the Certified EIR, which would also apply to the Modified Project, are more restrictive than the construction hour noise regulations currently set forth in Section 41.40 of the LAMC, which prohibit construction activities before 7:00 A.M. and after 9:00 P.M. Monday through Friday, before 8:00 A.M. and after 6:00 P.M. on Saturday or on a national holiday, and at any time on Sunday.

(i) Code Required Measures

CR G-1: The Applicant shall comply with the ~~City of Los Angeles Noise Ordinance No. 144,331 and 161,574, and any subsequent ordinances~~ LAMC, which prohibits the emission or creation of noise beyond certain levels at adjacent uses unless technically infeasible.

CR G-2: The Applicant shall ensure exterior construction and demolition activities are limited ~~be restricted~~ to the hours of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday.

(ii) Project Design Features

PDF L-1: During non-event days, the amplified program sound system shall be designed so as not to exceed a maximum noise level of 85 dBA L_{eq} and 75 dBA L_{eq} at a distance of 50 feet within the Northwest Plaza and the Figueroa Street frontage, respectively.

(iii) Project-Specific Mitigation Measures

MM G-1: The Applicant shall prepare a ~~construction-related traffic plan~~ Construction Management Plan detailing proposed haul routes and staging areas for the transportation of materials and equipment, with consideration for sensitive uses in the neighborhood. ~~A traffic and parking plan for the construction phase will~~ The Construction Management Plan shall be submitted for approval by LADOT and the Department of Building and Safety prior to the issuance of any permits. The Construction Management Plan shall include the following requirements:

- The preferred haul route to and from the Project Site shall be Martin Luther King, Jr. Boulevard to and from the Harbor Freeway. Trucks shall not be permitted to travel along local residential streets.
- A flagman shall be placed at the truck entry and exit from the Project Site onto Martin Luther King, Jr. Boulevard to control the flow of exiting trucks.

- Deliveries and pick-ups of construction materials shall be scheduled during non-peak travel periods to the degree possible and coordinated to reduce the potential of trucks waiting to load or unload for protracted periods of time.
- Access shall remain unobstructed for land uses in proximity to the Project Site during construction of the Modified Project.
- In the event of a lane or sidewalk closure, a worksite traffic control plan, approved by the City of Los Angeles, shall be implemented to route traffic or pedestrians around any such lane or sidewalk closures.
- The locations of truck staging shall be identified and measures shall be included to ensure that trucks use the specified haul route and do not travel through nearby residential neighborhoods.
- Vehicle movements shall be scheduled to minimize vehicles waiting off-site and impeding public traffic flow on the surrounding streets.
- Requirements shall be established for the loading, unloading, and storage of materials on the Project Site.
- Requirements shall be established for the temporary removal of parking spaces, time limits for the reduction of travel lanes, and closing or diversion of pedestrian facilities to ensure the safety of pedestrian and access to local businesses.
- The Applicant shall coordinate with the City and emergency service providers to ensure adequate access is maintained to the Project Site and neighboring businesses.
- If the construction periods for the Modified Project and the My Figueroa street improvement project overlap, the Applicant shall coordinate with the City to minimize the potential combined effects of the two projects to the extent possible.

MM G-2: The Applicant shall ensure all construction equipment engines be properly tuned and muffled according to manufacturers' specifications. For example, Table IV.G-6 in the Certified EIR indicates that noise levels of 82 dBA at 50 feet could be reduced to a noise level of 76 dBA at 100 feet with the proper use of mufflers.

MM G-3: Adjacent museums and residents shall be given regular notification of major construction activities and their durations. A visible and readable sign (at a distance of 50 feet) shall be posted on the construction site identifying a telephone number where residents can inquire about the construction process and register complaints.

MM G-4: The perimeter of the Project Site shall be enclosed with a temporary barrier wall for security and noise protection purposes during project construction. This barrier wall shall consist of a solid, heavy vinyl material or 0.75-inch plywood positioned to block direct line of sight from the active construction areas and other open space areas and sensitive uses.

M. Population, Housing, and Employment

The Certified EIR for the Original Stadium Project concluded that impacts with respect to population, housing, and employment would be less than significant under the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR). Significant impacts with respect to population, housing, and employment could occur if a project were to displace existing housing or residents, or induce substantial population growth (either directly or indirectly). As stated in the Certified EIR, there are no residential uses on the Project Site, and the Original Stadium Project did not propose residential uses. Therefore, the Original Stadium Project would not have displaced existing housing or provided additional housing capacity. Similarly, the Modified Project would neither displace residential uses, nor provide additional housing capacity. Rather, the Modified Project involves the development of the Original Stadium Project with certain modifications that include additional Ancillary Uses that are all commercial land uses that would complement the proposed stadium.

As described in the Certified EIR, construction of the Original Stadium Project would result in an increase in employment opportunities and related demand for housing. However, the work requirements of most construction projects are highly specialized so that construction workers remain at a job site only for the time in which their specific skills are needed to complete a particular phase of the construction process. Thus, due to the temporary nature of construction employment opportunities, the Certified EIR stated that it is unlikely that construction workers would relocate their households as a consequence of construction employment associated with the Original Stadium Project; therefore, no new permanent residents would be generated as result of the construction of the Original Stadium Project. This conclusion would not change under the Modified Project. While the Modified Project proposes the construction of up to approximately 105,900 square feet of floor area for the Ancillary Uses in addition to the proposed stadium, the amount of additional construction work involved would not require substantial numbers of additional construction workers. In total, approximately 1,200 construction workers are projected for construction of the Modified Project.[73] In May 2015, there were approximately 119,600

[73] *Based on information provided by the Project Applicant.*

workers employed in the construction industry in Los Angeles County.[74] Therefore, the Modified Project's projected construction workforce could be accommodated by the existing regional supply of construction workers.

With respect to employees generated during operation, the Certified EIR concluded that implementation of the Original Stadium Project would not result in a substantial change in employment levels at the Project Site because the Original Stadium Project would redevelop the Project Site with the same general use (i.e., sports stadium) that currently exists on-site. Therefore, the Certified EIR concluded that any additional employment opportunities created by the Original Stadium Project would not result in a significant indirect impact on housing supply or demand in the Project area. As is the case under the Original Stadium Project, the Modified Project would replace the existing Sports Arena with an MLS stadium with a permanent seating capacity of 22,000 seats. Therefore, employment impacts with respect to the stadium operations of the Modified Project would not change. However, additional employees beyond those anticipated in the Certified EIR may result from operation of the Ancillary Uses proposed as part of the Modified Project. Specifically, as shown in Table 14 on page 136, conservatively assuming that all employees associated with the Ancillary Uses would be new to the Project Site and the Project vicinity, the Modified Project's 105,900 square feet of Ancillary Uses would generate as many as 282 employees on-site, based on employee generation rates for non-residential land uses promulgated by the Los Angeles Unified School District (LAUSD).[75]

The Southern California Association of Governments (SCAG) is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino and Imperial Counties, and addresses regional issues relating to transportation, the economy, community development, and the environment. SCAG's 2012–2035 RTP/SCS provides population, housing, and employment projections for cities under its jurisdiction through 2035. The growth projections in the 2012–2035 RTP/SCS reflect the 2010 Census, employment data from the California Employment Development Department (EDD), population and household data from the California Department of Finance (DOF), and extensive input from local jurisdictions in SCAG's planning area. The Project Site is located in SCAG's City of Los Angeles Subregion. According to the 2012–2035 RTP/SCS, the employment forecast for the City of Los Angeles Subregion in 2015 is approximately 1,809,341 employees. In 2018, the projected build-out year of the Modified Project, the City of Los Angeles Subregion is anticipated to have approximately

---

[75] *Los Angeles Unified School District, 2012 Developer Fee Justification Study, February 9, 2012, Table 11.*

Table 14
Additional Employees Potentially Generated by the Modified Project

Land Use	Size (sf)	Employee Generation Factor (employees/sf)	Employees Generated
Conference Facilities	9,000	0.00271	24
Office	21,250	0.00479	102
Museum	36,000	0.00135	49
Team Store and Other Retail	27,750	0.00271	75
Restaurant	11,900	0.00271	32
Total			**282**

sf = square feet

Source: Los Angeles Unified School District, 2012 Developer Fee Justification Study, February 9, 2012, Table 11. Conservatively based on employee generation rates for "Neighborhood Shopping Center" uses (0.00271 employees per average square foot),"Standard Commercial Office" uses (0.00479 employees per average square foot), and "Industrial Park" uses (0.00135 employees per average square foot).

1,840,552 employees.[76] Thus, the 282 estimated on-site employees for the Modified Project's Ancillary Uses would constitute approximately 0.9 percent of the employment growth forecasted for the Subregion between 2015 and 2018. In July 2015, the unadjusted unemployment rate for the County of Los Angeles was 7.5 percent.[77] The California seasonally adjusted unemployment rate was 6.2 percent in July 2015, 6.3 percent in June 2015, and 7.4 percent in July 2014. Thus, the additional part-time and full-time jobs created by the Modified Project would be considered a beneficial economic impact for the region, and the, additional employees generated by the Modified Project would fall within SCAG's employment projections for the Subregion. Furthermore, the estimated number of new employees would not be anticipated to induce substantial indirect population or housing growth in the Project area, as it is anticipated that the majority of Modified Project employees would come from the existing local labor pool and would not relocate as a result of working at the Project Site. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR), impacts with respect to population, housing, and employment would be less than significant under the Modified Project. Accordingly, the Modified Project would not result in any new significant impacts with respect to population, housing, and employment,

[76] *Based on a linear interpolation of 2015–2020 data.*

[77] *State of California, Employment Development Department, Labor Market Information Division, August 21, 2015.*

and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

N. Public Services

(a) Fire Protection

Potential impacts to fire protection services during construction were not assessed in detail in the Certified EIR. Significant impacts to fire protection services could occur if construction of a project were to require the addition of a new fire station or the expansion, consolidation, or relocation of an existing facility in order to maintain service. Construction activities have the potential to result in accidental on-site fires from such sources as the operation of mechanical equipment and the use of flammable construction materials. However, in compliance with Occupational Safety and Health Administration (OSHA) and Fire and Building Code requirements, Modified Project construction managers and personnel would be trained in emergency response and fire safety operations, which include the monitoring and management of life safety systems and facilities. Additionally, fire suppression equipment (e.g., fire extinguishers) specific to construction would be maintained on-site during Modified Project construction. Furthermore, construction of the Modified Project would occur in compliance with all applicable federal, State, and local requirements concerning the handling, disposal, use, storage, and management of hazardous waste. Thus, compliance with applicable regulatory requirements would effectively reduce the potential for construction activities under the Modified Project to expose people to the risk of fire or explosion related to hazardous materials. With the implementation of these regulatory requirements, the Modified Project's potential impacts with respect to fire services during construction would be less than significant. No mitigation measures are required.

The Certified EIR for the Original Stadium Project concluded that potential operational impacts related to fire protection service would be mitigated to a less-than-significant level under the Original Stadium Project with implementation of Mitigation Measures H.1-1 through H.1-12 in the Certified EIR (refer to Section IV.H.1, Public Services—Fire Services, of the Certified EIR). The thresholds on which this analysis was based are stated on page IV.H-4 of the Certified EIR. As discussed in the Certified EIR, the Los Angeles Fire Department (LAFD) provides fire protection services to the Project Site. The LAFD focuses on the following metrics in assessing a project's potential demands on fire protection and emergency medical services: current equipment and staffing levels, emergency response times, fire flow requirements, and emergency access. Each of these topics is addressed below in the context of both the Original Stadium Project and the Modified Project to determine whether substantial changes have occurred since preparation of the Certified EIR.

As stated in the Certified EIR, three fire stations provide initial response to the Project Site, including Fire Station No. 46, located at 4370 S. Hoover Street, approximately 0.8 mile from the Project Site; Fire Station No. 15, located at 915 W. Jefferson Boulevard, approximately 0.9 mile from the Project Site; and Fire Station No. 14, located at 3401 S. Central Avenue, approximately 1.6 miles from the Project Site. These three stations continue to serve the Project Site and would be the first response stations under the Modified Project. At the time the Certified EIR was prepared, Fire Station No. 46 was equipped with an engine and two rescue ambulances. Fire Station No. 15 was equipped with an engine, an assessment light force,[78] and a paramedic ambulance. Fire Station No. 14 was equipped with a task force station,[79] engine and truck companies, and paramedic ambulances. Based on current data from the LAFD,[80] the equipment inventory at Fire Station No. 46 has been augmented to include a basic life support (BLS) rescue ambulance and an EMS battalion captain (in addition to the equipment listed above); the equipment inventory at Fire Station No. 15 has not changed; and the equipment inventory at Fire Station No. 14 has been restructured to include a paramedic rescue ambulance, a BLS rescue ambulance, and an assessment engine. Therefore, current equipment levels at the fire stations serving the Project Site are commensurate with the levels that were assessed in the Certified EIR.

Fire protection service to the Project Site was considered to be adequate at the time the Certified EIR was prepared, based on a comparison of existing service levels to Citywide response standards. Based on the most recent data available from the LAFD,[81] the average response time for emergency medical services (EMS) was 4 minutes and 4 seconds for Fire Station No. 46, 3 minutes and 35 seconds for Fire Station No. 15, and 3 minutes and 8 seconds for Fire Station No. 14. The Citywide average response time for EMS is 4 minutes and 9 seconds;[82] therefore, each station that serves the Project Site is currently achieving a response time that is less than the Citywide average, indicating that these stations continue to provide adequate service to the Project Site area. Furthermore, the response time for each station currently meets the national standard (i.e., nine minutes

---

[82] *Los Angeles Fire Department, FireStat LA, City-wide Response Metrics, http://lafd.org/sites/default/files/pdf_files/05-12-2015_CityWide.pdf, accessed June 5, 2015.*

for urban areas).[83] It should also be noted that since preparation of the Certified EIR, the LAFD has been reorganized into four geographic bureaus in an effort to reduce response times and improve performance.[84]

Fire flow requirements, as determined by the LAFD, vary by site as they are dependent on land use (e.g., higher intensity land uses require higher flow from a greater number of hydrants), life hazard, occupancy, and fire hazard level. As set forth in Section 57.507.3.1 of the LAMC, fire flow requirements vary from 2,000 gallons per minute (gpm) in low density residential areas to 12,000 gpm in high-density commercial or industrial areas, with a minimum residual water pressure of 20 pounds per square inch (psi) to remain in the water system. As stated in the Certified EIR, the LAFD-required fire flow for the Original Stadium Project is 6,000 gallons per minute (gpm) from four fire hydrants flowing simultaneously, which corresponds with the LAMC-required fire flow for industrial and commercial land uses. Based on information in the Certified EIR, a fire hydrant is located directly north of the Sports Arena on the west side of Figueroa Street and is connected to a 16-inch water main. In addition, two fire hydrants are located at the intersection of Martin Luther King, Jr. Boulevard and Figueroa Street, one on the southeast corner (connected to a 12-inch water main) and one on the southwest corner (connected to an 8-inch water main). The Certified EIR determined that, based on infrastructure present at the time, improvements to water system in the area could be necessary to meet the fire flow requirement of 6,000 gpm, and such improvements would be the responsibility of the developer. The Modified Project proposes the construction of a 22,000-seat MLS stadium, similar to the Original Stadium Project, in addition to approximately 105,900 square feet of commercial facility floor area (i.e., the Ancillary Uses). Thus, like the Original Stadium Project, the Modified Project would include exclusively commercial land uses. Based on its preliminary review of the Modified Project, the LAFD has not identified any substantial deficiencies in the fire flow infrastructure that serves the Project Site, or in the design of the Modified Project, that would prohibit the Modified Project from meeting applicable Fire Code requirements. Notwithstanding, as with the Original Stadium Project, the final fire-flow requirement for the Modified Project would be determined by the LAFD and the Applicant would be responsible for constructing any necessary infrastructure upgrades. The Modified Project would also implement Mitigation Measures H.1-2 through H.1-3 in the Certified EIR (with revisions proposed below to reflect amendments to the City's Fire Code that have occurred since the Certified EIR) which include requirements for the

---

[83] *National Fire Protection Association (NFPA), NFPA 1720, www.nfpa.org/codes-and-standards/standards-development-process/safer-act-grant/nfpa-1720, accessed June 5, 2015.*

[84] *Los Angeles Fire Department, LAFD Implements New Bureau Command Structure, January 12, 2015, http://lafd.org/news/lafd-implements-new-bureau-command-structure, accessed June 12, 2015.*

provision of fire hydrants (see the MMP for the Modified Project included in Appendix A of this Addendum).

As discussed in the Certified EIR, emergency access to the Project Site is currently provided via public roadways located directly adjacent to the Project Site, including primary access from Martin Luther King, Jr. Boulevard to the south and Figueroa Street to the east. The Modified Project does not propose reconfiguration of any existing roadways within Exposition Park or in the surrounding area, and therefore emergency access to the Project Site would remain the same for the Modified Project. Additionally, the Modified Project would implement Mitigation Measures H.1-4 through H.1-11 in the Certified EIR to ensure that adequate access is provided to the Project Site (see the MMP for the Modified Project included in Appendix A of this Addendum). As stated in the Certified EIR, the three fire stations serving the Project Site have established response plans for the Sports Arena, and it is anticipated that these response plans would be carried over to the Modified Project along with any needed modifications. Pursuant to Section 57.507.3.3 of the LAMC, commercial and industrial land uses with a required fire flow of 6,000 to 9,000 gpm should be within one mile of an engine company and 1.5 mile of a truck company. If these response distances are exceeded, automatic sprinkler systems are required. Based on the information above, fire and emergency medical services for the Modified Project are available within acceptable response distances. Additionally, as stated above, based on its preliminary review of the Modified Project, the LAFD has not identified any substantial deficiencies in the fire flow infrastructure that serves the Project Site, or in the design of the Modified Project, that would prohibit the Modified Project from meeting applicable Fire Code requirements. Furthermore, as discussed below, the Modified Project would implement Mitigation Measure H.1-1 in the Certified EIR, which requires the installation of sprinkler systems (see the MMP for the Modified Project included in Appendix A of this Addendum).

As previously discussed, a project's potential demands on fire protection and emergency medical services are assessed based on current LAFD equipment and staffing levels, emergency response times, fire flow requirements, and emergency access. Based on the analysis above, current equipment levels at the fire stations serving the Project Site are commensurate with the levels that were assessed in the Certified EIR. Each station is currently achieving a response time that is less than the Citywide average and in compliance with the national standard for urban areas. Like the Original Stadium Project, the fire flow requirement for the Modified Project would be determined by the LAFD and the Applicant would be responsible for implementing any required improvements to the water system. Additionally, there would be no appreciable change to emergency access under the Modified Project. Furthermore, the Modified Project would be reviewed by the LAFD to ensure that it complies with applicable regulatory requirements related to fire protection and emergency medical services, including those contained within the LAMC, which

incorporates by reference California Building Code and Fire Code building construction standards as well as policies within the City of Los Angeles General Plan Safety Element. As stated above, based on its preliminary review of the Modified Project, the LAFD has not identified any substantial deficiencies in the fire flow infrastructure that serves the Project Site, or in the design of the Modified Project, that would prohibit the Modified Project from meeting applicable Fire Code requirements. Finally, the Modified Project would continue to implement Mitigation Measures H.1-1 through H.1-12 in the Certified EIR (with revisions proposed below to reflect amendments to the City's Fire Code that have occurred since the Certified EIR), which have been incorporated into the MMP for the Modified Project (see Appendix A to this Addendum). Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.H.1, Public Services—Fire Services, of the Certified EIR), operational impacts with respect to fire protection services would be less than significant under the Modified Project with implementation of Mitigation Measures H.1-1 through H.1-12 in the Certified EIR (as revised below), and no additional mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to fire services, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(i) Project Design Features and Mitigation Measures

The following mitigation measures were included in the Certified EIR to address the Original Stadium Project's potential impacts with respect to fire protection and emergency medical services. These Mitigation Measures would continue to be implemented as part of the Modified Project and have been incorporated into the MMP for the Modified Project included in Appendix A of this Addendum, but have been revised as follows to reflect amendments that were made to the City of Los Angeles Fire Code (Chapter V, Article 7 of the LAMC) after preparation of the Certified EIR pursuant to Ordinance No. 182,822 (effective January 10, 2014):

EIR Mitigation Measure MM H.1-1: Sprinkler systems ~~will~~ shall be required throughout any structure to be built, consistent with the LAMC requirements for public venue structures (Section 57.903~~09.07~~).

EIR Mitigation Measure MM H.1-2: All first-story portions of any commercial or industrial building must be within 300 feet of an approved fire hydrant (Section 57.507.3.2~~09.06, Subsection B-1~~).

EIR Mitigation Measure MM H.1-3: The maximum distance between fire flow hydrants on the roads and fire lanes in a high-density residential and commercial area is 300 feet.

EIR Mitigation Measure MM H.1-4: Any person owning or having control of any facility, structure, group of structures or premises shall provide and maintain Fire Department access (Section 57.4701.4~~09.03, Subsection A~~).

EIR Mitigation Measure MM H.1-5: If any portion of the first story exterior walls of any building structure is more than 150 feet from the edge of the roadway of an approved street, an approved fire lane shall be provided so that such portion is within 150 feet of the edge of the fire lane. (Section 57.503.1.4~~09.03, Subsection B.~~)

EIR Mitigation Measure MM H.1-6: When required access is provided by an improved street, fire lane or combination of both which results in a dead-end in access of 700 feet in length from the nearest cross street, at least one additional ingress-egress roadway shall be provided in such a manner that an alternative means of ingress-egress is accomplished (Section 57.503.1.5~~09.03, Subsection C~~).

EIR Mitigation Measure MM H.1-7: All public and private streets shall be dedicated and improved in conformance with Board of Public Works, Standard Dimension Plan, Number D-22549.

EIR Mitigation Measure MM H.1-8: Construction of public or private roadways in the proposed development shall not exceed 15 percent in grade.

EIR Mitigation Measure MM H.1-9: Fire lanes, where required, and dead ending streets, shall terminate in a cul-de-sac or other approved turning area.

EIR Mitigation Measure MM H.1-10: All access roads, including fire lanes, shall be maintained in an unobstructed manner. Removal of obstructions shall be at the owner's expense. The entrance to all required fire lanes or required private driveways shall be posted with a sign no less than three square feet in area (Section 57.503.4.2~~09.05~~).

EIR Mitigation Measure MM H.1-11: Fire lane width shall not be less than 20 feet. When a fire lane must accommodate the operation of Fire Department aerial ladder apparatus or where fire hydrants are installed, those portions shall not be less than 28 feet in width. The Fire Department may require additional vehicular access where buildings exceed 28 feet in height.

(b) Police Protection

The Certified EIR for the Original Stadium Project concluded that under the Original Stadium Project, potential impacts related to police protection service would be mitigated to a less-than-significant level with implementation of Mitigation Measures H.2-1 through H.2-3 in the Certified EIR (refer to Section IV.H.2, Public Services—Police Protection, of the Certified EIR). The thresholds on which this analysis was based are stated on

pages IV.H-9–IV.H-10 of the Certified EIR. As discussed in the Certified EIR, the Project Site is served by the Los Angeles Police Department's (LAPD) Southwest Area Police Station located at 1546 W. Martin Luther King, Jr. Boulevard, approximately 1.2 miles west of the Project Site. At the time the Certified EIR was prepared, staff at the Southwest Area Police Station included 347 sworn officers and 26 civilian support staff that served a population of 191,041 (or approximately one officer per 551 residents). The staff at this police station currently consists of 352 sworn personnel and 32 civilian personnel serving a population of approximately 165,000 (or approximately one officer per 469 residents).[85] Thus, the officer-to-resident ratio and staffing levels at the Southwest Area Police Station have improved since the preparation of the Certified EIR. Additionally, at the time the Certified EIR was prepared, the Southwest Area Police Station responded to 2,462 violent crimes and 6,038 property crimes annually. Based on current data from the LAPD, in 2014, the Southwest Area Police Station responded to 690 violent crimes and 2,128 property crimes.[86] Thus, crime levels in the Southwest Area Police Station service area have also decreased since the preparation of the Certified EIR.

As described in the Certified EIR, on-site construction activities could result in an increased demand for police protection services due to the potential for theft and vandalism at the Project Site. Thus, the Certified EIR includes Mitigation Measure H.2-1, which requires temporary fencing to properly secure the construction site. Given the similarity in construction duration and activities to the Original Stadium Project analyzed in the Certified EIR, the Modified Project would result in a similar demand for police protection services during construction. The Modified Project would also continue to implement Mitigation Measure H.2-1 as set forth in the Certified EIR, which has been incorporated into the MMP included in Appendix A of this Addendum. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.H.2, Public Services—Police Protection, of the Certified EIR), impacts with respect to police protection services during construction would be less than significant under the Modified Project with implementation of Mitigation Measure H.2-1 in the Certified EIR. No additional mitigation measures are required.

Like the Original Stadium Project, the Modified Project would introduce crowds of up to 22,000 people during an event day, which could increase the number of calls requesting police responses due to burglaries, damage to vehicles, traffic-related incidents, and crimes against persons. Under the Modified Project, maximum attendance on event days

---

[85] *Los Angeles Police Department, About Southwest, www.lapdonline.org/southwest_community_police_station/content_basic_view/1639, accessed June 18, 2015.*

[86] *COMPSTAT, Southwest Area Profile, 05/10/15-06/06/15, http://assets.lapdonline.org/assets/pdf/sowprof.pdf, accessed June 18, 2015.*

would be the same as under the Original Stadium Project analyzed in the Certified EIR, since the Modified Project's proposed Ancillary Uses would only be open to ticket-holding patrons (refer to Project Design Feature O-4 in Section IV.O, Traffic/Transportation/ Parking, on page 169 of this Addendum). Thus, the anticipated demand for police protection services on event days would be substantially similar to that of the Original Stadium Project. While the Modified Project would result in a greater demand for police protection services on non-event days due to the operation of the Ancillary Uses, this demand would be far less than the demand on event days, and therefore within the service capabilities of the LAPD. Furthermore, the Modified Project would continue to implement Mitigation Measures H.2-2 to H.2-3 from the Certified EIR (as revised below to reflect the Modified Project's design characteristics) to further reduce impacts related to police services and ensure that impacts would remain less than significant both on event days and on non-event days (see the MMP for the Modified Project included in Appendix A of this Addendum). Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.H.2, Public Services—Police Protection, of the Certified EIR), impacts with respect to police protection services during operation would be less than significant under the Modified Project with implementation of Mitigation Measures H.2-2 and H.2-3 in the Certified EIR (as revised below). No additional mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to police protection services, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(i) Mitigation Measures

The following mitigation measures were included in the Certified EIR to address the Original Stadium Project's potential impacts with respect to police protection services. These Mitigation Measures would continue to be implemented as part of the Modified Project and have been incorporated into the MMP for the Modified Project included in Appendix A of this Addendum, but have been revised as follows to reflect the design characteristics of the Modified Project:

EIR Mitigation Measure H.2-1: The ~~Project~~ Applicant shall erect temporary fencing around the Project Site during construction activities to secure the Project Site and discourage trespassers.

EIR Mitigation Measure H.2-2: Event Sponsors at the Project Site shall employ private security guards to monitor and secure the Project Site during events and deter any potential criminal activity.

EIR Mitigation Measure H.2-3: The ~~Project~~ Applicant shall develop and implement a Security Plan in consultation with the LAPD outlining the security

services and features to be provided in conjunction with the ~~Approved~~ Project. The plan shall be coordinated with the LAPD and a copy of the said plan shall be filed with the LAPD Central Bureau commanding Officer. Said security plan may include some or all of the following components:

i. Provisions for an on-site private security force ~~for the mixed-use trade school. Through individual lease agreements for the proposed trade school/retail uses, private on-site security services~~ that shall provide 24-hour presence. Security officers shall be responsible for patrolling all common areas including the back service corridors and ~~alleys~~ walkways, parking ~~garages~~ lots, and stairwells.

ii. ~~The parking garage~~ The VIP parking lot on the Project Site shall be fitted with emergency features such as closed circuit television (CCTV) or emergency call boxes that would provide a direct connection with the on-site security force or the LAPD 911 emergency response system.

iii. The proposed security shall incorporate low level and directional lighting features to effectively illuminate project entryways, seating areas, lobbies, elevators, service areas, and parking areas with sufficient illumination and minimum dead space to eliminate areas of concealment. Full cut-off fixtures shall be installed that minimize glare from the light source and provide light downward and inward to structures to maximize visibility.

(c) Schools

Potential impacts to schools were not assessed in detail in the Certified EIR. Significant impacts to schools could occur if a project were to generate an amount of students that would exceed the capacity of the schools that serve the Project Site, thereby requiring the construction of new facilities, and/or modifications to the existing operational characteristics of the schools that serve the Project Site. The Project Site is located within the boundaries of the Los Angeles Unified School District (LAUSD). While the Modified Project would not generate residents at the Project Site, the additional employment generated by the Modified Project would have the potential to generate new students that may attend LAUSD schools. However, the potential for actual student generation is anticipated to be limited because, as discussed above in Section IV.M, Population, Housing, and Employment, on page 134, it is anticipated that the majority of Modified Project employees would come from the existing labor pool and would not relocate as a result of working at the Project Site. Moreover, any increase in LAUSD enrollment that may occur under the Modified Project would be dispersed across many LAUSD schools, as school attendance is primarily a function of an employee's location of residence rather than

his or her place of work, and Modified Project employees are anticipated to live in many different areas within LAUSD's jurisdiction.

The Leroy F. Greene School Facilities Act of 1998 (Senate Bill 50) allows governing boards of school districts to establish fees to offset costs associated with school facilities made necessary by new construction. The LAUSD collects school developer fees at a rate of $0.47 per square foot of commercial construction, $1.57 per square foot of office construction, $1.31 per square foot of retail construction, and $0.09 per square foot of parking structure construction.[87] Payment of these fees is required prior to the issuance of building permits. Pursuant to Government Code Section 65995, the payment of these fees by a developer serves to fully mitigate all potential project impacts on school facilities from implementation of a project to a less-than-significant level. As the payment of these fees is mandatory, through compliance with this regulatory requirement the Modified Project's potential impacts with regard to school facilities would be less than significant. No mitigation measures are required. Therefore, the Modified Project would not result in any new significant impacts with respect to schools, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

With regard to potential impacts on schools during construction, as discussed in Section IV.C, Air Quality, on page 49 of this Addendum, impacts with respect to localized air quality during construction would be less than significant under the Modified Project, consistent the conclusions of the Certified EIR's analysis for the Original Stadium Project. As discussed in Section IV.L, Noise, on page 119 of this Addendum, the Certified EIR determined that the Original Stadium Project would result in significant construction-related noise impacts at Receptor Location 1, which is near the southwest corner of the Project Site and represents the Ralph M. Parsons Pre-School located within the Expo-Center. This impact would remain significant and unavoidable under the Modified Project, but would not substantially increase compared to levels analyzed in the Certified EIR. As discussed in Section IV.O, Traffic/Transportation/Parking, on page 149 of this Addendum, potential impacts from construction-related traffic were not assessed in detail in the Certified EIR. Nonetheless, the analysis in Section IV.O, Traffic/Transportation/Parking, determined that construction-related traffic impacts under the Modified Project would be less than significant. Furthermore, the Modified Project would continue to implement EIR Mitigation Measure MM G-1 requiring the preparation and implementation of a Construction Management Plan, subject to LADOT approval, which would establish proposed haul routes and staging areas for the transportation of materials and equipment with consideration for sensitive uses in the neighborhood, including schools. Therefore,

---

[87] *City of Los Angeles Department of Building and Safety, Building Permit Fee Estimate, http://netinfo.ladbs.org/feecalc.nsf/cef2203faf5fd7df8825779900644031?OpenForm, accessed June 17, 2015.*

construction of the Modified Project would not result in any new significant impacts with respect to schools, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(d) Parks and Recreation

Potential impacts to parks and recreational facilities were not assessed in detail in the Certified EIR. Significant impacts to parks and recreational facilities could occur if a project were to create an increased demand for parks and recreational facilities that could result in the need for new or physically altered facilities. Parks within the City's boundaries are operated and maintained by the Los Angeles City Recreation and Parks Department. During construction of the Modified Project, the use of public parks and recreational facilities by construction workers would be expected to be limited, as construction workers are highly transient in their work locations and are more likely to utilize parks and recreational facilities near their places of residence. There is potential for construction workers to spend their lunch breaks at the parks and recreational facilities located in proximity to the Project Site, particularly the open space areas within Exposition Park. However, any such use would be temporary and nominal and would not be anticipated to create an increased demand for parks and recreational facilities that could result in the need for new or physically altered facilities. Therefore, the Modified Project's potential impacts with respect to parks and recreational facilities would be less than significant during construction. No mitigation measures are required.

Since no residential uses would be developed as part of the Modified Project, no new residents would be generated on-site during Modified Project operations. Thus, implementation of the Modified Project would not result in on-site residents who would utilize nearby parks and/or recreational facilities. The standards and goals imposed by the City's Public Recreation Plan with respect to parks and recreation relate specifically to residential users. While the Modified Project would not generate residents at the Project Site, the additional employment generated by the Modified Project would have the potential to generate an increased demand for parks and recreation facilities, particularly the open space areas within Exposition Park adjacent to the Project Site, including recreational facilities within the Expo Center. However, this potential is anticipated to be limited because, as discussed above in Section IV.M, Population, Housing, and Employment, on page 134, it is anticipated that the majority of Modified Project employees would come from the existing labor pool and would not relocate as a result of working at the Project Site. While employees could spend their lunch breaks in Exposition Park or at other nearby facilities, any such use would be for limited periods and would not be anticipated to create an increased demand for parks and recreational facilities that could result in the need for new or physically altered facilities. The uses proposed under the Modified Project could result in increased usage of Exposition Park due to the patrons that would be drawn to the Project Site as compared to existing conditions, particularly since the Ancillary Uses would

be open on non-event days. However, it is anticipated that any potential increase in demand would be offset by the open space amenities that would be included as part of the Modified Project. Specifically, as compared the Original Stadium Project, the Modified Project would provide enhanced pedestrian improvements and open space areas, including approximately 143,000 square feet of improved public open space around the Project Site that would include pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas and could potentially include water features, public art, and seating areas. Therefore, operation of the Modified Project would not result in a substantial adverse impact to parks and recreational facilities, and impacts would be less than significant. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to parks and recreational facilities, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(e) Other Public Facilities

Potential impacts to other public facilities (i.e., libraries) were not assessed in detail in the Certified EIR. Significant impacts to libraries could occur if a project were to create an increased demand for library facilities that could result in the need for new or physically altered facilities. Library services within the Project area are provided by the Los Angeles Public Library (LAPL). The LAPL assesses service capacity based on the residential population within a specified distance of City libraries. The closest library to the Project Site is the Exposition Park–Dr. Mary McLeod Bethune Regional Library located at 3900 S. Western Avenue, approximately 1.5 miles from the Project Site. The residential population of a library's service area is the primary metric used by the LAPL for assessing the adequacy of library services and planning for future growth. Because no residential uses would be developed as part of the Modified Project, no new residents would be generated on-site. Thus, implementation of the Modified Project would not result in a direct increase in the number of residents within the service population of the Exposition Park–Dr. Mary McLeod Bethune Regional Library. As such, the Modified Project would not exceed the capacity of the local libraries to adequately serve the existing residential service population based on target service populations. In addition, it is unlikely that construction workers would utilize the libraries that serve the Project Site on their way to/from work or during their lunch hours. Rather, construction workers would likely utilize library facilities near their places of residence because lunch break times are typically not long enough (30 to 60 minutes) for construction workers to take advantage of library facilities, eat lunch, and return to work within the allotted time. Therefore, any increase in usage of the libraries by construction workers is anticipated to be negligible. While new employment at the Project Site would have the potential to generate an indirect demand for library services, this potential demand is anticipated to be limited because, as discussed above in Section IV.M,

Population, Housing, and Employment, on page 134, it is anticipated that the majority of Modified Project employees would come from the existing labor pool and would not relocate as a result of working at the Project Site. While employees could spend their lunch breaks at nearby libraries or visit them after work, any such use would be for limited periods and would not be anticipated to create an increased demand for libraries that could result in the need for new or physically altered facilities. Furthermore, due to the periodic, largely event-driven nature of the uses proposed on-site, and the distance to the nearest library, it is unlikely that the demand for LAPL facilities would increase as a result of visitors and patrons generated by the Modified Project. Therefore, the Modified Project would not result in substantial adverse physical impacts associated with the provision of, or need for, new or physically altered LAPL facilities, and impacts would be less than significant. No mitigation measures are required. As such, the Modified Project would not result in any new significant impacts with respect to other public facilities (i.e., libraries), and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

O. Traffic/Transportation/Parking

The following analysis of the Modified Project's potential impacts associated with traffic, transportation, and parking is based on the Draft Technical Memorandum, dated October 2010, to the Los Angeles Department of Transportation (LADOT) from Fehr & Peers Transportation Consultants, of the Proposed Redevelopment of the Los Angeles Memorial Sports Arena (see Appendix F to the Certified EIR); the Traffic, Transportation and Parking analysis provided in Section IV.J of the Certified EIR; the Los Angeles Football Club Stadium Project Draft Transportation Analysis Report (Modified Project Transportation Report) prepared by Fehr & Peers Transportation Consultants, dated August 2015; and the Parking Analysis for the Los Angeles Football Club Stadium Project (Modified Project Parking Analysis) prepared by Fehr & Peers Transportation Consultants, dated August 2015. The Modified Project Transportation Report is included in Appendix P-1 of this Addendum. LADOT reviewed and approved the Modified Project Transportation Report on August 10, 2015. A copy of LADOT's Assessment Letter is included as in Appendix P-2 of this Addendum. The Modified Project Parking Analysis is included in Appendix Q of this Addendum.

(a) Construction

Potential impacts from construction-related traffic were not assessed in detail in the Certified EIR. LADOT generally considers construction-related traffic to cause adverse but less than significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary. LADOT requires implementation of worksite traffic control plans to ensure that any construction-related effects are minimized to the greatest extent possible. Additionally, in the context of Appendix G of the CEQA Guidelines, the *L.A.*

CEQA Thresholds Guide includes specific factors to be considered with regard to impacts associated with transportation, including construction-related traffic.[88] Based on these factors, for the purposes of this analysis, construction of the Modified Project would have a significant impact on traffic and circulation if construction activities were to: (1) cause substantial delays and disruption of existing traffic flow; (2) require substantial roadway and/or sidewalk closures to the extent that a hazard to roadway travelers and/or pedestrians would occur; (3) result in changes to bus/transit service such that a substantial inconvenience to riders would occur; or (4) result in the substantial loss of on-site and/or off-site parking such that the parking needs of the Project area would not be met.

(i) Proposed Construction Activities and Schedule

As discussed in Section III, Project Description, on page 4, construction of the Modified Project is expected to take a total of approximately 20.5 months to complete. Construction is anticipated to involve five key phases:

1. Abatement & Soft Demolition—Approximately 10 weeks, 48 truckloads per workday, 80 workers.
2. Structure Demolition—Approximately 14 weeks, 72 truckloads per workday, 40 workers.
3. Grading—Approximately 4 weeks, 200 truckloads per workday, 40 workers.
4. Building Construction—Approximately 14 months, peak of 25 truckloads per workday (peak of 50 ready-mix concrete truckloads per day during concrete structure operations), typically 150 workers, and peak of 275 workers.
5. Site Finishes—Approximately 2 months overlapping with the last several weeks of building construction, trucks and workers included in estimates for building construction phase.

As discussed in Section IV.L, Noise, on page 119, pursuant to Mitigation Measure CR G-2 in the Certified EIR, construction and demolition activities under the Modified Project would be restricted to the hours of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday, which is more restrictive than Section 41.40 of the LAMC, which restricts construction hours to the hours of 7:00 A.M. to 9:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday and national holidays. Pursuant to Section 41.40 of the LAMC, construction activities are prohibited on Sundays. However,

---

[88] *City of Los Angeles, L.A. CEQA Thresholds Guide, 2006, p. L.8-2.*

construction hours may be extended with approval from the Executive Director of the Board of Police Commissioners. Under the proposed Modified Project, the Applicant may seek approval from the Executive Director to extend the construction hours to permit interior construction activities outside of the hours provided in Mitigation Measure CR G-2. Refer to Section IV.L, Noise, on page 119, for additional discussion.

Peak hauling activity is anticipated to occur during the grading phase. Approximately 200 haul trucks are expected on peak days of activity. The hauling activity is likely to use double-belly dump haul trucks. For access to the I-110 freeway to/from both the south and the north, the primary anticipated truck route would be via Martin Luther King, Jr. Boulevard for inbound and outbound trucks. These trucks could adversely affect the adjacent roadway network since the major roadways anticipated to be used as a truck route for the Modified Project already experience congestion during peak traffic periods. Thus, a secondary route, expected to be used infrequently, would be Figueroa Street to Martin Luther King, Jr. Boulevard to the I-110 freeway. In addition to haul trucks, the Project Site is also expected to generate equipment and delivery trucks during each phase of construction. One example would be concrete delivery, which would be required to lay foundation. Other materials could include plumbing supplies, electrical fixtures, and items used in furnishing the Modified Project. These materials would be delivered to the Project Site and stored on-site. These deliveries are expected to occur in variety of vehicles, including small delivery trucks to cement mixer trucks and 18-wheel trucks. Additionally, construction equipment would also have to be delivered to the Project Site. This equipment could include cranes, bulldozers, excavators, and other large items of machinery. Most of the heavy equipment is expected to be transported to the Project Site on large trucks such as 18-wheelers or other similar vehicles.

The Modified Project proposes to provide sufficient construction staging areas either on the Project Site itself or in the adjacent Exposition Park Parking Lot 6 for trucks throughout the construction period. One or two trucks may queue along the Martin Luther King, Jr. Boulevard curbside between Figueroa Street and Hoover Street before entering the Project Site. Temporary and occasional truck staging at this location may result in lane closures along Martin Luther King, Jr. Boulevard. Such closures, if required, would be subject to LADOT review and approval.

The number of construction workers would vary throughout the construction period. The maximum number of workers expected to be generated on a peak worker trip day would occur during the building construction phase, when it is expected that up to 275 workers could be on-site on a single day. Parking for all construction workers would be provided either on the Project Site or in the adjacent Exposition Park Parking Lot 6.

(ii) Intersections

A construction period trip generation analysis was conducted in the Modified Project Transportation Report to estimate daily, morning, and evening peak-hour passenger car equivalent (PCE) trips. Construction workers often travel to and from a worksite outside of the typical peak commute hours. For the purpose of the analysis, and in accordance with Project Design Feature O-5, it was assumed that up to 70 construction workers would arrive during the peak morning commute hour and up to 180 construction workers would depart during the peak evening commute hour. Trucks were assumed to arrive and depart evenly through an 11-hour construction day. A PCE factor of 2.5 was assumed for double belly dump haul trucks while a PCE factor of 2.0 was assumed for concrete, vendor and delivery trucks, based on the 2010 *Highway Capacity Manual*.

Table 7 in the Modified Project Transportation Report included in Appendix P-1 of this Addendum presents the estimated construction truck and employee vehicle trip generation for each of the Modified Project's proposed construction phases. Table 8 in the Modified Project Transportation Report presents the estimated construction trip generation by phase converted into passenger car equivalents. As shown on Table 7, the highest number of potential construction-related vehicle trips on a daily basis could occur during the concrete pour element of the building construction phase, with up to 275 workers and 50 trucks per day for a total of 788 daily vehicle trips. As shown on Table 8, the highest number of potential construction-related PCE trips on a daily basis, however, could occur during the grading phase, with up to 200 haul trucks and 40 workers per day leading to an estimate of 1,100 daily PCE trips. During peak hours, up to 125 (80 inbound and 45 outbound) PCE trips are projected during the A.M. peak hour and up to 200 (10 inbound and 190 outbound) PCE trips are projected during the P.M. peak hour.

The peak construction activity would generate fewer daily trips, A.M. peak-hour inbound trips, and P.M. peak-hour outbound trips than are projected for the Modified Project's Ancillary Uses on a non-event weekday (as demonstrated in the Modified Project Transportation Report, A.M. inbound and P.M. outbound trips are the most critical trips in terms of their potential to impact operating conditions at nearby study area intersections). Specifically, as discussed below in Section IV.O.b, Traffic/Transportation/Parking, on page 155, the Modified Project's Ancillary Uses are estimated to generate a net external 2,615 daily trips on a non-event weekday, including 85 inbound trips during the A.M. peak hour and 197 outbound trips during the P.M. peak hour, which would result in less than significant impacts to study area intersections. Therefore, because Modified Project construction traffic would fall within the scope of the Ancillary Use's operational non-event day traffic, potential traffic impacts associated with construction would also be less than significant. Nonetheless it is conservatively recognized that the influx of material and equipment could create impacts on the adjacent roadway network based on the following considerations:

- There may be intermittent periods when large numbers of material deliveries are required, such as when concrete trucks would be needed for the concrete pour.

- Some of the materials and equipment could require the use of large trucks (18-wheelers), which could create additional congestion on the adjacent roadways.

- Delivery vehicles may need to queue temporarily on adjacent roadway of Martin Luther King, Jr. Boulevard before entering the Project Site. Based on past experience, it is not uncommon for these types of deliveries to result in temporary lane closures.

The Certified EIR included Mitigation Measure G-1 requiring the preparation of a construction-related traffic management plan to reduce construction-related noise impacts. This mitigation measure would also serve to reduce construction-related traffic impacts. Mitigation Measure G-1 has been incorporated into the Modified Project's MMP (see Appendix A of this Addendum), along with modifications that are detailed below based on recommendations from the Modified Project Transportation Report. While the Modified Project Transportation Report concludes that potential traffic impacts from Modified Project construction would be less than significant in the absence of mitigation, implementation of Mitigation Measure G-1, as revised below, would further ensure that the Modified Project would not result in substantial delays and disruption of existing traffic flow. Therefore, peak-hour intersection impacts during construction would remain less than significant following the implementation of this measure.

(iii) Access and Safety

During construction of the Modified Project, construction trucks and workers would access the Project Site via Martin Luther King, Jr. Boulevard. The Modified Project proposes to provide adequate construction truck staging and construction worker parking either on the Project Site or in the adjacent Exposition Park Parking Lot 6 throughout the construction period. One or two trucks may queue along the Martin Luther King, Jr. Boulevard curbside between Figueroa Street and Hoover Street before entering the Project Site. Temporary and occasional truck staging at this location may result in lane and/or sidewalks closures along Martin Luther King, Jr. Boulevard. However, it is not uncommon for these types of deliveries to result in temporary lane closures. Furthermore, as stated in revised Mitigation Measure G-1 below, the Construction Management Plan would include provisions to ensure driver and pedestrian safety along affected roadways and sidewalks, including: implementing a worksite traffic control plan to route traffic and/or pedestrians around lane and/or sidewalk closures; maintaining existing access for land uses in proximity of the Project Site; scheduling deliveries and pick-ups of construction materials to off-peak travel periods, to the extent feasible; and using flag persons to control traffic movement during the ingress and egress of trucks and heavy equipment to/from the

Project Site. Implementation of the Construction Management Plan would minimize potential conflicts between construction activity and pedestrian and vehicular traffic in the vicinity of the Project Site, further ensuring that the Modified Project would not result in substantial roadway and/or sidewalk closures to the extent that a hazard to roadway travelers and/or pedestrians would occur. Therefore, construction traffic impacts related to access and safety would be less than significant.

(iv) Public Transit

There are a variety of public transit facilities in the vicinity of the Project Site. For purposes of evaluating potential impacts to transit resulting from Modified Project construction, transit stops immediately adjacent to the Project Site and in the vicinity of truck and construction worker access points and potential queue areas were analyzed. These transit stops include: a bus stop for the Metro Line 200 and Metro Line 40 at the northeast corner of Figueroa Street and on Martin Luther King, Jr. Boulevard; a bus stop for Metro Line 81 and the LADOT DASH Southeast Line at the southeast corner of Figueroa Street and on Martin Luther King, Jr. Boulevard; a bus stop for Metro Line 40 at the northwest corner of Martin Luther King, Jr. Boulevard and Hoover Street; and a bus stop for the Metro Lines 81, 200, 442, and 550 and the DASH Southeast Line at the southeast corner of 39th Street and Figueroa Street. These transit stops would be maintained during construction of the Modified Project, including any potential lane closures on Martin Luther King, Jr. Boulevard, which would be limited to the stretch between Hoover Street and Figueroa Street (east of the Metro Line 40 bus stop). Furthermore, pursuant to Mitigation Measure J-2 in the Certified EIR, which would be implemented under the Modified Project, the Applicant would coordinate with Metro Bus Operation Control Special Events Coordinator regarding construction activities that may affect Metro and LADOT bus line operations. Therefore, construction of the Modified Project would not result in changes to bus/transit service such that a substantial inconvenience to riders would occur, and construction traffic impacts related to bus/transit service would be less than significant.

(v) Parking

As discussed in the Modified Project Transportation Report, during all phases of Modified Project construction, construction workers would park on the Project Site and/or in the Exposition Park Parking Lot 6 adjacent to the Project Site. This combined parking supply would be sufficient to accommodate construction-related parking. Pursuant to Project Design Feature O-1, the Applicant would be required to coordinate construction parking through the Exposition Park General Manager, who manages the parking supply in Exposition Park. To the degree that any portion of Parking Lot 6 is required for parking for events occurring in Exposition Park during Modified Project construction, coordination through the General Manager would ensure that adequate parking supplies are provided either by requiring all construction workers to park on the Project Site during those events,

or requiring the Applicant to secure temporary off-site parking facilities for event users in the numerous nearby lots (such as those maintained by USC). Construction is not anticipated to require the removal of, or impair access to, on-street parking spaces along Martin Luther King, Jr. Boulevard or Figueroa Street adjacent to the Project Site, as street parking is not permitted along these street segments. Therefore, construction of the Modified Project would not result in substantial loss of on-site and/or off-site parking such that the parking needs of the Project Site area would not be met, and construction traffic impacts related to parking would be less than significant.

(vi) Conclusion

Based on the analysis above, Modified Project construction would result in less-than-significant traffic and transportation impacts to area intersections. Specifically, construction of the Modified Project would not: (1) cause substantial delays and disruption of existing traffic flow; (2) require substantial roadway and/or sidewalk closures to the extent that a hazard to roadway travelers and/or pedestrians would occur; (3) result in changes to bus/transit service such that a substantial inconvenience to riders would occur; or (4) result in the substantial loss of on-site and/or off-site parking such that the parking needs of the Project area would not be met. Construction-related impacts to traffic, transportation, and parking would be further reduced with implementation of Mitigation Measure G-1 from the Certified EIR, as revised below, and Mitigation Measure J-2 from the Certified EIR. No additional mitigation measures are required. As such, the Modified Project would not result in any new significant impacts with respect construction-related traffic, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(b) Operation

The traffic impacts of operating the Original Stadium Project were analyzed in the Certified EIR (refer to Section IV.J, Transportation, Traffic, and Parking, of the Certified EIR), which concluded that no new significant traffic impacts would result from a game or event hosted at the proposed stadium as compared to operation of the existing Sports Arena. Further, since the Coliseum and the Sports Arena currently hold events with up to 93,000 persons in attendance combined, the Certified EIR also concluded that no new traffic impacts would result from concurrent events in the Coliseum and Original Stadium Project with combined attendees of up to 93,000 persons, and included a mitigation measure (Mitigation Measure J-1) to ensure that events in the two venues are scheduled in such a manner as to not exceed this limit. As stated below, Mitigation Measure J-1 would continue to be implemented under the Modified Project, and has been incorporated into the Modified Project's MMP (see Appendix A of this Addendum). Additionally, the Certified EIR did not account for the trip reduction associated with the Expo Light Rail stations in proximity to the Project Site. The Expo Park/USC Station is located approximately 0.35 mile

from the Project Site and the Expo/Vermont Station is located approximately 0.7 mile from the Project Site. Given the proximity of these stations, it is anticipated that a substantial number of attendees at the Modified Project would use the light rail on event days, further reducing the less-than-significant event day traffic impacts identified in the Certified EIR.

Like the Original Stadium Project analyzed in the Certified EIR, the Modified Project proposes a 22,000-seat professional soccer stadium. Pursuant to Project Design Feature O-4, the Ancillary Uses proposed as part of the Modified Project would be open only to ticket-holding game/event patrons during a period of time before, during and after the game/event, with no material increase in event-related traffic expected. Therefore, because traffic impacts are assessed based on peak-hour conditions, the Certified EIR's conclusions with respect to event day traffic would not change under the Modified Project, and potential impacts on event days in the Modified Project would remain less than significant.

However, because the Modified Project's proposed Ancillary Uses would be open to the public on non-event days, this analysis focuses on and quantitatively evaluates potential traffic impacts related to operation of the Ancillary Uses on non-event days.

(i) Intersections

The following analysis assumes that the Modified Project would be completed by 2018 and analyzes the Modified Project's potential traffic impacts on weekday non-event days under both existing and future year traffic conditions. Specifically, the following traffic scenarios are analyzed: Existing Conditions (Year 2015), Existing (Year 2015) plus Project Conditions, Future Base (Year 2018) Conditions, and Future (Year 2018) plus Project Conditions. For further discussion of the traffic scenarios and the assumptions on which they are based, refer to the Modified Project Transportation Report in Appendix P-1 of this Addendum.

Fourteen study intersections were identified for purposes of this analysis, in consultation with LADOT (pursuant to a Memorandum of Understanding (MOU) dated May 7, 2015). All 14 intersections are signalized and, in accordance with LADOT guidelines and City of Los Angeles requirements, the signalized intersections were analyzed for potential Modified Project traffic impacts on weekday non-event days. The study intersections are as follows:

1. Vermont Avenue & Exposition Boulevard
2. Vermont Avenue & Martin Luther King, Jr. Boulevard
3. Hoover Street & Martin Luther King, Jr. Boulevard

4. Figueroa Street & Exposition Boulevard
5. Figueroa Street & Flower Street
6. Figueroa Street & Exposition Park Drive/39th Street
7. Figueroa Street & Martin Luther King, Jr. Boulevard
8. Flower Street/I-110 Off-Ramp & Exposition Boulevard
9. Flower Street & 37th Street
10. Hope Street & 37th Street
11. I-110 Ramps & Martin Luther King, Jr. Boulevard
12. Hill Street/I-110 Ramps & Martin Luther King, Jr. Boulevard
13. Hoover Street & Vernon Street
14. Figueroa Street & Vernon Street

For further discussion of the existing conditions of the study area, refer to the Modified Project Transportation Report in Appendix P-1 of this Addendum.

Trip generation rates from *Trip Generation, 9th Edition* (Institute of Transportation Engineers [ITE], 2012) were used to estimate the number of trips associated with the Modified Project's Ancillary Uses on non-event weekdays. As shown in Table 15 on page 158, the Ancillary Uses are estimated to generate a net external 2,615 daily trips on a non-event weekday, including 89 trips (85 inbound/4 outbound) during the A.M. peak hour and 260 trips (63 inbound/197 outbound) during the P.M. peak hour. The Modified Project's traffic was assigned to the street network using the distribution patterns described in Figure 5A and Figure 5B of the Modified Project Transportation Report (refer to Appendix P-1 of this Addendum). Additionally, Appendix C of the Modified Project Transportation Report shows the assignment of the Modified Project-generated peak-hour traffic volumes at the analyzed intersections during the A.M. and P.M. peak hours. Trip-generation estimates and intersection traffic distributions account for the design limitations set forth in Project Design Features O-2 and O-3, below.

As shown in Table 16 on page 160, the intersection of Figueroa Street & Martin Luther King, Jr. Boulevard (Study Intersection 7) is projected to operate at Level of Service (LOS) E during the A.M. peak period both under Existing Conditions and Existing plus Project Conditions. Based on the City of Los Angeles' thresholds of significance, which are

[a] *Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition, 2012, unless otherwise noted.*

[b] *Conference facility trip estimates assume a morning event with 50 percent of attendees arriving during the A.M. peak hour, an afternoon event with 75 percent of attendees departing during the P.M. peak hour, an evening event with 10 percent of attendees arriving during the P.M. peak hour, and an average vehicle occupancy (AVO) of 2.0 attendees per vehicle. Events generating trips during the weekday A.M. peak hour will be limited to 320 attendees.*

[c] *Internal capture represents the percentage of trips between land uses that occur within the Project Site. Estimated using internal capture rates from ITE Trip Generation Handbook, 3rd Edition, 2014, Tables 6.1 and 6.2, balanced to the constrained end of the internal trip. Considers internalization between the various Modified Project uses, as well as between the Modified Project and the California Science Center.*

[d] *LADOT's Traffic Study Policies and Procedures, August 2014, state that a 15-percent transit credit may be taken for projects within 0.25 mile of a transit station or rapid bus stop. The Expo Park/USC LRT station, the Harbor Transitway 37th St./USC station, and Metro Rapid 754 on Vermont individually are each beyond 0.25 mile, but are each within 0.30 to 0.37 mile. Given the proximity of all three services, however, the combined effect of the three is considered to be 15 percent.*

[e] *The source for pass-by credits is Attachment I of LADOT's Traffic Study Policies and Procedures, August 2014.*

[f] *Internal capture for fast food restaurant and other retail possibly along the Figueroa Street frontage capped at 15 percent to reflect the potential that these uses attract a greater level of external trips, given their locations.*

[g] *No daily rate available from ITE for museum. Daily rate assumed to be 10 x P.M. peak-hour rate.*

[h] *Specialty retail (ITE code 826) used for museum store and other retail (used A.M. rate from code 820 since no A.M. rate is available for code 826).*

[i] *The museum, team store, other retail, quality restaurants, high-turnover sit-down restaurants, and fast food restaurants would not open for business until mid- to late-morning and, thus, would generate negligible trips during the A.M. peak hour.*

further discussed in the Modified Project Transportation Report (refer to Appendix P-1 of this Addendum), increased traffic resulting from Modified Project non-event weekday operations would be below the applicable thresholds of significance at the intersection of Figueroa Street & Martin Luther King, Jr. Boulevard (Study Intersection 7) and at all other study area intersections. Therefore, the Modified Project's potential traffic and transportation impacts at intersections under Existing plus Project Conditions would be less than significant, and no mitigation measures would be required.

As shown in Table 17 on page 161, the following three intersections are projected to operate at LOS E or worse during one or both of the peak hours during both Future Base (Year 2018) Conditions, and Future (Year 2018) plus Project Conditions on a non-event day: Vermont Avenue & Exposition Boulevard (Study Intersection 1); Figueroa Street & Exposition Boulevard (Study Intersection 4); and Figueroa Street & Martin Luther King, Jr. Boulevard (Study Intersection 7). Based on the City of Los Angeles' thresholds of significance, which are further discussed in the Modified Project Transportation Report (refer to Appendix P-1 of this Addendum), increased traffic resulting from Modified Project non-event weekday operations would be below the applicable thresholds of significance at these three intersections and at all other study area intersections. Therefore, the Modified Project's potential traffic and transportation impacts at intersections under Future plus Project Conditions would be less than significant, and no mitigation measures would be required.

(ii) Congestion Management Program

The Los Angeles County Metropolitan Transportation Authority's (Metro) Congestion Management Program (CMP) requires that, when an environmental impact report is prepared for a project, traffic and public transit impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use those facilities.[89] The closest CMP arterial monitoring station, the intersection of Alameda Street & Washington Boulevard, is approximately 2.5 miles from the Project Site. As described in the Modified Project Transportation Report (see Appendix P-1 of this Addendum), the Modified Project would not add 50 or more vehicle trips during the A.M. or P.M. peak hours on non-event days at this intersection. Therefore, no further arterial review using CMP criteria is required.

---

[89] *In addition, the "Agreement between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures" sets forth criteria for when a freeway impact analysis should be conducted. LADOT determined as part of the Traffic Study Memorandum of Understanding for the Modified Project that the Modified Project would not meet these criteria for requiring a freeway impact analysis. Therefore, no further analysis under the City's agreement with Caltrans is required.*

Source: Fehr & Peers, 2015.

The CMP mainline freeway monitoring stations closest to the Project Site are I-10 at Budlong Avenue and I-110 at Slauson Avenue. According to the trip generation and distribution estimates discussed above, the Modified Project is projected to result in an increase of fewer than 150 trips for both the morning and evening peak hours on non-event days at both of these locations. Additionally, the Modified Project is projected to result in an increase of fewer than 150 trips for both the morning and evening peak hours on non-event days on I-110 at Exposition Boulevard and Martin Luther King, Jr. Boulevard and on I-10 at Vermont Avenue and Hoover Street, which represent the freeway segments closest to the Project Site. Since fewer than 150 trips would be added during the A.M. or P.M. peak hours to the freeways serving the study area, no further analysis of the freeway segments is required for CMP purposes.

As further discussed in the Modified Project Transportation Report (refer to Appendix P-1 of this Addendum), the Modified Project would generate an estimated 22 transit riders in A.M. peak hour and an estimated 75 transit riders in the P.M. peak hour on non-event days.[90] The Project Site is well served by numerous established local and regional transit routes, including the Metro Expo light rail transit line (with the Expo Park/USC Station located approximately 0.35 mile from the Project Site), the Metro Silver Line and numerous express bus routes on the Harbor Transitway (with the 37th Street/USC station located approximately 0.37 mile from the Project Site), four local lines, one rapid line, and two express routes operated by Metro, and two LADOT DASH routes. The total estimated capacity for transit services in the Project Site vicinity is approximately 24,380 persons in the peak hours. Furthermore, The Modified Project would utilize approximately 0.3 percent of available transit capacity during the peak hours on non-event days.

As stated in the Certified EIR, the operation of Phase I of Metro's Exposition Light Rail Transit Project was anticipated to commence in 2011, prior to the anticipated build-out of the Original Stadium Project. With a dedicated station to serve Exposition Park (the Expo Park/USC Station), the planned capacity of the Expo Line accounted for existing uses within Exposition Park, including the existing Sports Arena. The Original Stadium Project would not increase the maximum historic attendance levels on-site compared to the

---

[90] *As part of the trip generation estimates presented in Table 15 on page 158, a transit credit of 15 percent was taken for the conference, museum, retail, restaurant, and office land uses. This credit accounts for trips made to and from the Project Site using modes other than automobiles. These include trips on light-rail, bus, bicycle, walk, etc. As discussed in the Modified Project Transportation Report (refer to Appendix P-1 of this Addendum), the 15 percent transit credit is estimated to reduce Modified Project-generated trips by 16 vehicle trips during the A.M. peak hour and 54 vehicle trips during the P.M. peak hour on non-event days. Applying an average vehicle ridership (AVR) factor of 1.4, the Modified Project would generate an estimated 22 transit riders in A.M. peak hour and an estimated 75 transit riders in the P.M. peak hour on non-event days.*

existing Sports Arena, therefore, the planned capacity of the Expo Line also accounted for the potential operation of the Original Stadium Project including stadium events. Operation of the Expo Line has since commenced with the actual opening of Phase 1 in 2012, and the Expo Line currently provides service for approximately 30,300 riders on an average daily basis. Phase 2 of the Expo Line is under construction to Santa Monica and will open in spring 2016. As is the case under the Original Stadium Project, the Modified Project would replace the existing Sports Arena with an MLS stadium with a permanent seating capacity of 22,000 seats, which is within the historic attendance levels of the Sports Arena. On event days, the Project's ancillary uses would be open only to ticket-holding patrons already traveling for the event. Therefore, like the Original Stadium Project, the Modified Project's stadium would not change the event day ridership levels from those anticipated at the time the Expo Line was planned. The Applicant will, however, coordinate with Metro regarding appropriate service levels on event days, pursuant to Project Design Feature O-6.

Based on the analysis above, the Modified Project would result in less-than-significant impacts to CMP transit facilities. No mitigation measures are required.

(iii) Access

As shown in Table 16 and Table 17 on pages 160 and 161, each of the analyzed intersections that provide primary access to the Project Site are projected to operate at LOS C or better under Existing plus Project conditions and at LOS D or better under Future with Project Conditions on non-event days. Therefore, with the addition of Modified Project traffic under these conditions, no significant impact would occur.

(iv) Parking

The Certified EIR determined that the LAMC-required parking requirement for the Original Stadium Project was 4,400 parking spaces. The thresholds on which this analysis was based are stated on page IV.J-5 of the Certified EIR. At the time the Certified EIR was prepared, there were approximately 19,981 parking spaces available within the Exposition Park and USC Campus area that were generally available to meet the parking demands of the land uses within the general vicinity of the Project Site. Specifically, there were approximately 7,340 parking spaces within the Exposition Park area alone that could meet the parking demands of the Coliseum, Sports Arena, and other Exposition Park uses. As such, the Certified EIR determined that an adequate supply of parking existed within the area to meet the LAMC-required parking and the parking demands of future events held under the Original Stadium Project. Therefore, parking impacts were determined to be less than significant.

Like the Original Stadium Project, the Modified Project proposes the development of a 22,000-seat MLS stadium. Therefore, the parking demand associated with the stadium portion of the Modified Project would not change. However, an increase in parking demand beyond levels analyzed in the Certified EIR could result from the Modified Project's Ancillary Uses on non-event days, as well as from employees of the Ancillary Uses on event days. Potential parking impacts associated with each of these conditions are addressed below. The following analysis also addresses potential bicycle parking impacts, which were not analyzed in detail in the Certified EIR.

As discussed in Section III, Project Description, of this Addendum, consistent with the Original Stadium Project, parking for the Modified Project would be provided by the supply available at Exposition Park. Based on an updated parking supply inventory, as detailed in Table 1 in the Modified Project Parking Analysis included in Appendix Q of this Addendum, Exposition Park currently provides approximately 5,961 parking spaces in multiple parking lots and on streets within Exposition Park. These spaces are used by the Coliseum, the Sports Arena, the California Science Center, the Los Angeles County Natural History Museum, the California African American Museum, and other park visitors. Per the terms of the Non-Disturbance Agreement between the California Science Center and the University of Southern California, during special events at the Coliseum or Sports Arena (i.e., events with a reasonably anticipated or actual attendance of 3,000 people or more), 600 parking spaces may be reserved by the California Science Center in the Science Center Structure and 375 spaces may be reserved by the Natural History Museum in Parking Lot 3. If these reservations occur, an estimated 4,986 vehicle spaces would be available for events in the Exposition Park parking supply. The Modified Project would not alter the parking space allocations in the Non-Disturbance Agreement between the California Science Center and USC.

It should also be noted that the on-site VIP parking lot, which contains approximately 238 vehicle parking spaces, is not included in the approximately 5,961-space parking supply in Exposition Park. Under the Modified Project, this parking lot would be retained and reconfigured to provide up to approximately 250 spaces. This would increase the vehicle parking supply in Exposition Park up to approximately 6,211 spaces (5,236 on special event days if the Science Center and Natural History Museum reservations occur).

The parking requirements for the Modified Project were analyzed pursuant to LAMC Section 12.21A.4, which establishes vehicle parking space ratios based on square feet or seats, and Section 12.21A.16, which establishes requirements for bicycle parking spaces. The ratios used to determine the required number of vehicle parking spaces for the Modified Project are shown in Table 18 on page 166 and described in detail in the Modified Project Parking Analysis included in Appendix Q of this Addendum. As shown in Table 18, after applying the aforementioned LAMC parking requirements, the required parking for the

Table 18
Parking Code Analysis—Vehicle Spaces

Total Ancillary Uses (with reduction for bicycle parking)[b]			**648**

[a] *Los Angeles Municipal Code, Section 12.21A.4.*

[b] *The City of Los Angeles Bicycle Ordinance allows for replacement of required vehicle parking spaces for non-residential uses at a ratio of 1 vehicle space for every 4 bicycle spaces up to 20 percent of required spaces. Refer to Table 2 in the Modified Project Parking Analysis included in Appendix Q of this Addendum for calculations.*

Source: Fehr & Peers, 2015.

stadium component of the Modified Project on event days would be 4,400 vehicle parking spaces, consistent with the Certified EIR analysis. For non-event days, as shown in Table 18, the required parking for the Modified Project's Ancillary Uses under the LAMC is estimated at 676 vehicle parking spaces. As discussed below, the Modified Project would provide 107 bicycle parking spaces in LAMC-compliant bike racks (58 as short-term spaces and 49 as long-term spaces), thus satisfying the LAMC-required bicycle parking for the Ancillary Uses on non-event days.[91] The LAMC permits reductions in the required number of vehicle spaces at a ratio of one vehicle space reduced for every four bicycle spaces provided, up to a maximum of 20 percent of the required vehicle spaces for non-residential uses. Thus, 648 vehicle parking spaces would be required on non-event days for the Ancillary Uses when taking a credit for bicycle parking pursuant to the LAMC. Pursuant to Project Design Feature O-4, on event days, the Ancillary Uses would only be open to ticketed patrons of the stadium; thus, the 648 vehicle spaces for the Ancillary Uses would not be needed separate from the stadium requirement. However, to the extent that some

[91] *See LAMC Section 12.21A.16.*

of the Ancillary Uses may be considered additional to the typical uses considered in the LAMC requirement for a stadium, there could be some additional parking need for Ancillary Use employees on event days. As described in the Modified Project Parking Analysis, it is estimated that up to approximately 178 parking spaces may be needed for employees of the Ancillary Uses if they all were to be open during stadium events and were all considered to be additional employees beyond those normally required to operate a stadium (see Table 19 on page 168).[92] This could conservatively increase the Modified Project's potential parking need on event days to as many as 4,578 spaces (4,400 for the stadium and 178 for the additional Ancillary Uses employees), which would still be fully accommodated by the parking supply provided for events in Exposition Park (approximately 4,986 to 5,961 existing spaces and up to 5,236 to 6,211 spaces with the Modified Project). On non-event days, the parking supply provided by Exposition Park (approximately 5,961 existing spaces and up to 6,211 spaces with the Modified Project) would adequately meet the LAMC requirement of 648 vehicle parking spaces for the Modified Project's Ancillary Uses. Therefore, consistent with the conclusions in the Certified EIR for the Approved Stadium Project (refer to Section IV.J, Transportation, Traffic, and Parking, of the Certified EIR), impacts with respect to parking would be less than significant under the Modified Project on event days and non-event days. No mitigation measures are required.

With regard to bicycle parking, the Modified Project would be required to provide at least 440 bicycle parking spaces (two percent of the proposed stadium seating capacity) pursuant to the bicycle parking requirements set forth in a proposed Specific Plan amendment that would require sufficient bicycle parking to accommodate two percent of stadium seating capacity.[93]. One-hundred and seven of these spaces would be provided in LAMC-compliant bike racks (58 as short-term spaces and 49 as long-term spaces), thus satisfying the LAMC-required bicycle parking for the Ancillary Uses on non-event days. The remaining 333 would be provided through a bicycle valet service on event days. In the event that bicycle parking needs increase over time, the bicycle valet service on event days could be expanded. As discussed further in the Modified Project Parking Analysis, the proposed amount of bicycle parking would exceed the bicycle parking rates at the other recently approved professional sports stadiums, including Farmers Field in Los Angeles, Avaya Stadium in San Jose, and Levi's Stadium in Santa Clara. Therefore, the proposed

---

[92] *In order to not interfere with the parking supply available to the Coliseum on large Coliseum event days, these employees would be parked either in one or more of the following locations: (1) temporarily in the subterranean loading dock/service area beneath the Project Site; (2) in the VIP parking lot adjacent to the soccer stadium should that development option be constructed; and/or (3) in off-site parking locations to be arranged by the Applicant. If off-site location(s) are beyond 750 feet from the Project Site, shuttles would be provided to shuttle employees between the parking location(s) and the Project Site.*

[93] *The Specific Plan does not currently provide a bicycle parking requirement.*

Table 19
LAFC Employee Parking Needs

Land Use	Total Vehicle Spaces Required per LAMC Code[a]	Estimated Number of Vehicle Spaces Needed for Employees							
		Size (sf)	Employee Factor (employees/sf)[b]	No. of Employees	Transit	Rideshare	AVR	Absentee	Employee Parking Need

[c] *Museum employee density would be lower than retail. Employee factor for industrial parks used as surrogate for museum.*
Source: Fehr & Peers, 2015.

bicycle parking supply would be adequate to satisfy the anticipated bicycle parking demand of the Modified Project, and would be consistent with required bicycle parking rates with approval of the requested Specific Plan amendment. Therefore, impacts related to bicycle parking would be less than significant. No mitigation measures are required.

(v) Conclusion

As demonstrated above, the Modified Project would have less-than-significant traffic, transportation, and parking impacts during both construction and operation. Therefore, the Modified Project would not result in any new significant impacts with respect to traffic, transportation, and parking, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(c) Project Design Features and Mitigation Measures

The Modified Project would implement the following Project Design Features related to traffic, transportation, and parking:

PDF O-1: The Applicant shall coordinate construction parking through the Exposition Park General Manager. To the degree that any portion of Parking Lot 6 is required for parking for events occurring in Exposition Park during Modified Project construction, adequate parking supplies shall be provided either by requiring all construction workers to park on the Project Site during those events, or requiring the Applicant to secure temporary off-site parking facilities for event users in the numerous nearby lots (such as those maintained by the University of Southern California).

PDF O-2: If the maximum permitted amount of office floor area (i.e., 21,250 square feet) is developed, attendance at morning conference facility functions on non-event days shall be limited to 261 attendees, and attendance at evening conference facility functions on non-event days shall be limited to 430 attendees. For every reduction of 850 square feet in office space floor area that is ultimately built in the Modified Project, the number of persons attending functions in the conference facility could be increased by 5.6 persons for morning conference facility functions on non-event days, and by 3.0 persons for evening conference facility functions on non-event days.

PDF O-3: The museum, team store, other retail uses, and all restaurant uses shall not open for business until 10:00 A.M. or later.

PDF O-4: For periods at least two hours before, during, and two hours after games/events at the proposed stadium, the Ancillary Uses shall be open only to ticket-holding game/event patrons. For events at the adjacent Coliseum reasonably anticipated to equal or exceed

25,000 patrons in attendance, including USC home football games, the Ancillary Uses shall be open only to ticket-holding patrons of those events for periods at least three hours before, during, and two hours after the events.

PDF O-5: Construction activities shall be scheduled so that no more than 70 construction worker vehicles are scheduled to arrive at the Project Site between the hours of 7:00 A.M. and 9:00 A.M.

PDF O-6: The Applicant shall coordinate with Metro on appropriate service levels for Metro transit services on stadium event days, including but not limited to the Expo Light Rail.

The following mitigation measures were included in the Certified EIR to further reduce the less-than-significant traffic impacts associated with construction and operation of the Original Stadium Project. These Mitigation Measures would continue to be implemented as part of the Modified Project and have been incorporated into the MMP included with this Addendum (see Appendix A of this Addendum), but have been revised as follows to reflect the design characteristics of the Modified Project:

EIR Mitigation Measure MM G-1: The Applicant shall prepare a ~~construction-related traffic plan~~ Construction Management Plan detailing proposed haul routes and staging areas for the transportation of materials and equipment, with consideration for sensitive uses in the neighborhood. ~~A traffic and parking plan for the construction phase will~~ The Construction Management Plan shall be submitted for approval by LADOT and the Department of Building and Safety prior to the issuance of any permits. The Construction Management Plan shall include the following requirements:

- The preferred haul route to and from the Project Site shall be Martin Luther King, Jr. Boulevard to and from the Harbor Freeway. Trucks shall not be permitted to travel along local residential streets.
- A flagman shall be placed at the truck entry and exit from the Project Site onto Martin Luther King, Jr. Boulevard to control the flow of exiting trucks.
- Deliveries and pick-ups of construction materials shall be scheduled during non-peak travel periods to the degree possible and coordinated to reduce the potential of trucks waiting to load or unload for protracted periods of time.
- Access shall remain unobstructed for land uses in proximity to the Project Site during construction of the Modified Project.

- In the event of a lane or sidewalk closure, a worksite traffic control plan, approved by the City of Los Angeles, shall be implemented to route traffic or pedestrians around any such lane or sidewalk closures.
- The locations of truck staging shall be identified and measures shall be included to ensure that trucks use the specified haul route and do not travel through nearby residential neighborhoods.
- Vehicle movements shall be scheduled to minimize vehicles waiting off-site and impeding public traffic flow on the surrounding streets.
- Requirements shall be established for the loading, unloading, and storage of materials on the Project Site.
- Requirements shall be established for the temporary removal of parking spaces, time limits for the reduction of travel lanes, and closing or diversion of pedestrian facilities to ensure the safety of pedestrian and access to local businesses.
- The Applicant shall coordinate with the City and emergency service providers to ensure adequate access is maintained to the Project Site and neighboring businesses.
- If the construction periods for the Modified Project and the My Figueroa Street improvement project overlap, the Applicant shall coordinate with the City to minimize the potential combined effects of the two projects to the extent possible.

EIR Mitigation Measure MM J-1: Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. The Coliseum Commission shall schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.

EIR Mitigation Measure MM J-2: The ~~Coliseum Commission~~ Applicant shall coordinate with Metro Bus Operation Control Special Events Coordinator at 213-922-4632 and LADOT Staff regarding construction activities that may affect Metro and LADOT bus line operations.

P. Utilities and Service Systems

The following analysis is based on the Public Utilities analysis provided in Section IV.I of the Certified EIR, and on the Utility Infrastructure Technical Memorandum (Infrastructure Report) prepared for the Modified Project by Langan Engineering and Environmental Services, dated August 28, 2015, which is included in Appendix R of this

Addendum. The Infrastructure Report evaluates the potential environmental impacts associated with the proposed modifications to the Original Stadium Project under the Modified Project to determine whether such modifications would result in new significant impacts to utility infrastructure that were not already evaluated in the Certified EIR.

(a) Wastewater

The Certified EIR for the Original Stadium Project concluded that impacts with respect to wastewater infrastructure and treatment capacity would be less than significant under the Original Stadium Project (refer to Section IV.I.2, Public Utilities—Wastewater, of the Certified EIR). Specifically, the Certified EIR determined that the peak and average wastewater flows from the Project Site would not increase with implementation of the Original Stadium Project as compared to existing conditions since average and maximum attendance levels at the Project Site under the Original Stadium Project would be substantially similar to existing conditions. Therefore, the existing wastewater infrastructure in the Project Site vicinity and existing wastewater treatment facilities would be able to accommodate the Original Stadium Project's demand for wastewater conveyance and treatment, and impacts related to wastewater would be less than significant. The thresholds on which this analysis was based are stated on page IV.I-6 of the Certified EIR.

As discussed in the Certified EIR, wastewater conveyance infrastructure and treatment services for the Project area are provided by the City of Los Angeles Department of Public Works Bureau of Sanitation Division (BOS). The Project Site is serviced by multiple BOS sewers as follows:

- A sewer main in Hoover Street that is 18 inches in diameter south of South Park Drive, transitions to a 10-inch sewer line at South Park Drive and extends northerly, generally along the eastern side of South Coliseum Drive;
- 6- and 8-inch sewer laterals servicing the existing Sports Arena and other uses within Exposition Park; and
- A 72-inch-diameter North Outfall Sewer main in 41st Place, south of the Project Site.

As described in the Certified EIR and Infrastructure Report, the existing Sports Arena is serviced by four sewer laterals: two 6-inch sewer laterals on south side of the Project Site and two additional sewer laterals, 6- and 8-inches in diameter, on the north side of the Project Site. The laterals on the north side of the Project Site head east to an existing manhole, tying into the 10-inch sewer main adjacent to the south side of South Coliseum Drive/Christmas Tree Lane. The laterals on the south side of the Project Site

head west to an existing manhole, transitioning to an 8-inch sewer lateral. The 8-inch lateral continues west to an existing manhole off the existing sewer main adjacent to the east side of South Coliseum Drive. As noted above, this main is 10 inches in diameter north of South Park Drive. South of South Park Drive, it transitions to an 18-inch main, and then runs south to connect to a 72-inch North Outfall Sewer main in 41st Place.

Wastewater generated from the Project Site is conveyed via the local collector sanitary sewer system directly to the Hyperion Treatment Plant (HTP), located southwest of the Los Angeles International Airport in Playa del Rey, for treatment. The HTP has the capacity to treat approximately 450 million gallons per day (mgd) of wastewater for full secondary treatment, and currently treats approximately 362 mgd.[94] This includes wastewater currently generated on the Project Site from the existing Sports Arena. As such, the HTP is currently operating at approximately 80 percent of its capacity, with a remaining available capacity of approximately 88 mgd. The treated water from the HTP is discharged through an outfall pipe 5 miles into the Santa Monica Bay and Pacific Ocean.[95]

Wastewater impacts during construction were not analyzed in detail in the Certified EIR. Wastewater generation would occur incrementally throughout construction of the Modified Project. However, such use would be temporary and nominal when compared with the wastewater generated by operation of the Modified Project, which is analyzed below. In addition, construction workers would typically utilize portable restrooms, which would not contribute to wastewater flows to the City's wastewater conveyance system. As such, wastewater impacts during construction would be less than significant and no mitigation measures are required.

Operational wastewater impacts are assessed based on daily wastewater generation on a maximum activity day (i.e., event day). As is the case under the Original Stadium Project, the Modified Project would replace the existing Sports Arena with an MLS stadium with a permanent seating capacity of 22,000 seats, which is within the historic attendance levels of the Sports Arena. Therefore, wastewater impacts with respect to the stadium portion of the Modified Project would not represent a substantial increase in wastewater generation compared to existing conditions, consistent with the Certified EIR analysis. However, additional event-day wastewater generation beyond levels analyzed in the Certified EIR may result from operation of the Ancillary Uses proposed as part of the Modified Project. Although the estimated wastewater generation of the stadium would not

---

[94] *City of Los Angeles Department of Public Works, Bureau of Sanitation, About Wastewater—Facts and Figures, www.lacitysan.org/wastewater/factsfigures.htm, accessed July 23, 2015.*

[95] *City of Los Angeles Department of Public Works, LA Sewers Website, Treatment Plants—Hyperion Treatment Plant, www.lasewers.org/treatment_plants/hyperion/index.htm, accessed July 23, 2015.*

change compared to levels analyzed under the Certified EIR, for informational purposes, and to be consistent with BOS methodology for determining sewer line capacity, this analysis presents the estimated wastewater generation of the entire Modified Project, including the stadium component.

As shown in Table 20 on page 175, the Modified Project's total estimated wastewater flow would be approximately 87,675 gallons per day (gpd), of which 21,675 gpd would be generated by the proposed Ancillary Uses. To provide a conservative analysis, this estimate is based on gross square footage (rather than floor area). Furthermore, it does not account for the wastewater reduction requirements of the City's Green Building Code, which calls for a 20-percent reduction in wastewater through the installation of water-conserving fixtures or through utilizing Los Angeles Plumbing Code-approved non-potable water systems within a building.

A Sewer Capacity Availability Request, included in Appendix B of the Infrastructure Report provided in Appendix R of this Addendum, was obtained from the City of Los Angeles Bureau of Sanitation to evaluate the capability of the existing wastewater system to serve the Modified Project's estimated wastewater flow. Based on the current approximate flow levels and design capacities in the sewer system, and the Modified Project's estimated wastewater flow, the City determined that the existing sanitary sewer lines that serve the Project Site would have an adequate capacity to accommodate the additional infrastructure demand created by the Modified Project. Sewer service for the Modified Project would be provided utilizing new or existing sewer connections to the existing sewer main that generally runs along the east side of South Coliseum Drive within the Project Site. Except for these sewer connection pipes, no upgrades to the existing sewer mainlines are anticipated as forecasted flow levels are all below the available capacity within each of the sewers that would serve the Project Site. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.2, Public Utilities—Wastewater, of the Certified EIR), impacts with respect to wastewater infrastructure would be less than significant under the Modified Project. No mitigation measures are required.

As described above, the Hyperion Treatment Plant has a capacity of 450 mgd, and current wastewater flow levels are at 362 mgd. These flow levels include wastewater currently generated on the Project Site from the existing Sports Arena. Accordingly, the remaining available capacity at the Hyperion Treatment Plant is 88 mgd. As shown in Table 20, the Modified Project would generate a net increase wastewater flow from the Project Site of approximately 21,675 gpd, or approximately 0.022 mgd, beyond levels analyzed in the Certified EIR for the Original Stadium Project. The Modified Project's increase in average daily wastewater flow of 0.022 mgd would represent approximately 0.02 percent of the current 88 mgd remaining available capacity of the Hyperion Treatment

Table 20
Modified Project Event Day Wastewater Generation

Facility Description	Quantity	Daily Average Generation Rate (GPD)	Total Average (GPD)
Original Stadium Project Uses			
Stadium (seats filled)	22,000 seats	3/seat[a]	66,000
Additional Ancillary Uses Under Modified Project			
Conference Facilities	10,000 gsf	120/1,000 sf[b]	1,200
Museum	40,000 gsf	30/1,000 sf[c]	1,200
Team Store	15,000 gsf	50/1,000 sf[d]	750
Restaurant—Full Service	380 seats[e]	30/seat[f]	11,400
Restaurant—Fast Food	150 seats[g]	25/seat[h]	3,750
Retail	15,000 gsf	25/1,000 sf[i]	375
Office	25,000 gsf	120/1,000 sf[j]	3,000
Subtotal Additional Uses			*21,675*
Total Modified Project Demand—Typical Event Day (Stadium and Ancillary Uses)			87,675

gsf = gross square feet

Plant. Therefore, the net increase in wastewater generation associated with the Modified Project could be accommodated by the existing capacity of the Hyperion Treatment Plant. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.2, Public Utilities—Wastewater, of the Certified EIR), impacts with respect to wastewater treatment capacity would be less than significant under the Modified Project. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to wastewater, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(b) Water

The Certified EIR for the Original Stadium Project concluded that impacts with respect to water supply, infrastructure, and treatment capacity would be less than significant under the Original Stadium Project (refer to Section IV.I.2, Public Utilities—Water, of the Certified EIR). Specifically, the Certified EIR determined that the peak and average water demand from the Project Site would not increase with implementation of the Original Stadium Project as compared to existing conditions since average and maximum attendance levels at the Project Site under the Original Stadium Project would be substantially similar to existing conditions (i.e., operation of the Sports Arena). Therefore, the existing water infrastructure in the Project Site vicinity, as well as projected water supplies, would be able to accommodate the Original Stadium Project's water demand, and impacts related to water would be less than significant. The thresholds on which this analysis was based are stated on pages IV.I-17–IV.I-18 of the Certified EIR. The Certified EIR also determined that a Water Supply Assessment is not required for the Original Stadium Project pursuant to Senate Bill (SB) 610.

As discussed in the Certified EIR, water is currently supplied to the Project Site by the City of Los Angeles Department of Water and Power (LADWP). The Project Site is adjacent to several existing LADWP public water mains, including the following:

- 16-inch diameter water main in Figueroa Street;
- 61-inch diameter water main (Silver Lake Outlet Trunk Line) generally within and adjacent to Figueroa Street;
- 12-inch diameter main in Martin Luther King, Jr. Boulevard;
- 4-inch diameter main in Martin Luther King, Jr. Boulevard; and
- 8-inch diameter main in Hoover Street that extends to South Coliseum Drive.

The existing Sports Arena is currently serviced by an 8-inch lateral that runs parallel to the north side of South Park Drive, which stems from the 16-inch water main within Figueroa Street. Additionally, there are a minimum of eleven existing fire hydrants on Figueroa Street, Martin Luther King, Jr. Boulevard and South Coliseum Drive adjacent to the Project Site. Within the Project Site there is one private fire hydrant and multiple fire department connections. The private hydrant is located near the southwest corner of the existing Sports Arena footprint.

LADWP's water supply portfolio is comprised of four primary sources: the Los Angeles Aqueduct, local groundwater, purchased water from the Metropolitan Water District (MWD), and recycled water. In 2013, LADWP had an available water supply of 581,098 acre-feet, of which approximately 11 percent was from the Los Angeles Aqueduct, approximately 11 percent was from local groundwater, approximately 75 percent was from the MWD, and approximately 2 percent was from recycled water.[96] This amount does not represent the totality of water supplies available to LADWP; rather, LADWP's supply portfolio changes annually as purchases and withdrawals are made in response to projected demands within its service area. Thus, future anticipated supplies are represented in terms of projected demand. Water demand projections in five-year increments through 2035 are available in LADWP's 2010 Urban Water Management Plan (UWMP). As shown in Table 21 on page 178, the water demand for the City in 2018 (the Modified Project's buildout year) is expected to be approximately 637,120 acre-feet during average year hydrological conditions, approximately 675,340 acre-feet during a single-dry year, and approximately 675,400 acre-feet during a multiple-dry year.[97] As concluded in LADWP's 2010 UWMP, the projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years (i.e., 2018).

Additionally, as discussed in the Certified EIR, SB 610, codified in the California Water Code, Sections 10910 *et seq.*, became effective January 1, 2002. SB 610 requires counties and cities to consider the availability of adequate water supplies for certain new large development projects. These statutory provisions include requirements for both water supply assessments (WSAs) and UWMPs applicable to the California Environmental Quality Act (CEQA) process. Projects subject to CEQA requiring submittal of a WSA include the following:

- Residential developments of more than 500 dwelling units;

AFY = acre-feet per year

Source: Los Angeles Department of Water and Power, 2010 Urban Water Management Plan, Exhibits 11E–11K.

- Shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space;
- Commercial office buildings employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- Hotels, motels, or both, having more than 500 rooms;
- Industrial, manufacturing, or processing plant, or industrial park of more than 40 acres of land, more than 650,000 square feet of floor area, or employing more than 1,000 persons;
- Mixed-use projects that include one or more of the above-identified categories; or

- A project that would demand an amount of water equivalent to or greater than the amount of water required by a 500-dwelling unit project.

As analyzed below, consistent with the conclusions of the Certified EIR, a Water Supply Assessment is not required for the Modified Project pursuant to SB 610.

(i) Construction

As stated in the Certified EIR, during construction, upgrades to water service connections may cause temporary impacts on the adjacent land uses during construction. Although new service connections may occasionally result in temporary interruptions in water services for existing customers, new water service installations are generally "hot tapped" so as to avoid water service interruption. Therefore, the Certified EIR concluded that temporary disruptions in local water service during the construction period of the Original Stadium Project are not anticipated, and impacts would be less than significant. This conclusion would not change under the Modified Project, which would implement the same standard practices to ensure that potential service interruptions are avoided to the extent feasible. Additionally, while construction of the Modified Project would result in a temporary and intermittent increase in potable water demand on the Project Site for activities such as dust control, mixing and placement of concrete, equipment and site cleanup, irrigation for plant and landscaping establishment, water line testing and flushing, and other short-term related activities, construction-related demand would be substantially less than the Modified Project's operational water demand, which is analyzed below. As demonstrated through the analysis below, the Modified Project's operational water demand would be within the City's available water supply, infrastructure, and treatment capacity. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.2, Public Utilities—Water, of the Certified EIR), impacts with respect to construction-related water demand would be less than significant under the Modified Project. No mitigation measures are required.

(ii) Operation

Water demand during operation is analyzed by estimating domestic, fire (sprinkler and fire hydrant), and irrigation uses. Fire flow demands require high flow rates and constitute a relatively short term demand. Domestic and irrigation flow demands require low to moderate flow rates and constitute long term demand. An analysis of the Modified Project's demands with respect to each of these categories is provided below.

Additionally, as set forth in the Certified EIR, the existing Sports Arena hosts a variety of sports and civic events as well as concerts and shows throughout the year. As described in Table II-1 on page II-6 of the Certified EIR, the Sports Arena has hosted an average of 69 annual events, including 60 events per year with an average attendance of

4,100 persons, 6 events per year with an average attendance of 13,500 and 3 events per year with an average attendance of 37,800. Based on these data, Sports Arena events generate an average annual attendance of approximately 440,400 persons. Like the Original Stadium Project, the Modified Project proposes a 22,000-seat MLS stadium. Therefore, peak day attendance under the Modified Project is also expected to be similar to peak historic attendance levels at the Sports Arena. However, based on preliminary programming data provided by LAFC, annual attendance in the Modified Project's stadium could range from 628,500 persons to a maximum of approximately 1,403,500 persons. In addition to peak day attendance, these annual attendance estimates are relevant for determining the Modified Project's annual water demand as it relates to SB 610 requirements, as discussed below.

Fire Flow

Los Angeles Fire Code (Fire Code) Chapter 5, Section 507, establishes fire flow standards by development type. The Modified Project is within the Industrial and Commercial category, which has a required fire flow of 6,000 to 9,000 gallons per minute (gpm) from four to six fire hydrants flowing simultaneously (1,500 gpm per hydrant). The Fire Code also requires hydrants to be spaced to provide adequate coverage of the building exterior and deliver a minimum pressure of 20 pounds per square inch (psi) at full flow. Industrial and Commercial uses require one hydrant per 80,000 square feet of land area with 300 feet distance between hydrants on roads and fire lanes. Required hydrant types include 2.5-inch by 4-inch double fire hydrants or 4-inch by 4-inch double fire hydrants. Fire hydrant demands therefore act as the baseline for any water system upgrades.

The Certified EIR stated that the Original Stadium Project would be required to comply with LAFC and building code fire flow requirements for the Project Site. Based on information in the Modified Project Infrastructure Report, the hydrant coverage around the Project Site is considered adequate pursuant to LADWP and LAFD standards. Existing hydrant and/or fire department connections within the Project Site may be need to be removed and replaced as required if necessary as part of the Sports Arena demolition or if the City requires increased coverage around the Modified Project. Based on recent correspondence from LADWP, which is included in Appendix A of the Modified Project Infrastructure Report, the static water pressure at 3939 Figueroa Street is 89 psi in the high pressure system and 71 psi in the low pressure systems. Therefore, there are no known existing deficiencies in the water system that would preclude the system from being able to provide the required fire flow to the Modified Project. Upon finalization of the Modified Project design, a pressure flow report would be requested from LADWP to ensure that existing water pressure is sufficient to serve the Modified Project. Furthermore, as stated in Section IV.N.a, Public Services—Fire Protection, on page 137 of this Addendum, based on its preliminary review of the Modified Project, the LAFD has not identified any

substantial deficiencies in the fire flow infrastructure that serves the Project Site, or in the design of the Modified Project, that would prohibit the Modified Project from meeting applicable Fire Code requirements. Notwithstanding, as with the Original Stadium Project, the final fire-flow requirement for the Modified Project would be determined by the LAFD and the Applicant would be responsible for constructing any necessary infrastructure upgrades. Thus, with adherence to LAFD and Fire Code requirements for the Project Site, impacts with respect to fire flow would be less than significant, consistent with the conclusions of the Certified EIR. No mitigation measures are required.

Domestic and Irrigation Water Demand

As previously discussed, the Certified EIR determined that the peak and average water demand for the Project Site would not increase with implementation of the Original Stadium Project as compared to existing conditions since average and maximum attendance levels at the Project Site under the Original Stadium Project would be substantially similar to existing conditions. Therefore, the Certified EIR concluded that existing water infrastructure in the vicinity of the Project Site, as well as projected water supplies, would be able to accommodate the Original Stadium Project's water demand, and impacts related to water supply would be less than significant. For the same reason, the Certified EIR also determined that the Original Stadium Project would not require a Water Supply Assessment (WSA) pursuant to SB 610.

Operational impacts related to water are assessed in terms of both peak daily consumption (in relation to infrastructure capacity) and annual consumption (in relation to water supplies and SB 610 requirements). With regard to peak daily consumption, as is the case under the Original Stadium Project, the Modified Project would replace the existing Sports Arena with an MLS stadium with a permanent seating capacity of approximately 22,000 seats, which is within the historic maximum attendance levels of the Sports Arena (i.e., up to 55,132 attendees, as shown in Table II-3 in the Certified EIR). Therefore, potential water supply and infrastructure capacity impacts with respect to the stadium portion of the Modified Project during a maximum activity day (i.e., event day) would not represent a substantial increase compared to existing conditions, consistent with the Certified EIR's analysis.

However, additional event-day water consumption beyond levels analyzed in the Certified EIR may result from operation of the Ancillary Uses proposed as part of the Modified Project. Although the estimated water consumption of the stadium would not change compared to levels analyzed under the Certified EIR, for informational purposes, and to be consistent with LADWP methodology for determining pipeline capacity, this analysis presents the estimated peak daily water consumption of the entire Modified Project, including the stadium component. Furthermore, as discussed above, while maximum event day attendance in the stadium portion of the Modified Project would be

substantially the same as under the Original Stadium Project, annual attendance at the proposed stadium could increase under the Modified Project as compared to levels projected under the Original Stadium Project. Therefore, the analysis below also estimates the annual water consumption for the entire Modified Project in order to determine the Modified Project's potential water supply impacts, or whether the Modified Project would result in the need for a WSA in accordance with SB 610.

As shown in Table 22 on page 183, the Modified Project's total estimated water demand on an event day would be approximately 94,322 gpd, of which 72,647 gpd would be associated with the stadium and 21,675 gpd would be associated with the proposed Ancillary Uses. To provide a conservative analysis, this estimate is based on gross square footage (rather than floor area). Furthermore, it conservatively does not account for implementation of Project Design Feature P-1, which reflects the water conservation commitment of the Modified Project. Specifically, the Modified Project would commit to reducing indoor potable water demand by at least 20 percent below 2013 CALGreen requirements. Additionally, the Modified Project would implement Mitigation Measure MM I.2-1 in the Certified EIR, which reflects DWP requirements for new construction. Mitigation Measure MM I.2-1 has been incorporated into the MMP for the Modified Project (see Appendix A to this Addendum) with revisions to reflect current DWP requirements.

The total Modified Project demand of 94,322 gpd on an event day converts to a peak flow demand of approximately 66 gallons per minute (gpm). Utilizing a peaking factor of 3, the peak demand on an event day would be 198 gpm. This is significantly lower than the fire flow requirement of 1,500 gpm from a single hydrant discussed above. Thus, sufficient infrastructure capacity would be available to accommodate the Modified Project's daily water demand on an event day. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.2, Public Utilities—Water, of the Certified EIR), impacts with respect to water infrastructure would be less than significant under the Modified Project. No mitigation measures are required.

Annual water demand has also been evaluated to determine whether the Modified Project would result in the need for a WSA in accordance with SB 610. As summarized above and described in detail in the Certified EIR, existing events within the Sports Arena have generated an average annual attendance of 440,400 persons. Using a per patron water demand rate of 8.8778 units, consistent with LADWP's methodology for analyzing annual water demand associated with professional sports stadiums,[98] this average

annual attendance generates an annual demand for approximately 3.9 million gallons (11.97 acre-ft) of water. As discussed above, based on preliminary programming data provided by LAFC, annual attendance would range from 628,500 persons to a maximum of approximately 1,403,500 persons under the Modified Project. Based on water demand from the maximum annual attendance projected for events, the proposed Ancillary Uses, and use of irrigation, the annual water demand for the Modified Project was estimated and is summarized in Table 23 on page 185. As shown therein, the Modified Project would result in a net annual water demand of approximately 15,094,769 gallons, or 46 acre-feet. This estimate is highly conservative in that it is based on the following assumptions:

- Maximum number of potential events occurring at the proposed stadium with maximum potential attendance;
- Irrigation occurring four days a week, year-round, for each square foot of landscaped surface; and
- Gross square feet rather than floor area for the proposed Ancillary Uses.

As shown in Table 21 on page 178, the water demand for the City in 2018 (the Modified Project's buildout year) is expected to be approximately 637,120 acre-feet during average year hydrological conditions, approximately 675,340 acre-feet during a single-dry year, and approximately 675,400 acre-feet during a multiple-dry year.[99] As concluded in LADWP's 2010 UWMP, the projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years (i.e., 2018). The Modified Project's estimated net increase in water demand of approximately 46 acre-feet per year would comprise less than 0.008 percent of the water demand for the City in 2018 during an

[99] *Year 2018 estimates are based on a linear interpolation of 2015–2020 data.*

Table 23
Modified Project Annual Water Consumption

Event	Max Quantity (days)	Max Capacity/ Unit	Daily Average Consumption Rate (GPD)	Total (gallons)

average year, single-dry year, and multiple-dry year period. Therefore, the Modified Project would be well within the available and projected water supplies for normal, single-dry, and multiple-dry years for the Modified Project build-out year, as such, LADWP would be able to meet the water demand for the Modified Project as well as existing and planned water demands of its future service area.

LADWP's water supplies are facing challenges due to environmental concerns and litigation associated with LADWP's sources of water supply. Additionally, changes in hydrological conditions due to climate change could also have an impact on MWD's water supplies. However, along with MWD's water management and reliability initiatives, LADWP is committed to, as outlined in the 2010 Urban Water Management Plan, providing a reliable water supply for the City. The 2010 Urban Water Management Plan takes into account the realities of climate change and the concerns of drought and dry weather and notes that the City will meet all new demand for water due to projected population growth through a combination of water conservation and water recycling. The 2010 Urban Water Management Plan addresses the current and future State Water Project supply shortages. However, the 2010 Urban Water Management Plan specifically concludes that MWD's actions in response to the threats to the State Water Project will ensure continued reliability of its water deliveries. Furthermore, by focusing on demand reduction, LADWP will ensure that long-term dependence on MWD supplies will not be exacerbated by potential future

shortages. Additionally, water conservation and recycling will play an increasing role in meeting future water demands.

With regard to SB 610 requirements, conservatively using the Bureau of Sanitation wastewater generation rate for a one-bedroom dwelling unit of 110 gallons per day per dwelling unit, 500 residential units generate a demand of approximately 20,075,000 gallons of water per year, or 61.6 acre-ft. As discussed above, the net annual water demand for the Modified Project is well below this number. As such, consistent with the conclusions of the Certified EIR, a Water Supply Assessment is not required for the Modified Project pursuant to SB 610.

Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.2, Public Utilities—Water, of the Certified EIR), operational impacts with respect water supply and infrastructure capacity would be less than significant under the Modified Project. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to water supply and infrastructure capacity, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(iii) Project Design Features and Mitigation Measures

The Modified Project would implement the following Project Design Features related to water:

PDF P-1: The Modified Project would reduce indoor potable water demand by at least 20 percent below Section 5.303.3 of the 2013 California Green Building Standards Code—January 1, 2014, Errata.

The following mitigation measure was included in the Certified EIR to further reduce the Original Stadium Project's less-than-significant impacts with respect to water. This Mitigation Measure would continue to be implemented as part of the Modified Project and has been incorporated into the MMP for the Modified Project included in Appendix A of this Addendum, but has been revised as follows to reflect current City conservation requirements:

EIR Mitigation Measure MM I.2-1: The Project shall comply with Ordinance No. 170,978 (Water Management Ordinance), which imposes numerous water conservation measures in landscape, installation, and maintenance (e.g., use drip irrigation and soak hoses in lieu of sprinklers to lower the amount of water lost to evaporation and

overspray, set automatic sprinkler systems to irrigate during the early morning or evening hours to minimize water loss due to evaporation, and water less in the cooler months and during the rainy season). In addition, the Department of Water and Power requires the following conservation measures for all new development in the City of Los Angeles:

- High-efficiency toilets (1.28 gallons per flush or less, includes dual flush);
- High-efficiency dual flush toilets in single-use bathrooms;
- High-efficiency urinals (~~0.5~~ 0.125 gallons per flush or less, includes waterless urinals);
- Restroom faucet flow rate of ~~1.5~~ 0.35 gallons per minute or less;
- Public restroom self-closing faucets;
- Showerhead flow rate of ~~2.0~~ 1.5 gallons per minute or less;
- Limit of one showerhead per shower stall;
- High-efficiency clothes washers (water factor of 6.0 or less);
- High-efficiency dishwashers (ENERGY STAR rated);
- Use of tankless and on-demand water heaters as feasible;
- Cooling towers must be operated at a minimum of 5.5 cycles of concentration;
- Require onsite water recycling systems for wastewater discharge for commercial laundries, dye houses, food processing, certain manufacturing operations, etc. (subject to a payback threshold of five years or less). Mandate water recycling system for all new car wash facilities.
- Strict prohibition of single-pass cooling; (Note: Single-pass cooling refers to the use of potable water to extract heat from process equipment)
- Irrigation system requirements:
  - Weather-based irrigation controller with rain shutoff;
  - Flow sensor and master valve shutoff (large landscapes);
  - Matched precipitation (flow) rates for sprinkler heads;
  - Drip/microspray/subsurface irrigation where appropriate;
  - Minimum irrigation system distribution uniformity of 75 percent;

  - Proper hydro-zoning, turf minimization and use of native/drought tolerant plant materials;
  - Use of landscape contouring to minimize precipitation runoff;
- Metering:
  - All irrigated landscapes of 5,000 square feet or more require separate metering or submetering;
- Mandated use of recycled water (where available) for appropriate end uses (irrigation, cooling towers, sanitary);
- Standard Urban Stormwater Mitigation Plan (SUSMP): Compliance with all City of Los Angeles SUSMP requirements, and encouraging implementation of Best Management Practices that have stormwater recharge or reuse benefits.

(c) Solid Waste

The Certified EIR for the Original Stadium Project determined that the amount of solid waste generated during construction and operation of the Original Stadium Project would fall within the available permitted capacity of area landfills and recycling centers (refer to Section IV.I.4, Public Utilities—Solid Waste, of the Certified EIR). Therefore, the Certified EIR concluded that solid waste impacts associated with construction and operation would be less than significant. The thresholds on which this analysis was based are stated on pages IV.I-30–IV.I-31 of the Certified EIR. Although impacts would be less than significant, the Certified EIR included Mitigation Measures I.4-1 and I.4-2, which requires implementation of recycling programs during construction and operation, respectively, to further ensure that potential solid waste impacts remain less than significant.

As stated in the Certified EIR, construction of the Original Stadium Project would require the demolition of the existing Sports Arena. The Certified EIR estimated that approximately 5.4 million cubic feet of debris would be generated from this activity. Construction debris from building activities would also be generated included concrete, asphalt, wood, drywall, metals, and a variety of other miscellaneous and composite materials. The Certified EIR concluded that the amount of solid waste generated during construction would fall within the available permitted daily intake capacity of area landfills and recycling centers. Therefore, impacts associated with demolition and construction debris would be less than significant under the Original Stadium Project.

Like the Original Stadium Project, the Modified Project would require the demolition of the existing Sports Arena. The estimated amount of demolition debris from the Sports Arena (5.4 million cubic feet of debris according to the Certified EIR) would not change

under the Modified Project. As shown in Table 25 on page 191, construction of the Modified Project's stadium and Ancillary Uses would generate an estimated 1,478 tons of solid waste. Combined with the demolition of the Sports Arena, which was addressed in the Certified EIR but is provided herein for informational purposes, Modified Project demolition and construction activities would generate a total of 121,478 tons of solid waste. This estimate is conservative in that it does not account for implementation of Project Design Feature P-2, which reflects the Modified Project's commitment to utilize building materials with at least 20 percent recycled-contents. Additionally, pursuant to revised Mitigation Measure I.4-1, the Modified Project would implement a construction waste management plan to achieve a minimum 75-percent diversion from landfills, which exceeds the City of Los Angeles Green Building Code (Ordinance No. 181,480) requirement of 50 percent. Mitigation Measure I.4-1 from the Certified EIR has been incorporated into the Modified Project's MMP included as Appendix A to this Addendum, and has been revised to reflect the specific diversion rate that would be implemented under the Modified Project. Therefore, following the implementation of this measure, a total of approximately 30,370 tons of construction and demolition waste from the Modified Project would be disposed of in area landfills that accept construction and demolition waste generated within the City of Los Angeles. As shown in Table 26 on page 192, the combined estimated remaining permitted capacity of these landfills is 156.28 million tons. The Modified Project's estimated generation of construction and demolition waste would represent approximately 0.02 percent of this total. Therefore, the landfills that serve the Project Site would have sufficient capacity to accommodate the Modified Project's construction and demolition-related solid waste disposal needs. Accordingly, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.4, Public Utilities—Solid Waste, of the Certified EIR), impacts with respect to solid waste generation during construction would be less than significant under the Modified Project, and would be further reduced through implementation of Mitigation Measure I.4-1 and Project Design Feature P-2. No additional mitigation measures are required.

With respect to solid waste generated during operation, the Certified EIR concluded that implementation of the Original Stadium Project would not result in a substantial change in the amount of solid waste generated at the Project Site on an event day because the Original Stadium Project would redevelop the Project Site with the same general use (i.e., sports stadium) that currently exists on-site, and maximum attendance of the stadium would be within historic attendance levels of the Sports Arena. Therefore, the Certified EIR concluded that any additional solid waste generated by the Original Stadium Project would not result in significant impacts on solid waste services.

As is the case under the Original Stadium Project, the Modified Project would replace the existing Sports Arena with an MLS stadium with a permanent seating capacity of 22,000 seats. Therefore, impacts associated with the stadium portion of the Modified

Table 25
Demolition and Construction Waste Generated by the Modified Project

Land Use	Size (gsf)	Generation Rate[a] (lbs/sf)	Total (tons)
Demolition			
Sports Arena	—	—	120,000[b]
Construction			
MLS Stadium	641,000	3.89	1,247
Ancillary Uses			
Conference Facilities	10,000	3.89	19

Restaurant	14,000	3.89	27
Office	25,000	3.89	49
Subtotal for Construction	—	—	*1,478*
Total (prior to recycling)			**121,478**
Total (after 75 percent recycling)			**30,370**

gsf = gross square feet

lbs = pounds

[a] *U.S. Environmental Protection Agency, Report No. EPA530-98-010, Characterization of Building-Related Construction and Demolition Debris in the United States, June 1998.*

[b] *Based on information in the Certified EIR (i.e., 5.4 million cubic feet) and applying a conversion factor of 1,200 lbs/cubic yard for construction and demolition waste (Source: County of Los Angeles, Countywide Integrated Waste Management Plan, 2013 Annual Report, Permitted Large Volume Solid Waste Transfer and Processing Facilities in Los Angeles County in 2013, Appendix E-4).*

Source: Eyestone Environmental, 2015.

Project would not change compared to levels analyzed in the Certified EIR. However, the Modified Project would include additional Ancillary Uses, which would operate in conjunction with the stadium on event days and could increase solid waste generation on maximum generation days as compared to levels analyzed in the Certified EIR. As shown in Table 27 on page 193, the Modified Project's Ancillary Uses would have the potential to generate an additional 348 tons of solid waste per year. This estimate is conservative as it does not account for the solid waste reduction features provided for in Project Design Feature P-3, below, or implementation of Mitigation Measure I.4-2 in the Certified EIR, which requires implementation of an on-site recycling plan to achieve an operational diversion rate of at least 40 percent. These measures are anticipated to substantially reduce solid waste generated by the Modified Project.

Table 26
Solid Waste Disposal and Estimated Remaining Capacity for Landfills That Serve the City of Los Angeles[a]

Source: Eyestone Environmental, 2015.

within the City of Los Angeles is estimated to be approximately 93.94 million tons. The estimated additional generation of 348 annual tons of solid waste from the Modified Project's Ancillary Uses would represent approximately 0.0004 percent of this total each year. Furthermore, the additional solid waste disposal associated with the Modified Project's Ancillary Uses would represent approximately 0.009 percent of the City's annual solid waste disposal quantity at these landfills in 2013 (i.e., approximately 3.8 million tons, as shown in Table 26 on page 192). Therefore, the Modified Project's estimated increase in solid waste generation as compared to levels analyzed in the Certified EIR would increase the City's solid waste stream by a negligible amount, and the landfills that serve the Project Site would have sufficient capacity to accommodate the Modified Project's operational solid waste disposal needs. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.4, Public Utilities—Solid Waste, of the Certified EIR), impacts with respect to solid waste generation during operation would be less than significant under the Modified Project, and would be further reduced through implementation of Mitigation Measure I.4-2. No additional mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect to solid waste, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(i) Project Design Features and Mitigation Measures

The Modified Project would implement the following Project Design Features related to solid waste:

PDF P-2: A minimum of 20 percent of all Construction Specifications Institute (CSI) divisions three through ten building materials and products for development, measured by cost, shall consist of pre-consumer and post-consumer recycled content and shall be manufactured within a 500-mile radius of the Project Site.

PDF P-3: During operation, the Modified Project shall:

- Divert solid waste from landfills through robust recycling, the donation of durable goods, and implementing a front-of-house composting program that includes sourcing biodegradable concessions packaging. The composting program shall incorporate appropriate odor management practices to reduce odor emissions at adjacent receptors. Examples of such practices include nutrient balance, temperature, moisture content, and aeration control.
- Utilize a minimum of 90 percent of on-going consumable paper, janitorial, and lighting products that meet the following criteria:
  - Bio-based materials and/or chemicals
  - Minimal presence of exposure to potentially harmful chemicals
  - No Volatile Organic Compounds (VOC)
  - Biodegradable
  - Non-toxic
  - Low flammability

The following mitigation measures were included in the Certified EIR to further reduce the Original Stadium Project's less-than-significant impacts with respect to solid waste. These Mitigation Measures would continue to be implemented as part of the Modified Project and have been incorporated into the MMP for the Modified Project included in Appendix A of this Addendum, but have been revised as follows to reflect the specific solid waste diversion commitment of the Modified Project:

EIR Mitigation Measure MM I.4-1: The ~~Project~~ Applicant shall develop a construction and demolition debris recycling program to divert a minimum of 75 percent of construction related solid waste and demolition debris from area landfills.

EIR Mitigation Measure MM I.4-2: The ~~Project~~ Applicant shall develop an operational project recycling plan that includes the design and allocation of recycling collection and storage space in the Project. The Applicant shall demonstrate through annual compliance reports submitted to the City of Los Angeles Department of Public Works, Bureau of Sanitation, an annual operational diversion rate of at least 40 percent.

(d) Energy

The Certified EIR for the Original Stadium Project concluded that impacts with respect to energy conservation would be less than significant under the Original Stadium Project (refer to Section IV.I.3, Public Utilities—Energy Conservation, of the Certified EIR). The thresholds on which this analysis was based are stated on page IV.I-23 of the Certified EIR. Specifically, the Certified EIR determined that energy demands during construction would be typical of construction projects for similarly sized projects and would not necessitate additional energy facilities or distribution of infrastructure. During operation, peak and average electricity and natural gas demand from the Project Site would not increase compared to the existing conditions since average and maximum attendance levels at the Project Site under the Original Stadium Project would be substantially similar to existing conditions (i.e., operation of the Sports Arena). Therefore, the Certified EIR concluded that the existing electricity and natural gas infrastructure and supplies would be able to accommodate the Original Stadium Project's energy demand, and impacts related to energy conservation would be less than significant.

As discussed in the Certified EIR, electricity is supplied to the Project Site by the Los Angeles Department of Water and Power (LADWP). LADWP generates power from a variety of energy sources including hydropower, coal, gas, nuclear sources, and renewable resources such as wind, solar, and geothermal sources. According to LADWP's 2014 Power Integrated Resource Plan, LADWP has a net dependable generation capacity greater than 7,639 megawatts (MW).[100] During the 2013 fiscal year, the most recent year for which data is available, LADWP delivered a total of approximately 23.5 million megawatt-hours (MWh) of electricity to its customers.[101] Approximately 23 percent of

[100] *LADWP, 2014 Power Integrated Resource Plan, Section 1, Introduction, page 17, www.ladwp.com/ladwp/faces/wcnav_externalId/a-p-doc?_adf.ctrl-state=10f8usiiei_38&_afrLoop=1466297694517747, accessed August 11, 2015.*

[101] *LADWP, Power Facts and Figures, www.ladwp.com/ladwp/faces/ladwp/aboutus/a-power/a-p-factand figures?_adf.ctrl-state=10f8usiiei_38&_afrLoop=1466462244888847, accessed August 11, 2015.*

LADWP's 2013 electricity purchases were from renewable sources, compared to 19 percent statewide.[102]

The Project Site is served by multiple underground electrical service conduit distribution systems along South Coliseum Drive, Martin Luther King, Jr. Boulevard, and Figueroa Street. There is also a series of above-ground power poles along the east side of Hoover Street. These poles support overhead power lines along Hoover Street and east along the southern limits of the Project Site, terminating just east of the existing VIP parking lot. At the point of termination, two underground conduits stem from the power pole, providing primary power to the Sports Arena.

As discussed in the Certified EIR, natural gas is supplied to the Project Site by the Southern California Gas Company (SCG). SCG receives gas supplies from several sedimentary basins in the western United States and Canada, including supply basins located in New Mexico (San Juan Basin), West Texas (Permian Basin), the Rocky Mountains, and Western Canada as well as local California supplies.[103] Gas supply available to SCG from all sources was approximately 2.8 billion cubic feet (cf) per day in 2013 (the most recent year for which data are available).[104]

The Project Site is adjacent to several existing SCG mains as follows:

- 3-inch diameter lateral servicing the existing Sports Arena;
- 4-inch diameter main in South Coliseum Drive just north of the intersection with South Park Drive; and
- 12-inch diameter gas main in Martin Luther King, Jr. Boulevard.

Energy demands are also generated by mobile sources. According to the California Energy Commission, transportation accounts for nearly 40 percent of California's total energy consumption.[105] In 2013, California consumed 14.53 billion gallons of gasoline and

2.74 billion gallons of diesel fuel.[106] Petroleum-based fuels currently account for 92 percent of California's transportation energy sources.[107] Over the last decade California has implemented several policies, rules, and regulations to improve vehicle efficiency, increase the development and use of alternative fuels, reduce air pollutants and GHGs from the transportation sector, and reduce vehicle miles traveled (VMT). Accordingly, gasoline consumption in California has declined. The California Energy Commission predicts that the demand for gasoline will continue to decline over the next ten years and there will be an increase in the use of alternative fuels.[108]

(i) Construction

As stated in the Certified EIR, during construction, energy would be consumed during the demolition, excavation, and construction phases of the Original Stadium Project. The Certified EIR determined that energy demands during construction would be typical of construction projects of similar types and sizes and would not necessitate additional energy facilities or distribution infrastructure. Therefore, the Certified EIR concluded that energy demands during construction would be less than significant. The Modified Project includes design changes to the proposed stadium and additional construction associated with the proposed Ancillary Uses. Therefore, the Modified Project could result in additional energy consumption during the construction phases beyond levels analyzed in the Certified EIR. Accordingly, the analysis below presents an estimate of the construction-related energy consumption of the entire Modified Project, including the proposed stadium.

As shown in Table 28 on page 198, approximately 59,767 kWh of electricity, approximately 121,516 gallons of gasoline, and approximately 217,244 gallons of diesel fuel would be consumed during Modified Project construction. Electricity would be consumed during the conveyance of the water used to control fugitive dust, as well as to provide electricity for temporary lighting and other general construction activities. Overall, construction activities associated with the Modified Project would require limited electricity use that would not have an adverse impact on available electricity supplies. Construction activities typically do not involve the consumption of natural gas. The petroleum-based fuel use summary provided in Table 28 represents the highest amount of energy that could be

Off-Road Equipment	Gallons	0
Total	**Gallons**	**121,516**
Diesel		
On-Road Vehicles	Gallons	102,393
Off-Road Equipment	Gallons	114,852
Total	**Gallons**	**217,244**

kWh = kilowatt hours

[a] *Energy usage during Project construction is calculated for the duration of the construction period.*

[b] *Electricity usage associated with lighting during construction and other construction activities necessitating electrical power is not easily quantifiable. Such electricity demand would be nominal and temporary and would cease upon the completion of construction.*

Source: Eyestone Environmental, 2015. Calculation worksheets are provided in Appendix S of this Addendum.

consumed during Modified Project construction. While construction activities would consume petroleum-based fuels, consumption of such resources would be temporary and would cease upon the completion of construction. Consistent with the conclusions in the Certified EIR, energy demands during Modified Project construction would be typical of construction projects of similar types and sizes, and would not necessitate additional energy facilities or distribution infrastructure. Thus, the Modified Project's consumption of electricity and transportation-fuel would continue to be temporary and typical of similarly sized construction projects. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.3, Public Utilities—Energy Conservation, of the Certified EIR), impacts with respect to construction-related energy demand would be less than significant under the Modified Project. No mitigation measures are required.

(ii) Operation

The Certified EIR determined that peak and average electricity and natural gas demand from the Project Site would not increase since average and maximum attendance levels at the Project Site under the Original Stadium Project would be substantially similar to existing conditions (i.e., operation of the Sports Arena). Therefore, the Certified EIR determined that existing electricity and natural gas infrastructure and supplies would be able to accommodate the Original Stadium Project's energy demand, and impacts related to energy would be less than significant. While impacts would be less than significant, the Certified EIR included mitigation measures to reflect LADWP-recommended energy efficiency features, which would further reduce impacts. As the Modified Project includes design changes to the proposed stadium, changes to the stadium's operational program, and additional construction associated with the Ancillary Uses, the Modified Project could result in additional energy consumption beyond levels analyzed in the Certified EIR. Accordingly, the analysis below presents an estimate of the operational-related energy consumption of the entire Modified Project, including the proposed stadium.

Operational impacts related to energy are assessed in terms of both peak daily consumption (in relation to infrastructure capacity) and annual consumption (in relation to supplies and overall energy efficiency). With regard to peak daily consumption, as is the case under the Original Stadium Project, the Modified Project would replace the existing Sports Arena with an MLS stadium with a permanent seating capacity of approximately 22,000 seats, which is within the historic peak attendance level of the Sports Arena (i.e., a maximum attendance of 55,132 attendees was recorded in 2009, as shown in Table II-3 in the Certified EIR). In addition, the Modified Project would implement energy conservation features under the Los Angeles Green Building Code that were not required when the Original Stadium Project was approved. Therefore, energy impacts with respect to the stadium portion of the Modified Project during a maximum activity day (i.e., event day) would not represent a substantial increase in energy consumption compared to existing conditions, consistent with the Certified EIR's analysis.

However, additional event-day electricity and natural gas consumption beyond levels analyzed in the Certified EIR would result from concurrent operation of the Ancillary Uses proposed as part of the Modified Project. Although the estimated electricity and natural gas consumption of the stadium would not change compared to levels analyzed under the Certified EIR, for informational purposes, this analysis presents the estimated peak daily electricity and natural gas consumption of the entire Modified Project, including the stadium component, on an event day.

As shown in Table 29 and Table 30 on pages 200 and 201, the Modified Project's total estimated electricity demand on an event day would be approximately

Table 29
Modified Project Event Day Electricity Consumption

Facility Description	Quantity	Consumption Rate (kWh/unit/year)[a]	Total Average (kWh/day)[b]
Original Stadium Project Uses			
Stadium	253,400 gsf	53.30[c,d]	37,003
Additional Ancillary Uses Under Modified Project			
Conference Facilities	10,000 gsf	10.5[e]	288
Museum	40,000 gsf	10.5[e]	1,151
Team Store and Other Retail	30,000 gsf	13.55	1,114
Restaurant	14,000 gsf	47.45	1,820
Office	25,000 gsf	12.95	887
Subtotal Additional Uses			*5,260*
Total Modified Project Demand—Event Day (Stadium and Ancillary Uses)			**42,263**

gsf = gross square feet

[a] *Usage Factors are based on Table A9-11-A of SCAQMD CEQA Air Quality Handbook, April 1993.*

[b] *Annual consumption/365 days per year.*

[c] *Based on the Infrastructure Report included in Appendix R of this Addendum. Uses higher "event day" consumption rate for stadium as the stadium would consume more electricity on event days compared to non-event days.*

[d] *Corresponding rate not available for this land use. Therefore, the highest rate, "Food Store," was applied.*

42,263 kilowatt-hours (kWH), of which 37,003 kWh would be associated with the stadium and 5,260 kWh would be associated with the proposed Ancillary Uses. The Modified Project's total estimated natural gas demand on an event day would be approximately 140 therms[109] per day, of which 16 therms would be associated with the outdoor stadium and 124 therms would be associated with the proposed Ancillary Uses. To provide a conservative analysis, these estimates are based on gross square footage (rather than floor area). Furthermore, they conservatively do not account for implementation of the energy conservation features discussed below.

[109] *1 Therm = 100,000 British thermal units (Btu) = 100 cubic foot (sf).*

Table 30
Modified Project Event Day Natural Gas Consumption

According to the Infrastructure Report, off-site electrical and natural gas service is available for the Project Site, and LADWP and SCG have confirmed that existing infrastructure has adequate capacity to serve the peak demand of the Modified Project (see Appendix R, Infrastructure Report). As stated in the Certified EIR, depending on the exact location and size of the requested services (to be determined as site plans are finalized), the Applicant may be financially responsible for some on-site infrastructure improvements. Such improvements may include installation of meters and/or service lateral connections, or the relocation of service laterals or the undergrounding of power lines necessary to serve the Project Site. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.3, Public Utilities—Energy Conservation, of the Certified EIR), impacts with respect to electricity and natural gas infrastructure would be less than significant under the Modified Project. No mitigation measures are required.

While the stadium's energy demand on an event day would be substantially the same as that of the Original Stadium Project (i.e., comparable or less than existing event-

day demand under the Sports Arena), the number of events held at the stadium on an annual basis could increase under the Modified Project as compared to levels projected under the Original Stadium Project. As shown in Table II-2 and Table II-3 in Section II, Project Description, of the Certified EIR, the existing Sports Arena hosts an average of 69 events a year (29 weekday events and 40 weekend events). Based on the programming proposed for the Modified Project, up to 88 stadium events could occur each year. In addition, the proposed Ancillary Uses would be operational up to seven days a week. Therefore, the following analysis estimates the annual operational energy consumption for the entire Modified Project to assess (1) whether adequate energy supplies are available to serve the Modified Project, and (2) the extent to which the Modified Project would incorporate energy conservation features to avoid wasteful, inefficient, and unnecessary consumption of energy. In accordance with Appendix F of the CEQA Guidelines, the estimate of the Modified Project's annual energy consumption includes estimated transportation energy consumption.

As shown in Table 31 on page 203, a total of approximately 5,019,673kWh of electricity, approximately 50,978 therms of natural gas, approximately 1,057,248 gallons of gasoline, and approximately 180,542 gallons of diesel fuel would be consumed annually during Modified Project operation. The annual electricity and natural gas shown in Table 31, reflects the Modified Project's consumption of electricity and natural gas after implementation of project design features, regulatory requirements, and mitigation measures, which are provided below. The Modified Project would comply with the required measures of the 2013 Los Angeles Green Building Code and implement additional efficiency measures to achieve a reduction in energy consumption that is greater than 25 percent relative to the ASHRAE 90.1-2007 standard, but no less than minimum compliance with the 2013 California energy efficiency standards (Title 24, Part 6). The 2013 CALGreen Code (applicable to the Modified Project) is anticipated to be 30 percent more efficient than the 2008 Title 24 (applicable to the Original Stadium Project) for nonresidential construction.[110] Therefore, while the Modified Project would represent an increase in annual energy consumption over existing conditions with the Sports Arena due to the additional number of events and proposed Ancillary Uses, the Modified Project would be more energy efficient than both the Sports Arena and the Original Stadium Project. With regard to transportation energy consumption, the gasoline and diesel fuel usage estimates provided reflect internalization and the use of transit by people visiting the Project Site. In particular, the Expo Light Rail Line had not been completed when the

[110] *California Energy Commission, Energy Commission Approves More Efficient Buildings for California's Future, May 31, 2012, www.energy.ca.gov/releases/2012_releases/2012-05-31_energy_commission_approves_more_efficient_buildings_nr.html, accessed August 10, 2015.*

Table 31
Summary of Annual Energy Use During Modified Project Operation

	Unit	Existing Sports Arena[a]	Modified Project Without Project Features[b,c]	Modified Project With Project Features	Percent Reduction from Project Features	Net Annual Energy Use
Electricity						
Electricity (building)	kWh/Year	2,207,477	6,012,376	4,809,901	-20%	2,602,424
Electricity (water)	kWh/Year	41,242	239,793	209,772	-13%	168,530
Total Electricity	kWh/Year	2,248,719	6,252,169	5,019,673	-20%	2,770,954
Natural Gas	Therms	48,316	50,978	50,978	0%	2,662
Mobile						
Gasoline	Gallons	277,274	1,464,954	1,057,248	-28%	779,974

Original Stadium Project was analyzed in the Certified EIR. This rail line now provides substantial access to the Project vicinity via public transit and provides a substantial source of conservation of transportation energy. As shown in Table 31 on page 203, the Modified Project's conservation features would result in a reduction of energy use of 12 to 20 percent. Therefore, the Modified Project would not result in the wasteful, inefficient, or unnecessary consumption of energy.

With respect to energy supplies, the Modified Project would result in a net increase in 2,770,954 kWh/year in electricity consumption when accounting for the removal of the existing Sports Arena. Based on LADWP's 2014 Power Integrated Resource Plan, LADWP forecasts that its total energy sales in 2018 (the Modified Project's buildout year) will be 22,807 gigawatt-hours (GWh) of electricity.[111,112] As such, the Modified Project-related net increase in annual electricity consumption of 2,770,954 kWh/year would represent approximately 0.01 percent of LADWP's projected sales (i.e., supplies) in 2018. Therefore, it is anticipated that LADWP's existing and planned electricity supplies would be sufficient to support the Modified Project's electricity demand. Impacts would be less than significant and no mitigation is required.

As stated above, the Modified Project's estimated net increase in annual gas consumption is 50,978 therms. Based on the California Energy Commission's staff demand forecast for the 2014–2024 period, annual natural gas supply within SoCalGas's service area is estimated to be approximately 7,161 million therms in 2018. [113,114] Therefore, the Modified Project would account for approximately 0.001 percent of the 2018 forecasted consumption in SCG's planning area. Therefore, it is anticipated that SCG's existing and planned natural gas supplies would be sufficient to support the Modified Project's net increase in demand for natural gas. Impacts would be less than significant and no mitigation is required.

---

[111] *LADWP defines its future electricity supplies in terms of sales that will be realized at the meter.*

[113] *Demand was interpolated between 2015 and 2020 estimates.*

[114] *The California Energy Commission's forecast includes three scenarios: a high energy demand case, a low energy demand case, and a mid energy demand case. The consumption forecast for the low energy demand case is used in this calculation to provide a conservative analysis of the Project (i.e., the Project would represent a greater percentage of overall demand under this scenario). California Energy Commission, Commission Final Report, California Energy Demand 2014–2024 Final Forecast, January 2014, p. 63, www.energy.ca.gov/2013publications/CEC-200-2013-004/CEC-200-2013-004-V1-CMF.pdf, accessed August 12, 2015.*

Based on the analysis above, and consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.I.3, Public Utilities—Energy Conservation, of the Certified EIR), impacts with respect to operational-related energy demand would be less than significant under the Modified Project. Accordingly, the Modified Project would not result in any new significant impacts with respect to operational-related energy demand, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(iii) Project Design Features and Mitigation Measures

The Modified Project would incorporate sustainability as part of its key design and operation criteria. In so doing, the Modified Project would comply with Title 24 of the California Code of Regulations, including Part 6 (Energy Efficiency Standards for Residential and Nonresidential Buildings) and Part 11 (California Green Building Standards Code, commonly referred to as the CALGreen Code), as well as the City of Los Angeles Green Building Code (2013), which incorporates the CALGreen Code into Chapter IX of the LAMC, in effect at the time of the Modified Project's permit application. The Modified Project would also be designed to be capable of achieving at least Silver certification under the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED)-BD+C or LEED-ND Rating System (v.3), or equivalent green building standards.

The Modified Project would also implement the following Project Design Features related to energy conservation:

PDF P-4: The Modified Project shall explore the feasibility of additional energy efficiency options as applicable to demonstrate compliance with AIA2030 challenge goal of 60-percent reduction from the 2003 Commercial Building Energy Consumption Standard (CBECS) for "Public Assembly—Recreation" facilities. The CBECS baseline for similar building types is 65 kBtu/sf. In order to achieve a 60-percent reduction the Modified Project shall investigate setting an energy consumption goal of 26 kBtu/sf.

PDF P-5: The Modified Project shall explore the feasibility of achieving a 10-percent reduction in energy use below the 2013 California energy efficiency standards (Title 24, Part 6). In so doing, the Modified Project shall register for the savings of the design program.

The following mitigation measures were included in the Certified EIR to further reduce the Original Stadium Project's less-than-significant impacts with respect to energy. These mitigation measures would continue to be implemented as part of the Modified Project and has been incorporated into the MMP for the Modified Project included in

Appendix A of this Addendum, but have been revised as follows to reflect current City conservation requirements:

EIR Mitigation Measure MM I.3-1: Built-in appliances, refrigerators, and space-conditioning equipment shall exceed the minimum efficiency levels mandated in the California Code of Regulations.

EIR Mitigation Measure MM I.3-2: The ~~Project~~ Applicant shall install high-efficiency air conditioning controlled by a computerized energy-management system in the office and retail spaces that provides the following:

- A variable air-volume system that results in minimum energy consumption and avoid hot water energy consumption for terminal reheat;
- A 100-percent outdoor air-economizer cycle to obtain free cooling in appropriate climate zones during dry climatic periods;
- Sequentially staged operation of air conditioning equipment in accordance with building demands; ~~and~~
- The isolation of air conditioning to any selected floor to floors; and
- Where feasible, reduce building conditioning load by reducing the amount of conditioned building area.

EIR Mitigation Measure MM I.3-3: The ~~project~~ Proposed Project shall be designed in a manner that utilizes Cascade (i.e., passively transferred) ventilation air from high-priority areas before exhausted, thereby decreasing the volume of ventilation air required. For example, air could be passively transferred from occupied space to corridors then to mechanical spaces before being exhausted.

EIR Mitigation Measure MM I.3-4: The Applicant shall incorporate a recycle lighting system heat for space heating during cool weather. Exhaust lighting-system heat from buildings, via ceiling plenum, shall be used to reduce cooling loads in warm weather.

EIR Mitigation Measure MM I.3-5: The Applicant shall install low and medium static-pressure terminal units and ductwork to reduce energy consumption by air-distribution systems.

EIR Mitigation Measure MM I.3-6: The Applicant shall ensure that buildings are well sealed to prevent outside air from infiltrating and increasing interior space-conditioning loads. ~~Where applicable, building entrances shall be designed with vestibules to restrict infiltration of unconditioned air and exhausting of conditioned air.~~

EIR Mitigation Measure MM I.3-7: The Applicant shall conduct a performance check of the installed space-conditioning system prior to the

issuance of the certificate of occupancy to ensure that energy-efficiency measures incorporated into the Project operate as designed.

EIR Mitigation Measure MM I.3-8: Exterior walls shall be finished with light-colored materials and high-emissivity characteristics to reduce cooling loads. Interior walls shall be finished with light-colored materials to reflect more light and, thus, increase lighting efficiency.

EIR Mitigation Measure MM I.3-9: White, high albedo, and reflective material shall be used for roofing in order to meet California standards for reflectivity and emissivity to reject heat, and be Energy Star rated.

EIR Mitigation Measure MM I.3-10: Thermal insulation that exceeds requirements established by the California Code of Regulations shall be installed in walls and ceilings in accordance with the following specifications as feasible:

- Exterior walls abutting to conditioned spaces: R-60
- Roof areas abutting conditioned spaces: R-80[115]

EIR Mitigation Measure MM I.3-11: Window systems shall be designed to reduce thermal gain and loss, thus reducing cooling loads during warm weather and heating loads during cool weather.

EIR Mitigation Measure MM I.3-12: The ~~Project~~ Applicant shall install heating-rejecting window treatments, such as films, blinds, draperies, or other on appropriate exposures.

EIR Mitigation Measure MM I.3-13: The ~~Project~~ Applicant shall install light-emitting diode (LED), fluorescent, and high-intensity-discharge (HID) lamps, which give the highest light output per watt of electricity consumed, wherever possible including all street and parking lot lighting to reduce electricity consumption. Reflectors shall be used to direct maximum levels of light to work surfaces.

EIR Mitigation Measure MM I.3-14: The ~~Project~~ Applicant shall install photosensitive controls and dimmable electronic ballasts to maximize the use of natural daylight available and reduce artificial lighting load.

EIR Mitigation Measure MM I.3-15: The ~~Project~~ Applicant shall install occupant-controlled light switches and thermostats to permit individual adjustment of lighting, heating, and cooling to avoid unnecessary energy consumption

---

[115] *Insulation is rated in terms of thermal resistance, called R-value, which indicates the resistance to heat flow. The higher the R-value, the greater the insulating effectiveness. The R-value of thermal insulation depends on the type of material, its thickness, and its density.*

EIR Mitigation Measure MM I.3-16: The ~~Project~~ Applicant shall install time-controlled interior and exterior public area lighting limited to that necessary for safety and security.

EIR Mitigation Measure MM I.3-17: Mechanical systems (HVAC) and lighting building shall be controlled with timing systems to prevent accidental or inappropriate conditioning or lighting of unoccupied space.

EIR Mitigation Measure MM I.3-18: The ~~Project~~ Applicant shall incorporate windowless walls or passive solar inset of windows into the Project for appropriate exposures.

EIR Mitigation Measure MM I.3-19: Design Project shall focus pedestrian activity within sheltered outdoor areas.

Q. Cumulative Impacts

CEQA requires that the analysis of potential project impacts include cumulative impacts. CEQA defines cumulative impacts as "two or more individual effects which, when considered together are considerable or which compound or increase other environmental impacts."[116] This analysis of cumulative impacts need not be as in-depth as what is performed relative to the project, but instead is to "be guided by the standards of practicality and reasonableness."[117]

The Certified EIR analyzed the potential cumulative impacts of the Original Stadium Project (see Section IV.K, Cumulative Impacts, in the Certified EIR). The Certified EIR's analysis of cumulative impacts was based on a list of individual related projects in the Project Site area that were known at the time the Certified EIR was prepared (see Table IV.K-1 on page IV.K-2 of the Certified EIR). The Certified EIR analysis concluded that the Original Stadium Project would result in significant and unavoidable cumulative impacts with respect to construction-related air quality, and less than significant cumulative impacts with respect to aesthetics, operational air quality, GHG emissions, historic resources, land use, noise, fire protection, wastewater, water, electricity, natural gas, solid waste, parking, and traffic. Cumulative impacts with respect to agriculture and forestry resources, biological resources, archaeological and paleontological resources, geology and soils, hazards and hazardous materials, hydrology and water quality, mineral resources, population/housing/employment, police services, schools, parks and recreational facilities, libraries, and construction traffic were not assessed in detail in the Certified EIR.

---

[116] *State CEQA Guidelines, 14 California Code of Regulations, § 15355, et seq.*

[117] *Ibid, § 15355.*

An updated list of related projects in the Project Site vicinity is provided in Table 4 in the Modified Project Transportation Report included in Appendix P-1 of this Addendum. As the following analysis indicates, the Modified Project would not result in new significant cumulative impacts or increase the severity of significant cumulative impacts that were previously evaluated and disclosed in the Certified EIR. Therefore, no further environmental analysis of the Modified Project's cumulative impacts is necessary.

- *Aesthetics*—Impacts to aesthetics resources have the potential to be cumulatively considerable if a project's development in conjunction with related project development were to substantially block existing views of visual resources or negatively alter the visual character of the area. As analyzed above, views of visual resources would not be significantly impacted by the Modified Project. In addition, new buildings constructed as part of the Modified Project would be compatible with existing buildings within the Project Site vicinity. The two nearest related projects are located in the northeastern portion of Exposition Park at the California African American Museum and the California Science Center. Due to the distance between these sites and the Project Site, as well as intervening landscape, the extent to which these related projects may be visible within viewsheds of the Project Site is anticipated to be minimal. Furthermore, as expansions of the existing museums, these related projects would be designed to be compatible with the existing California African American Museum and the California Science Center structures. No other related projects are immediately adjacent to or within the Modified Project's primary viewsheds. Accordingly, none of the related projects when viewed with the Modified Project would have the potential to adversely affect views or the visual character of the area. Further, through the environmental review and/or plan check processes, related projects would be reviewed on a case-by-case basis by the City and/or Coliseum Commission to ensure that they comply with applicable LAMC requirements regarding building heights, setbacks, massing, and lighting. Thus, consistent with the Certified EIR analysis, cumulative impacts associated with aesthetics would be less than significant.

- *Agriculture and Forestry Resources*—The Project Site area is highly urbanized and no agricultural or forestry lands or uses exist. Implementation of the Modified Project and related projects in the Project Site vicinity would not convert farmland to non-agricultural use or result in the loss of forest land. Thus, no cumulative impacts related to agricultural resources or forestry resources would occur.

- *Air Quality*—As stated in the Certified EIR, according to the SCAQMD, individual construction projects that exceed the SCAQMD recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the Basin is in non-attainment. As discussed above, impacts with respect to regional air emissions during construction would be significant and unavoidable under the Modified Project,

albeit less than levels analyzed in the Certified EIR. Therefore, consistent with the analysis in the Certified EIR for the Original Stadium Project, cumulative impacts related to construction air quality would be significant and unavoidable under the Modified Project. However, the Modified Project's contribution to cumulative impacts would be reduced compared to that of the Original Stadium Project.

As stated in the Certified EIR, according to SCAQMD methodology for assessing cumulative operational impact, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD recommended daily thresholds for project-specific impacts, then it would also result in a cumulatively considerable net increase of these criteria pollutants for which the region is in non-attainment under an applicable federal or State ambient air quality standard. As discussed above, operational air quality impacts under the Modified Project would be less than significant at the project level. Therefore, consistent with the Certified EIR analysis for the Original Stadium Project, cumulative impacts would be less than significant under the Modified Project.

- *Biological Resources*—As discussed above, the Modified Project would result in less-than-significant impacts associated with biological resources. The Project Site vicinity is highly urbanized and no special status species, wetlands, or habitats supporting such resources are located in the Project Site vicinity. Therefore, it is not anticipated any of the related projects in the Project Site vicinity would significantly impact biological resources. Related projects would also be required to comply with both the City of Los Angeles' Protected Tree Ordinance, as well as the provisions of the Street Tree Ordinance and the Migratory Bird Treaty Act. Thus, cumulative impacts related to biological resources would be less than significant.

- *Cultural Resources*—The Project Site vicinity is located within an urbanized area that has been substantially disrupted over time. In the event that archaeological and/or paleontological resources are uncovered, each related project would be required to comply with regulatory requirements. In addition, as part of the environmental review processes for the related projects, it is expected that mitigation measures would be established as necessary to address the potential for uncovering of archeological and paleontological resources. Thus, the Modified Project would not contribute to any cumulative impacts associated with archaeological or paleontological resources.

  With regard to historic resources, as discussed above, like the Original Stadium Project, the Modified Project would result in significant and unavoidable project-related impacts to historic resources due to the demolition of the existing Sports Arena. Impacts on the adjacent Coliseum would be less than significant because the Modified Project has been designed in a manner so as not to interfere with the historical integrity of the Coliseum. Impacts to historic resources are generally site-specific, and related to the proximity of a given project to an

identified historic resource. As previously discussed, the two nearest related projects are located in the northeastern portion of Exposition Park at the California African American Museum and the California Science Center. Due to the distance between these sites and the Project Site, as well as intervening landscape, the extent to which these related projects may be visible within viewsheds of the Project Site, as well as viewsheds of the Project Site and the Coliseum, is anticipated to be minimal. Furthermore, as expansions of the existing museums, these related projects would be designed to be compatible with the existing California African American Museum and the California Science Center structures, as well as the Coliseum and other identified historic resources within Exposition Park. Additionally, these related projects do not involve historic resources that are significant within the same historic context as the Sports Arena. Therefore, consistent with the Certified EIR analysis for the Original Stadium Project, cumulative impacts to historic resources would be less than significant.

- *Geology and Soils*—Due to their site-specific nature, geology impacts are typically assessed on a project-by-project basis for a particular localized area. Cumulative development has the potential to expose a greater number of people to seismic hazards, depending on the geologic conditions in a given area. As discussed above, the Project Site is generally flat in nature, does not contain known active faults, and is not within a mapped liquefaction potential investigation zone, mapped landslide area, or Methane Zone. It is therefore expected that related projects in the immediate vicinity of the Project Site would have similar geologic conditions, such that cumulative development would not have the potential to impose substantial safety risks to people, structures or infrastructure. However, as with the Modified Project, related projects would be subject to local, State, and federal regulations and standards for seismic safety to ensure potential impacts would be avoided. Thus, cumulative impacts related to geology and soils would be less than significant.

- *Greenhouse Gas Emissions*—As evaluated above, the Modified Project would not result in significant greenhouse gas emissions. Further, the analysis of greenhouse gas emissions is cumulative in nature. Thus, the Modified Project would not result in significant cumulatively considerable impacts associated with greenhouse gas emissions, consistent with the Certified EIR analysis for the Original Project. Cumulative impacts would be less than significant.

- *Hazards and Hazardous Materials*—As with the Modified Project, all related development located within the vicinity of the Project Site would be subject to local, regional, State, and federal regulations pertaining to hazards and hazardous materials. Therefore, with adherence to such regulations, development of the Modified Project and related projects would not result in cumulatively significant impacts with regard to hazards and hazardous materials.

- *Hydrology and Water Quality*—Related projects could potentially result in an increase in surface water runoff and contribute point and non-point source pollutants to nearby water bodies. However, as with the Modified Project, related projects would be subject to NPDES permit requirements for both construction and operation, including development of SWPPPs for construction projects greater than 1 acre, compliance with SUSMP requirements during operation and compliance with other local requirements pertaining to hydrology and surface water quality. It is anticipated that related projects would be evaluated on an individual basis by City of Los Angeles Department of Public Works to determine appropriate BMPs and treatment measures to avoid significant impacts to hydrology and surface water quality. Furthermore, as discussed above, the Modified Project would not increase runoff from the Project Site as compared to existing conditions or provide for uses that generate substantial pollutants. Therefore, the Modified Project's hydrology/water quality impacts would not be cumulatively considerable, and cumulative impacts related to hydrology/water quality would be less than significant.

- *Land Use and Planning*—As with the Modified Project, related projects would be reviewed on a case-by-case basis to ensure consistency with existing land use policies and regulations. Where inconsistencies occur, it is anticipated that appropriate actions would be undertaken to ensure that land use impacts would be less than significant. Furthermore, no related projects that could cause land use incompatibility are known to be located within Exposition Park or in the immediate vicinity of the Project Site. Thus, consistent with the Certified EIR analysis for the Original Stadium Project, cumulative land use impacts would be less than significant.

- *Mineral Resources*—As the Project Site is not located within a mineral producing area, the Modified Project would not result in the loss of a locally-important mineral resource recovery site. Furthermore, no mineral resources or extraction operations for such resources occur in the Project Site vicinity. Therefore, cumulative impacts associated with the loss of mineral resources would not occur.

- *Noise*—Short-term cumulative construction-noise impacts in the immediate vicinity of the Project Site could occur if related projects in close proximity to the Project Site are under construction during the same time period as the Modified Project. As stated above, impacts with respect to construction noise would continue be significant and unavoidable under the Modified Project, consistent with the Certified EIR's analysis of the Original Stadium Project. However, based on the distance between the related projects the Project Site and the presence of existing intervening structures, construction noise from the related projects would not be anticipated to combine with that of the Modified Project to a measureable extent. Furthermore, related projects would be required to comply with LAMC requirements related to construction noise, including limitations on hours when construction and demolition activities are allowed to occur, and would be

required to mitigate construction noise to the extent feasible pursuant to CEQA. Therefore, consistent with the Certified EIR analysis for the Modified Project, cumulative construction noise impacts would be less than significant.

As discussed above, impacts with respect to operational stadium event noise (i.e., related to concerts, crowd noise including yelling and cheering, a public address system, amplified music, and announcements) would continue be significant and unavoidable under the Modified Project, consistent with the Certified EIR's analysis of the Original Stadium Project. The two nearest related projects are located in the northeastern portion of Exposition Park at the California African American Museum and the California Science Center. These projects involve interior expansions of the existing museum facilities, and are not anticipated to result in large, outdoor events that would occur simultaneously with events at the Project Site. Based on the distance between the related projects the Project Site and the presence of existing intervening structures, noise from outdoor crowds would not be anticipated to combine to result in significant cumulative impacts. Furthermore, the Applicant would coordinate with the California African American Museum and the California Science Center regarding the scheduling of events to minimize noise, traffic, and parking impacts to the extent feasible. Additionally, as described above, under existing conditions the Coliseum currently hosts outdoor events with approximately 93,000 attendees. Pursuant to Mitigation Measure J-1 in the Certified EIR, the Coliseum Commission is required to schedule events at the Coliseum and Sports Arena in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people. Accordingly, noise from operations of the Modified Project in combination with noise from events at the Coliseum is not anticipated to result in a substantial increase above existing conditions. Further, the analysis of operational noise impacts in Section IV.L, Noise, on page 119 of this Addendum, which concluded that operational noise impacts associated with traffic would be less than significant, considers future traffic levels and is therefore cumulative by nature. Therefore, consistent with the Certified EIR analysis for the Modified Project, cumulative operational noise impacts would be less than significant.

- *Population/Housing/Employment*—As discussed above, no residential population or housing units would be introduced by the Modified Project. In addition, the Project Site is located in an urbanized area with infrastructure that is already in place. Thus, the Modified Project would not induce substantial population growth or displace substantial numbers of people, and the Modified Project's impacts to population and housing would not be cumulatively considerable. In addition, while related projects would cumulatively increase population in the area, such increases are expected to be within City and SCAG growth forecasts. Thus, cumulative impacts associated with population and housing would be less than significant.

- *Public Services*—Development of the Modified Project in conjunction with related projects would cumulatively increase the demand for fire services. However, as discussed above, all three fire stations serving the Project Site area are achieving response times that are less than the Citywide average, and therefore can accommodate additional demand. Over time, LAFD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, trucks and engines, ambulances, other special apparatuses, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Through the City's regular budgeting efforts, LAFD's resource needs would be identified and monies allocated according to the priorities at the time. Any new or expanded fire station would be funded via existing mechanisms (e.g., property and sales taxes) to which the Modified Project and related projects would contribute. Moreover, all of the related project's plans would be reviewed by the LAFD in order to ensure adequate fire flow capabilities and adequate emergency access. Compliance with LAFD requirements and LAMC requirements related to fire safety, access, and fire flow would ensure that cumulative impacts to fire protection would be below a level of significance. Therefore, consistent with the Certified EIR analysis for the Modified Project, cumulative impacts to fire protection would be less than significant.

  Development of the Modified Project in conjunction with related projects would also cumulatively increase the demand for police services. As discussed above, the Certified EIR determined that the Original Stadium Project's potential impacts to police services would be less than significant, and since the Certified EIR was approved the officer-to-resident ratio and staffing levels at the Southwest Area Police Station have improved and violent crimes and property crimes in the area have decreased. Therefore, while the Southwest Area Police Station can accommodate additional demand from cumulative development, the LAPD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, vehicles, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Through the City's regular budgeting efforts, the LAPD's resource needs would be identified and monies allocated according to the priorities at the time. Any new or expanded police station would be funded via existing mechanisms (e.g., property and sales taxes) to which the Modified Project and related projects would contribute. Moreover, it is anticipated that related projects would be reviewed by the LAPD to ensure that sufficient security measures would be implemented to reduce potential impacts to police protection services. Furthermore, given the Modified Project's proposed security design features, the Modified Project's contribution to cumulative impacts to police protection would not be cumulatively considerable and would be less than significant.

  As discussed above, payment of developer impact fees in accordance with Senate Bill 50 and pursuant to Section 65995 of the California Government Code

would ensure that the impacts of the Modified Project on school facilities would be less than significant. Related projects would also be required to pay the developer impact fee. As also discussed above, the Modified Project would not result in a significant impact on library services and facilities. In addition, much of the growth associated with the Modified Project and related projects is already accounted for in the service population projections made by the LAPL. Therefore, the Modified Project would not contribute to a cumulatively considerable impact with regard to schools and libraries. Cumulative impacts would be less than significant.

- *Recreation*—The Modified Project does not include residential uses that generate a direct need for recreational services. Furthermore, related projects would be required to provide open space and recreational amenities or comply with the parks and open space requirements established by the LAMC. Finally, the Modified Project is providing approximately 143,000 square feet of improved public open space within Exposition Park, which will provide new open space amenities for area residents, including new residents associated with related projects. Thus, cumulative impacts with respect to recreation would be less than significant.

- *Traffic*—As discussed in Section IV.O, Traffic/Transportation/Parking on page 149 of this Addendum, cumulative traffic impacts of the Modified Project in conjunction with related projects would be less than significant.

- *Water and Wastewater*—Due to shared urban infrastructure, the Modified Project and related projects would cumulatively increase wastewater generation and water consumption. However, utility system capacity must be demonstrated during the approval process for each related project. As the service providers conduct ongoing evaluations to ensure that facilities are adequate to serve the forecasted growth of the community, cumulative impacts on utilities are concluded to be less than significant. Furthermore, the Modified Project's increase in average daily wastewater flow would represent approximately 0.02 percent of the current remaining available capacity of the Hyperion Treatment Plant, and the estimated net increase in water demand would comprise less than 0.008 percent of the water demand for the City in 2018. Therefore, the Modified Project's impacts with respect to wastewater treatment capacity and water supply would not be cumulatively considerable, and cumulative impacts would be less than significant.

- *Solid Waste*—The Modified Project in conjunction with related projects would increase the need for solid waste disposal during their respective construction periods. However, since unclassified landfills in the County do not generally have capacity concerns, inert landfills serving the related projects would have sufficient capacity to accommodate construction waste disposal needs. With regard to operational waste disposal needs, the Modified Project's estimated increase in solid waste generation would represent approximately 0.0004 percent

of the total combined remaining disposal capacity for the Class III landfills that accept municipal solid waste generated within the City of Los Angeles. Furthermore, the County of Los Angeles conducts ongoing evaluations to ensure that landfill capacity is adequate to serve the forecasted disposal needs of the region. Therefore, the Modified Project's impacts with respect to solid waste would not be cumulatively considerable, and cumulative impacts would be less than significant.

- *Energy*—Development of the Modified Project and related projects would increase the use of electricity and natural gas. Nevertheless, as required by the City Building Code, the Modified Project and all related projects would incorporate Title 24 Energy Efficiency Standards into their project design. In addition, new buildings would be subject to the requirements of the City's Green Building Ordinance which incorporates CALGreen requirements. Therefore, the Modified Project and related projects would achieve the highest standards of energy efficiency mandated by applicable regulations. Furthermore, as discussed above, the net increase in electricity and natural gas usage associated with the Modified Project would represent approximately 0.01 percent of LADWP's projected sales (i.e., supplies) in 2018 and approximately 0.001 percent of the 2018 forecasted consumption in SCG's planning area, respectively. Therefore, the Modified Project's impacts with respect to energy would not be cumulatively considerable, and cumulative impacts would be less than significant.

V. Conclusion

As demonstrated by the discussion above, all of the potential environmental impacts associated with the Modified Project would be within the envelope of impacts already evaluated in the Certified EIR for the Original Stadium Project. Therefore, the Modified Project would not result in new significant impacts or increase the severity of significant impacts that were previously evaluated and disclosed in the Certified EIR. Therefore, no further environmental analysis of the Modified Project is necessary. A revised MMP containing all Project Design Features and Mitigation Measures applicable to the Modified Project, including applicable mitigation measures from the Certified EIR analysis, is included as Appendix A to this Addendum.

Errata 1

Addendum to the EIR for the Los Angeles Memorial Sports Arena Redevelopment Project

A. Background and Introduction

An Environmental Impact Report (EIR) for the Los Angeles Memorial Sports Arena Redevelopment Project (State Clearinghouse No. 2010041059) was certified by the Los Angeles Memorial Coliseum Commission (Coliseum Commission) on February 2, 2011 (Certified EIR). The Certified EIR analyzed the demolition of the existing Los Angeles Sports Arena (Sports Arena) on an approximately 15-acre site in the southeastern portion of Exposition Park in the City of Los Angeles (Project Site), and the development of two potential options on the Project Site: (1) a multiple-use space that would serve as a public venue for civic gatherings, celebratory and entertainment events (Multi-Use Project); or (2) a Major League Soccer (MLS) Stadium with a permanent seating capacity of approximately 22,000 seats and associated amenities (Original Stadium Project).

Subsequent to certification of the EIR by the Coliseum Commission, the University of Southern California (USC) leased the Project Site and the Los Angeles Football Club (LAFC) acquired an MLS franchise. LAFC and USC have proposed modifications to the Original Stadium Project that were addressed in an Addendum to the Certified EIR dated September 2015. These changes, referred to as the Modified Project, include a reconfigured stadium, together with approximately 105,900 square feet of ancillary facility floor area (up to approximately 119,000 gross square feet) for office and conference facility space, a “World Football” museum, a team store or other retail space, and restaurant uses. The Modified Project also includes signage and lighting programs to support stadium operations. The Addendum together with a Project Agreement were approved by the Coliseum Commission on September 17, 2015. The Coliseum Commission specifically determined that the Modified Project is consistent with the Certified EIR based on evidence in the Addendum and the record and that none of the events requiring preparation of a Subsequent or Supplemental EIR under Public Resources Code Section 21166 or CEQA Guidelines section 15162 have occurred.

This Errata has been prepared to address a specific correction and addition to the Addendum as set forth below.

B. Correction and Addition to the Addendum

The following correction and addition to Project Design Feature P-2 in Section P. Utilities and Service Systems of the Addendum has been made to address a typographical error. The deletion is shown with ~~strikethrough~~ and the addition is shown with underline.

PDF P-2: A minimum of 20 percent of all Construction Specifications Institute (CSI) divisions three through ten building materials and products for development, measured by cost, shall consist of pre-consumer and post-consumer recycled content ~~and~~ or shall be manufactured within a 500-mile radius of the Project Site.

C. Effect of Correction and Addition

The correction and addition to Project Design Feature P-2 merely corrects a typographical error. Furthermore, the provisions regarding a minimum 20 percent use of pre-consumer and post-consumer recycling content and the use of building materials and products manufactured within a 500-mile radius of the Project Site do not affect any of the calculations or conclusions with regard to the analysis of solid waste or any other impact area analyzed in the Certified EIR or the Addendum. With or without the implementation of Project Design Feature P-2, impacts regarding solid waste would be less than significant. Therefore, the clarifications to the Addendum would not result in any new significant impacts or a substantial increase in the severity of any impact already identified in the Certified EIR and Addendum. Thus, none of the conditions in Public Resources Section 21166 or Section 15162 of the CEQA Guidelines have occurred.

SECOND ADDENDUM

TO THE ENVIRONMENTAL IMPACT REPORT FOR THE LOS ANGELES MEMORIAL SPORTS ARENA REDEVELOPMENT PROJECT RE: TEMPORARY EXTENSION OF CONSTRUCTION HOURS

SECOND ADDENDUM TO THE ENVIRONMENTAL IMPACT REPORT FOR THE LOS ANGELES MEMORIAL SPORTS ARENA REDEVELOPMENT PROJECT RE: TEMPORARY EXTENSION OF CONSTRUCTION HOURS

I. Introduction

This document is an Addendum to the previously certified Los Angeles Memorial Sports Arena Redevelopment Project (Project) Environmental Impact Report (State Clearinghouse No. 2010041059; Certified EIR) and associated First Addendum, which were certified and adopted by the Los Angeles Memorial Coliseum Commission (Coliseum Commission) as Lead Agency on February 2, 2011, and September 17, 2015, respectively. Those documents were prepared in accordance with the California Environmental Quality Act (CEQA), with the City of Los Angeles (City) acting as a Responsible Agency. This document is referred to herein as the Second Addendum and addresses potential physical environmental effects associated with the currently proposed temporary extension of construction hours for the Project. Specifically, and as discussed and analyzed further below, the only proposed physical change to the Project relates to the temporary extension of construction hours, and none of the conditions described in CEQA Guidelines Section 15162 calling for preparation of a subsequent EIR have occurred.

The previously Certified EIR consists of the Draft EIR (November 2010) and Final EIR (January 2011). Additional CEQA analysis was conducted regarding modifications to the Project and was included in a First Addendum to the Certified EIR (September 2015). A summary of these documents and associated Project changes is provided below.

The Certified EIR analyzed the demolition of the Los Angeles Memorial Sports Arena (Sports Arena) on an approximately 15-acre site in the southeastern portion of Exposition Park (Project Site) in the City of Los Angeles (City) and the development of two potential options on the Project Site: (1) a multiple-use space that would serve as a public venue for civic gatherings, celebratory and entertainment events (e.g., festivals, carnivals, rallies, and concerts), and other similar uses (Multi-Use Project); or (2) a Major League Soccer (MLS) stadium with a permanent seating capacity of approximately 22,000 seats and associated amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities (Original Stadium Project).

After certification of the Certified EIR on February 2, 2011, the Coliseum Commission leased both the Los Angeles Memorial Coliseum (Coliseum) and Sports Arena sites to the University of Southern California (USC), allowing development of the uses approved under the EIR. USC subsequently agreed with the Los Angeles Football Club (LAFC), which acquired an MLS expansion franchise, to cooperate with LAFC's efforts to seek approval of certain modifications to the Original Stadium Project in order to develop a MLS stadium on the Project Site (Modified Project). The Modified Project was the subject of the First Addendum and consisted of the Original Stadium Project (reconfigured on the Project Site) together with the addition of up to approximately 105,900 square feet (sf) of ancillary facility floor area (up to approximately 119,000 gross sf), including office and conference facility space, a "World Football" museum, a team store or other retail space; and restaurant uses.[1] The Modified Project also included signage and lighting programs to support stadium operations. The First Addendum together with a Project Agreement were approved by the Coliseum Commission on September 17, 2015. The Coliseum Commission specifically determined that the Modified Project is consistent with the Certified EIR based on evidence in the First Addendum and the record and that none of the events requiring preparation of a subsequent or supplemental EIR under Public Resources Code Section 21166 or CEQA Guidelines Section 15162 had occurred. On May 6, 2016, the Los Angeles City Council approved the Modified Project and approved an Amendment of the Coliseum District Specific Plan (Specific Plan), the creation of the Coliseum and Soccer Stadium Supplemental Use District (Sign District), and adopted the Project findings, the project design features and mitigation measures set forth in a Mitigation Monitoring Program (MMP), and a Statement of Overriding Considerations.

The Project Applicant, LAFC, now seeks to temporarily extend construction hours during evening/nighttime hours for a limited duration of approximately four months; no other modifications to the Project are proposed. To temporarily extend construction hours, LAFC is seeking, pursuant to Los Angeles Municipal Code (LAMC) Section 41.40, an approval from the Los Angeles Board of Police Commissioners to permit two construction shifts over a period of approximately four months: (1) a daytime shift to operate during the hours of approximately 7:00 A.M. to 5:00 P.M. (Daytime Shift); and (2) a nighttime shift to operate during the hours of approximately 7:00 P.M. to 5:00 A.M. (Nighttime Shift). No construction activities would occur on Sundays or national holidays, consistent with LAMC restrictions.[2]

---

[1] *Except where otherwise noted, square footage is calculated pursuant to the LAMC definition of floor area for the purpose of calculating FAR. In accordance with LAMC Section 12.03, floor area is defined as: "[t]he area in square feet confined within the exterior walls of a building, but not including the area of the following: exterior walls, stairways, shafts, rooms housing building-operating equipment or machinery, parking areas with associated driveways and ramps, space for the landing and storage of helicopters, and basement storage areas."*

[2] *LAMC Section 41.40 prohibits construction noise that disturbs persons occupying sleeping quarters in any dwelling, hotel, or apartment or other place of residence between the hours of 9:00 P.M. and 7:00 A.M.*
(Footnote continued on next page)

In addition to seeking approval from the Los Angeles Board of Police Commissioners, LAFC is seeking a clarification to Code Required Measure CR G-2 from the adopted Mitigation Monitoring Program, which provides: "The Applicant shall ensure exterior construction and demolition activities are limited to the hours of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday."

Construction activities during the proposed Nighttime Shift would occur within two separate work areas, Work Area I and Work Area II, shown in Figure 1 on page 4. Work Area I is located on the western half of the Project Site. Structural steel erection activities would occur in Work Area I during the Nighttime Shift, however, no welding activities would be undertaken. Equipment operating in Work Area I during the Nighttime Shift would be limited to an electric powered tower crane and forklift. Work Area II is located within the interior of the stadium bowl, and all work in this area would occur 25 feet below street level. Precast erection activities would occur within Work Area II during the Nighttime Shift. Equipment operating in Work Area II during the Nighttime Shift would be limited to a crawler crane, forklift, and truck. During the Nighttime Shift, approximately six light fixtures would be operated on the Project Site, all of which would be electric powered. The lights would be approximately 18 to 20 feet tall; within Work Area II these fixtures would be located entirely below street level. In addition to the on-site work, materials deliveries for the Nighttime Shift would occur with approximately four trucks arriving between 8:00 P.M. and 10:00 P.M. and departing the Project Site before midnight. Delivery trucks would access the Project Site from the 110 Freeway via Martin Luther King Jr. Boulevard to Figueroa Street.

In accordance with the California Environmental Quality Act (CEQA), the purpose of this Second Addendum is to analyze the temporary extension of construction hours to enable the Nighttime Shift and to determine whether that temporary extension of construction hours would result in any new significant environmental impacts that were not identified in the Certified EIR or First Addendum, or whether the previously identified significant impacts would be substantially more severe. This Second Addendum is intended to support the proposed clarification to Code Required Measure CR G-2 and the request to the Los Angeles Board of Police Commissioners to temporarily extend construction hours.

As demonstrated below, this Second Addendum shows that all of the potential environmental impacts associated with the temporary extension of construction hours

---

Monday through Friday, before 8:00 A.M. and after 6:00 P.M. on Saturday or a national holiday, and at any time on Sunday. Construction hours may be extended with approval from the Executive Director of the Board of Police Commissioners.

would be within the envelope of impacts evaluated in the Certified EIR and First Addendum. Therefore, the temporary extension of construction hours would not result in new significant impacts or increase the severity of significant impacts that were previously evaluated and disclosed in the Certified EIR and First Addendum.

II. CEQA Authority for Addendum

CEQA establishes the type of environmental documentation required when changes to a project occur after an EIR is certified. Specifically, Section 15164(a) of the CEQA Guidelines states that:

> *The lead agency or responsible agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred.*

CEQA Guidelines Section 15162 requires the preparation of a subsequent EIR when an EIR has been certified or a negative declaration has been adopted for a project and one or more of the following circumstances exist:

1. Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

2. Substantial changes occur with respect to the circumstances under which the project is undertaken, which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

3. New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:

    a. The project will have one or more significant effects not discussed in the previous EIR or negative declaration;

    b. Significant effects previously examined will be substantially more severe than shown in the previous EIR;

    c. Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant

effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

d. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

Likewise, California Public Resources Code Section 21166 states that unless one or more of the following events occur, no subsequent or supplemental EIR shall be required by the lead agency or by any responsible agency:

- Substantial changes are proposed in the project which will require major revisions of the environmental impact report;
- Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report; or
- New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, becomes available.

As demonstrated by the analysis herein, construction of the Project with the temporary extension of construction hours would not result in any new significant impacts, nor would it substantially increase the severity of previously identified significant impacts. In addition, the current proposal to temporarily extend construction hours does not involve any substantial changes to the circumstances under which the Original Stadium Project analyzed in the Certified EIR or the Modified Project analyzed in the First Addendum would be undertaken. Furthermore, no new information of substantial importance has been identified which was not known and could not have been known when the Certified EIR and First Addendum were certified. Therefore, the minor changes associated with the proposed temporary extension of construction hours do not meet the standards for a subsequent or supplemental EIR pursuant to CEQA Guidelines Section 15162 or Public Resources Code Section 21166. Further, since only minor changes and additions to the Certified EIR and First Addendum are necessary and none of the conditions described in CEQA Guidelines Section 15162 or Public Resources Code Section 21166 have occurred, an Addendum is the appropriate CEQA document to analyze the proposed temporary extension of construction hours.[3]

---

[3] *See CEQA Guidelines Section 15164(a).*

III. Comparative Analysis of Temporary Extension of Construction Hours

The analyses provided below address the environmental issues evaluated in the Certified EIR and First Addendum and focus on any potential changes in environmental impacts that could result from the temporary extension of construction hours. Specifically, potential impacts are compared with the analyses and findings within the Certified EIR and First Addendum for those impact areas that could be implicated by the temporary extension of construction hours to determine if such impacts are within the envelope of impacts previously documented, including whether new significant impacts would result from the temporary extension of construction hours or whether previously identified significant impacts would be substantially more severe. As set forth by the analyses below, the temporary extension of construction hours would not result in any new significant environmental impacts or a substantial increase in the severity of a significant impact already identified in the Certified EIR or the First Addendum.

A. Aesthetics (Construction)

(a) Visual Character and Views

Construction-related visual character and views impacts associated with the Original Stadium Project were not assessed in detail in the Certified EIR. However, the First Addendum concluded that impacts with respect to visual character and views during construction of the Modified Project would be less than significant.

Project construction activities associated with the temporary extension of construction hours would be substantially similar to those of the Modified Project and would involve the same general footprint and areas of disturbance. The nature of construction activities would be unchanged, and additional construction equipment or construction barriers are not proposed. As such, construction of the Project with the temporary extension of construction hours would not affect the construction-phase analysis of visual character and views provided in the First Addendum. Therefore, impacts would remain less than significant, and no mitigation measures are required.

(b) Light and Glare

The Certified EIR and First Addendum concluded that light and glare impacts associated with proposed construction under the Original Stadium Project and the Modified Project, respectively, would be less than significant with mitigation.

The First Addendum specified the Modified Project would implement Code Required Measure CR G-2 of the Certified EIR, which restricts exterior construction and demolition activities to the hours of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday. Accordingly, the First Addendum explained construction lighting would be both temporary and limited to short durations during the winter season, as construction activities typically do not require lighting during daylight hours. Further, construction-related illumination would be used for safety and security purposes only, in compliance with LAMC light intensity requirements. As such, the First Addendum determined uses that are not adjacent to the Project Site would not be substantially affected by construction lighting or daytime glare. Additionally, in accordance with Project Design Feature A-1, the perimeter of the Project Site would be screened, which would limit views of construction activities. Thus, through implementation of Code Required Measure CR G-2 and Project Design Feature A-1 and with adherence to existing LAMC regulations, light and glare impacts associated with proposed construction under the Modified Project would be less than significant.

The proposed extension of construction hours would temporarily extend the hours during which construction lighting may be used on-site beyond the hours provided in Code Required Measure CR G-2. Project construction lighting would continue to comply with the light intensity requirements of the LAMC, and Project Design Feature A-1, which provides for perimeter screening of the Project Site to limit views of construction activities, would be implemented. As previously described, construction lighting during the proposed Nighttime Shift would be limited to six electric-powered light fixtures of approximately 18 to 20 feet in height. Approximately three light fixtures would operate within Work Area I, and approximately three light fixtures would operate within Work Area II. Within Work Area II, all light fixtures would be located below grade. In addition, all light fixtures would be directionally angled downward and positioned on the Project Site to avoid light spill onto any properties located outside of Exposition Park. For light-sensitive uses to the south and east, the distance from the on-site nighttime construction lighting located at grade level combined with intervening development and roadways that include illuminated signage, street lights, and vehicle headlights, would limit the effects of night lighting. Furthermore, existing street trees along both sides of Martin Luther King Jr. Boulevard and existing residential landscaping would help block any potential light emissions that could affect light-sensitive uses to the immediate south. With implementation of the additional measures provided below in the proposed clarification to Code Required Measure CR G-2, which require that all lights during the Nighttime Shift be positioned to avoid light spill, and given the limited lighting proposed during the temporary extension of construction hours, light and glare impacts would remain less than significant during the temporary extension of construction hours.

(c) Aesthetics Conclusion

Based on the analysis above, through the implementation of project design features and mitigation measures identified in the adopted MMP and the proposed clarification of Code Required Measure CR G-2, the temporary extension of construction hours would not result in any new significant impacts with respect to aesthetics (construction) and would not substantially increase the severity of any significant impacts previously identified in the Certified EIR or the First Addendum.

(d) Project Design Features and Mitigation Measures

Each of the project design features and mitigation measures set forth in the adopted MMP, including those from the Certified EIR and First Addendum, remain applicable to the Project with the temporary extension of construction hours, with the exception of the revised and clarified measure shown below. Specifically, Code Required Measure CR G-2 would be clarified as follows (new text is underlined).

Code Required Measure CR G-2: The Applicant shall ensure exterior construction and demolition activities are limited to the hours of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday <u>except as may be permitted by the Los Angeles Board of Police Commissioners pursuant to Los Angeles Municipal Code Section 41.40. If extended construction hours are permitted by the Los Angeles Board of Police Commissioners, the following additional measures shall be implemented for any construction hours outside of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday:</u>

- <u>Conduct regular ambient noise level readings to ensure that noise levels at the nearest residential uses to the Project Site do not exceed the ambient noise level by 5 dBA. If the measured noise levels during the night shift exceed the ambient noise levels by 4.0 dBA at the residential sensitive uses, the contractor shall evaluate and employ alternative construction methods to ensure that the construction activities shall not exceed the existing ambient noise levels by 5 dBA at the residential sensitive uses</u>;
- <u>Utilize additional sound blankets and sound walls to reduce noise levels;</u>
- <u>Disable all equipment back up bells;</u>
- <u>Prohibit crane horns for signaling;</u>
- <u>Limit the use of radio contact on-site;</u>
- <u>Use electricity to power lighting to reduce noise levels;</u>

- Position lighting to avoid spill onto properties outside of Exposition Park;
- Stage materials on the Project Site during the Daytime Shift, to the extent feasible, to reduce activities occurring during the Nighttime Shift; and
- Coordinate with the Office of Exposition Park Management to ensure that extended construction hours shall not conflict with any scheduled Exposition Park activities.

B. Air Quality (Construction)

(a) Construction

The Certified EIR concluded that air quality impacts associated with construction of the Original Stadium Project would be significant and unavoidable for regional emissions of nitrogen oxides (NO_X) and reactive organic compounds (ROG) and less than significant for localized emissions of all pollutants. The First Addendum determined that while regional construction emissions under the Modified Project would be less than those of the Original Stadium Project for most pollutants, peak daily emissions of NO_X and volatile organic compounds (VOC) would still exceed the South Coast Air Quality Management District (SCAQMD) regional thresholds despite mitigation, resulting in a significant and unavoidable impact.[4] With respect to localized construction impacts, the Modified Project would generate greater localized emissions than the Original Stadium Project, but such emissions would remain below their respective SCAQMD Localized Significance Threshold (LST). Accordingly, such impacts would be less than significant.

Overall, Project construction activities would be the same as those described in the First Addendum for the Modified Project. While the proposed temporary extension of construction hours would extend the duration of construction on the Project Site on a daily basis, the intensity of construction activities at any given time of day may be reduced. Specifically, by extending the construction hours less equipment would need to operate on-site during the Daytime Shift and equipment that would otherwise have been operating during the Daytime Shift would instead operate during the Nighttime Shift. As a result, construction activities would be spread out over the course of the two shifts, as opposed to being concentrated in a single shift during the day. As construction-related air quality impacts are based on maximum daily emissions generated by peak daily activity, and peak daily activity would not increase due to spreading construction activities over two shifts, no

[4] *Note the SCAQMD significance threshold is expressed in terms of VOC, and CalEEMod calculates ROG emissions. VOC and ROG are used interchangeably for purposes of this analysis since ROG represents approximately 99.9 percent of VOC emissions.*

change in maximum daily emissions would occur. Therefore, the proposed temporary extension of construction hours would not result in an increase in construction emissions. Accordingly, impacts would be similar to those evaluated in the First Addendum despite the additional hours of construction. Furthermore, the Project would still implement the same project design features and mitigation measures set forth in the adopted MMP, thus controlling exhaust emissions from on-site heavy-duty construction equipment, encouraging contractors to apply for SCAQMD Surplus Off-Road Opt-In for NO_X (SOON) funds, complying with SCAQMD Rule 403 regarding fugitive dust control, and utilizing low-VOC paints.

As such, construction impacts associated with the temporary extension of construction hours are anticipated to be similar to those of the Modified Project. Therefore, consistent with the conclusions in the Certified EIR and the First Addendum, regional construction emissions of NO_X and VOC would continue to exceed SCAQMD's regional thresholds despite mitigation, resulting in a significant and unavoidable impact, and impacts with respect to localized air quality would be less than significant. No other feasible mitigation measures have been identified to reduce the regional construction impact to a less-than-significant level. Based on the analysis above, the Project with temporarily extended construction hours would not result in any new significant construction-related impacts with respect to air quality, nor would it substantially increase the severity of any significant impacts previously identified in the Certified EIR or the First Addendum.

(b) Air Quality Conclusion

Based on the analysis above, through the implementation of project design features and mitigation measures identified in the adopted MMP and the proposed clarification of Code Required Measure CR G-2, the temporary extension of construction hours would not result in any new significant impacts with respect to air quality (construction) and would not substantially increase the severity of any significant impacts previously identified in the Certified EIR or the First Addendum.

(c) Project Design Features and Mitigation Measures

Each of the project design features and mitigation measures set forth in the adopted MMP, including those from the Certified EIR and First Addendum, remain applicable to the Project with the temporary extension of construction hours, with the exception Code Required Measure CR G-2, which would be revised and clarified as provided above.

C. Land Use and Planning (Construction)

(a) Land Use Compatibility

The Certified EIR for the Original Stadium Project concluded that impacts related to land use compatibility during construction would be significant and unavoidable under the Original Stadium Project. The analysis therein concluded that construction of the Original Stadium Project would cause temporary and intermittent impacts to adjacent land uses due to temporary increases in air emissions (including fugitive dust), noise, and traffic congestion. These potential effects were discussed in their respective sections of the Certified EIR, and mitigation measures were recommended to further reduce construction-related impacts to adjacent land uses. Nonetheless, the Certified EIR concluded that from a land use compatibility standpoint, construction impacts would be significant and unavoidable, although the extent of impacts would be temporary and sporadic and would only persist through the construction period.

The First Addendum concluded construction of the Modified Project would not result in new significant construction-related impacts or increase the severity of significant construction-related impacts that were previously evaluated and disclosed in the Certified EIR. Therefore, from a land use compatibility standpoint, since construction activities under the Modified Project would be substantially similar to those under the Original Stadium Project in terms of overall scope, duration, and activities, land use compatibility impacts associated with construction of the Modified Project would be substantially the same as the Original Stadium Project. Accordingly, potential impacts would continue to be significant and unavoidable, but the changes proposed under the Modified Project would not increase the severity of those impacts analyzed in the Certified EIR.

As provided in this Second Addendum, the Project with the proposed temporary extension of construction hours is substantially similar to the Original Stadium Project and Modified Project in terms of overall construction scope, duration, and activities. By allowing construction activities during the Nighttime Shift, as previously discussed, the intensity of construction activities at any given time of day may be reduced. Specifically, less equipment would need to operate on-site during the Daytime Shift and equipment that otherwise would have been operating during the Daytime Shift would instead operate during the Nighttime Shift. As a result, construction activities would be spread out over the course of the two shifts, as opposed to being concentrated in a single shift during the day when many of the adjacent uses (such as museum uses within Exposition Park) are typically in operation. Thus, allowing some construction activities during the evening hours may serve to decrease the intensity of land use compatibility impacts with adjacent uses. Therefore, the proposed temporary extension of construction hours would not result in new significant impacts or increase the severity of previously identified impacts. With the additional measures provided in Code Required Measure CR G-2, land use compatibility

impacts associated with construction of the Project would be substantially the same as those analyzed in the Certified EIR and First Addendum. Accordingly, potential impacts would continue to be significant and unavoidable, but the extension of construction activities would not increase the severity of those impacts analyzed in the Certified EIR and First Addendum.

(b) Land Use and Planning Conclusion

Based on the analysis above, through the implementation of project design features and mitigation measures identified in the adopted MMP and the clarification of Code Required Measure CR G-2, the temporary extension of construction hours would not result in any new significant impacts with respect to land use and planning (construction) and would not substantially increase the severity of any significant impacts previously identified in the Certified EIR or the First Addendum.

(c) Project Design Features and Mitigation Measures

Each of the project design features and mitigation measures set forth in the adopted MMP, including those from the Certified EIR and First Addendum, remain applicable to the Project with the temporary extension of construction hours, with the exception Code Required Measure CR G-2, which would be revised and clarified as provided above.

D. Noise (Construction)

(a) Construction Noise

The Certified EIR concluded that construction noise impacts for the Original Stadium Project would be significant and unavoidable even with implementation of mitigation at the off-site noise sensitive receptor locations within Exposition Park near the southwestern corner of the Project Site, which was selected to represent the Ralph M. Parsons Pre-School located within the Expo-Center (Receptor Location 1) and near the northern boundary of the Project Site, which was selected to represent the open space areas to the north of the Project Site (Receptor Location 2). Consistent with the conclusion in the Certified EIR, the First Addendum determined that impacts with respect to construction noise would be significant and unavoidable under the Modified Project at Receptor Location 1 and Receptor Location 2. While Mitigation Measures MM G-1 through MM G-4 would reduce those impacts to the maximum extent feasible, such impacts would remain significant and unavoidable. While the Certified EIR and First Addendum identified a significant and unavoidable construction noise impact, the analysis found that no significant noise impact from construction activities would occur at the residential uses east of Figueroa Street, which are accessed from South Flower Drive (Receptor Location 3) or the

residential uses south of the Project Site across Martin Luther King Jr. Boulevard (Receptor Location 4).

The proposed temporary extension of construction hours would permit Project construction to occur in two shifts over an approximately four-month period: (1) the Daytime Shift during the hours of approximately 7:00 A.M. to 5:00 P.M.; and (2) the Nighttime Shift during the hours of approximately 7:00 P.M. to 5:00 A.M. Because the analysis in the First Addendum assumed construction hours consistent with Code Required Measure G-2, which provides for construction hours from 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday, a supplemental noise analysis entitled *Extended Hours (Night Shift) Construction Noise Impact Analysis* (Noise Analysis) was prepared by Acoustical Engineering Services (AES), dated May 2017 and included in Appendix A, to evaluate the noise associated with construction activities during the Nighttime Shift. Since construction activities taking place during the Nighttime Shift would occur when the facilities within Exposition Park generally are not in operation, the Noise Analysis analyzed the impact of construction activities during the Nighttime Shift on the nearest residential receptors (Receptor Locations 3 and 4). To further ensure that uses within Exposition Park are not impacted by construction activities during the Nighttime Shift, Code Required Measure CR G-2 is proposed for revision to require LAFC to coordinate with the Office of Exposition Park Management to avoid any potential conflicts between Nighttime Shift construction and scheduled Exposition Park activities, as detailed above.

As previously described, construction activities during the proposed Nighttime Shift would occur within two limited and separate work areas, Work Area I and Work Area II, shown in Figure 1 on page 4. Work Area I is located on the western half of the Project Site, which is the area closest to the Coliseum. Structural steel erection activities would occur in Work Area I during the Nighttime Shift, and no welding activities would take place. Equipment operating during the Nighttime Shift in Work Area I would be limited to an electric powered tower crane and forklift. Work Area II is located within the interior of the stadium bowl, and all work would occur 25 feet below street level. Precast erection activities would occur within Work Area II during the Nighttime Shift, and equipment would be limited to a crawler crane, forklift, and truck. Approximately six electric-powered light fixtures would be located on the Project Site during the Nighttime Shift. The lights would be approximately 18 to 20 feet tall and within Work Area II would be located entirely below street level. In addition to the on-site work, materials deliveries for the Nighttime Shift would occur with approximately four trucks arriving between 8:00 P.M. and 10:00 P.M. and departing before midnight. Delivery trucks would access the Project Site from the 110 Freeway via Martin Luther King Jr. Boulevard to Figueroa Street.

Ambient noise measurements were taken during the proposed hours for the Nighttime Shift on six separate days. The measured ambient noise levels over the

six nights ranged from 63.0 to 68.0 A-weighted decibels (dBA) at Receptor Location 3 and from 63.5 dBA to 71.1 dBA at Receptor Location 4. As indicated in the Noise Analysis, to represent the most conservative analysis, the lowest measured nighttime ambient noise levels at Receptor Locations 3 and 4 of 63.0 and 63.5 dBA, respectively, were used for the impact analysis. Table 1 below provides the estimated construction noise levels associated with on-site construction activities and off-site deliveries that would occur during the Nighttime Shift based on the limited construction equipment operations and deliveries that are proposed. The analysis conservatively assumed simultaneous use of all equipment. As indicated in Table 1, the estimated construction-related noise would be well below the significance threshold (existing ambient plus 5 dBA) at the nearest residential noise-sensitive uses, Receptor Locations 3 and 4. Specifically, as indicated in Table 1, noise levels would be below the measured ambient noise levels by 18.1 dBA at Receptor Location 3 and 16.4 dBA at Receptor Location 4.

Table 1
Estimated Project Construction Noise Levels During Nighttime Shift

Receptor Location	Approximate Distance to Project Construction Area (feet)	Estimated Construction Noise Levels During Nighttime Shift, dBA L_{eq}			Significance Threshold[a] dBA L_{eq}
		On-Site Construction	Off-Site Delivery Trucks	Composite On- and Off-Site Construction Noise	
3 Residential Uses East of Figueroa Street	350	48.8	43.5	49.9	68.0
4 Residential Uses on Martin Luther King, Jr. Boulevard	390	49.9	48.2	52.1	68.5

[a] *Significance threshold is equal to the measured nighttime ambient noise levels plus 5 dBA.*

Source: AES, 2017.

Therefore, noise impacts associated with the proposed temporary construction activities during the Nighttime Shift would be less than significant. While noise impacts at Receptor Locations 3 and 4 would remain less than significant and consistent with the impact conclusions in the Certified EIR and First Addendum, to ensure that noise impacts at residential uses remain less than significant, Code Required Measure CR G-2 would be revised and clarified to provide additional measures to be implemented during Nighttime Shift. As previously detailed, these additional measures include the following:

- Conduct regular ambient noise level readings to ensure that noise levels at the nearest residential uses to the Project Site do not exceed the ambient noise level by 5 dBA. If the measured noise levels during the night shift exceed the ambient

noise levels by 4.0 dBA at the residential sensitive uses, the contractor shall evaluate and employ alternative construction methods to ensure that the construction activities shall not exceed the existing ambient noise levels by 5 dBA at the residential sensitive uses;

- Utilize additional sound blankets and sound walls to reduce noise levels;
- Disable all equipment back up bells;
- Prohibit crane horns for signaling;
- Limit the use of radio contact on-site;
- Use electricity to power lighting to reduce noise levels;
- Stage materials on the Project Site during the Daytime Shift, to the extent feasible, to reduce activities occurring during the Nighttime Shift; and
- Coordinate with the Office of Exposition Park Management to ensure that extended construction hours shall not conflict with any scheduled Exposition Park activities.

With the implementation of these additional measures during Nighttime Shift construction activities, potential noise impacts at sensitive residential receptors during the Nighttime Shift time period would remain less than significant. Accordingly, while potential impacts from construction-related noise would continue to be significant and unavoidable for nearby sensitive receptors within Exposition Park that operate primarily during the daytime, the temporary extension of construction activities into the evening hours would not increase the severity of those impacts analyzed in the Certified EIR and First Addendum, and no new significant impact would occur during the Nighttime Shift.

(b) Construction Vibration

The Certified EIR and First Addendum concluded that vibration impacts associated with construction would be less than significant under the Original Stadium Project and the Modified Project, respectively. The temporary extension of construction hours during the Nighttime Shift does not involve any modifications that would affect the analysis of vibration. No construction activities that are typically associated with vibration impacts, such as earthwork or pile driving, are proposed during the Nighttime Shift. Accordingly, the Project with extended construction hours would likewise result in less than significant construction vibration impacts. No mitigation measures are required.

(c) Noise Conclusion

Based on the analysis above, the Project with temporarily extended construction hours would not result in any new significant impacts with respect to noise or vibration, nor would it substantially increase the severity of any significant impacts previously identified in the Certified EIR or the First Addendum.

(d) Project Design Features and Mitigation Measures

Each of the project design features and mitigation measures set forth in the adopted MMP, including those from the Certified EIR and First Addendum, remain applicable to the Project with the temporary extension of construction hours, with the exception of Code Required Measure CR G-2, which would be revised and clarified as provided above.

E. Traffic/Transportation/Parking (Construction)

(a) Construction

Potential impacts from construction-related traffic were not assessed in detail in the Certified EIR. The Modified Project's construction traffic impacts were determined to be less than significant in the First Addendum.

Peak hour construction traffic activities associated with the temporary extension of construction hours would be substantially similar to or less than those of the Modified Project. The extension of construction hours would allow LAFC to increase the number of construction deliveries occurring outside of congested daytime A.M. and P.M. peak hours, which would reduce Project construction traffic during peak travel times. Further, as previously discussed, the intensity of construction at any given time of day may be reduced as a result of extending construction hours; accordingly, the number of construction workers on-site at any given time during the construction workday would not increase (and may be reduced). As a result, transit and parking impacts during construction would not change (or may be reduced) from those analyzed in the First Addendum. Similarly, access and safety impacts would remain unchanged due to the similar construction characteristics, including type and location of construction activities, deliveries, and construction worker trips. Therefore, because the Project's construction traffic as a result of temporarily extending the construction hours would fall within the scope of construction traffic evaluated for the Modified Project in the First Addendum, potential traffic impacts associated with construction of the Project with temporarily extended construction hours, including intersection, access and safety, transit, and parking impacts, would be less than significant, consistent with the conclusions in the First Addendum.

(b) Traffic/Transportation/Parking Conclusion

Based on the analysis above, through the implementation of project design features and mitigation measures identified in the adopted MMP and the clarification of Code Required Measure CR G-2, the temporary extension of construction hours would not result in any new significant impacts with respect to Traffic/Transportation/Parking (construction) and would not substantially increase the severity of any significant impacts previously identified in the Certified EIR or the First Addendum.

(c) Project Design Features and Mitigation Measures

Each of the project design features and mitigation measures set forth in the adopted MMP, including those from the Certified EIR and First Addendum, remain applicable to the Project with the temporary extension of construction hours, with the exception Code Required Measure CR G-2, which would be revised and clarified as provided above.

F. Other Impact Categories

The temporary extension of construction hours would not involve any modifications that would affect the analysis of: aesthetics (operation); agricultural or forestry resources; air quality (operations); biological resources; cultural resources; geology and soils; greenhouse gas emissions; hazards and hazardous materials; hydrology and water quality; land use and planning (operations); mineral resources; noise (operation); population, housing, and employment; public services; or traffic (operation), as provided in the Certified EIR or the First Addendum. Accordingly, the temporary extension of construction hours would not result in any new significant impacts with respect to these issues, nor would it substantially increase the severity of any significant impacts previously identified in the Certified EIR or the First Addendum.

G. Cumulative Impacts

While the specific geographic context for the cumulative impact analysis of each of the issues addressed above, including aesthetics (construction), air quality (construction), land use and planning (construction), noise (construction), and traffic/transportation/parking (construction), may vary, cumulative construction-related impacts are typically localized and thus largely limited to the immediate Project vicinity. In each of the analyses provided above, impacts associated with construction of the Project with temporarily extended construction hours would be within the envelope of impacts evaluated in the Certified EIR and First Addendum, and as such, the Project's contribution to cumulative impacts would remain unchanged from that previously evaluated. Furthermore, in light of the City's noise regulations set forth in LAMC Section 41.40, it is not anticipated that any related projects in

close proximity to the Project Site would conduct nighttime construction activities, particularly during the same limited timeframe as the Project. Moreover, other development projects in the City for which extended construction hours may be sought would be required to undergo review and obtain approval from the Board of Police Commissioners, where any potential conflicts with the Project's nighttime construction activities would need to be addressed. Therefore, cumulative impact conclusions set forth in the Certified EIR and First Addendum would not change as a result of the proposed temporary extension of construction hours. As a result, the temporary extension of construction hours for the Project would not result in any new significant cumulative impacts, nor would it substantially increase the severity of any significant cumulative impacts previously identified in the Certified EIR or the First Addendum.

IV. Conclusion

This Second Addendum provides necessary information regarding the requested approval of a temporary extension of construction hours.

Based on the analysis above, implementation of the temporary extension of construction hours would not result in any new significant impacts, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR. In addition, no substantial change in circumstances or new information not previously available with the exercise of reasonable diligence exists that would trigger additional environmental review under CEQA Guidelines Section 15162 or Public Resources Code Section 21166 has occurred.

Appendix A

Noise Analysis

Los Angeles Football Club Stadium
Extended Hours (Night Shift) Construction Noise Impact Analysis

Introduction

The Los Angeles Football Club (LAFC) Stadium (Project) is currently under construction. The Project proposes to extend construction hours to permit a night shift from approximately 7:00 P.M. to 5 A.M. The proposed night shift construction would include structural steel erection and precast seating erection. This noise impact analysis evaluates the potential noise impacts on the nearby sensitive noise receptors associated with the proposed night shift construction activities.

Impact Analysis

As provided in the Addendum to the Los Angeles Memorial Sports Arena Redevelopment Project Environmental Impact Report (State Clearinghouse No. 2010041059) (AEIR), pursuant to the *L.A. CEQA Thresholds Guide* the Project would have a significant impact on existing ambient sound levels from nighttime construction if:

- Construction activities would exceed the ambient noise level by 5 dBA at a noise-sensitive use between the hours of 9:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, or at any time on Sunday.

The AEIR analyzed four noise-sensitive receptors within the vicinity of the Project Site. Receptor Location 1, located within Exposition Park near the southwestern corner of the Project site was selected to represent the Ralph M. Parsons Pre-School located within the Expo-Center. Receptor Location 2, located near the northern boundary of the Project site was selected to represent the open space areas to the north of the Project site. Receptor Location 3 was selected to represent the residential uses east of Figueroa Street, which are accessed from South Flower Drive. Receptor Location 4 was selected to represent the residential uses south of the Project site across Martin Luther King Jr. Boulevard. Since night shift construction activities would occur when the facilities within Exposition Park generally are not in operation, Receptor Locations 1 and 2 are not included in the night shift construction noise impacts analysis. In addition, to the extent activities within Exposition Park may occur during the night shift, LAFC shall coordinate with the Office of Exposition Park Management to ensure that night shift activities do not conflict with scheduled Exposition Park activities.

The existing nighttime ambient noise levels at Receptor Locations 3 and 4 were measured on six days (April 21, 22, 23, 24, 25 and 28, 2017), between 7:00 P.M. and 1:00 A.M., by PCL Construction Services, Inc. (detail ambient noise data are included Appendix A). Table 1 on

Table 1
Existing Ambient Noise Levels

Receptor Location	Description of Receptor	Measured Ambient Noise Levels, dBA L_{eq}
3	Residential uses east of Figueroa Street, east of Project Site	63.0 – 68.0
4	Residential use on Martin Luther King, Jr. Boulevard, south of Project Site	63.5 – 71.1
Source: PCL Construction Services, Inc., April 2017.		

page 2 provides the measured nighttime ambient noise levels at the Receptor Locations 3 and 4. As indicated therein, the measured ambient noise levels over the six nights ranged from 63.0 to 68.0 dBA at Receptor Location 3 and from 63.5 dBA to 71.1 dBA at Receptor Location 4. To represent the most conservative analysis, the lowest measured nighttime ambient noise levels of 63.0 dBA at Receptor Location 3 and 63.5 dBA at Receptor Location 4 (measured between midnight and 1:00 A.M.) were used for the impact analysis. The measured ambient noise levels included at Appendix A are representative of the ambient noise levels for the entire nighttime period. The ambient noise levels at the Project site and at the nearby residential land uses are primarily dominated by the auto traffic on the local roadways. Road traffic volume, typically, decreases during the nighttime hours. While traffic volumes may decrease further after 1:00 A.M., the ambient noise levels measured between midnight and 1:00 A.M. would not be expected to fall by more than 5 dBA during the early morning hours of 1:00 A.M. and 5:00 A.M., as the Project ambient measurement locations are located adjacent to major roadways in an urban environment and in close proximity to the 110-Freeway. A 5 dBA reduction in a traffic noise level would require the traffic volume to be reduced by over 67% between 1 A.M. and 5 A.M. It is highly unlikely that the auto traffic volume in the vicinity of the Project site would drop by more than a 67% between 1:00 A.M. and 5:00 A.M. Therefore, assuming a 5 dBA reduction in ambient noise conditions between the hours of 1:00 A.M. and 5:00 A.M. would be extremely conservative.

The proposed night shift construction activities would include the following:

1. Crew #1 Area: Construction would be located near the western portion of the Project Site. Work in this area would be limited to structural steel erection and would include the use of an electric powered tower crane and fork lift.

2. Crew #2 Area: Construction would be located within the interior of the stadium bowl. Work in this area would be limited to installing the precast concrete seating and would be located approximately 25 feet below street level. Construction equipment would include a crawler crane, a fork lift, and a construction truck.

3. Deliveries: In addition to the on-site work, materials deliveries for the precast concrete seating would also occur with approximately 4 trucks arriving between 8:00 – 10:00 P.M. and departing before midnight. Delivery trucks would access the Project Site via Martin Luther King Jr. Boulevard from the 110 Freeway and Figueroa Street.

The proposed night shift construction equipment (five pieces of construction equipment) is substantially less than the 18 pieces of construction equipment analyzed for the building construction period in the AEIR.

A construction noise model similar to the noise model used in the analysis provided for the AEIR was created to calculate the noise levels associated with the on-site construction activities during the night shift. The noise model utilized the FHWA published reference noise levels.[1] All construction equipment was placed at the boundary of the Project construction areas for Crew #1 and Crew #2 nearest to the analyzed receptor locations, to represent a conservative analysis. The off-site delivery trucks noise generation was calculated using the FHWA Traffic Noise Model (TNM) and was based on four truck trips (two coming and two leaving) in one hour along the proposed delivery route. Table 2 on page 4 provides the estimated construction noise levels associated with the on-site construction activities and the off-site deliveries. In addition, the composite on-site and off-site construction noise levels were calculated by adding the estimated on-site and off-site construction-related noise levels (noise calculation worksheets are included in Appendix B). As indicated in Table 2, the estimated construction-related noise level would be well below the existing ambient as well as below the Project significance threshold (existing ambient plus 5 dBA) at the nearest noise-sensitive residential uses, Receptor Locations 3 and 4. Specifically, as indicated in Table 2, noise levels would be below the significance threshold by 18.1 dBA at Receptor Location 3 and 16.4 dBA at Receptor Location 4. The estimated construction noise levels would also be well below the significance threshold even if the nighttime ambient noise levels were lowered by 5 dBA as described above.

In addition to the noise impact analysis in terms of hourly L_{eq}, the night shift construction noise level was calculated in terms of CNEL (a 24-hour average level), which include 5 dBA and 10 dBA adjustment factors for noise levels occuring during the evening (7:00 P.M. and 10:00 P.M.) and nighttime (10:00 P.M. and 7:00 A.M.) hours, respectively. Table 3 on page 4 presents the estimated construction noise levels in terms of CNEL, which include both daytime and proposed nighttime construction activities. Conservatively, this analysis did not reduce the activities that

Table 3
Estimated Project Construction Noise Levels – CNEL

Receptor Location	Estimated Construction Noise Levels,[a] CNEL	Ambient Noise Levels,[b] CNEL	Significance Threshold[c] CNEL
3 – Residential uses East of Figueroa Street	66.2	69.9	74.9
4 – Residential uses on Martin Luther King, Jr. Boulevard	65.1	73.4	78.4

[a] *Estimated based on the daytime construction hours of 7:00 A.M. to 5:00 P.M. and nighttime construction hours of 7:00 P.M. to 5:00 A.M. Detail calculations are provided in Appendix B.*

[b] *Ambient in terms of CNEL were estimated based on the daytime ambient noise levels provided in the AEIR and the measured evening/nighttime ambient noise measurement provided in Appendix A.*

[c] *Significance threshold is equal to the ambient noise levels plus 5 dBA.*

Source: AEIR, 2015; AES, 2017.

As analyzed above, the estimated night shift construction noise levels in terms of L_{eq} at Receptor Locations R3 and R4 would be well below the nighttime ambient noise levels and the significance thresholds. In addition, the estimated construction noise levels in terms of CNEL, which include both daytime and nighttime, would also be below the ambient noise levels and the

significance thresholds. Therefore, noise impacts associated with the proposed night shift construction would be less than significant.

Noise Reduction Measures

Although, the estimated construction-related noise level at the nearest residential noise-sensitive uses would be below the applicable significance thresholds, the following noise reduction measures (in addition to the measures provided in the AEIR) are recommended to ensure the noise impacts during the night shift would remain less than significant. During the night shift, the Project shall include the following additional noise reduction measures:

1. Perform ambient noise level readings during the night shift construction activities to ensure that noise levels at residential sensitive uses do not exceed the ambient noise level by 5 dBA. If the measured noise levels during the night shift exceed the ambient noise levels by 4.0 dBA at the residential sensitive uses, the contractor shall evaluate and employ alternative construction methods to ensure that the construction activities shall not exceed the existing ambient noise levels by 5 dBA at the residential sensitive uses.
2. Disable equipment back up bells during the night shift.

I. INTRODUCTION/SUMMARY

INTRODUCTION

CEQA Process

The California Environmental Quality Act (CEQA) (Public Resources Code (P.R.C.) Division 13, § 21000 et seq.) was enacted in 1970 with the main objective of providing public disclosure to inform decision makers and the public of the significant environmental effects of proposed activities and to require agencies to avoid or reduce the environmental effects by implementing feasible alternatives or mitigation measures.

CEQA applies to all discretionary activities proposed to be carried out or approved by California public agencies, including state, regional, county, and local agencies. The proposed Sports Arena Redevelopment Project requires discretionary approval from the Los Angeles Memorial Coliseum Commission (LAMCC) and, therefore, is subject to the environmental review requirements established under CEQA. For purposes of complying with CEQA, LAMCC is identified as the Lead Agency for the Proposed Project.

This Draft Environmental Impact Report (EIR) was prepared in accordance with CEQA, the State CEQA Guidelines (California Code of Regulations (C.C.R.), Title 14, Division 6, Chapter 3, §§ 15000-15387, as amended), and the City of Los Angeles CEQA Thresholds Guide. The State CEQA Guidelines § 15121(a) provides the following description of an EIR:

> *An EIR is an informational document which will inform public agency decision-makers and the public generally of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information which may be presented to the agency.*

Furthermore, this Draft EIR was prepared in accordance with State CEQA Guidelines § 15151 which defines the standards for EIR adequacy:

> *An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.*

This EIR is a Project-level EIR in accordance with State CEQA Guidelines §§ 15161-15168.

Notice of Preparation and EIR Scope

The Notice of Preparation was circulated to local and regional government agencies and the general public for a 30-day public review period starting on April 19, 2010 and ending on May 19, 2010. The NOP was subsequently re-circulated on May 27, 2010 to announce a public scoping meeting would be held to solicit comments from the general public and responsible agencies with regard to the scope of the EIR. The re-circulated NOP comment period began on May 27, 2010 and ended on June 30, 2010.

The public scoping meeting was held on June 16, 2001 at 9:30 a.m. at the Los Angeles Memorial Coliseum Commission's Board Room at 3939 S. Figueroa Street, in Los Angeles CA. Appendix A to this Draft EIR contains copies of both NOPs, the scoping meeting attendance sign-in sheet, and all written comments submitted to the lead agency in response to the NOPs. Based on a preliminary assessment of the Proposed Project and comments received in response to the NOP and at the public scoping meeting, the Lead Agency determined that the following environmental issue areas should be included within the scope of the EIR:

- Aesthetics (Views, Light and Glare)
- Air Quality
- Global Climate Change
- Hydrology and Water Quality
- Land Use and Planning
- Noise/Vibration
- Public Utilities (Water, Sewer, Energy Conservation, Solid Waste)
- Public Services (Police and Fire Protection)
- Transportation/Traffic/Parking
- Cumulative Impacts

Public Participation

To provide full public disclosure of potential environmental impacts that may occur as a result of a proposed project, CEQA requires the Draft EIR to be circulated during the public review period to all responsible agencies, trustee agencies, and the general public. Consistent with CEQA, this Draft EIR shall be circulated for a 45-day review period (P.R.C. § 21091 (a)). During this review period, all public agencies and interested individuals and organizations have the opportunity to provide written comments raising their concerns, if any, with the adequacy and completeness of the Draft EIR. When providing written comments on the subject matter of the Draft EIR, the readers are referred to State CEQA Guidelines §15204(a), which states:

In reviewing Draft EIRs, persons and public agencies should focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that would provide better ways to avoid or mitigate the significant environmental effects. At the same time, reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. When responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR.

The Draft EIR public review period will begin on November 16, 2010 and will end on December 30, 2010. During this period, the Draft EIR will be made available to the public via the LAMCC's official website at: http://www.lacoliseumlive.com. Copies of the Draft EIR and all documents referenced in the Draft EIR will be also be available for public review at the LAMMC's Administrative Offices during normal business hours at the address listed below. All comments regarding the adequacy and completeness of the Draft EIR should be submitted in writing to the following address by no later than 5:00 p.m. on December 30, 2010:

Patrick Lynch, General Manager
Los Angeles Memorial Coliseum Commission
3939 S. Figueroa Street
Los Angeles, CA 90037

Following the public review period, the Lead Agency will prepare a Final EIR. The Final EIR will include additions and corrections to the Draft EIR if any are warranted, and written responses addressing the comments and recommendations received from individuals, organizations, and public agencies during the public review period.

Organization of Draft EIR

This Draft EIR is organized into eight sections, as follows:

Section I. Introduction/Summary: This section provides an introduction to the environmental review process per CEQA, a summary of the Proposed Project, areas of concern, issues to be resolved, alternatives to the Proposed Project, and environmental impacts and mitigation measures.

Section II. Project Description: This section provides a description of the Proposed Project, including the project location, project objectives, project characteristics, and required discretionary actions.

Section III. Environmental Setting: An overview of the study area's environmental setting is provided including a description of existing and surrounding land uses as they existed at the time of the NOP, and a list of related projects proposed in the project area.

Section IV. Environmental Impact Analysis: Each environmental issue contains a discussion of existing conditions for the project area, an assessment and discussion of the significance of impacts associated with the Proposed Project, proposed mitigation measures, cumulative impacts, and level of impact significance after mitigation.

Section V. General Impact Categories: This section provides a summary of any significant and unavoidable impacts and a discussion of the potential growth inducement of the Proposed Project.

Section VI. Alternatives to the Proposed Project: This section provides an analysis of a reasonable range of alternatives to the Proposed Project. The range of alternatives selected is based on their ability to feasibly attain most of the basic objectives of the Proposed Project and their ability to avoid or substantially lessen any of the significant effects of the Proposed Project.

Section VII. Preparers of the EIR and Persons Consulted: This section presents a list of agencies and consultant team members that contributed to the preparation of the Draft EIR.

Section VIII. References and Acronyms: This section includes a list of written materials used in the preparation of this Draft EIR.

Appendices: The various technical appendices cited and referenced throughout the Draft EIR are included on compact disc and attached to this Draft EIR.

PROPOSED PROJECT

Project Location

The Los Angeles Memorial Sports Arena ("Sports Arena") occupies an approximate 15-acre parcel of land within the boundaries of the Exposition Park Master Plan Area. Exposition Park is located approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street on the east, Martin Luther King, Jr. Boulevard on the south, and Vermont Avenue on the west. Exposition Park is the largest park in the Central Los Angeles area of the City of Los Angeles. The Sports Arena is generally situated in the southeastern portion of Exposition Park.

Project Characteristics

The Proposed Project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the LAMCC is

considering two different and mutually exclusive future uses for the Project Site: Option 1, which consists of a Multiple Use Space for civic and special event gatherings; or Option 2: a Major League Soccer Stadium with approximately 22,000 seats. Both of these development options are analyzed in an equal level of detail in this Draft EIR to allow flexibility for the decision–makers to select either one of the two projects.

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. This multiple use space would be improved to provide additional surface parking for Coliseum events and would serve as a public venue for civic gatherings and announcements, capable of hosting a variety of celebratory and entertainment civic events such as parades, rallies, public gatherings, festivals and neighborhood carnivals similar to the current outdoor event usage at the Sports Arena. Under this proposal, the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operation, and would partner with the City to produce civic events.

The Multiple Use Space Option would be primarily developed as an open-air amphitheater. However, as a Multiple Use Space, the intent of this Option is to provide flexibility in event programming to stimulate the local economy and promote civic activity. The Multiple Use Space could support stand-alone events confined to the 15-acre project site or, alternatively, provide flexible uses for joint events held at the Coliseum. For events held at the Coliseum, the Multiple Use Space could serve as an extension of the park-like grounds within Exposition Park, be utilized as an overflow surface parking lot, or serve as an extension to the event activity and staging areas.

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Major League Soccer (MLS) Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with site's history. The VIP parking lot would remain to the west of the proposed stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on a north-south axis and would have a permanent seating capacity of approximately 22,000. The state-of-the art venue would host MLS games, USC soccer games, open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. The stadium would also serve as a practice facility for local soccer teams. Under this Option the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operation, and would partner with the League, private promoters, the City, County or State to produce soccer games and civic events. It is expected to be a high-profile attraction within the City of Los Angeles, with nationally televised events and visitation from world-renowned athletes and coaches.

AREAS OF CONCERN

Included in Appendix A to this Draft EIR, are written comment letters that have been submitted to the Lead Agency during the NOP public review period. Environmental concerns that were raised within the comment letters include the following topics: air quality, regional land use planning, traffic, public transit,

public services and utilities, and historic resources.

In addition to these written comments, verbal comments were made at the public scoping meeting held on June 16, 2010. The issues that were raised at the scoping meeting primarily focused on the public participation process and timeline of the EIR and the Project. The scoping meeting was attended by representatives from the following entities: a private sign company, the University of Southern California, the Los Angeles City Fire Department, Councilman Bernard Park's office, and the Los Angeles Conservancy. All of the issues that were discussed at the scoping meeting and raised in comments to the NOP are addressed within the scope of this EIR within the respective sections contained in Section IV, Environmental Impact Analysis.

ALTERNATIVES

Section 15126.6(c) of the State CEQA Guidelines requires that the Draft EIR include a reasonable range of project alternatives that could feasibly accomplish most of the basics objectives of the Proposed Project and could avoid or lessen one or more of the significant effects of the Proposed Project. The following Alternatives are analyzed in this Draft EIR:

- **No Project Alternative:** The No Project Alternative would be the result of not approving the Proposed Project. Under this scenario, the Los Angeles Memorial Sports Arena would continue operating as it currently is without any physical improvements or renovation projects.

- **Historic Retention Alternative.** This Alternative would consist of renovating the Los Angeles Sports Arena in accordance with the Secretary of Interior's Standards for the Rehabilitation and Renovation of Historic Structures. The existing structure would not be demolished and renovation efforts would be aimed at maintenance projects and providing modern amenities to make the facility an attractive and desirable location for sporting, entertainment and civic events.

Section VI, Alternatives to the Proposed Project, includes a detailed description of each of the above-listed Alternatives, including the logic in choosing the Alternative and an analysis of the potential environmental impacts of each Alternative as compared to the impacts of the Proposed Project.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Table I-1, beginning on the following page, summarizes the various environmental impacts associated with the construction and operation of the Proposed Project. Mitigation measures are proposed for significant environmental impacts, and the level of impact significance after mitigation is also identified.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Aesthetics		
Views Under Option 1, Multiple Use Space, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be demolished and the site would be redeveloped with an open-air greenspace with an amphitheater. The proposed Multiple Use Space Option would contrast sharply with the existing aesthetic and visual character of the existing Project Site, as the existing Sports Arena would be replaced with an open air landscaped area with no structures. In this regard aesthetic impacts would be less than significant. Under Option 2, MLS Stadium, the existing Sports Arena would be removed and the site would be redeveloped with a MLS Stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on a north-south axis and would occupy the existing footprint of the Sports Arena building. Architecturally, the stadium would resemble other comparable venues in the nation, such as the Home Depot Center in the City of Carson, home to both the Los Angeles Galaxy and Chivas USA of Major League Soccer. It would feature dome-style geometry typical of stadium architecture, partially topped by a curved canvas tensile canopy on its west and east sides. The lighting to be used for the soccer field would consist of highly focused and directional lighting arrays. Much of the lighting (and all of the high-intensity field lighting) would be directed downward into the bowl-shaped stadium. Similar to existing conditions, low level security lighting would also be installed throughout the remainder of the site to mark walkways, parking areas, restroom facilities, and entrances. Signage A detailed signage program has not been developed for either Option at this time. However, in the absence of any specific programmatic goals for signage it is assumed that the project would be developed in a manner that is consistent with and adheres to all of the applicable codes of the LAMC,	MM A-1 Outdoor lighting shall be designed and installed with shielding, such that the light source cannot be seen from adjacent residential properties or the public right-of-way. MM A-2 The exterior of the proposed structure shall be constructed of materials such as, but not limited to, high-performance and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize glare and reflected heat.	Impacts related to aesthetics would be less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
the design guidelines of the South Los Angeles Community Plan as it pertains to signage, and the overriding rules and regulations set forth in the Coliseum Signage Overlay District. As such, aesthetic impacts related to signage would be less than significant. Light and Glare Environmental impacts to the adjacent residential properties to the south of Martin Luther King, Jr. may result due to excessive illumination on the project site. The Multiple Use Space will include permanent lighting fixtures to illuminate landscaped areas, way-finding and directional signage, and pedestrian pathways for safety and security purposes. The lighting plan would consist of low-level directional lighting fixtures to minimize light trespass to off-site properties. The Multiple Use Space Option would also employ portable event lighting that would be brought in and set up on an event-by-event basis to illuminate the amphitheater stage and surrounding areas. Due to the fact that the amphitheater stage will be set below grade, and the stage lighting will be directed downward towards the stage, event lighting it is not anticipated to result in any light trespass to off site properties. Mitigation Measure A-1 is recommended to ensure lighting impacts from both permanent and portable lighting fixtures are minimized to the maximum extent possible. Aesthetic impacts associated with light and glare would be less than significant. Under the MLS Stadium Option, exterior stadium lights are proposed which could result in light spillage onto adjacent properties and land uses. Mitigation Measure A-1 is recommended to ensure lighting impacts from exterior and field lighting fixtures are minimized to the maximum extent possible. Aesthetic impacts associated with light and glare would be less than significant. Under both Options the potential exists for excessive and disruptive glare impacts to result from architectural materials yet to be selected. As such mitigation measure A-2 is recommended to reduce this impact to an acceptable level.		

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Air Quality		
Construction Impacts Construction activities would generate pollutant emissions from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction, including the application of architectural coatings; paving and asphalting; construction workers traveling to and from the project site; delivery and hauling of construction supplies and debris to and from the project site; and, the fuel combustion generated by on-site construction equipment. On-site emissions generated by the Proposed Project during the different phases of construction would not exceed the established SCAQMD localized thresholds for NOx (in the form of NO2), CO, PM_{10}, and $PM_{2.5}$ at a receptor distance of 82 feet. Thus, the on-site construction emissions would also not exceed the SCAQMD localized thresholds at receptor distances beyond 82 feet (i.e., 164, 328, 656, and 1,640 feet). Therefore, the localized air quality impacts resulting from construction emissions associated with the Proposed Project would be less than significant. Thus, impacts on sensitive receptors resulting from construction-related emissions would also be considered less than significant. Operational Impacts Operational emissions generated by both stationary and mobile sources would result from normal day-to-day activities on the project site after occupation. Stationary area source emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile emissions would be generated by the motor vehicles traveling to and from the project site. Stationary source emissions would be reduced compared to existing conditions, impacts would be considered less than significant.	MM B-1 The Project Applicant shall comply with SCAQMD Rule 403—Fugitive Dust. Examples of the types of dust control measures currently required and recommended include, but are not limited to, the following: • Water active grading/excavation sites and unpaved surfaces at least three times daily; • Sweep daily (with water sweepers) all paved construction parking areas and staging areas; • Provide daily clean-up of mud and dirt carried onto paved streets from the site; • Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site; • Suspend excavation and grading activity when winds (instantaneous gusts) exceed 15 miles per hour over a 30-minute period or more; and • An information sign shall be posted at the entrance to each construction site that identifies the permitted construction hours and provides a telephone number to call and receive information about the construction project or to report complaints regarding excessive fugitive dust generation. Any reasonable complaints shall be rectified within 24 hours of their receipt. MM B-2 The Project Applicant shall use low VOC paints for all interior and exterior surfaces.	Therefore, regional construction-related air quality impacts would be considered significant and unavoidable. Operational impacts would be less than significant without mitigation measures.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
With respect to mobile sources, the Proposed project under either option would not increase the maximum size of the events currently held at the facility. Combined with the Coliseum, the Project Site supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new event/soccer stadium facility are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Accordingly, mobile source emissions would also not be increased as a result of the Proposed Project and operational impacts related to regional and localized emissions would be considered less than significant.		
Global Climate Change		
Construction emissions represent an episodic, temporary source of GHG emissions. Emissions are generally associated with the operation of construction equipment and the disposal of construction waste. Anticipated GHG emissions were calculated for each year of construction of the proposed project. It is estimated thet 878 metric tons of CO2e would be generated in 2011 and 451 metric tons of CO2e would be generated in 2012, representing approximately 0.000002 percent and 0.000001 percent of the 2008 State-wide level, respectively. This amount is considered to be less than significant as the construction activities would be finite and not persist after construction. Operational GHG emissions generated by both stationary and mobile sources would result from future activities on the Project Site. Stationary area source GHG emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile GHG emissions would be generated by the motor vehicles traveling to and from the project site. With respect to stationary GHG sources, Project Option 1 would result in	See the water and energy conservation measures identified under Public Utilities, below.	Impacts related to the generation of GHGs would be considered less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
the development of an open-air, all-grass amphitheater. Project Option 2 would result in the development of an open-air MLS Stadium. Under either Option the Project would result in a substantial reduction of stationary source GHG emissions such as water and space heating, air conditioning, and cooking appliances. Under both options, the Proposed Project would replace an existing venue over 50 years old with a state-of-the art venue that would include numerous sustainability and design features that would result in significantly increased energy efficiencies at the Project Site. Therefore, stationary source GHG emissions would be reduced compared to existing conditions. With respect to mobile sources, the Proposed Project is not expected to generate significant new traffic impacts. The new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility. Accordingly, mobile source GHG emissions would also not be increased as a result of the Proposed Project.		
Historic Resources		
The Los Angeles Memorial Sports Arena was constructed in 1959, after more than two decades of planning by various agencies and individuals, to provide the City of Los Angeles with a world-class facility for a variety of events. The Sports Arena is now more than 50 years of age and, based on an evaluation by ICF Jones & Stokes (July 2010), appears eligible for the California Register of Historical Resources under Criteria 1 (Pub. Res. Code Section 5024.1, Title 14 CCR, Section 44852) for its association with events that have made a significant contribution to Los Angeles history. As such, the Sports Arena has been determined to be a historically significant resource, the demolition of which would result in a significant environmental impact.	MM H-1. Prior to the issuance of a demolition permit, a report documenting the architectural and historical features of the Sports Arena shall be prepared and offered to the Southern California Information Center at California State University, Fullerton, and the City. The report shall include the following: a) A written report according to the Historic American Building Survey (HABS) narrative format, which includes historical and descriptive information; b) Duplicates of historic photographs, if available; c) Duplicates of original drawings, if available; and d) Large format (4-inch by 5-inch negative or larger) black and white 35-millimeter photographs based on	The demolition of the Sports Arena, which has association with events that have made a significant contribution to Los Angeles history, would be considered significant and unavoidable.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	HABS guidelines. The photographs shall be keyed to a floor and site plan to show the location of each photograph taken. Views shall include the setting, important site features, all exterior elevations, detailed views of significant exterior architectural features, and interior views of significant spaces and features.	
Hydrology and Water Quality		
Surface Water Quality During construction, sediment is typically the constituent of greatest potential concern. The greatest risk of soil erosion during the construction phase occurs when site disturbance peaks due to grading activity and removal and re-compaction or replacement of fill areas. Other pollutants that could affect surface-water quality during the Project construction phase include petroleum products (gasoline, diesel, kerosene, oil, and grease), hydrocarbons from asphalt paving, paints and solvents, detergents, fertilizers, and pesticides (including insecticides, fungicides, herbicides, and rodenticides). Discharges of stormwater from construction sites with a disturbed area of one or more acres are required to either obtain individual NPDES permits for stormwater discharges or be covered by the Construction General Permit. Coverage under the Construction General Permit is accomplished by completing and filing a Notice of Intent with the SWRCB. Under the Construction General Permit, the project contractor must ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared prior to grading and implemented during construction. Mitigation Measure E-1 requires the Project Applicant to prepare a SWPPP to the satisfaction of the City of Los Angeles Department of Building and Safety prior to the issuance of building permits. Once the Project has been constructed with either Options 1 or 2, urban runoff from the Project Site would have the potential to include all of the	MM E-1 The Project Applicant shall ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared and implemented during construction. The SWPPP shall be prepared to the satisfaction of the City of Los Angeles Department of Building and Safety prior to the issuance of building permits. MM E-2 The Project Applicant must prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program. The SUSMP shall be submitted and prepared to the satisfaction of the City of Los Angeles Department of Building and Safety. MM E-3 The Project Applicant must comply with LARWQCB's General NPDES Permit and General Waste Discharge Requirements (WDRs) (Order No. R4-2003-0111, NPDES No. CAG994004) governing construction-related dewatering discharges (the "General Dewatering Permit").	With the implementation of Mitigation Measures E-1 through E-3, impacts related to hydrology and water quality would be less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
above contaminants. The Project Applicant would be required to prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program for both Options 1 and 2. Post-construction BMPs (e.g., biofiltration swales, flow-through planters, and educational materials) would be used to reduce pollutant loadings in runoff. Preparation and implementation of the SUSMP would ensure that water quality impacts of the Project would be minimized and that the Project would not violate any water quality standards. Therefore, Project impacts related to surface water quality would be less than significant. The Project Site in its existing state is mostly impervious. Stormwater runoff from the site discharges to landscaped areas or to the local stormdrain system. Development of Option 1 would greatly increase the permeability of the site, as most of the 15-acre site would be converted to landscaped areas. Minimal paving would be required for pedestrian pathways and for the concrete stage/foundation within the amphitheater. Under Option 2, MLS Stadium, permeable areas would be only slightly increased as compared to the existing conditions, and the Stadium would be an open air and uncovered stadium. Thus, under either Option, the project design would not increase the amount of impervious areas and stormwater conditions would be improved compared to existing conditions. The potential for erosion/siltation as a result of runoff from the Project Site would be limited by the increased landscaped cover of the site. The landscaped areas would be designed and maintained to limit soil erosion. Project Therefore, impacts associated with erosion/siltation would be less than significant with mitigation.		
Land Use and Zoning		
Construction Impacts Construction of the Proposed Project under either Option (the Multiple Use Space or the MLS Stadium) would cause temporary and intermittent	(See Sections IV.B, Air Quality, IV.G, Noise, and IV.J, Traffic, Transportation and Parking.) MM.F-1. The Los Angeles Memorial Coliseum Commission shall	Incorporation of the mitigation measures for construction-related traffic,

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
impacts to adjacent land uses due to temporary increases in air emissions (including fugitive dust), noise, and traffic congestion. These potential effects are discussed in detail in Sections IV.B, Air Quality; IV.G, Noise; and IV.J.1, Traffic, Transportation and Parking, of this EIR. The Proposed Project would redevelop the site with a similar serving land use and thus would be consistent with the existing composition of land uses within Exposition Park, and compatible with the existing community in the vicinity of the Project Site. No new significant or substantially altered land use compatibility impacts on the existing surrounding land uses are anticipated. Furthermore, the Proposed Project would be consistent with various regional land use plans, such as Southern California Association of Governments (SCAGs) Regional Transportation Plan (RTP), the South Coast Air Quality Management District's Air Quality Management Plan (AQMP), and the Regional Water Quality Control Board's National Pollution Discharge Elimination System (NPDES) statewide General Construction Activity Permit requirements, and Los Angeles County's Congestion Management Plan (CMP) and City of Los Angeles Department of Transportation (LADOT) Guidelines. On a local level, the Proposed Project would be generally consistent with the City of Los Angeles General Plan designation for the Project Site, which is OS, Open Space. This designation permits parks and community centers under the ownership and operation of a public agency. Furthermore, economic growth would be fostered along the Figueroa corridor within the City's Redevelopment Plan area, consistent with the goals identified in the CRA's Five Year Implementation Plan. As a result, the Proposed Project would be consistent with the City's General Plan and the Redevelopment Plan and no impacts are anticipated. The Proposed Project uses are consistent with the allowable uses for the OS-1XL (Open Space) zone, which permits parks and recreation facilities (including park land/lawn areas and athletic fields). With regard to the Project Site's height district of 1XL, which limits the maximum FAR to 3:1	obtain all applicable permits from the Building and Safety Department (and other state and municipal agencies, as may be required) for Project construction actions associated with implementation of either Option 1 or Option 2 including, but not limited to a height variance.	noise, and air quality impacts identified in Sections IV.B, Air Quality, IV.G, Noise this Draft EIR would serve to reduce the Proposed Project's anticipated construction impacts, but significant and unavoidable impacts would result on a temporary basis during the construction period. The proposed project under Option 1 (Multiple Use Space) and Option 2 (MLS Stadium) would be consistent with the underlying General Plan and Zone Designation, the Redevelopment Plan, the Exposition Park Master Plan, and applicable regional plans and regulations. As such, impacts to operational land use compatibility and consistency with the applicable land use plans and the zoning code would be less than significant prior to mitigation and no mitigation measures are

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
and the height of a building or structure to two stories and 30 feet, the Proposed Project would require a discretionary action to exceed this limitation. With approval of the required discretionary actions, project impacts related to land use would be less than significant.		required.
Noise		
Construction Noise Construction activities with the Proposed Project would generate noise from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction; paving and asphalting; construction workers traveling to and from the project site; and delivery and hauling of construction supplies and debris to and from the project site. Outdoor noise levels at noise-sensitive receptors 50 feet from the noise source could range from 77 dBA to 86 dBA Leq with the use of noise-attenuating devices. Thus, construction activities associated with the Proposed Project would result in a temporary or periodic increase in noise levels at some of the off-site noise sensitive receptor locations. Accordingly, construction activities associated with the Proposed Project would generate a substantial temporary or periodic increase in ambient noise levels in the Proposed Project vicinity, and impacts would be considered potentially significant. Construction-Related Groundborne Vibration Construction activities that would occur within the Project Site would include demolition and excavation, which would have the potential to generate low levels of groundborne vibration. The vibration level that would be experienced by the Project's construction activities would not exceed the Federal Railway Administration's vibration impact thresholds, and this impact would be considered less than significant. Operational Noise – Special Event Noise Under both project options, the existing indoor venue would be replaced	Code Required Measures CR G-1 The Applicant shall comply with the City of Los Angeles Noise Ordinance No. 144,331 and 161,574, and any subsequent ordinances, which prohibit the emission or creation of noise beyond certain levels at adjacent uses unless technically infeasible. CR G-2 The Applicant shall ensure construction and demolition be restricted to the hours of 7:00 AM to 6:00 PM Monday through Friday, and 8:00 AM to 6:00 PM on Saturday. Project-Specific Mitigation Measures MM G-1 The Applicant shall prepare a construction-related traffic plan detailing proposed haul routes and staging areas for the transportation of materials and equipment, with consideration for sensitive uses in the neighborhood. A traffic and parking plan for the construction phase will be submitted for approval by LADOT and the Department of Building and Safety prior to the issuance of any permits. MM G-2 The Applicant shall ensure all construction equipment engines be properly tuned and muffled according to manufacturers' specifications. For example, Table IV.G-6 indicates that noise levels of 82 dBA at 50 feet could be reduced to a noise level of 76 dBA at 100 feet	Construction Noise: Significant and unavoidable. Construction Groundborne Vibration: Less Than Significant. Operational Event Noise: Significant and unavoidable. Traffic & Parking Lot Noise: Less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
with an outdoor venue. Noise sources from special events at the open-air amphitheater or soccer stadium would include: crowd noise (particularly yells and cheers at high attendance soccer or concert events); a public address system (amplified public announcements and/or play-by-play announcements); amplified concert music; traffic-related noise from motorists traveling to and from events (discussed in detail below); and helicopters and other aircrafts covering events. It is anticipated that noise levels during soccer games and related sporting events would be substantially similar to the peak noise generating events currently occurring at the Coliseum. It is typically expected that the sound level achieved for concert music, particularly popular or rock type music, would be in the 95 to 110 decibel range within the venue boundaries. Operational noise impacts from special events would be considered potentially significant.	with the proper use of mufflers. MM G-3 Adjacent museums and residents shall be given regular notification of major construction activities and their durations. A visible and readable sign (at a distance of 50 feet) shall be posted on the construction site identifying a telephone number where residents can inquire about the construction process and register complaints. MM G-4 The perimeter of the Project Site shall be enclosed with a temporary barrier wall for security and noise protection purposes. This barrier wall shall consist of a solid, heavy vinyl material or ¾-inch plywood positioned to block direct line of sight from the active construction areas and other open space areas and sensitive uses.	
Public Services – Fire Protection Services		
Under Option 1 (Multiple Use Space) and Option 2 (MLS Stadium), the demands placed upon the Los Angeles Fire Department would be substantially similar to the current conditions, as all of the aforementioned uses would generate large public gatherings. Definitive plans and specifications shall be submitted to the Fire Department and requirements for necessary permits satisfied prior to commencement of any portion of the Proposed Project. In addition, compliance with the listed Code-Required Measures, as well as any additional recommendations made during later reviews of the Proposed Project by the Fire Department will reduce potential impacts to less than significant levels.	MM H.1-1 Sprinkler systems will be required throughout any structure to be built, consistent with the LAMC requirements for public venue structures (Section 57.09.07). MM H.1-2 All first-story portions of any commercial or industrial building must be within 300 feet of an approved fire hydrant (Section 57.09.06, Subsection B-1). MM H.1-3 The maximum distance between fire-flow hydrants on the roads and fire lanes in a high-density residential and commercial area is 300 feet. MM H.1-4 Any person owning or having control of any facility,	Less Than Significant

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	structure, group of structures or premises shall provide and maintain Fire Department access (Section 57.09.03, Subsection A). MM H.1-5 If any portion of the first story exterior walls of any building structure is more than 150 feet from the edge of the roadway of an approved street, an approved fire lane shall be provided so that such portion is within 150 feet of the edge of the fire lane. (Section 57.09.03, Subsection B.) MM H.1-6 When required access is provided by an improved street, fire lane or combination of both which results in a dead-end in access of 700 feet in length from the nearest cross street, at least one additional ingress-egress roadway shall be provided in such a manner that an alternative means of ingress-egress is accomplished (Section 57.09.03, Subsection C). MM H.1-7 All public and private streets shall be dedicated and improved in conformance with Board of Public Works, Standard Dimension Plan, Number D-22549. MM H.1-8 Construction of public or private roadways in the proposed development shall not exceed 15 percent in grade. MM H.1-9 Fire lanes, where required, and dead ending streets, shall terminate in a cul-de-sac or other approved turning area. MM H.1-10 All access roads, including fire lanes, shall be maintained in an unobstructed manner. Removal of obstructions shall be at the owner's expense. The entrance to all required fire lanes or required private driveways shall be posted with a sign no less than three square feet in area (Section 57.09.05). MM H.1-11 Fire lane width shall not be less than 20 feet. When a fire lane must accommodate the operation of Fire	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure		Level of Significance After Mitigation
		Department aerial ladder apparatus or where fire hydrants are installed, those portions shall not be less than 28 feet in width. The Fire Department may require additional vehicular access where buildings exceed 28 feet in height.	
	MM H.1-12	In the event that a subterranean parking structure is included as a part of the Proposed Project, and where fire apparatus will be driven onto the road level surface of such subterranean parking structure, that structure shall be engineered to withstand a bearing pressure of 8,600 pounds per square foot.	
Public Services – Police Protection Services			
Construction Impacts The Proposed Project has the potential to adversely affect police services during the construction period due to an increased potential for theft and vandalism. However, the Proposed Project would employ mitigation measures including erecting temporary fencing around the construction site, and installing a security camera to discourage trespassers as well as deploying security guards to monitor the construction site and deter any potential criminal activity. Implementation of the recommended mitigation measures would reduce the demands upon police services during construction of the Proposed Project and reduce the potentially significant impact to a less-than-significant level. Operational Impacts The Proposed Project has the potential to place high demands upon police protection services during operation as a result of the redevelopment of the site as a public venue. However, the Proposed Project includes security/design features that would reduce the demand for police service to less than significant levels. In addition private security staff will be	H.2-1	The Project shall erect temporary fencing around the Project Site during construction activities to secure the Project Site and discourage trespassers.	Less Than Significant.
	H.2-2	Project Event Sponsors shall employ private security guards to monitor and secure the Project Site during events to secure the site and deter any potential criminal activity.	
	H.2-3	The Project Applicant shall develop and implement a Security Plan in consultation with the LAPD outlining the security services and features to be provided in conjunction with the Proposed Project. The plan shall be coordinated with the LAPD and a copy of said plan shall be filed with the LAPD Central Bureau Commanding Officer. Said security plan may include some or all of the following components: i. Provisions for an on-site private security force for the mixed-use trade school. Through individual lease agreements for the proposed trade school/retail uses,	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
employed for special events, in a manner that is consistent with the current operations. The Proposed Project would be subject to LAPD review, and would be required to comply with all applicable safety requirements of the LAPD and the City of Los Angeles in order to address police protection service demands adequately. Thus, the Proposed Project would not necessitate new or expanded police facilities, and impacts to police services and facilities would be less than significant.	private on-site security services shall provide a 24-hour presence. Security officers shall be responsible for patrolling all common areas including the back service corridors and alleys, parking garages, and stairwells. ii. The parking garage shall be fitted with emergency features such as closed circuit television (CCTV) or emergency call boxes that would provide a direct connection with the on-site security force or the LAPD 911 emergency response system. iii. The proposed security plan shall incorporate low-level and directional security lighting features to effectively illuminate project entryways, seating areas, lobbies, elevators, service areas, and parking areas with sufficient illumination and minimum dead space to eliminate areas of concealment. Full cut-off fixtures shall be installed that minimize glare from the light source and provide light downward and inward to structures to maximize visibility.	
Public Utilities - Wastewater		
The peak and average wastewater flows from the Project Site would not be increased compared to existing conditions and it is anticipated that the existing wastewater infrastructure in the vicinity would be able to accommodate the Proposed Project. As such, impacts with respect to local sewer capacity would be less than significant. With respect to wastewater treatment facilities, as stated above, the HTP currently processes average wastewater flows of approximately 340 mgd, resulting in a remaining capacity of approximately 110 mgd. The peak and average wastewater flows from the Proposed Project would not be	No mitigation measures are required.	Less Than Significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
increased compared to existing conditions and would not substantially alter the treatment capacity presently available at the HTP. Thus, impacts are considered to be less than significant.		
Public Utilities – Water		
Construction The Project Area is currently served by adequate potable water infrastructure. Construction of the Proposed Project would require connection to the existing potable water infrastructure in the Project's service area to serve the Project's operational demands. The Project's water demands (i.e., quantity, size and type of infrastructure) will be determined by the Applicant's engineering consultants in consultation with the Los Angeles Department of Building and Safety based on applicable building code requirements. Although new service connections may occasionally result in temporary interruptions in water services for existing customers, new water service installations are generally "hot tapped" so as to avoid water service interruption. Therefore, temporary disruptions in local water service during the construction period are not anticipated and impacts would be less than significant. Operation The peak and average water demand for the Project Site would not be increased compared to existing conditions and it is anticipated that the existing water supply infrastructure in the vicinity would be able to accommodate the Proposed Project. Thus, as the projected water demand of the Proposed Project would be similar to existing conditions at the Project Site, it is anticipated the future water demand be within the 20-year water demand growth projected in the City of Los Angeles' Year 2005 Urban Water Management Plan. Furthermore, because the water demands of the Proposed Project are within the 20-year water demand growth	MM I.2-1 The Project shall comply with Ordinance No. 170,978 (Water Management Ordinance), which imposes numerous water conservation measures in landscape, installation, and maintenance (e.g., use drip irrigation and soak hoses in lieu of sprinklers to lower the amount of water lost to evaporation and overspray, set automatic sprinkler systems to irrigate during the early morning or evening hours to minimize water loss due to evaporation, and water less in the cooler months and during the rainy season). In addition, the Department of Water and Power requires the following conservation measures for all new development in the City of Los Angeles: • High efficiency toilets (1.28 gallons per flush or less, includes dual flush); • High efficiency urinals (0.5 gallons per flush or less, includes waterless); • Restroom faucet flow rate of 1.5 gallons per minute or less; • Public restroom self-closing faucets; • Showerhead flow rate of 2.0 gallons per minute or less; • Limit of one showerhead per shower stall; • High efficiency clothes washers (water factor of 6.0 or less);	Less Than Significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
projected in the UWMP and water supplies are considered to be reliable, impacts associated with regional water supplies would be less than significant. In addition, the LADWP imposes water conservation mitigation measures for all projects within its jurisdiction. Implementation of these water conservation measures would ensure impacts related to water supply remain less than significant.	• High efficiency dishwashers (Energy Star rated); • Use of tankless and on-demand water heaters as feasible; • Cooling towers must be operated at a minimum of 5.5 cycles of concentration; • Require onsite water recycling systems for wastewater discharge for commercial laundries, dye houses, food processing, certain manufacturing operations, etc. (subject to a payback threshold of five years or less). Mandate water recycling system for all new car wash facilities. • Strict prohibition of single-pass cooling; (Note: Single pass cooling refers to the use of potable water to extract heat from process equipment) • Irrigation system requirements: o Weather-based irrigation controller with rain shutoff; o Flow sensor and master valve shutoff (large landscapes); o Matched precipitation (flow) rates for sprinkler heads; o Drip/microspray/subsurface irrigation where appropriate; o Minimum irrigation system distribution uniformity of 75 percent; o Proper hydro-zoning, turf minimization and use of native/drought tolerant plant materials; o Use of landscape contouring to minimize precipitation runoff; • Metering: o All irrigated landscapes of 5,000 square feet or more	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	require separate metering or submetering; • Mandated use of recycled water (where available) for appropriate end uses (irrigation, cooling towers, sanitary); Standard Urban Stormwater Mitigation Plan (SUSMP): Compliance with all City of Los Angeles SUSMP requirements, and encouraging implementation of Best Management Practices that have stormwater recharge or reuse benefits.	
Public Utilities – Energy Conservation		
Construction Energy would be consumed during the demolition, excavation, and construction phases of the Proposed Project for grading and materials transfer by heavy-duty equipment, which is usually diesel powered. The energy demands during construction would be typical of construction projects for projects of this size and would not necessitate additional energy facilities or distribution infrastructure. Accordingly, energy demands during construction would be less than significant. Operation - Electricity The peak and average electricity demand for the Project Site would not be substantially increased compared to existing conditions and it is anticipated that the existing electrical infrastructure in the vicinity would be able to accommodate the Proposed Project. With modern energy-efficient construction materials and operating equipment, the Proposed Project would promote conservation in accordance with the policies identified in Title 24 and in the City of Los Angeles General Plan Framework. While impacts upon regional energy resources are expected to be less than significant, the LADWP imposes standard mitigation measures for all new	MM I.3-1 Built-in appliances, refrigerators, and space-conditioning equipment shall exceed the minimum efficiency levels mandated in the California Code of Regulations. MM I.3-2 The Project Applicant shall install high-efficiency air conditioning controlled by a computerized energy-management system in the office and retail spaces that provides the following: • A variable air-volume system that results in minimum energy consumption and avoids hot water energy consumption for terminal reheat; • A 100-percent outdoor air-economizer cycle to obtain free cooling in appropriate climate zones during dry climatic periods; • Sequentially staged operation of air-conditioning equipment in accordance with building demands; and • The isolation of air conditioning to any selected floor or floors.	Project impacts on energy resources or infrastructure systems would be less than significant without mitigation. The proposed mitigation measures would further reduce energy demand.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure		Level of Significance After Mitigation
projects to further reduce project impacts and promote conservation efforts. Implementation of these measures would further reduce the project's overall demand for electricity to ensure the project's impacts remain less than significant. Natural Gas The peak and average natural gas demand for the Project Site would not substantially increase as compared to existing conditions and it is anticipated that the existing natural gas infrastructure in the vicinity would be able to accommodate the Proposed Project. Since the Proposed Project is located in an area already served by existing natural gas infrastructure, the Project would not require extensive infrastructure improvement to serve the Project Site. It is not anticipated that any new natural gas distribution pipelines or infrastructure facilities would be constructed or expanded as a result of the Project. The project would require local infrastructure improvements to connect to the existing infrastructure serving the project area. "Hooking-up" disruptions, however, cannot be determined until the actual natural gas demand is known. Impacts associated with utility upgrades or additional connections would be temporary in nature and thus result in less than significant impacts upon the environment.	MM I.3-3	The project shall be designed in a manner that utilizes Cascade (i.e., passively transferred) ventilation air from high-priority areas before being exhausted, thereby decreasing the volume of ventilation air required. For example, air could be passively transferred from occupied space to corridors and then to mechanical spaces before being exhausted.	
	MM I.3-4	The Applicant shall incorporate a recycle lighting system heat for space heating during cool weather. Exhaust lighting-system heat from the buildings, via ceiling plenums, shall be used to reduce cooling loads in warm weather.	
	MM I.3-5	The Applicant shall install low and medium static-pressure terminal units and ductwork to reduce energy consumption by air-distribution systems.	
	MM I.3-6	The Applicant shall ensure that buildings are well sealed to prevent outside air from infiltrating and increasing interior space-conditioning loads. Where applicable, building entrances shall be designed with vestibules to restrict infiltration of unconditioned air and exhausting of conditioned air.	
	MM I.3-7	The Applicant shall conduct a performance check of the installed space-conditioning system prior to issuance of the certificate of occupancy to ensure that energy-efficiency measures incorporated into the Project operate as designed.	
	MM I.3-8	Exterior walls shall be finished with light-colored materials and high-emissivity characteristics to reduce cooling loads. Interior walls shall be finished with light-colored materials to reflect more light and, thus, increase lighting efficiency.	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure		Level of Significance After Mitigation
	MM I.3-9	White, high albedo, and reflective material shall be used for roofing in order to meet California standards for reflectivity and emissivity to reject heat.	
	MM I.3-10	Thermal insulation that exceeds requirements established by the California Code of Regulations shall be installed in walls and ceilings.	
	MM I.3-11	Window systems shall be designed to reduce thermal gain and loss, thus reducing cooling loads during warm weather and heating loads during cool weather.	
	MM I.3-12	The Project Applicant shall install heat-rejecting window treatments, such as films, blinds, draperies, or others on appropriate exposures.	
	MM I.3-13	The Project Applicant shall install fluorescent and high-intensity-discharge (HID) lamps, which give the highest light output per watt of electricity consumed, wherever possible including all street and parking lot lighting to reduce electricity consumption. Reflectors shall be used to direct maximum levels of light to work surfaces.	
	MM I.3-14	The Project Applicant shall install photosensitive controls and dimmable electronic ballasts to maximize the use of natural daylight available and reduce artificial lighting load.	
	MM I.3-15	The Project Applicant shall install occupant-controlled light switches and thermostats to permit individual adjustment of lighting, heating, and cooling to avoid unnecessary energy consumption.	
	MM I.3-16	The Project Applicant shall install time-controlled interior and exterior public area lighting limited to that necessary for safety and security.	
	MM I.3-17	Mechanical systems (HVAC) and lighting	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure		Level of Significance After Mitigation
		buildings shall be controlled with timing systems to prevent accidental or inappropriate conditioning or lighting of unoccupied space.	
	MM I.3-18	The Project Applicant shall incorporate windowless walls or passive solar inset of windows into the Project for appropriate exposures.	
	MM I.3-19	Design Project shall focus pedestrian activity within sheltered outdoor areas.	
Public Utilities – Solid Waste			
Construction Construction of the Proposed Project would require the demolition of the existing Sports Arena. Approximately 5.4 million cubic feet of debris would be generated from this activity. Construction debris from building activities would also be generated which includes concrete, asphalt, wood, drywall, metals, and a variety of other miscellaneous and composite materials. As such, construction of the Proposed Project would generate construction debris that would need to be disposed of at area landfills and/or recycled. Construction debris includes concrete, asphalt, wood, drywall, metals, and a variety of other miscellaneous and composite materials. The amount of solid waste generated during construction would fall within the available permitted daily intake capacity of area landfills and recycling centers. Therefore, impacts associated with demolition and construction debris would be less than significant. Operational Impacts The peak and average solid waste generated by the Project Site would not	MM I.4-1	The Project Applicant shall develop a construction and demolition debris recycling program to divert construction related solid waste and demolition debris from area landfills.	Less Than Significant.
	MM.I.4-2	The Project Applicant shall develop an operational project recycling plan that includes the design and allocation of recycling collection and storage space in the Project.	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
be substantially increased compared to existing conditions. It is anticipated that the solid waste demands generated by the Proposed Project could be readily accommodated by the existing regional landfill operations without the need to expand operations or divert existing waste streams to alternative locations. However, because the existing landfill capacity is finite and its overall capacity will be reduced over time, additional landfills and solutions to address the ongoing regional solid waste demands of the City beyond 2024 will need to be addressed on a regional basis. For purposes of a Project-specific impact conclusion, the Project's impact upon solid waste disposal facilities would be considered less than significant with the implementation of the recommended mitigation measures.		
Transportation Traffic and Parking		
Traffic Impacts The Proposed uses under Option 1 (Multiple Use Space) or Option 2 (MLS Stadium) would result in a venue that operates in a manner that is consistent with existing events held at the Sports Arena and Coliseum, and thus is not anticipated to generate a substantial change to the project related traffic volumes. In addition to hosting MLS games, the proposed event/soccer stadium would continue to host events of attendance levels similar to the ones held at the existing Sports Arena facility except that the events would be held in the open-air facility instead. Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new Multiple Use Space (Option 1) or MLS Stadium facility (Option 2) are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Furthermore, similar to the existing operations, the Coliseum Commission will schedule events at the two facilities in such a manner that	MM J-1 Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. The Coliseum Commission shall schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.	Traffic: Less Than Significant. Parking: Less Than Significant

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
the event attendance size at the two venues combined does not exceed 93,000 people. Furthermore, it is anticipated that the Exposition Light Rail project (which is expected to open before the project is constructed) would provide an alternate mode of transit for patrons and employees to the new facility, which would help to reduce traffic congestion on local roadways. Traffic impacts are thus expected to be less than significant. Parking Impacts The Proposed Project does not include any major changes to existing parking facilities at the Coliseum, Exposition Park, USC, or the surrounding area. Under the Multiple Use Space (Option 1), the existing Sports Arena will be demolished and replaced with an open-air venue for civic gatherings and entertainment events. The Multiple Use Space will also be developed to provide overflow surface parking for the Coliseum events. The existing parking inventory is capable of supporting events with up to 93,000 attendees for the Coliseum. Thus, smaller events held at the Multiple Use Space (Option 1) or a MLS Stadium event (Option2), would be supported by adequate parking facilities, which include over 19,981 spaces within Exposition Park and the surrounding area. The Project's code required parking under Option 2 (MLS Stadium) is approximately 4,400 spaces. As the owner/operator of both the Coliseum and the Sports Arena, the Los Angeles Memorial Coliseum Commission will have direct control over programming events such that attendance at both uses operating concurrently would not exceed the current maximum capacity of the Coliseum (i.e., 93,000 attendees). Therefore, no parking impacts would occur.		

II. PROJECT DESCRIPTION

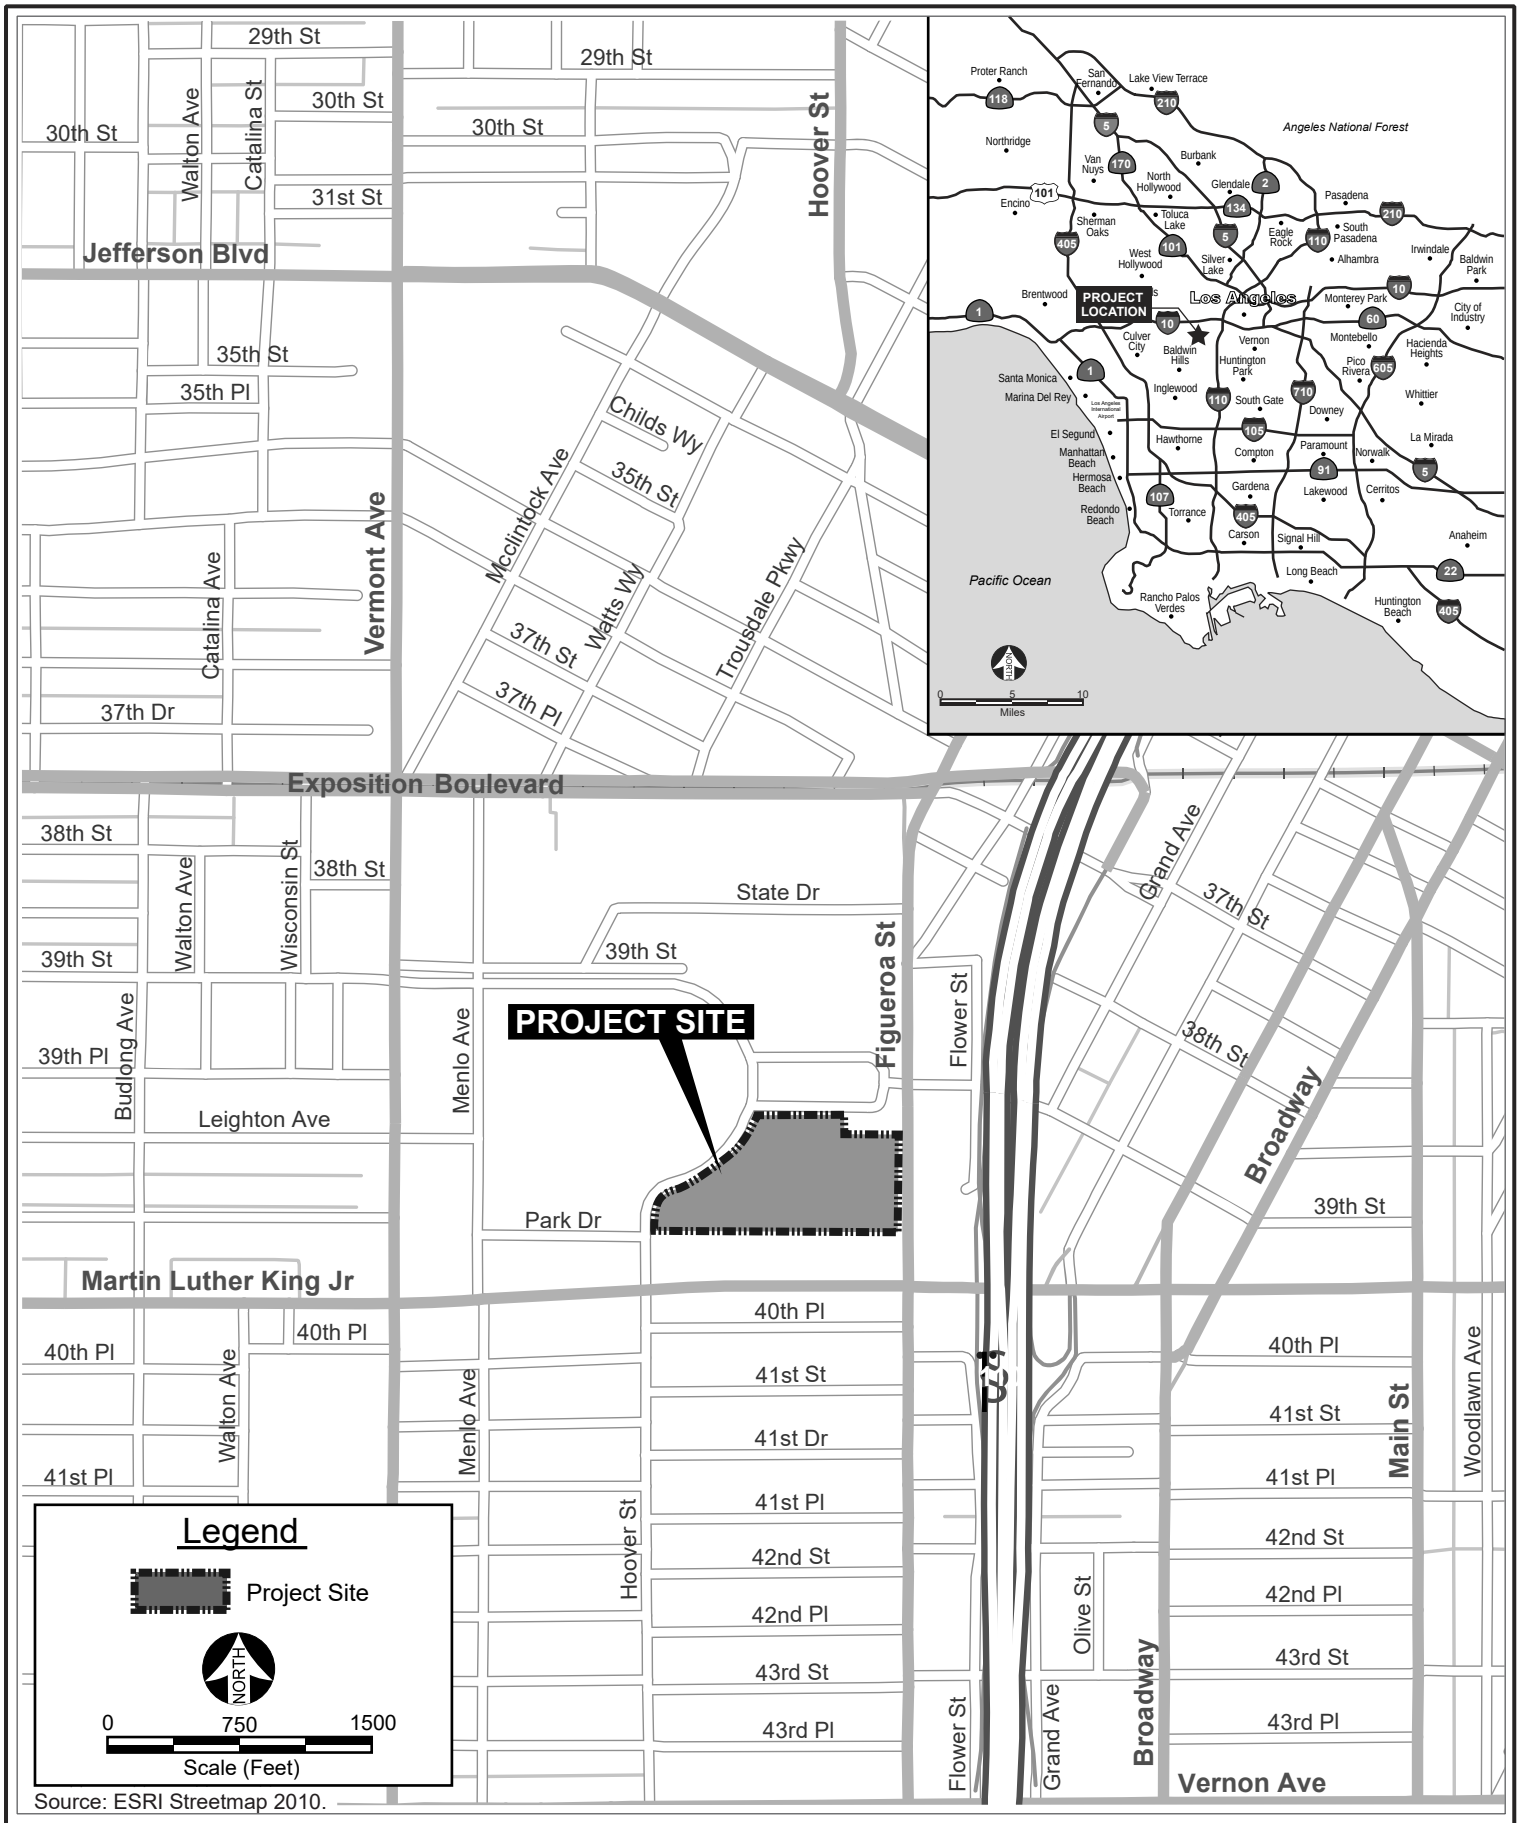
PROJECT LOCATION

The Los Angeles Memorial Sports Arena ("Sports Arena") occupies an approximate 15-acre parcel of land within the boundaries of the Exposition Park Master Plan Area. Exposition Park is located approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street on the east, Martin Luther King, Jr. Boulevard on the south, and Vermont Avenue on the west. Exposition Park is the largest park in the Central Los Angeles area of the City of Los Angeles. The Sports Arena is generally situated in the southeastern portion of Exposition Park. The regional location of the project area is depicted in Figure II-1, Regional Location Map, on page 2.

The Sports Arena Redevelopment Project area (i.e., the "Project Site") includes the Sports Arena, located at 3939 S. Figueroa Street, and the immediately surrounding parking and landscape areas. The specific boundary of the irregularly shaped Project Site is shown in Figure 2, Project Vicinity Map, on page 3. As shown in Figure II-3, the Project Site is generally bounded by S. Coliseum Drive on the west and north, Figueroa Street on the east, and Exposition Park Parking Lot 6 ("Parking Lot 6") on the south.

Other land uses immediately adjacent to the Project Site include internal roadways encircling a landscaped plaza marking the 39th Street entrance to Exposition Park to the north; the Sports Arena's sister facility, the Los Angeles Memorial Coliseum, and adjacent surface parking across South Coliseum Drive to the west and northwest; Parking Lot 6 to the south; and commercial/retail uses fronting the east side of Figueroa Street to the east. With the exception of the commercial/retail uses on Figueroa Street, all of these adjacent facilities are also within Exposition Park. All of Exposition Park, including the Sports Arena, is located within the City of Los Angeles in the South Central Los Angeles Community Plan Area, the eastern boundary of which is Figueroa Street. All land uses east of Figueroa Street are located in the Southeast Los Angeles Community Plan Area.

Major streets in the vicinity of the Proposed Project include Martin Luther King, Jr. Boulevard, located approximately 0.1 mile south of the Project Site; Vermont Avenue, located approximately 0.4 mile west of the Project Site; Exposition Boulevard, located approximately 0.4 mile north of the Project Site; and Figueroa Street, located approximately 0.1 mile east of the Project Site. Regional access to the Coliseum is provided by the Harbor Freeway (Interstate 110), located approximately 0.2 mile east of the site; and by the Santa Monica Freeway (Interstate 10), located approximately 1.7 miles north of the site.



Source: ESRI Streetmap 2010.

CAJA Environmental Services, LLC

Figure II-1
Regional and Vicinity Map

EXISTING CONDITIONS

Environmental Setting

The primary feature on the 15-acre Project Site is the Sports Arena structure. Paved pedestrian pathways and landscaping encircle the Sports Arena within the boundaries of the Project Site. A surface parking lot for VIPs occupies the western portion of the Project Site. The VIP parking lot is accessed from South Coliseum Drive via Martin Luther King, Jr. Boulevard. The Project Site is generally flat, with the exception of the sunken court and seating within the Sports Arena structure.

The Sports Arena is an oval-shaped structure oriented along a north-south axis. It was constructed within a large excavated hole; as such, the seven-story arena extends only 45 feet above grade level. The original main entrance on the east side of the arena is reached by walking over a sunken forecourt on a 65-foot-wide pedestrian bridge. Two ramps on either side of the east entry lead down to the sunken forecourt. The forecourt is landscaped with palm trees and adaptable for trade show displays. The forecourt is next to the lower level service entry. The lower level, or Arena Level, houses storage rooms, mechanical space (room on south side), concession areas, rest room facilities, lockers, shower rooms, and the arena floor itself. The upper level, or Concourse Level, houses offices, concession stands and restrooms. Three other entrances featuring lines of metal double doors are located on the north, west, and south sides of the arena, respectively. The south entrance has two stairways that go down to the lower level. The north entrance also has a stairway to the lower level. The north and south entries have escalators and the south lobby has a wheelchair ramp. The oval shape of the building on the west end flattens out. The piers on the east and west end are flat and rectangular, while the supports on the south and north ends are columns. A road under the west entrance leads to a loading dock at the Arena Level.

Inside, the Sports Arena has terrazzo floors in the restrooms and wrap-around lobbies on the concourses. The lobbies feature ceramic tile walls and indirect fluorescent lighting. The arena interior features a long steel truss with a span of 315 feet. At the time it was constructed, it was the world's longest steel truss roofs. The locker rooms have open entrances marked by curved walls of block glass. The west side has a meeting room. The building also has catwalks for lighting and colorama seating of premium gold seats, gray-blue and red upholstered theater-style seats. Today the arena seats up to 16,740 for boxing, 16,161 for basketball and 14,546 for hockey.

The Sports Arena's exterior features an inward-slanting roof composed of vertical panels with standing seams between them. The concrete around the Sports Arena is scored with large hexagonal panels. The sunken forecourt is landscaped with clumps of California fan palms (*Washingtonia robusta*). The southeast side also has a grassy area on the lower level. Sycamore trees are located on the east side in multi-sided concrete planters. The south side has a staggered line of Indian laurel fig (*Ficus microcarpa nitida*) trees. The north side has a line of sycamore trees.

The Sports Arena has experienced a variety of changes since it opened in 1959. In the early 1980s, a number of alterations were made to accommodate the Clippers move to Los Angeles. At this time, the

locker rooms were remodeled and the Clipper Club was created. The building was also damaged by the Northridge Earthquake in 1994 and required seismic retrofitting, which was accomplished in 2002. Other changes at that time included replacement of original signage and the original terrazzo floors. Two significant changes have been made to the exterior of the building. The main entrance was moved from the east side to the south side of the building. This move also resulted in the only addition to the building, the ticket office. The original blue tile that covered the roof was covered by a different material with a green tint.

Baseline Operations

The Sports Arena is owned and operated by the Los Angeles Memorial Coliseum Commission, which, as stated previously, leases the parcels occupied by the Sports Arena and the Coliseum from the State of California. The Sports Arena was constructed to accommodate sports events in Los Angeles and first commenced operations in 1959. Before the Sports Arena, there were no major facilities available for indoor spectator sports like basketball, hockey, track, tennis, wrestling, and boxing in Los Angeles. In the history of its operations, it has held sporting events for a variety of sports, including boxing, basketball (professional and college), and hockey. It has also hosted a number of major events including the 1960 Democratic National Convention and the 1961 Freedom Rally (at which Martin Luther King, Jr. spoke), as well as numerous rock concerts, track meets, rodeos, home shows, auto shows, roller derbies, rallies, fundraisers, Latin dances, etc. However, by the mid-1960s, the Sports Arena had largely fulfilled its promise as a modern, large-scale, indoor venue for sports and other major events, and home teams began to leave the venue for other comparable venues such as Pauley Pavilion, the Forum, and the Los Angeles Convention Center. It now has to compete with the aforementioned venues as well as the Staples Center and the Galen Center.

As a result the Sports Arena site has become vastly underutilized. Based on a five year history of events and attendance levels at the Sports Arena, the current utilization of the Sports Arena includes hosting on average, approximately 69 events a year with an average of approximately 60 events (or approximately 87 percent of the annual bookings) attracting fewer than 10,000 attendees, 6 events (or approximately 9 percent of the annual bookings) attracting crowds between 10,000 and 20,000 attendees, and an average of 3 events per year (or roughly 4 percent of the total annual bookings) with attendance levels above 20,000.

As shown in Table II-2, The Historic Weekday Event Schedule and Attendance Levels, the Sports Arena hosts on average 29 events per year during the week (M-F). The maximum attendance was recorded at 52,234 attendees while the average attendance levels ranged from 3,591 (in year 2005) to 11,862 (in year 2009) over the five-year history. As expected, the Five Year Historic Weekend Events and Attendance Levels had higher utilization rates, with a maximum attendance level recorded at 55,132 attendees and an average attendance level ranging from 5,550 (in year 2005) to 11,367 (in year 2009).

Table II-1
Historic Attendance Levels at the Sports Arena (2005-2009)

Year	<10,000 Attendees		10,000 – 20,000 Attendees		> 20,000 Attendees	
	No. Events	Ave. Attendance	No. Events	Ave. Attendance	No. Events	Ave. Attendance

Economic Viability

The Los Angeles Memorial Coliseum Commission operates, manages and maintains the Coliseum and Sports Arena complex solely within the operating revenue generated by the use of the these facilities and are not subsidized by State or local taxes or government subsidies. As such, the facilities managed by the Coliseum Commission have to be economically self-sustaining. The Los Angeles Memorial Sports Arena has had an operating loss of between $750,000 and $900,000 each of the last five fiscal years. These losses have been absorbed due to the profitability of the Los Angeles Memorial Coliseum. It is anticipated that the Sports Arena will continue to lose a significant amount of money for the foreseeable future. Due to the age of the facility, the Sports Arena will require significant capital expenditures in the next five years just to keep it operating. These expenditures are as follows:

New Seats	$1,600,000
New HVAC System	$1,200,000
New Ice Floor & Plumbing	$3,000,000
Bathroom Remodeling	$1,600,000
Concession Stand Remodeling	$ 800,000
Total Capital Needs	**$8,200,000**[1]

The total amount of capital projects required exceeds the Commission's current cash position. The above improvements would not make the Sports Arena any more competitive with the Staples Center or any of the other venues in and around Los Angeles.

PROJECT CHARACTERISTICS

The Proposed Project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the Los Angeles Memorial Coliseum Commission (LAMCC) is considering two different and mutually exclusive future uses for the Project Site: Option 1, which consists of a Multiple Use Space for civic and special event gatherings; or Option 2: a Major League Soccer Stadium with approximately 22,000 seats. Both of these development options are analyzed in an equal level of detail in this Draft EIR to allow flexibility for the decision–makers to select either one of the two projects.

[1] *E-mail correspondence from Ron Lederkramer, Chief Financial Office for the Los Angeles Memorial Coliseum Commission, November 3, 2010.*

Option 1: Multiple Use Space

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. This multiple use space would be improved to provide additional surface parking for Coliseum events and would serve as a public venue for civic gatherings and announcements, capable of hosting a variety of celebratory and entertainment civic events such as parades, rallies, public gatherings, festivals and neighborhood carnivals similar to the current outdoor event usage at the Sports Arena. Under this proposal, the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operation, and would partner with the City to produce civic events.

The Multiple Use Space Option would be primarily developed as an open-air amphitheater. However, as a Multiple Use Space, the intent of this Option is to provide flexibility in event programming to stimulate the local economy and promote civic activity. The Multiple Use Space could support stand alone events confined to the 15-acre project site or, alternatively, provide flexible uses for joint events held at the Coliseum. For events held at the Coliseum, the Multiple Use Space could serve as an extension of the park-like grounds within Exposition Park, be utilized as an overflow surface parking lot, or serve as an extension to the event activity and staging areas. The typical event planning and attendance projections for the Multiple Use Space are provided in Table II-4 on page II-8. As shown in Table II-4, the projected attendance for larger annual events would range from 1,000 to 90,000 attendees. The projected attendance for monthly events such as concerts and cultural gatherings would range from 500 to 4,000 attendees. The projected attendance for smaller and more frequent uses and events, such as Farmer's Markets and exercise groups would range from 50 to 1,000 attendees. It should be noted that under any possible joint use of the Coliseum and the Multiple Use Space, the total planned attendance would not exceed the current capacity of the Coliseum.

Table II-4
Projected Attendance Levels for the Multiple Use Space (Option 1)

Events	# of Days	Projected Attendance
Annual Events		
Christmas Toy Drive	1	1,000
African Market Place	5	5,000
Revlon Run	1	50,000
City Wide Celebration	1	10,000-90,000
Charity walk	4	2,000
Health Fair	4	1,500-2,000
Public Safety Outreach	2	15,000
Neighborhood Carnival	3	1,500-2,000
Car/Auto (rally, shows, sales)	3	2000
Kids Camps	10	500
Fireworks	1	10,000
Music Festivals	5	5,000-50,000
Religious Festival	4	5,000-10,000
Monthly Events		
Concert in the Park	1	3,000-4,000
Corporate Event Rental	1	500-1,000
Cultural Gathering	1	500-2,000
Weekly Events		
Farmers Market	1	1,000
Exercise Groups	1	50-100
Pet Walking	7	50-100
Source: Los Angeles Memorial Coliseum Commission, 2010.		

Taking advantage of the topography of the site, the bowl-shaped amphitheater would be built into the depression currently occupied by the Sports Arena, although the hole would be partially filled. An approximate 800-square foot (40 feet x 20 feet) concrete pad would be located at the lowest elevation in the center of the amphitheater to serve as the stage and provide support for audio and visual equipment. The stage would be surrounded in a horseshoe configuration by grass-covered seating levels that would be tiered to ensure visibility of the stage from each level. Seating would be provided on the grass (no fixed seats are proposed).

Source: Los Angeles Memorial Coliseum Commission, 2010.

CAJA Environmental Services, LLC

Figure II-3
Illustrative Rendering of the Multiple Use Space (Option 1)

The bowl would be surrounded by flagpoles to highlight the celebratory nature of the special events. The remainder of the Project Site would be improved as grass-covered flat surface. An artistic illustration of this concept is depicted in Figure II-3 on page II-9.

The design of the Multiple Use Space Option promotes the principal goals of providing an open-air, publicly accessible space that requires minimal upkeep and little to no permanent staff. Restroom facilities and permanent concession facilities may be provided as well. Additionally, in the interest of creating an accessible outdoor space, no permanent fencing would be constructed. Rather, temporary fencing would be utilized as needed for certain ticketed special events. Lighting would include stage lighting, which would be directed towards the center of the site and only operated during events, and low-level security lighting around the site's perimeter. Signage would consist of standard identification signage placed at the facility's entrances.

The maximum capacity of the multiple use space amphitheaters would be smaller than that of the existing Sports Arena, however the areas surrounding the amphitheater would be capable of supporting gatherings for larger events, similar to the limited outdoor uses that occur at the existing Sports Arena. It is anticipated that this area could be set up with tents and or booths for local fairs and festivals. The Multiple Use Space Option would not require any circulation improvements and parking would be accommodated through existing parking facilities in and around Exposition Park.

Construction of the Multiple Use Space Option would involve the following phases: 1) demolition of the existing Sports Arena and VIP parking lot, resulting in 5.4 million cubic feet of demolition debris; 2) partial filling of the existing hole which is estimated to necessitate approximately 250,000 cubic yards of imported soil; 3) grading and reconfiguration of the site to create the amphitheater bowl and seating levels; 4) pouring of approximately 30 cubic yards of concrete to create the stage and pedestrian walkways; 5) construction of the restroom and press room facilities; and 6) installation of grass and landscaping.

Option 2: Major League Soccer Stadium

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Major League Soccer (MLS) Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with site's history. The VIP parking lot would remain to the west of the proposed stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on a north-south axis and would have a permanent seating capacity of approximately 22,000. The state-of-the art venue would host MLS games, USC soccer games, open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. The stadium would also serve as a practice facility for local soccer teams. Under this Option the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operation, and would partner with the League, private promoters, the City, County or State to produce soccer games and civic events. It is expected to be a high-profile attraction within the City of Los Angeles, with nationally televised events and visitation

from world-renowned athletes and coaches. Illustrative renderings of the proposed MLS Stadium from different perspectives are depicted in Figures II-4 and I-5, respectively, on pages II-10 and II-11.

The proposed outdoor soccer stadium would take advantage of the existing topography of the Project Site by constructing the stadium within the existing depression currently occupied by the Sports Arena, although the hole would need to be reconfigured to accommodate the different shape of the stadium. Thus, the field and most of the seating would be situated below-ground, reducing the height and perceived mass of the venue when viewed from grade level.

Architecturally, the stadium would resemble other comparable venues in the nation, such as the Home Depot Center in the City of Carson, which currently serves as the home stadium to the Los Angeles Galaxy and Chivas USA of Major League Soccer. It would feature dome-style geometry typical of stadium architecture, topped by a curved roof on its east and west sides. While detailed architectural plans have not been developed, Figures II-3 and II-4 provide illustrative renderings of the proposed concept plan.

The lighting to be used for the soccer field would consist of highly focused and directional lighting arrays. Much of the lighting (and all of the high-intensity field lighting) would be directed downward into the bowl-shaped stadium. Low-level security lighting would also be installed throughout the remainder of the site to mark walkways, parking areas, restroom facilities, and entrances.

The proposed soccer stadium would also include landscaped plazas and roadways and perimeter landscaping to buffer the site from surrounding uses.

Construction of Option 2 would involve the following phases: 1) demolition of the existing Sports Arena, resulting in 5.4 million cubic feet of demolition debris; 2) Import of approximately 125,000 cubic yards of soil; 3) grading and reconfiguration of the site to accommodate the stadium footprint; 4) pouring of concrete to create the stadium foundation; 5) construction of the stadium and related support facilities; and 6) installation of grass and landscaping.

PROJECT OBJECTIVES

The Los Angeles Memorial Coliseum Commission was created as a separate independent legal entity pursuant to a joint exercise of powers agreement between the City of Los Angeles, County of Los Angeles, and the Sixth District Agricultural Association, an institution of the State of California. The Joint Powers Agreement, which currently extends through 2054, authorizes and empowers the Coliseum Commission specifically and exclusively to maintain, manage, and operate the Coliseum and Sports Arena. Under the Joint Powers Agreement, the Coliseum Commission has a duty to:

> *"lease, license, rent, use or permit the use of all or part of the Coliseum and Sports Arena, to any person, for competitive sports, athletics, games, pageants, parades, plays, celebrations, patriotic gatherings, public recreation, motion picture production, or public gatherings, or such other events as are deemed appropriate, or for City, County, or District affairs, or for viewing any of the foregoing, and particularly to develop, and promote a wider use of the Coliseum and Sports Arena, through the presentation of festivals, pageants, games exhibits, industrial, horticultural or agricultural shows, conventions, exhibitions, and productions of a local, regional, national, or international character, primarily to the end that the citizens and public generally may enjoy and receive the greatest benefit possible from the Coliseum, and Sports Arena, and the City, and County and the District may more effectively exploit their climatic, geographical, recreational, cultural, and commercial resources and advantages."*[2]

The Sports Arena complex is supported solely by revenue generated from its operations and no taxpayer funds are used to support the existing facilities. Constructed in 1959, the Sports Arena is in need of major repairs and renovation to extend its structural lifespan and increase programming options in order to generate the necessary revenues to become an economically self-sufficient sports and entertainment venue. As a result, the Los Angeles Memorial Coliseum Commission's primary objectives are as follows:

Primary Objectives

- To plan for the long-term use and operation of the Sports Arena property to fulfill the duties of the Coliseum Commission as identified in the Joint Powers Agreement. Specifically, the Coliseum Commission seeks to evaluate and develop a successful plan that will enable the Coliseum Commission to manage and use the Sports Arena property for competitive sports, athletics, games, pageants, plays, celebrations, patriotic or religious gatherings, festivals, exhibits, industrial, trade, horticultural or agricultural shows, conventions, and exhibitions and productions of a local, regional, national, or international character in a manner that is economically self-sufficient and consistent with the terms of the Sports Arena ground lease between the Coliseum Commission and the Sixth District Agricultural Association.

---

[2] *Para. 12(f) of the Los Angeles Coliseum Commission Joint Powers Agreement.*

.

- To enhance the prestige and visibility of Exposition Park and the City of Los Angeles through the development of a modern, world-class sports, entertainment, and cultural use complex.
- To assure that Project Site operations generate enough revenue to enable the Coliseum Commission to preserve and maintain the Project Site and its sister facility, the Coliseum, in a self-sufficient manner.
- To utilize the existing topography of the Project Site without the need for a substantial amount of additional grading.
- To serve the community's need for public outdoor gathering spaces.

In furtherance of the primary project objectives identified above, the Coliseum Commission has identified two potentially viable options: Option 1 (Multiple Use Space) and Option 2 (MLS Stadium). The specific set of objectives for the two development options are as follows:

Option 1 (Multiple Use Space):

- To expand the function of the Sports Arena Site within the community as a gathering place for civic events that celebrate community achievements.
- To construct an open-air venue that provides maximum flexibility for the dual use of the site to support overflow parking needs for Coliseum events and to be utilized as an outdoor venue for public entertainment and cultural events.

Option 2 (MLS Stadium):

- To provide a stadium venue in conformance with the generally accepted standards of design for Major League Soccer (MSL) stadiums, thus enabling the Coliseum Commission to host MSL games in Exposition Park.
- To provide a stadium venue in conformance with the generally accepted standards of design for collegiate soccer, thus enabling a landlord/tenant relationship with a USC soccer team.
- To provide spectators and users of the stadium with the amenities and conveniences consistent with a state-of-the-art facility, including restrooms, concession, and press facilities; spectator viewing; luxury suites and club seating; locker and dressing facilities; and parking and circulation space.
- To utilize the existing topography of the Project Site without the need for a substantial amount of additional grading.

DISCRETIONARY ACTIONS

The Lead Agency and sole decision-maker for the Proposed Project is the Los Angeles Memorial Coliseum Commission. This Draft EIR is intended to be used by the Coliseum Commission in support of its discretionary authority to approve the Proposed Project. It also may be used by other governmental entities to support other discretionary or ministerial permits and approvals required to construct and operate the Proposed Project. Specific discretionary actions include:

- Project approval by the Los Angeles Memorial Coliseum Commission
- Demolition permit (City of Los Angeles)
- Grading permit (City of Los Angeles)
- Zone Variance for Building Height (City of Los Angeles)
- Haul route permit (City of Los Angeles)
- Construction permit (City of Los Angeles).

III. ENVIRONMENTAL SETTING

PROJECT LOCATION

The Los Angeles Memorial Sports Arena ("Sports Arena") occupies an approximate 15-acre parcel of land within the boundaries of the Exposition Park Master Plan Area. Exposition Park is located approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street on the east, Martin Luther King Jr. Boulevard on the south, and Vermont Avenue on the west. Exposition Park is the largest park in the Central Los Angeles area of the City of Los Angeles. The Sports Arena is generally situated in the southeastern portion of Exposition Park. The general location of the project area is illustrated in Figure 1, Regional Location Map, on page III-2.

The Sports Arena Project area (i.e., the "Project Site") includes the Sports Arena, located at 3939 S. Figueroa Street, and the immediately surrounding VIP parking lot and landscape areas. The specific boundary of the irregularly shaped Project Site is shown in Figure 2, Project Vicinity Map, on page III-3. The Project Site is generally bounded by South Coliseum Drive on the west and north, Figueroa Street on the east, and Parking Lot 6 on the south.

Other land uses immediately adjacent to the Project Site include internal roadways encircling a landscaped plaza marking the 29th Street entrance to Exposition Park to the north; the Sports Arena's sister facility, the Los Angeles Memorial Coliseum, and adjacent surface parking across South Coliseum Drive to the west and northwest; Parking Lot 6 to the south; and commercial/retail uses fronting the east side of Figueroa Street to the east. With the exception of the commercial/retail uses on Figueroa Street, all of these adjacent facilities are also within Exposition Park. All of Exposition Park, including the Sports Arena, is located within the City of Los Angeles in the South Central Los Angeles Community Plan Area, the eastern boundary of which is Figueroa Street. All land uses east of Figueroa Street are located in the Southeast Los Angeles Community Plan Area.

Major streets in the vicinity of the Proposed Project include Martin Luther King Jr. Boulevard, approximately 0.1 mile south of the Project Site; Vermont Avenue, approximately 0.4 mile west of the Project Site; Exposition Boulevard, approximately 0.4 mile north of the Project Site; and Figueroa Street, approximately 0.1 mile east of the Project Site. Regional access to the Coliseum is provided by the Harbor Freeway (Interstate 110), located approximately 0.2 mile east of the site; and by the Santa Monica Freeway (Interstate 10), located approximately 1.7 miles north of the site.

ENVIRONMENTAL SETTING

Aesthetics

Generally speaking, the aesthetic character of the area surrounding the Project Site relates primarily to its urban form rather than to any dominant natural feature. Low-level views from the Project Site looking outward consist largely of the surrounding areas of Exposition Park, as well as the commercial, retail and residential uses bordering the site to the east and south. Views from the site to the north and west are limited by the presence of the Coliseum and swim stadium, as well as by vegetation and stands of trees within the open space portions of the Park. Intermittent views of the skyline of Downtown Los Angeles (approximately 2 miles north) are partially visible from areas within the Park. The downtown skyline forms a backdrop against which the lower-relief urban development in the intervening areas may be seen. Intermittent views of the more distant San Gabriel Mountains beyond the downtown skyline may also be obtained from the Park area. In general, existing structures, landscaping and vegetation limit most views from the ground the level in the Park area and views in all four directions from the site can generally be characterized by heavily urban land uses.

The site is marginally visible from vantage points on the east and south due to large setbacks, and is minimally visible from the north and west due to the relatively low profile of the existing Sports Arena, the location of the Coliseum, swim stadium, trees, and landscaping to the north and west of the site in Exposition Park.

Air Quality

The Project Site is located within the jurisdiction of the South Coast Air Quality Management District (SCAQMD), which has divided the Basin into 38 source receptor areas (SRAs) for purposes of monitoring the various concentrations of air pollutants in the region. The project site is located in the City of Los Angeles and is located within the SCAQMD's SRA 1, which covers the Central Los Angeles County area. Currently, SCAQMD Station No. 087 collects ambient air quality data for SRA 1. This station currently monitors emission levels of O_3, CO, NO_2, SO_2, and PM_{10}.

Air pollutant emissions are generated in the local vicinity of the project site by stationary and area-wide sources, such as space and water heating, landscape maintenance from leaf blowers and lawn mowers, consumer products, and mobile sources, primarily automobile traffic. Overall, motor vehicles are the primary source of pollutants in the project site vicinity. A key characteristic of the Sports Arena is that it generates vehicle trips and high levels of traffic congestion for short periods on event days only. The attendance level and associated vehicle trips generated by specific events vary significantly. In the past five years, the Sports Arena held, on average, 69 events a year. Of the 69 events, 60 had an attendance of less than 10,000 people, six events had an attendance between 10,000 to 20,000 people, and three events had an attendance of more than 20,000 people.

Greenhouse Gases

The California Energy Commission (CEC) published the *Inventory of California Greenhouse Gas Emissions and Sinks: 1990 to 2004* in December 2006. This report indicates that California emitted between 425 to 468 million metric tons of greenhouse gases in 1990. This seemingly large amount is a result of the large population residing in California. When considering fossil fuel emissions at the level of each individual person, California is second lowest in the nation in per capita CO_2 emissions, with only the District of Columbia being lower. Between 1990 and 2000, California's population grew by 4.1 million people and during the 1990 to 2003 period, California's gross state product grew by 83 percent (in dollars, not adjusted for inflation). However, California's greenhouse gas emissions were calculated to have grown by only 12 percent over the same period. The report concluded that California's ability to slow the rate of growth of greenhouse gas emissions was largely due to the success of its energy efficiency, renewable energy programs, and commitment to clean air and clean energy. In fact, the State's programs and commitments were calculated to have lowered its greenhouse gas emissions rate of growth by more than half of what it would have been otherwise.

Locally, GHG emissions are generated in the local vicinity of the project site by stationary and area-wide sources, such as space and water heating, landscape maintenance from leaf blowers and lawn mowers, consumer products, and mobile sources, primarily automobile traffic. Overall, motor vehicles are the primary source of GHGs in the project site vicinity. A key characteristic of the Sports Arena is that it generates vehicle trips and high levels of traffic congestion for short periods on event days only.

Historic Resources

The Project Site is situated within the southeast quadrant of Exposition Park, which is bounded by Exposition Boulevard on the north, Martin Luther King, Jr. Boulevard on the south, Vermont Avenue on the west and Figueroa Street on the east, is a mixture of public and privately owned structures and open space parkland. Originally known as Agricultural Park, Exposition Park was developed in the 1870s as an agricultural fairground. In 1909, the 160-acre property developed into a park when California's Sixth District Agricultural Association (then owner of the property) and the county and city of Los Angeles agreed to a plan to transform it into a cultural center, and renamed it renamed Exposition Park a year later.

The state would build an exposition building and armory if the county would construct and operate a history and art museum and the city would maintain the grounds.[1] In 1913, the park was officially dedicated, for use as a recreational, educational and cultural gathering place. In 1922, the Exposition Club opened, followed a year later by the Los Angeles Memorial Coliseum, designed by noted Los Angeles and USC architect John Parkinson, on the grounds of Exposition Park. The park is right next to the USC campus. In addition to hosting USC sporting events, the Coliseum was enlarged for the 1932 Olympics; the Swimming Stadium was also constructed for the 1932 Olympics. The park continued to be

[1] *"Natural History Museum Of Los Angeles County" located on the County's website at: http://www.nhm.org/expo/expopark.htm.*

occupied by culturally important buildings such as the County Museum of Natural History, the California African-American Museum and the Museum of Science and Industry (California Science Center). There is also the renowned Rose Garden and the Armory. In 1959, the Sports Arena was constructed. The park is still public space owned by the state of California, whose major cultural facilities mentioned above are operated by both the state and Los Angeles County.

The Exposition Park Historic District, which includes the Coliseum, Rose Garden, Natural History Museum; the Armory and Swimming Stadium; the Exposition Clubhouse; North and South Coliseum Drive; and the Exposition (Ahmanson Building), was established in the 2000 Historic Property Survey Report (HPSR), prepared for the State of California, Department of General Services, Real Estate Services Division, as part of an effects analysis of the proposed Exposition Park Master Plan Parking Facility, prepared by Myra L. Frank & Associates (now ICF). No formal finding of National Register eligibility was made for the Exposition Park Historic District at a meeting among the review agencies on August 9, 2000. Furthermore, the Exposition Park Historic District has not been recorded in the California Historical Resources Inventory database.

When the Sports Arena opened on July 4, 1959, it was the first modern indoor sports arena built in Los Angeles. The Sports Arena was designed by Welton Becket & Associates of Los Angeles, hired in 1957, and the contractor was L.E. Dixon Co. from San Gabriel, California. Over the years, the Sports Arena has been altered on several occasions, primarily on the interior. In the early 1980s, the Clippers moved to Los Angeles and the Sports Arena and required several upgrades to the building, including the locker rooms and the creation of the Clipper Club. The building was also damaged in the 1994 Northridge earthquake and required seismic retrofitting, which was accomplished in 2002. Other changes include the replacement of original signage and the original terrazzo floor. On the outside of the building, the most significant change occurred when the main entrance was moved from the east side to the south side of the parking lot. The move also introduced the only addition to the building, the ticket office. The other physical exterior change occurred when the original tile that covered the roof and gave it a blue tint was replaced with a different material that has a green tint.

Hydrology/Water Quality

The 15-acre Project Site consists of mostly impermeable surfaces as the site is developed with the Sports Arena structure, concrete paved walkways and asphalt covered parking areas. It is estimated that approximately 10 to 15 percent of the 15-acre site is covered with permeable landscaped areas. Surface water from the site is conveyed in part to the landscaped areas, with excess runoff diverted to the surface gutters and storm drain inlets in Figueroa Street and Martin Luther King, Jr. Boulevard. Surface water runoff is conveyed from the site to the Los Angeles River Flood Control Channel through a network of reinforced concrete pipes.

Land Use / Zoning

The Project Site is located within the South Los Angeles Community Plan Area, one of 35 Community Plans established for different areas of the City that are intended to implement the policies of the General Plan Framework, and collectively are considered the Land Use Element. The South Los Angeles Community Plan Land Use Map designates the entire Project Site, as well as the majority of Exposition Park (generally to the north and west of the Project Site), as "Open Space" and a Regional Recreational Site. The Open Space land use designation is reserved for public land and does not allow any residential or commercial development that is not associated with a public-oriented facility. The identified corresponding zoning for this land use designation is Open Space (OS) and Agricultural (A1). The Community Plan also identifies the Project Site as a Cultural and Historical Site (see Section IV.D, Cultural and Historic Resources). That portion of the Project Site located adjacent to Figueroa Street is identified as an Opportunity Area.

As identified by the Community Plan, Exposition Park is defined as a "major opportunity site." A major opportunity site is an area that has the potential to generate significant impacts within the surrounding neighborhoods.

The Project Site is also located within the CRA/LA's Exposition/University Park Redevelopment Project area (Redevelopment Plan). Originally known as the Hoover/Hoover Expansion Redevelopment Project, the 574-acre Exposition/University Park Redevelopment Project is located just southwest of Downtown Los Angeles. The Redevelopment Plan area is generally bounded by Adams Boulevard on the north, Flower Street on the east, 41st Street on the south, and Walton Avenue and Catalina Street on the west. The Redevelopment Plan was designed to promote revitalization and development within the Exposition/University Park Project area and designates the Project Site for Public Use. According to the Redevelopment Plan, permitted uses of land designated as Public- and Quasi-Public include the establishment, maintenance, or enlargement of public uses including, but not limited to, park and recreational facilities, libraries, educational or fraternal facilities, parking and parking structures, housing, philanthropic and charitable or other institutions, and facilities of other similar associations or organizations.

The Project Site is in the OS-1XL (Open Space) Zoning District, as is the majority of Exposition Park. The OS-1XL designation refers to a zoning designation of Open Space with a corresponding Height District of 1XL, Extra Limited Height District (XL). The OS zone permits a limited amount of uses under the City's Planning and Zoning Code (L.A.M.C. Section 12.04.05), including parks and recreation facilities (i.e. bicycle trails, equestrian trails, walking trails, nature trails, park land/lawn areas, children's play areas, picnic facilities, and athletic fields), natural resource preserves, marine and ecological preserves, sanitary landfill sites, and water conservation areas. Height District No. 1 limits development to a Floor Area Ratio (FAR) of 3:1. The XL allows a building height of two-stories, which shall not exceed a height of 30 feet. Like a number of other older buildings which pre-date the Planning and Zoning Code, the Sports Arena is "grandfathered" into the zoning code because it was constructed prior to establishment of the code.

Properties surrounding the Project Site to the north, west, and south are located within Exposition Park and are also zoned OS-1XL. Those properties directly east of the Project Site across Figueroa Street are zoned C2-1L. The parcels fronting on the south side of Martin Luther King Jr. Boulevard, across the street and south of Parking Lot 6, are zoned C2-1.

Noise

The Project Site is located in an urbanized environment with the following primary noise sources in the vicinity: Coliseum/Sports Arena activities during special events, traffic on the elevated Harbor Freeway (Interstate 110) located to the east of the Project Site, and traffic on the surface streets of Figueroa Street and Martin Luther King Jr. Boulevard. The Sports Arena is located within Exposition Park, which includes passive recreational spaces as well as County and State Museums. These areas are located north and west of the Sports Arena. Within this park/institutional setting, the ambient noise environment is dominated by the Coliseum and Sports Arena activities during special events.

To establish baseline noise conditions within the vicinity of the Project Site, existing daytime noise levels were documented by taking noise measurements at four locations during a non-event weekday on September 9, 2010 from approximately 11:30 a.m. to 12:50 p.m. A non-event weekday was selected to establish baseline conditions for the project vicinity as it would be most representative of the majority of the year. In the past five years, the Sports Arena and Coliseum held, on average, 69 events a year. As such, these measurements reflect the ambient weekday conditions for approximately 81% of the year. The 15-minute average noise levels measured at each of these locations are generally characteristic of an urban environment.

Public Services

Fire Protection

Fire prevention, fire suppression, and life safety services are provided throughout the City of Los Angeles, including the Project Site, by the Los Angeles City Fire Department (LAFD). These services are governed by the Fire Protection and Prevention Plan (Plan), an element of the City's General Plan, as well as the Fire Code section of the Los Angeles Municipal Code (LAMC).

The LAFD has fire stations at the following three locations for initial response service to the Project Site:

> Fire Station No. 46 – This station is located at 4370 S. Hoover Street, approximately 0.8 miles from the Project Site. It is staffed with 9 members and is equipped with an Engine and 2 Rescue Ambulances.
>
> Fire Station No. 15 – This station is located at 915 W. Jefferson Boulevard, approximately 0.9 miles from the Project Site. It is staffed with 12 members and is equipped with an Engine, an Assessment Light Force, and a Paramedic Ambulance.

Fire Station No. 14 – This station is located at 3401 S. Central Avenue, approximately 1.6 miles from the Project Site. It is staffed with 14 members and is equipped with a Task Force Station, Engine and Truck Companies, and Paramedic Ambulances.

Fire station locations are shown in Figure IV.H-1, Fire Station Locations. The above distances were computed to 3939 Figueroa Street, the address of the existing Sports Arena.

Police Protection Services

The Los Angeles Police Department (LAPD) is the local law enforcement agency responsible for providing police protection services to the Project Site and immediate Project Vicinity. The site is located within LAPD Reporting District (RD) 378, which consists entirely of Exposition Park. The boundaries of RD 378 are Exposition Boulevard to the north, Figueroa Street to the east, Martin Luther King, Jr. Boulevard to the south, and Vermont Avenue to the west. RD 378 is located within the Southwest Area, one of the LAPD's 18 area divisions within the City. The Southwest Area is bounded by the Santa Monica Freeway (Interstate 10) to the north, the Harbor Freeway (Interstate 110) to the east, Vernon Avenue to the South, and S. La Cienega Boulevard to the west.

The Southwest Area police station is located at 1546 W. Martin Luther King Jr. Boulevard, approximately 1.2 miles west of the site. The Southwest Area currently staffs 347 sworn officers and 26 civilian support staff deployed over three watches. The Project Site is routinely patrolled at all times by officers assigned to the Southwest Area.

Public Utilities

Wastewater

The City of Los Angeles Department of Public Works, Bureau of Sanitation Division, (the "Bureau of Sanitation") provides sewer conveyance infrastructure and wastewater treatment services to the Project Site and regulates the process of wastewater into the system.

The Proposed Project is located in the Hyperion Treatment Plant (HTP) service area, which encompasses approximately 328,000 acres, or approximately 515 square miles, of the greater Los Angeles area and serves approximately four million people, 96 percent of the total area served by the City. HTP currently processes average wastewater flows of approximately 340 mgd, resulting in a remaining capacity of approximately 110 mgd.

The sewer infrastructure serving the Sports Arena consists of an existing 9- to 15-inch pipe originating from the northwest area of the Sports Arena and flowing in a southwestern direction into a 15- to 30-inch pipe under Hoover Street. The sewage from this pipe flows south along Hoover Street into a pipe greater than 45 inches near the intersection of Hoover Street and 41st Place. Additional sewer infrastructure in vicinity of Exposition Park includes a network of six-, eight-, and ten-, twelve-, and 18-inch lines, which feed into a 44-inch pipe under Exposition Boulevard and a 75-inch pipe in Rodeo Road.

Water

Water is currently supplied to the Project Area by the City of Los Angeles Department of Water and Power (LADWP). The LADWP is responsible for ensuring that water demands within the City are met and that State and Federal water quality standards are achieved. In addition to supplying water for domestic uses, LADWP also supplies water for fire protection services, in accordance with Los Angeles Fire Department (LAFD) requirements (see discussion in Section IV.H.2, Fire Protection), as well as recycled water for irrigation and industrial uses in conjunction with the Department of Public Works.

The Project Site's current potable water demand is generated from the operation a variety of uses, the most significant of these being public restrooms, showers in the locker rooms, and concession stand/food preparation uses. In addition to these event-specific uses, irrigation for on-site vegetation and the daily operation of the staff offices and ticket offices demand a comparatively small amount of water. It should be noted that the majority of annual on-site water demand is created during events. Consequently, existing water demand on the Project Site varies significantly depending on attendance levels.

Electricity

The Los Angeles Department of Water and Power's (LADWP) provides electricity service to the City of Los Angeles. LADWP obtains electricity from various generating sources that utilize coal, nuclear, natural gas, hydroelectric, and renewable resources to generate power. The LADWP obtains power from four municipally owned power plants within the Los Angeles Basin, LADWP Hydrogenerators on the Los Angeles Aqueduct, and shared-ownership generating facilities in the Southwest, and also purchases power from the Southwest and Pacific Northwest. LADWP also purchases excess power, as it is made available, from self-generators interconnected with the LADWP within the City.

Currently during major events, electricity is consumed for a variety of uses, the most significant of these being arena lighting, scoreboard, and videoboard operations. Other less intensive event-associated uses of electricity on-site include public address/sound system operation, television and radio transmission equipment, internal lighting (locker rooms, press box, etc.), maintenance equipment, and food preparation. The primary electricity-consumptive on-site use not associated with events is the daily lighting of the administrative offices, continual security and maintenance lighting, and the operation of office equipment. It should be noted that the majority of annual on-site electricity consumption occurs during events, consistent with the existing events described in Section II, Project Description of this Draft EIR.

Natural Gas

The Southern California Gas Company (SCG) provides natural gas to the City of Los Angeles through existing gas mains located under the streets. Natural gas service is provided in accordance with the Gas Company's policies and extension rules on file with the California Public Utilities Commission (PUC) at the time contractual agreements are made. Natural gas is currently consumed at the Sports Arena for water heating; space heating in the arena area and offices, locker rooms, and press box; and boiler

operation. It should be noted that the majority of natural gas consumption on-site occurs during events, consistent with the existing events described in Section II, Project Description of this Draft EIR. Natural gas usage on-site is reduced substantially during periods when no events are scheduled.

Traffic, Transportation and Parking

Regional and local access to the Project Site is provided by the Los Angeles County Metropolitan Transit Authority's (MTA) bus and light rail lines. To the north of the Project Site, Exposition Boulevard is served by Metro Local and Limited Line 102 and the Metro Express Line 550. Immediately adjacent to the east, Figueroa Street is served by the Metro Silver Line (from downtown Los Angeles) as well as Metro Local and Limited Line 81. To the south of the Project Site, Martin Luther King, Jr. Boulevard is served by the Metro Rapid Line 740 as well as the Metro Local and Limited Lines 40 and 42. In the future, regional access would also be provided by way of the MTA's light rail line (Metro Rail Expo Corridor) to Culver City, connecting Downtown Los Angeles to Culver City (Phase I) and Santa Monica (Phase II). A dedicated station (the Expo/Vermont) will serve Exposition Park. Phase I of the MTA's "Exposition Park Light Rail Transit Project" is scheduled to open in 2011.[2]

Automobile access to the Project Site is provided from the east off of Figueroa Street at 39th Street, and from the south access is provided off of Martin Luther King Jr. Boulevard at Hoover Street. From the north, access to the Project Site is provided off of Exposition Boulevard at Victory Walk by way of South Coliseum Drive. From the west, access is provided off of Vermont Avenue at 39th Street by way of Exposition Park Drive and South Coliseum Drive.

Parking

There are 27 parking lots in the vicinity of the Project Site. Ten lots are within Exposition Park and provide parking for the museums and recreational areas as well as for the events at the Coliseum and the Sports Arena. A County of Los Angeles parking lot is located on the west side of Vermont Avenue, and two private parking areas are located on the south side of 40th Place. Four private parking lots, including one USC lot, are located on the east side of Figueroa Street, directly adjacent to Exposition Park, between Martin Luther King, Jr. Boulevard and Figueroa Street. The parking lot for the Department of Motor Vehicles is located east of the I-110 off of Exposition Boulevard, and the USC Parking Center is located north of the DMV's site on Jefferson Boulevard. Eight more parking areas are located to the north of Exposition Park, six of which are on the USC campus. The other two are located near the intersection of Jefferson Boulevard and Figueroa Street; one lot is located at the Shrine Auditorium, the other is private and is adjacent to the Shrine. The total number of existing parking spaces in the Coliseum, Exposition Park, and University Park (USC Campus) is 19,981.

[2] *http://www.expositionpark.org/park-history.*

IV. ENVIRONMENTAL IMPACT ANALYSIS
A. AESTHETICS

ENVIRONMENTAL SETTING

Existing Visual Character of the Project Site

The 15-acre Project Site is located within the boundaries of the approximately 145-acre Exposition Park complex, which consists of the Coliseum, the Los Angeles Swimming Stadium, several museums, exposition halls, the Exposition Park Rose Garden, surface and structured parking lots, and several acres of landscaped park areas, walkways, and tree-lined thoroughfares. The Park is bounded by Exposition Boulevard on the north, Figueroa Street on the east, Martin Luther King, Jr. Boulevard on the south, and Vermont Avenue on the west. Major public facilities within the Park include the California Science Center, the Los Angeles County Museum of Natural History, the African-American Museum, the LAUSD Armory School site, the Aerospace Museum, and the IMAX Theater. The southern half of Exposition Park is developed with sports- and assembly-related facilities. Portions of the southern and southwestern areas of the Park are dedicated to surface parking lots. Exposition Park also extends westerly from Menlo Avenue to Vermont Avenue. This area is currently developed with a series of surface parking lots and additional open-space park facilities.

The Sports Arena building is an ellipse-shaped multi-use facility, situated on a north-south axis. The roof is an elliptical transverse steel truss roof, spanning 315 feet by 430 feet. The exterior material of the lower walls is comprised of concrete block construction. There are no exterior windows. The original roof material, which was a blue tile specifically chosen for this structure, was replaced during the 2002 seismic retrofitting with a green material. Currently, the roof consists of large vertical panels with standing seam between them. The new color and material were chosen to match the roof of the Swim Stadium and other structures on the Exposition Park campus. The previous main entrance located on the east side fronting Figueroa Street was situated to take advantage of the pedestrians and vehicles accessing the site from the east. Patrons could utilize this entrance passing the memorial fountain and through parallel lines of palm trees. An eight-foot metal fence located along the perimeter of the Sports Arena site was added in 1980.

Landscaping on the site is limited to decorative trees and shrubs along the perimeter of the Sports Arena structure and parking lots located to the west and east of the structure. The sunken forecourt is landscaped with clumps of California fan palms (Washingtonia robusta). The southeast side also has a grassy area on the lower level. Sycamore trees are located on the east side in multi-sided concrete planters. The south side has a staggered line of Indian laurel fig (Ficus microcarpa nitida) trees. The north side has a line of sycamore trees. Views of the Sports Arena and surrounding area are provided later in this section.

Existing Visual Character of Surrounding Properties

Other prominent land uses in the immediate vicinity outside of Exposition Park that define the visual character of the surrounding neighborhood include the University of Southern California (USC) campus to the north, Manual Arts High School near the southwest corner of Vermont Avenue and Martin Luther King, Jr. Boulevard, and residential areas south of Martin Luther King, Jr. Boulevard and west of Vermont Avenue. The location of the USC campus adjacent to Exposition Park has effectively created a large public and quasi-public land reservation that dominates the vicinity and which is surrounded by the non-related residential and commercial land uses comprising the basic fabric of the community.

Adjacent to Exposition Park on its eastern, southern, and western borders are mixed commercial and residential land uses. Most of the properties in these areas are developed with low-rise buildings and residences, with the exception of the mid-rise Social Services Building on Vermont Avenue, west of the site. Areas to the east of Figueroa Street (the eastern boundary of Exposition Park) are developed with low-rise commercial retail structures. The land strip containing the elevated Harbor Freeway (Interstate 110) is located immediately to the east of these properties. Areas to the east of the Harbor Freeway in the vicinity of the Proposed Project are densely developed with a mix of multi-family residential, commercial, and light industrial uses.

In the general vicinity of the site, Vermont Avenue, Figueroa Street, and Martin Luther King, Jr. Boulevard can be characterized as commercial corridors. Vermont Avenue provides access from the area to the Mid-Wilshire District of Los Angeles on the north and to the South Bay cities of Gardena and Torrance to the south. Similarly, Figueroa Street provides direct surface-street access to Downtown Los Angeles to the north and the Los Angeles Harbor area to the south. Martin Luther King, Jr. Boulevard is both a commercial and residential corridor to the west, providing access to the Baldwin Hills area, as well as to the Crenshaw District of Los Angeles. Development along each of these streets extending outward from the vicinity of the Proposed Project is primarily characterized by a highly urban mix of densely developed residential neighborhoods and strip commercial areas largely defined by low- and mid-rise structures. Industrial land uses are prominent to the east of the Harbor Freeway, although the general pattern of low visual relief characterizing the area is broken intermittently by high-rise industrial facilities. Exposition Boulevard, defining the northern boundary of Exposition Park and the southern boundary of the USC campus, is generally characterized by commercial and light industrial uses to the west of Vermont Avenue and is situated parallel to a set of Southern Pacific railroad tracks. The Shrine Auditorium, a large mid-rise public assembly facility, is located to the northeast of the site, adjacent to the north edge of the USC campus. Overall, the high density of development in the greater project locale is characteristic of a major urban area, although not of an urban business center.

Viewsheds

In general, the aesthetic value of the area surrounding the Project Site relates primarily to its urban character rather than to any dominant natural feature. Low-level views from the Project Site looking outward consist largely of the surrounding areas of Exposition Park, as well as the commercial, retail and residential uses bordering the site to the east and south. Views from the site to the north and west are limited by the presence of the Coliseum and swim stadium, as well as by vegetation and stands of trees within the open space portions of the Park. Intermittent views of the skyline of Downtown Los Angeles (approximately 2 miles north) are partially visible from areas within the Park. The downtown skyline forms a backdrop against which the lower-relief urban development in the intervening areas may be seen. Intermittent views of the more distant San Gabriel Mountains beyond the downtown skyline may also be obtained from the Park area. In general, existing structures, landscaping and vegetation limit most views from the ground the level in the Park area and views in all four directions from the site can generally be characterized by heavily urban land uses.

The site is marginally visible from vantage points on the east and south due to large setbacks, and is minimally visible from the north and west due to the relatively low profile of the existing Sports Arena, the location of the Coliseum, swim stadium, trees, and landscaping to the north and west of the site in Exposition Park. Views of the Project Site and surrounding areas are provided in Figures IV.A-1 through IV.A-8. Each Figure includes an explanation of the view and a photograph location map for geographical reference.

Ambient Lighting and Illumination

The existing permanent lighting at the Sports Arena consists of small and moderate scale area lighting fixtures at the entrances and pedestrian access areas as well as pole lighting positioned throughout the Sports Arena VIP parking lots and walkways. View 1 in Figure IV.A-1 above illustrates common lighting fixtures currently used for parking areas and walkways. As the Proposed Project would involve the removal of an existing indoor facility and replace it with either an open-air amphitheater or outdoor soccer stadium, the potential impact of the field and event lighting on the surrounding community is the focus of the analysis provided below.

Ambient lighting in the vicinity of the Project Site consists of relatively moderate to high levels of lighting. The ambient lighting conditions are attributable to the commercial land uses, traffic lights and signals, and vehicle headlights travelling along Figueroa Street, Martin Luther King, Jr. Boulevard, Vermont Avenue, and Exposition Boulevard. The other uses in Exposition Park all maintain mid-level lighting at night, and surface parking lots in the Park are relatively brightly lit. During nighttime events held at the Coliseum, approximately 360 existing floodlights are in operation and contribute to increased ambient nighttime lighting levels. Surrounding commercial uses along Figueroa Street and Vermont Avenue maintain high-level lighting, while residential areas along Martin Luther King, Jr. Boulevard maintain a relatively low level of nighttime lighting. Overall, existing ambient lighting levels surrounding the Project Site range from moderate to high.

REGULATORY FRAMEWORK

General Plan Framework Element

The City of Los Angeles General Plan Framework Element, adopted in 1996 and re-adopted on August 8, 2001, sets forth a citywide comprehensive long-range growth strategy. It defines citywide policies that are to be implemented through subsequent amendments of the City's community plans, zoning ordinances, and other pertinent programs. The citywide policies of the General Plan Framework Element that are generally relevant to visual character and urban deign are contained in Chapter 5 (Urban Form and Neighborhood Design) and Chapter 6 Open Space and Conservation. While the General Plan Framework Element provides general guidelines for future updates of the City's community plans, specific the goals and policies that more directly apply to specific development projects are those that are contained in the relevant Community and Specific Plans.

South Los Angeles Community Plan

The City of Los Angeles General Plan designation for the Project Site is OS, Open Space. This designation permits parks and community centers under the ownership and operation of a public agency. Chapter V, Urban Design, of the South Los Angeles Community Plan sets forth specific design policies for individual projects and establishes broader community design policies for streetscape improvements and landscaping in public spaces. The design policies for individual projects apply to multi-family housing, commercial and industrial site planning and are not applicable to the Proposed Project. It is the intent of the Urban Design chapter of the Community Plan to establish a set of guidelines that will serve to improve the environment both aesthetically and physically, as opportunities in the South Central Community Plan Area occur which involve public improvements or other public and/or private projects that affect public spaces and rights-of-way. These guidelines should be referred to and implemented to the extent feasible through such projects and should be a guide to other City departments as they develop, update, and implement their respective plans. The following improvements are recommended:

Entryway Improvements

1. Provide improvements along principal streets and at the City boundary with adjacent jurisdictions, at major identified intersections and edges which clearly distinguishes these as major entries into the City. Such improvements may include elements such as signage, landscaping, vertical pylons and/or other distinctive treatments.

2. Establish entry improvements at appropriate locations along major highways and in the following areas: The Exposition Park/University Area, The Vermont/Manchester Area, Vermont Square, Arlington Heights, Jefferson Park, Adams/Normandie, and South Vermont.

3. Establish entry improvements at selected locations on freeway off-ramps within the Plan Area.

4. Create entry improvements as gateway elements to districts; these elements could consist of monument pylons, freestanding banners on poles, banners hung from existing light or marbelite standards or graphic elements hung from or attached to privately owned buildings. These improvements should be located at the intersections described in 2 and 3 above.

Streetscape

1. Provide for a coordinated streetscape design at identified entries to the Plan Area that includes street lighting, street furniture, and sidewalk/crosswalk improvements in the public right-of-way.

2. Establish a comprehensive streetscape and landscape improvement program for identified corridors and districts that will set standards and priorities for the selection and installation of, but not limited to, the following: street trees, street lighting, streetscape elements (sidewalk/crosswalk paving, street furniture), and public signage.

3. Establish streetscape and landscape standards for all major and secondary corridors and in areas described as community centers and neighborhood districts.

4. Identify locations for, and develop landscaped median strips within commercial streets, provided that there is adequate space, traffic flow, site access, and the proper street cross section to insert the medians.

Street Trees

1. Select species which (a) enhance the pedestrian character, and convey a distinctive high quality visual image for the streets, (b) are drought-and smog-tolerant, and fire-resistant and complement existing street trees.

2. Establish a hierarchy for street trees which shall include:

   a. Major Accent Trees. These trees should be located at entry locations, intersections, and activity centers.

   b. Street Trees. Select specific species to be the common tree for street frontages. A single flowering species may be selected for all residential neighborhoods and commercial districts or different species selected to distinguish one neighborhood, district, or street from another. In residential neighborhoods, the trees should be full, to provide shade and color. In commercial districts, the trees should provide shade, but be more transparent to promote views of store fronts and signs.

   c. Ornamental or Special Plantings. At special areas along street frontages, such as linkages to pedestrian walkways and plazas and outdoor dining areas, ornamental trees providing shade and color should be utilized to emphasize and focus attention on those places.

3. Provide for the installation of street trees along public sidewalks defining the types and spacing in accordance with a Street Tree Master Plan.

Street Furniture

1. Install street furniture that encourages pedestrian activity or physical and visual access to buildings and which is aesthetically pleasing, functional and comfortable, including such elements as bus and pedestrian benches, bus shelters, trash receptacles, newspaper racks, bicycle racks, public telephones, landscaped planters, drinking fountains, and bollards. Priority should be given to pedestrian oriented areas.

2. Provide for the use of kiosks or other street furniture.

Street Lighting

1. Install new street lights in commercial districts which are pedestrian-oriented, attractively designed, and compatible with facades and other street furniture, to provide adequate visibility, security, and a festive night time environment.

2. Establish a consistent street lighting type in areas designated historic, utilizing a light standard that is compatible with the historic commercial theme and coordinated with an overall street furniture and graphics/signage program.

Sidewalks/Paving

1. Re-pave existing sidewalks and crosswalks in principal commercial districts and significant cultural areas such as the Vermont/Manchester area, the Exposition Park area with brick pavers, concrete, or other safe, non-slip materials to create a distinctive pedestrian environment and, for crosswalks, to visually and physically differentiate these from vehicle travel lanes and promote continuity between pedestrian sidewalks.

2. Develop sidewalk "pull-outs" at intersections, where they do not adversely impact traffic flow or safety, by extending the sidewalk to the depth of a parking stall, to accommodate landscaping and street furniture and reduce the width of the crosswalk.

Signage

1. Establish a consistent design for all public signage, including fixture type, lettering, colors, symbols, and logos designed for specific areas or pathways.

2. Provide for distinctive signage which identifies principal entries to unique neighborhoods, historic structures and districts, and public buildings and parks.

3. Ensure that public signage complements, and does not detract from adjacent commercial and residential uses and that is enhances designated historic sites and districts.

4. Provide for signage which uniquely identifies principal commercial, cultural or historic areas in the Plan Area including, but not limited to, the Exposition Park area, the Vermont/Manchester area, and the Adams/Normandie area.

Public Open Space and Plazas

1. Establish public open space standards that will guide the design of new public plazas and open spaces; including the consideration of the siting of open space (to maximize pedestrian accessibility and circulation, solar exposure or protection), adjacency to pedestrian routes and other open spaces, and appropriate plant and hardscape materials.

Exposition/University Park Redevelopment Plan

The Project Site is designated for Public Uses by the Redevelopment Plan, consistent with the current and historic use of the Project Site. The Redevelopment Plan contains several goals that are generally applicable to the aesthetic character the Project Site and project vicinity. The applicable goals that relate to aesthetics and urban form are as follows:

- To eliminate and prevent the spread of blight and deterioration and to conserve, rehabilitate, and redevelop the Expanded Project Area in accordance with the Plan.

- To make provisions, throughout the Expanded Project Area, for well-planned community uses, facilities, pedestrian and vehicular, circulation, and adequate parking, particularly as these relate to Exposition Park.

- To provide a basis for the location and programming of public service facilities, parks, and recreation facilities.

- To promote compatible development, with consideration to scale, height, material, architectural quality, and site orientation.

Signage Regulations - Coliseum District Specific Plan (CDSP)

In 2006, the Los Angeles Memorial Coliseum Commission and the City of Los Angeles Department of City Planning adopted the Coliseum District Specific Plan Overlay District, which established a conceptual sign program to permit and regulate the size, placement, and general characteristics of on-and off-site signage within the Coliseum District Specific Plan (CDSP). The CDSP proposes five signage zones generally located within the area bounded by Exposition Boulevard on the north, Figueroa Street on the east, Martin Luther King Junior Boulevard on the south and Vermont Avenue on the west, and that

certain area easterly of the 110 (Harbor) Freeway. The Sports Arena Project Site is located within the *Periphery Zone* as designated CDSP Signage Zone designation Map, depicted in Figure IV.A-9 on page IV.A-17. For purposes of providing the full context of the signage regulations that apply to the Project Site, all of the regulations contained in Section 11 of the CDSP are provided below:

The following regulations shall apply to all signs which are subject to this Specific Plan and are erected or maintained within the Specific Plan area.

A. Prohibition. The Department of Building and Safety shall not issue a permit for a sign unless the sign complies with the requirements of this Section, as determined by the Director of Planning.

B. Permitted Signs. All signs listed in this Specific Plan, and all signs listed in LAMC Section 91.6203 which are not otherwise prohibited by this Specific Plan, shall be permitted. A building permit shall be obtained from the Department of Building and Safety in accordance with the provisions of Section 91.6205 of the LAMC for any signs and/or sign alterations, other than changes or replacement of copy, that are regulated by this Specific Plan or Section 91.6201 of the LAMC. Conceptual locations of primary signage are identified on Exhibits 1A and 1. B.

C. Prohibited Signs.

i. No signs shall be attached, affixed or applied to the historic elements of the exterior of the Stadium structure.

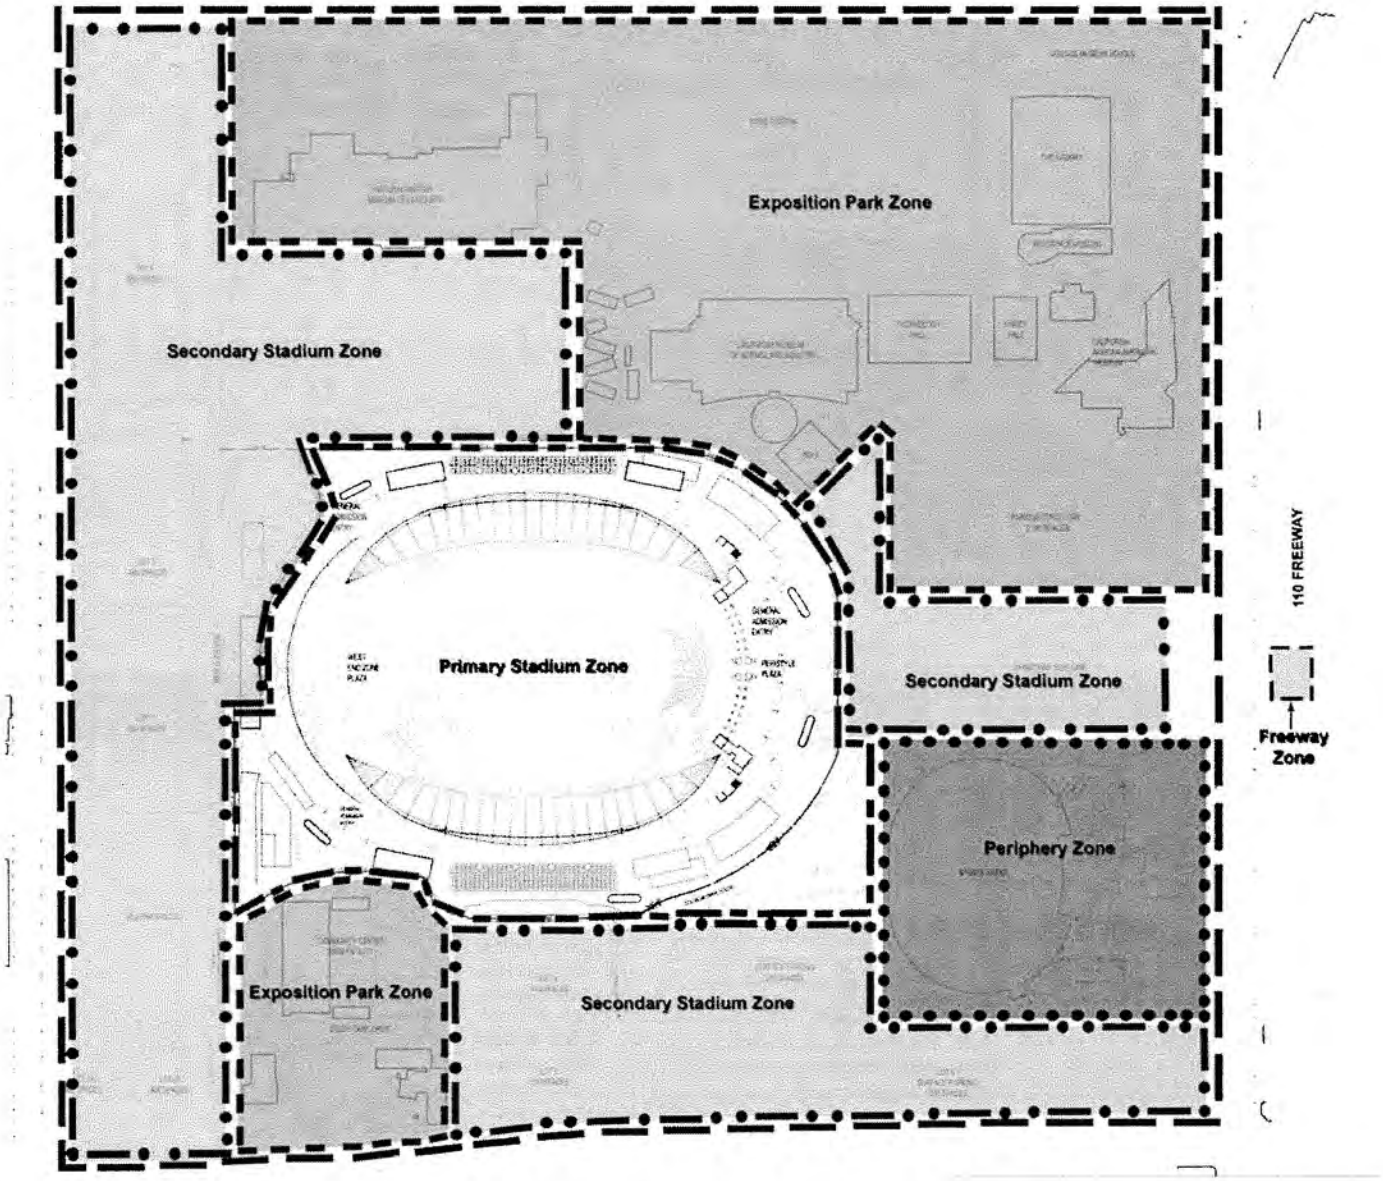
ii. Pole Signs, defined by LAMC.

iii. Roof Signs, defined by LAMC.

iv. Can Signs.

D. Interior Stadium Signs. Signs located within the interior of the Stadium structure, and which are oriented to the interior, shall be permitted and shall not be subject to any limitations of this Ordinance and shall not count as Sign Area, provided, however, the Back of Scoreboard Signs, as defined by this Specific Plan which back areas are primarily viewed from areas outside of the Stadium, shall be subject to this Specific Plan. Interior signs shall only be required to comply with Section 91.6205.1 through 91.6205.5 and 91-6205.7 through 91.6205.10.

E. Peristyle Area Sign Limitations. No permanent signs, other than Banners (Themed) may be placed on the Peristyle, as identified on Map 5 of the CDSP. Projected Image Signs (and other forms of illumination) may be used on the Peristyle. Signs in the Peristyle Plaza and on any



NORTH

NOT TO SCALE

CAJA Environmental Services, LLC

Figure IV.A-9
CDSP Signage Zone Designation Map

permanent or temporary facilities and structures in the Peristyle Plaza shall not substantially block primary viewing of the Peristyle from exterior viewing areas, although incidental obstruction of views from exterior viewing areas shall be permitted. Subject to the limits provided in this Section 11.E, signage within the Peristyle Plaza, as indicated on Map 5 of the CDSP, may include (i) signs on kiosks, carts, restaurants, temporary concession booths and broadcast facilities, (ii) Banner Signs (Themed), (iii) Inflatable Signs, (iv) Projected Image Signs, (v) Temporary Signs (Themed), and (vi) Freestanding iconic elements/statues. In addition, such other signs that are approved by the Director of Planning may be permitted within the Peristyle Plaza.

F. Banner Signs (Themed). Banner Signs shall be used to identify events, facilities, activities or sponsors associated with the NFL, an NFL team, the Stadium, the Stadium Naming Sponsor, Stadium Sponsors or Exposition Park. Such Banner Signs may be erected for an unlimited period of time and may be changed from time to time. A maximum of 25% of the Banner Sign may contain a commercial logo company name and/or other commercial message; provided, however, the Stadium, NFL, NFL Teams and Stadium Naming Sponsor shall not be subject to the 25% limitation.

G. Temporary Signs (Themed). Such signs shall be used to identify events, facilities, activities or sponsors associated with the NFL, an NFL team, the Stadium or Exposition Park including without limitation Stadium Sponsors or Stadium Naming Sponsor. Temporary signs shall not count as sign area.

H. Entry Monument Signs. There shall be a maximum of five such signs. Any corporate logo or other advertising elements shall be limited to 6’ in height, as measured from adjacent grade. The sign may extend an additional 2’ in height for wayfinding purposes. Adjacent grade shall include any earthen berm which is provided as a foundation for the sign.

I. Major Site Signs. Major Site Signs shall be a maximum of 170’ in height, as measured from adjacent grade. Adjacent grade shall include any earthen berm which is provided as a foundation for the sign. A Major Site Sign may be multi-sided. The total sign area for an individual Major Site Sign shall not exceed 8,000 square feet (e.g. a two-sided sign may have 4,000 square feet of sign area on each side). A Major Site Sign may incorporate other types of sign elements permitted by this Specific Plan, including but not limited to Electronic Message Display, Channel Letters, Off-site, On-site and Animated signs. A Major Site Sign shall have a 3:1 vertical to horizontal orientation. Landscaping shall be provided at the base of each Major Site Sign, and a landscaping plan shall be approved by the Director prior to issuance of a permit for each such sign. A Major Site Sign shall be free-standing, mounted to the ground and columns, poles or uprights used as its primary structural support shall be architecturally treated and themed. A Major Site Sign may incorporate a sculptural or themed shape. A total of two Major Site Signs shall be permitted by

this Specific Plan, at those locations indicated on Exhibit 1 (see Figure IV.A-9 of this EIR). The limitations of this Section 11 shall not apply to the Major Site Sign located east of the 110 (Harbor) Freeway, unless such Major Site Sign is substantially remodeled or replaced. Replacement of the video or messaging elements of the 110 Harbor Freeway Major Site Sign with new elements or messaging shall not be considered as remodeling or replacement of the sign.

J. Minor Site Signs. Minor Site Signs shall be a maximum of 30' in height, as measured from adjacent grade. Adjacent grade shall include any earthen berm which is provided as a foundation for the sign. A Minor Site Sign may be multi-sided. The total sign area for an individual Minor Site Sign shall not exceed 900 square feet (e.g. a two-sided sign may have 450 square feet of sign area on each side). A Minor Site Sign may incorporate other types of sign elements permitted by this Specific Plan, including but not limited to Electronic Message Display, Channel Letters, Off-site, On-site and Animated signs. A Minor Site Sign shall have a 3:1 vertical to horizontal orientation. Landscaping shall be provided at the base of each Minor Site Sign, and a landscaping plan shall be approved by the Director prior to issuance of a permit for each such sign. A Minor Site Sign shall be free-standing, mounted to the ground and columns, poles or uprights used as its primary structural support shall be architecturally treated and themed. A Minor Site Sign may incorporate a sculptural or themed shape. A total of four Minor Site Signs shall be permitted by this Specific Plan, at those locations indicated on Exhibit 1.

K. Wayfinding Signs. Wayfinding Signs which have less than 10% of the sign area devoted to a Stadium Sponsor logo or identification shall not count as sign area.

L. Window Signs. Window Signs shall not incorporate any materials which are affixed to the exterior window.

M. Sign Zones. The Coliseum Sign Plan area is divided into five Sign Zones, as shown on Map 4 of the CDSP.

i. Primary Stadium Zone.

1) Permitted Signs. All signs which are permitted by this Specific Plan shall be permitted in the Primary Stadium Zone, except for the following signs which shall be prohibited: Entry Monument, Minor Site Sign.

2) Permitted sign area. The total sign area within the Primary Stadium Zone shall not exceed 96,000 square feet, except that sign area for Upper Rim Signs, Stadium Identity Signs, Back of Scoreboard Signs and Major Site Sign shall not count against the 96,000 square feet limitation. The Upper Rim Signs, Stadium Identity Signs, Back of Scoreboard Signs and Major Site Sign shall be limited as set forth in this Section.

3) Upper Rim Signs. The total sign area for Upper Rim Signs within the Primary Stadium Zone shall not exceed 30,000 square feet. No individual Upper Rim Sign shall exceed 15,000 square feet of sign area.

4) Stadium Identity Signs. The total sign area for Stadium Identity Signs within the Primary Stadium Zone shall not exceed 100,000 square feet. No individual Stadium Identity Sign shall exceed 50,000 square feet of sign area.

5) Back of Scoreboard Signs. The total sign area for Back of Scoreboard Signs within the Primary Stadium Zone shall not exceed 24,000 square feet. No individual Back of Scoreboard Sign shall exceed 6,000 square feet.

6) Major Site Sign. A maximum of one of the two permitted Major Site Signs allowed by this Specific Plan may be located within the Primary Stadium Zone.

7) Maximum Aggregate Sign Area. Notwithstanding the sign area otherwise permitted by Section 11.M.i (2), (3) and (5) above, the aggregate total sign area permitted by Section 11.M.i (2), (3) and (5) shall not exceed 110,000 square feet.

ii. Secondary Stadium Zone.

1) Permitted Signs. All signs which are permitted by this Specific Plan shall be permitted in the Secondary Stadium Zone, except for the following signs which shall be prohibited: Back of Scoreboard, Stadium Identity, Upper Rim,

2) Permitted sign area. The total sign area within the Secondary Stadium Zone shall not exceed 40,000 square feet.

3) Major Site Signs. A maximum of one of the two permitted Major Site Signs allowed by this Specific Plan may be located within the Secondary Stadium Zone.

4) Minor Site Signs. A maximum of three of the four permitted Minor Site Signs allowed by this Specific Plan may be located within the Secondary Stadium Zone.

5) Entry Monument Signs. There shall be a maximum of five Entry Monument Signs within the Secondary Stadium Zone.

iii. Exposition Park Zone

1) Permitted Signs. All signs which are permitted by this Specific Plan shall be permitted in the Exposition Park Zone, except for the following signs which are prohibited:

Architectural Ledge, Awning, Back of Scoreboard, Inflatable, Major Site Sign, Projected Image, Stadium Identity, Upper Rim, Wall.

2) Permitted sign area. The total sign area within the Exposition Park Zone shall not exceed 11,000 square feet.

3) Minor Site Signs. A maximum of one of the four permitted Minor Site Signs allowed by this Specific Plan may be located within the Exposition Park Zone.

iv. Periphery Zone

1) Permitted Signs. All signs which are permitted by this Specific Plan shall be permitted in the Periphery Zone, except for the following signs which shall be prohibited: Awning, Back of Scoreboard, Blade, Electronic Message Display, Entry Monument, Fence Wrap, Major Site, Minor Site, Stadium Identity, Upper Rim, Wall, Window.

2) Permitted sign area. The total sign area within the Periphery Zone shall not exceed 20,000 square feet.

v. Freeway Sign Zone.

1) Permitted Signs. One Major Site Sign shall be permitted within the Freeway Zone.

2) Permitted sign area. The total sign area within the Freeway Sign Zone shall not exceed 8,000 square feet.

L. Illumination. All signs may be illuminated. Signs may be illuminated by either internal or external means. Methods of signage illumination may include, but not be limited to: electric lamps, such as neon tubes; fiber optic; incandescent lamps; cathode ray tubes exposed directly to view; shielded spot lights and wall wash fixtures. All illuminated signs shall be designed or located so as to reduce the impact of direct light sources onto residential uses to the extent reasonably feasible.

ENVIRONMENTAL IMPACTS

Thresholds of Significance

In accordance with the methodology and significance thresholds established by City of Los Angeles L.A. CEQA Thresholds Guide, the determination of significance shall be made on a case-by-case basis, considering the following factors:

- The amount or relative proportion of existing features or elements that substantially contribute to

the valued visual character or image of a neighborhood, community, or localized area, which would be removed, altered, or demolished;

- The amount of natural open space to be graded or developed;
- The degree to which proposed structures in natural open space areas would be effectively integrated into the aesthetics of the site, through appropriate design, etc.;
- The degree of contrast between proposed features and existing features that represent the area's valued aesthetic image;
- The degree to which a proposed zone change would result in buildings that would detract from the existing style or image of the area due to density, height, bulk, setbacks, signage, or other physical elements;
- The degree to which the Proposed Project would contribute to the area's aesthetic value;
- The Proposed Project's consistency with applicable design guidelines and/or regulations.

In addition, an impact to light and glare is considered to be significant if the project would result in a new source of substantial light or glare, which would adversely affect day or nighttime views in the area.

Project Impacts

Option 1: Multiple Use Space

Under Option 1, Multiple Use Space, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be demolished and the site would be redeveloped with an open-air greenspace with an amphitheater. The bowl-shaped amphitheater would be built into the depression currently occupied by the Sports Arena. This would allow Option 1 to take advantage of the existing topography of the Project Site. An approximate 800-square foot (40 feet x 20 feet) concrete pad would be located at the lowest elevation in the center of the amphitheater to serve as the stage and provide support for audio and visual equipment. The stage would be surrounded in a horseshoe configuration by grass-covered seating levels that would be tiered to ensure visibility of the stage from each level. Seating would be provided on the grass (no fixed seats are proposed). The bowl would be surrounded by flagpoles to highlight the celebratory nature of the special events. The remainder of the Project Site would be improved as grass-covered flat surface. See Figure II-3 in Section II, Project Description, for the conceptual rendering of this design.

The Multiple Use Space would provide an open-air, publicly accessible space that requires minimal upkeep and little to no permanent staff. Restroom facilities and permanent concession facilities may be provided. Additionally, in the interest of creating an unenclosed outdoor space, no fencing would be

constructed. Lighting would include stage lighting, which would be directed towards the center of the site and only operated during events, and low-level security lighting around the site's perimeter. Signage would consist of standard identification signage placed at the facility's entrances.

Impacts to Visual Character and Views

The proposed Multiple Use Space Option would contrast sharply with the existing aesthetic and visual character of the existing Project Site. The proposed development under this Option would result in the demolition of the Sports Arena building, which currently dominates the visual character of the southeast quadrant of Exposition Park. The Multiple Use Option would expose views of the Coliseum, museums, and landscaping features within Exposition Park that are currently concealed by the Sports Arena building. Because the proposed amphitheater would be built below grade level and within the topographic depression left behind by the demolition of the Sports Arena, this Option would not create any structural massing or result in the obstruction of existing views. In this regard aesthetic impacts would be less than significant.

Consistency with Applicable Plans and Policies

The Multiple Use Space would be consistent with the goal of the Exposition/University Park Redevelopment Plan to eliminate and prevent the spread of blight and deterioration and to conserve, rehabilitate, and redevelop the Expanded Project Area. The Multiple Use Space Option would redevelop the Sports Arena as an open-air greenspace with a below grade amphitheater built into the slope of the existing depression created by the Sports Arena structure. The Multiple Use space would transform the existing outdated and underutilized Project Site into a modern, state-of-the-art public use facility that is visually and operationally consistent with the grounds and public uses that occupy Exposition Park. The Multiple Use Space Option would also provide for well-planned community uses, facilities, pedestrian and vehicular, circulation, and adequate parking, that are consistent with the surrounding environ within Exposition Park. The Multiple Use Space Option would promote compatible development, with consideration to scale, height, material, architectural quality, and site orientation. The location of the amphitheater space would be within the existing footprint of the Sports Arena Site and would be visually concealed by topography and landscaping thus avoiding any structural massing altogether. The Project Site would reflect an open grass and park-like setting with walkways and garden areas. Thus, the Multiple Use Space Option would be consistent with the goals and objectives of the Redevelopment Plan as it pertains to aesthetics and impacts would be less than significant.

Signage

A detailed signage program has not been developed for the Multiple Use Space Option at this time. However, in the absence of any specific programmatic goals for signage it is assumed that the Multiple Use Space Option would be developed in a manner that is consistent with and adheres to all of the applicable codes of the LAMC, the design guidelines of the South Los Angeles Community Plan as it

pertains to signage, and the overriding rules and regulations set forth in the Coliseum Signage Overlay District. As such, aesthetic impacts related to signage would be less than significant.

Light and Glare

Environmental impacts to the adjacent residential properties to the south of Martin Luther King, Jr. may result due to excessive illumination on the project site. The Multiple Use Space will include permanent lighting fixtures to illuminate landscaped areas, way-finding and directional signage, and pedestrian pathways for safety and security purposes. The lighting plan would consist of low-level directional lighting fixtures to minimize light trespass to off-site properties. The Multiple Use Space Option would also employ portable event lighting that would be brought in and set up on an event-by-event basis to illuminate the amphitheater stage and surrounding areas. Due to the fact that the amphitheater stage will be set below grade, and the stage lighting will be directed downward towards the stage, event lighting it is not anticipated to result in any light trespass to off site properties. Mitigation Measure A-1 is recommended to ensure lighting impacts from both permanent and portable lighting fixtures are minimized to the maximum extent possible. Aesthetic impacts associated with light and glare would be less than significant.

The Multiple Use Space Option would not include the construction of any structural elements that would create reflective glare impacts. No impacts would occur and no mitigation measures are required.

Option 2: MLS Stadium

Under Option 2, MLS Stadium, the existing Sports Arena would be removed and the site would be redeveloped with a MLS Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with site's history. The VIP parking lot would remain to the west of the proposed stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on a north-south axis and would have a permanent seating capacity of approximately 22,000. The proposed outdoor soccer stadium would occupy the existing footprint of the Sports Arena building, which is set below grade level. Thus, the field and most of the seating would be situated below-ground, reducing the height and perceived mass of the venue when viewed from grade level. Illustrative renderings of the proposed MLS Stadium Oprion are depicted in Section II, Project Description (See Figures II-4 and II-5).

Architecturally, the stadium would resemble other comparable venues in the nation, such as the Home Depot Center in the City of Carson, home to both the Los Angeles Galaxy and Chivas USA of Major League Soccer. It would feature dome-style geometry typical of stadium architecture, partially topped by a curved canvas tensile canopy on its west and east sides. The lighting to be used for the soccer field would consist of highly focused and directional lighting arrays. Much of the lighting (and all of the high-intensity field lighting) would be directed downward into the bowl-shaped stadium. Similar to existing conditions, low level security lighting would also be installed throughout the remainder of the site to mark walkways, parking areas, restroom facilities, and entrances.

Impacts to Visual Character and Views

The development of the MLS Stadium Option would result in a notable change to the existing character of the project site, as the Sports Arena building would be demolished and replaced with a new modern open roof stadium complex. The proposed soccer stadium, while architecturally different than the existing Sports Arena, would occupy approximately the same general height, mass and orientation as the existing Sports Arena. Architecturally, the stadium would be designed to complement the existing public use structures within Exposition Park and would generally improve the visual character in the project area. Perimeter landscaping and pedestrian plaza areas would be improved around the stadium fronting Figueroa Street. Views from residential and commercial uses in the outlying vicinity would not be adversely affected since the proposed stadium structure would occupy the same general field of view as the current Sports Arena building. Accordingly, as the visual character and views in the vicinity of the Project Site would be improved compared to existing conditions, impacts would be considered less than significant.

Signage

A detailed signage program has not been developed for the MLS Stadium Option at this time. However, in the absence of any specific programmatic goals for signage it is assumed that the MLS Stadium would include advertising signage and naming rights that is consistent with similar sporting venues in the Los Angeles area. The proposed signage program will, however, be in conformance all of the applicable codes of the LAMC, the design guidelines of the South Los Angeles Community Plan, and the overriding rules and regulations set forth in the Coliseum Signage Overlay District. As such, aesthetic impacts related to signage would be less than significant.

Light & Glare

Under the MLS Stadium Option, exterior stadium lights are proposed which could result in light spillage onto adjacent properties and land uses. In is anticipated that the lighting plan would be designed in a manner that limits spillover and light pollution to the maximum extent feasible. However, as compared to the existing indoor facility, nighttime events and games held at the stadium would generate a high degree of artificial lighting in the night sky. This lighting system would employ directional lighting fixtures to illuminate the field level. In addition, similar to existing conditions at the Project Site, this Option would include pole-mounted lighting for parking lot areas, pedestrian walkways, and security lighting for pedestrian plaza areas. Mitigation Measure A-1 is recommended to ensure lighting impacts from exterior and field lighting fixtures are minimized to the maximum extent possible. Aesthetic impacts associated with light and glare would be less than significant.

The MLS Stadium Option would include the construction of a new modern MLS Stadium. While the exact architectural details of the structure have not been developed, the potential exists to utilize architectural features and materials that generate a high degree of reflectivity. Architectural materials that

have a high reflectivity values have the potential to adversely affect views within the project area, and could generate heat gain by reflecting the sun's rays. Land uses that could be potentially impacted by glare and light trespass would be predominantly the residential and commercial uses to the east across Figueroa Street and to the south across Martin Luther King Jr. Boulevard. In addition, glare cast on to the adjacent roadways of Figueroa Street and Martin Luther King, Jr., could adversely affect driver safety. Therefore, Mitigation Measures A-2 is recommended to mitigate this potential impact to a less than significant level.

MITIGATION MEASURES

The following mitigation measures are recommended to mitigate the project's impacts upon aesthetics to a less than significant level:

MM A-1 Outdoor lighting shall be designed and installed with shielding, such that the light source cannot be seen from adjacent residential properties or the public right-of-way.

MM A-2 The exterior of the proposed structure shall be constructed of materials such as, but not limited to, high-performance and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize glare and reflected heat.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Impacts related to aesthetics would be less than significant.

IV. ENVIRONMENTAL IMPACT ANALYSIS
B. AIR QUALITY

INTRODUCTION

This section examines the degree to which the Proposed Project may result in significant adverse changes to air quality. Both short-term construction emissions occurring from activities such as site grading and haul truck trips, as well as long-term effects related to the ongoing operation of the Proposed Project are discussed in this section. The analysis contained herein focuses on air pollution from two perspectives: daily emissions and pollutant concentrations. "Emissions" refer to the actual quantity of pollutant measured in pounds per day (ppd). "Concentrations" refer to the amount of pollutant material per volumetric unit of air and are measured in parts per million (ppm) or micrograms per cubic meter ($\mu g/m^3$).

The potential for the Proposed Project to conflict with or obstruct implementation of the applicable air quality plan, to violate an air quality standard or contribute substantially to an existing or projected air quality violation, to result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment, to expose sensitive receptors to substantial pollutant concentrations, or to create objectionable odors affecting a substantial number of people are also discussed. Furthermore, the impacts associated with greenhouse gas emissions generated by the Proposed Project during its construction and operation are also examined. Documents used in the preparation of this section include the South Coast Air Quality Management District (SCAQMD) *CEQA Air Quality Handbook* and the 2007 Air Quality Management Plan (AQMP), as amended, as well as federal and State regulations and guidelines.

ENVIRONMENTAL SETTING

The project site is located within the South Coast Air Basin (Basin), named so because its geographical formation is that of a basin, with the surrounding mountains trapping the air and its pollutants in the valleys below. This Basin includes all of Orange County and the non-desert portions of Los Angeles, San Bernardino, and Riverside Counties. The regional climate within the Basin is considered semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity. The air quality within the Basin is primarily influenced by a wide range of emissions sources – such as dense population centers, heavy vehicular traffic, and industry – and meteorology.

Air Pollutants

Air pollutant emissions within the Basin are generated by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point and area sources. Point sources occur at an

identified location and are usually associated with manufacturing and industry. Examples of point sources are boilers or combustion equipment that produce electricity or generates heat. Area sources are widely distributed and produce many small emissions. Examples of area sources include residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and consumer products such as lighter fluid and hair spray. Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircraft, ships, trains, racecars, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment such as when fine dust particles are pulled off the ground surface and suspended in the air during high winds.

Both the federal and State governments have established ambient air quality standards for outdoor concentrations of various pollutants in order to protect public health and welfare. These pollutants are referred to as "criteria air pollutants" as a result of the specific standards, or criteria, that have been adopted for them. The national and State standards have been set at levels considered safe to protect public health, including the health of "sensitive" populations such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

The criteria air pollutants that are most relevant to current air quality planning and regulation in the Basin include ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), sulfur dioxide (SO_2), and lead (Pb). In addition, toxic air contaminants (TACs) and greenhouse gas (GHG) emissions are of a concern in the Basin. The characteristics of each of these pollutants are briefly described below.

- *O_3* is a highly reactive and unstable gas that is formed when reactive organic gases (ROGs) and nitrogen oxides (NO_x), both byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. O_3 concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant.

- *CO* is a colorless, odorless gas produced by the incomplete combustion of carbon-containing fuels, such as gasoline or wood. CO concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike O_3, motor vehicles operating at slow speeds are the primary source of CO in the Basin. The highest ambient CO concentrations are generally found near congested transportation corridors and intersections.

- *PM_{10}* and *$PM_{2.5}$* consist of extremely small, suspended particles or droplets 10 microns and 2.5 microns or smaller in diameter, respectively. Some sources of particulate matter, like pollen and

windstorms, are naturally occurring. However, in populated areas, most particulate matter is caused by road dust, diesel soot, combustion products, abrasion of tires and brakes, and construction activities.

- *NO_2* is a nitrogen oxide compound that is produced by the combustion of fossil fuels, such as in internal combustion engines (both gasoline and diesel powered), as well as point sources, especially power plants. Of the seven types of NO_x compounds, NO_2 is the most abundant in the atmosphere. As ambient concentrations of NO_2 are related to traffic density, commuters in heavy traffic may be exposed to higher concentrations of NO_2 than those indicated by regional monitors.

- *SO_2* is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. When SO_2 oxidizes in the atmosphere, it forms sulfates (SO_4). Collectively, these pollutants are referred to as sulfur oxides (SO_x).

- *Pb* occurs in the atmosphere as particulate matter. The combustion of leaded gasoline is the primary source of airborne Pb in the Basin. The use of leaded gasoline is no longer permitted for on road motor vehicles, so the majority of such combustion emissions are associated with off-road vehicles such as racecars. However, because leaded gasoline was emitted in large amounts from vehicles when leaded gasoline was used for on-road motor vehicles, Pb is present in many urban soils and can be re-suspended in the air. Other sources of Pb include the manufacturing and recycling of batteries, paint, ink, ceramics, ammunition, and the use of secondary lead smelters.

- *TACs* refer to a diverse group of air pollutants that are capable of causing chronic (i.e., of long duration) and acute (i.e., severe but of short duration) adverse effects on human health. TACs include both organic and inorganic chemical substances that may be emitted from a variety of common sources including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations, and research and teaching facilities. TACs are different than "criteria" pollutants in that ambient air quality standards have not been established for them, largely because there are hundreds of air toxins and their effects on health tend to be felt on a local scale rather than on a regional basis.

Health Effects of Criteria Pollutants

The health effects of the criteria pollutants (i.e., O_3, CO, PM_{10} and $PM_{2.5}$, NO_2, SO_2, and Pb) and TACs are described below.[1] In addition, a list of the harmful effects of each criteria pollutant is provided in Table IV.B-1, Summary of Health Effects of Criteria Pollutants.

Table IV.B-1
Summary of Health Effects of Criteria Pollutants

Pollutants	Primary Health and Welfare Effects
Ozone (O_3)	• Aggravation of respiratory and cardiovascular diseases • Reduced lung function • Increased cough and chest discomfort
Carbon Monoxide (CO)	• Aggravation of some heart disease (angina) • Reduced tolerance for exercise • Impairment of mental function • Impairment of fetal development • Death at high levels of exposure
Fine Particulate Matter (PM_{10} and $PM_{2.5}$)	• Reduced lung function • Aggravation of respiratory and cardio-respiratory diseases • Increases in mortality rate • Reduced lung function growth in children
Nitrogen Dioxide (NO_2)	• Aggravation of respiratory illness
Sulfur Dioxide (SO_2)	• Aggravation of respiratory diseases (asthma, emphysema) • Reduced lung function
Lead (Pb)	• Behavioral and hearing disabilities in children • Nervous system impairment
Source: SCAQMD, Guidance Document for Air Quality Issues in General Plans and Local Planning, 2005.	

Ozone

Individuals exercising outdoors, children and people with preexisting lung disease such as asthma and chronic pulmonary lung disease are considered to be the most susceptible sub-groups for ozone effects. Short-term exposures (lasting for a few hours) to ozone at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. Elevated ozone levels are associated with increased school absences. In recent years, a correlation between elevated ambient ozone

[1] *The descriptions of the health effects of the criteria pollutants are taken from Appendix C (Health Effects of Ambient Air Pollutants) of SCAQMD's "Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning" document.*

levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and live in high ozone communities.

Ozone exposure under exercising conditions is known to increase the severity of the above mentioned observed responses. Animal studies suggest that exposures to a combination of pollutants that include ozone may be more toxic than exposure to ozone alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

Carbon Monoxide

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of worsening oxygen supply to the heart.

Inhaled CO has no direct toxic effect on the lungs, but exerts its effect on tissues by interfering with oxygen transport by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses, and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes.

Reduction in birth weight and impaired neurobehavioral development has been observed in animals chronically exposed to CO resulting in COHb levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels. These include pre-term births and heart abnormalities. Additional research is needed to confirm these results.

Particulate Matter

A consistent correlation between elevated ambient fine particulate matter (PM_{10} and $PM_{2.5}$) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. In recent years, some studies have reported an association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in life-span, and an increased mortality from lung cancer.

Daily fluctuations in fine particulate matter concentration levels have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children and to increased medication use in children and adults

with asthma. Recent studies show lung function growth in children is reduced with long-term exposure to particulate matter.

The elderly, people with pre-existing respiratory or cardiovascular disease and children appear to be more susceptible to the effects of PM_{10} and $PM_{2.5}$.

Nitrogen Dioxide

Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposures to NO_2 at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO_2 in healthy individuals. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups.

In animals, exposure to levels of NO_2 considerably higher than ambient concentrations results in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of O_3 and NO_2.

Sulfur Dioxide

A few minutes exposure to low levels of SO_2 can result in airway constriction in some asthmatics, all of whom are sensitive to its effects. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, are observed after acute exposure to SO_2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO_2.

Animal studies suggest that despite SO_2 being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract.

Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO_2 levels. In these studies, efforts to separate the effects of SO_2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.

Sulfates

Most of the health effects associated with fine particles and SO_2 at ambient levels are also associated with SO_4. Thus, both mortality and morbidity effects have been observed with an increase in ambient SO_4 concentrations. However, efforts to separate the effects of SO_4 from the effects of other pollutants have generally not been successful.

Clinical studies of asthmatics exposed to sulfuric acid suggest that adolescent asthmatics are possibly a subgroup susceptible to acid aerosol exposure. Animal studies suggest that acidic particles such as sulfuric acid aerosol and ammonium bisulfate are more toxic than non-acidic particles like ammonium sulfate. Whether the effects are attributable to acidity or to particles remains unresolved.

Lead

Fetuses, infants, and children are more sensitive than others to the adverse effects of lead exposure. Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence levels. In adults, increased lead levels are associated with increased blood pressure.

Lead poisoning can cause anemia, lethargy, seizures and death. It appears that there are no direct effects of lead on the respiratory system. Lead can be stored in the bone from early-age environmental exposure, and elevated blood lead levels can occur due to the breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland) and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of lead because of previous environmental lead exposure of their mothers.

Toxic Air Contaminants

TACs are a broad class of compounds known to cause or contribute to cancer or non-cancer health effects such as birth defects, genetic damage, and other adverse health effects. As discussed previously, effects from TACs may be both chronic and acute on human health. Acute health effects are attributable to sudden exposure to high quantities of air toxics. These effects include nausea, skin irritation, respiratory illness, and, in some cases, death. Chronic health effects result from low-dose, long-term exposure from routine releases of air toxics. The effect of major concern for this type of exposure is cancer, which requires a period of 10-30 years after exposure to develop.

TACs are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., dry cleaners). TACs are typically found in low concentrations, even near their source (e.g., benzene near a freeway). Because chronic exposure can result in adverse health effects, TACs are regulated at the regional, state, and federal level.

Diesel exhaust is the predominant TAC in urban air and is estimated to represent about two-thirds of the cancer risk from TACs (based on the statewide average). According to the California Air Resources Board (ARB), diesel exhaust is a complex mixture of gases, vapors, and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue. Some of the chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by the ARB, and are listed as carcinogens either under the State's Proposition 65 or under the federal Hazardous Air Pollutants programs. The United States Environmental Protection Agency (U.S. EPA) has adopted Ultra Low Sulfur Diesel (ULSD) fuel standards that went into effect in June 2006 in an effort to reduce diesel particulate matter substantially. As of June 1, 2006, refiners and importers nationwide have been required by the U.S. EPA to ensure that at least 80 percent of the volume of the highway diesel fuel they produce or import would be ULSD-compliant. By December 10, 2010, only ULSD fuel will be available for highway use nationwide. In California, which was an early adopter of ULSD fuel and engine technologies, 100 percent of the diesel fuel sold – downstream from refineries, up to and including fuel terminals that store diesel fuel – was ULSD fuel since July 15, 2006. Since September 1, 2006, all diesel fuel offered for sale at retail outlets in California have been ULSD fuel.

Existing Conditions

Existing Regional Air Quality

Ambient air quality is determined primarily by the type and amount of pollutants emitted into the atmosphere, as well as the size, topography, and meteorological conditions of a geographic area. The Basin has low mixing heights and light winds, which help to accumulate air pollutants. The most current average daily emissions inventory for the entire Basin and the Los Angeles County portion of the Basin is summarized in Table IV.B-2, 2008 Estimated Average Daily Regional Emissions.[2] As shown, exhaust emissions from mobile sources generate the majority of ROG, CO, NO_x, and SO_x in the Basin and the Los Angeles County portion of the Basin. Area-wide sources generate the most airborne particulates (i.e., PM_{10} and $PM_{2.5}$) in both the Basin and Los Angeles County.

[2] *The estimated annual average emissions for 2008 are the most recent data provided by the ARB.*

Table IV.B-2
2008 Estimated Average Daily Regional Emissions

Emissions Source	Emissions in Tons per Day					
	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
South Coast Air Basin						
Stationary (Point) Sources	107.0	56.0	48.1	16.1	24.0	15.4
Area-wide Sources	142.6	25.8	111.3	0.9	214.9	52.1
Mobile Sources	361.6	738.2	3,090.0	21.0	43.4	34.4
Natural (non-anthropogenic) Sources	86.5	5.0	164.2	1.5	16.6	14.1
Total Emissions	697.7	825.0	3,413.6	39.5	298.9	116.0
Los Angeles County – South Coast Air Basin						
Stationary (Point) Sources	67.3	39.1	36.5	14.5	24.7	12.3

Sources: California Air Resources Board, 2009 Almanac Emission Projection Data, website: http://www.arb.ca.gov/ei/emissiondata.htm, September 2010.

Measurements of ambient concentrations of the criteria pollutants are used by the U.S. EPA and the ARB to assess and classify the air quality of each air basin, county, or, in some cases, a specific urbanized area. The classification is determined by comparing actual monitoring data with national and State standards. If a pollutant concentration in an area is lower than the standard, the area is classified as being in "attainment." If the pollutant exceeds the standard, the area is classified as a "non-attainment" area. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated "unclassified."

The U.S. EPA and the ARB use different standards for determining whether the Basin is in attainment. Federal and State standards are summarized in Table IV.B-3, Ambient Air Quality Standards. The attainment status for the Los Angeles County portion of the Basin with regard to the national ambient air quality standards (NAAQS) and California ambient air quality standards (CAAQS) is shown in Table IV.B-4, Attainment Status for the South Coast Air Basin (Los Angeles County Portion).

Table IV.B-3
Ambient Air Quality Standards

Air Pollutant	Averaging Time	State Standard	Federal Standard
Ozone (O_3)	1 Hour	0.09 ppm	--
	8 Hour	0.07 ppm	0.075 ppm
Carbon Monoxide (CO)	1 Hour	20.0 ppm	35.0 ppm
	8 Hour	9.0 ppm	9.0 ppm
Nitrogen Dioxide (NO_2)	1 Hour	0.18 ppm	0.100 ppm
Sulfur Dioxide (SO_2)	1 Hour	0.25 ppm	--
	24 Hour	0.04 ppm	0.14 ppm
Particulate Matter 10 (PM_{10})	24 Hour	50 $\mu g/m^3$	150 $\mu g/m^3$
Particulate Matter 2.5 ($PM_{2.5}$)	24 Hour	--	35 $\mu g/m^3$

Note: The Pb standard is not listed because of the phase-out of leaded gasoline.

Existing Local Air Quality

The SCAQMD divides the Basin into 38 source receptor areas (SRAs) in which 38 monitoring stations operate to monitor the various concentrations of air pollutants in the region. The project site is located in

the City of Los Angeles and is located within SRA 1, which covers the Central Los Angeles County area.[3] Currently, SCAQMD Station No. 087 collects ambient air quality data for SRA 1. This station currently monitors emission levels of O_3, CO, NO_2, SO_2, and PM_{10}. Table IV.B-5, Summary of Ambient Air Quality in the Proposed Project Vicinity, identifies the national and State ambient air quality standards for the relevant air pollutants, along with the ambient pollutant concentrations that were measured at the SCAQMD Station No. 087 between 2006 and 2008.[4]

Existing Air Pollutant Emissions in Project Vicinity

Air pollutant emissions are generated in the local vicinity of the project site by stationary and area-wide sources, such as space and water heating, landscape maintenance from leaf blowers and lawn mowers, consumer products, and mobile sources, primarily automobile traffic. Overall, motor vehicles are the primary source of pollutants in the project site vicinity. A key characteristic of the Sports Arena is that it generates vehicle trips and high levels of traffic congestion for short periods on event days only. The attendance level and associated vehicle trips generated by specific events vary significantly. In the past five years, the Sports Arena held, on average, 69 events a year. Of the 69 events, 60 had an attendance of less than 10,000 people, six events had an attendance between 10,000 to 20,000 people, and three events had an attendance of more than 20,000 people.

Sensitive Receptors

The SCAQMD defines typical sensitive receptors as residences, schools, playgrounds, childcare centers, athletic facilities, hospitals, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Land uses such as primary and secondary schools, hospitals, and convalescent homes are considered to be sensitive receptors to poor air quality because the very young, the old, and the infirm are more susceptible to respiratory infections and other air quality-related health problems than the general public. Residential land uses are considered to be sensitive because people in residential areas are often at home for extended periods of time, so they could be exposed to pollutants for extended periods. Recreational areas are considered moderately sensitive to poor air quality because vigorous exercise associated with recreation places a high demand on the human respiratory function. For purposes of this air quality analysis, identified sensitive receptors near the Project Site include:

[4] *The most current air quality data available pertaining to ambient pollutant concentrations over a three-year period provided by the SCAQMD is from 2006 to 2008.*

Table IV.B-5
Summary of Ambient Air Quality in the Proposed Project Vicinity

Air Pollutants Monitored Within SRA 1—Central Los Angeles County Area	Year		
	2006	2007	2008
Ozone (O_3)			
Maximum 1-hour concentration measured	0.11 ppm	0.115 ppm	0.109 ppm
Number of days exceeding national 0.12 ppm 1-hour standard	0	0	0
Number of days exceeding State 0.09 ppm 1-hour standard	8	3	3
Maximum 8-hour concentration measured	0.079 ppm	0.102 ppm	0.090 ppm
Number of days exceeding national 0.075 ppm 8-hour standard [a]	n/a	3	3
Number of days exceeding State 0.07 ppm 8-hour standard	4	6	7
Respirable Particulate Matter (PM_{10})			
Maximum 24-hour concentration measured	59.0 µg/m^3	78.0 µg/m^3	66.0 µg/m^3
Number of days exceeding national 150 µg/m^3 24-hour standard	0	0	0
Number of days exceeding State 50 µg/m^3 24-hour standard	3	5	2
Annual Arithmetic Mean (AAM)	30.3 µg/m^3	33.3 µg/m^3	30.9 µg/m^3
Does measured AAM exceed State 20 µg/m^3 AAM standard? [b]	Yes	Yes	Yes
Carbon Monoxide (CO)			
Maximum 1-hour concentration measured	3.0 ppm	3.0 ppm	3.0 ppm
Days exceeding national 35.0 ppm 1-hour standard	n/a	n/a	n/a
Days exceeding State 20.0 ppm 1-hour standard	n/a	n/a	n/a
Maximum 8-hour concentration measured	2.6 ppm	2.2 ppm	2.1 ppm
Number of days exceeding national 9.0 ppm 8-hour standard	n/a	n/a	n/a
Number of days exceeding State 9.0 ppm 8-hour standard	n/a	n/a	n/a
Nitrogen Dioxide (NO_2)			
Maximum 1-hour concentration measured	0.11 ppm	0.10 ppm	0.12 ppm
Number of days exceeding State 0.18 ppm 1-hour standard	n/a	n/a	n/a
Annual average	0.0288 ppm	0.0299 ppm	0.0275 ppm
Does measured annual average exceed national 0.0534 ppm annual average standard?	No	No	No
Does measured annual average exceed State 0.030 ppm annual average standard?	No	No	No
Sulfur Dioxide (SO_2)			
Maximum 24-hour concentration measured	0.006 ppm	0.003 ppm	0.002 ppm
Number of days exceeding national 0.14 ppm 24-hour standard	n/a	n/a	n/a
Number of days exceeding state 0.04 ppm 24-hour standard	n/a	n/a	n/a

Notes: ppm = parts by volume per million of air.
µg/m^3=micrograms per cubic meter.
n/a = data not available or not collected by the District.

[a] *The national 8-hour standard for Ozone was 0.08 ppm for the year 2006 which was not exceeded.*

[b] *The national 50 µg/m^3 AAM standard for PM_{10} was revoked on December 17, 2006.*

- Residential uses located on the east side of Figueroa Street; and
- Residential uses located on the south side of Martin Luther King Jr. Boulevard between Figueroa Street and Menlo Avenue.

Regulatory Framework

Air quality in the United States is governed by the Federal Clean Air Act (CAA). In addition to being subject to the requirements of the CAA, air quality in California is also governed by more stringent regulations under the California Clean Air Act (CCAA). At the federal level, the CAA is administered by the U.S. EPA. In California, the CCAA is administered by the ARB at the State level and by the Air Quality Management Districts at the regional and local levels.

Air quality within the Basin is addressed through the efforts of various federal, State, regional, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for improving the air quality within the Basin are discussed below.

Federal

U.S. EPA

The U.S. EPA is responsible for setting and enforcing the federal ambient air quality standards for atmospheric pollutants. It regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain locomotives. The U.S. EPA also has jurisdiction over emissions sources outside state waters (outer continental shelf), and establishes various emissions standards for vehicles sold in states other than California.

As part of its enforcement responsibilities, the U.S. EPA requires each state with nonattainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain the federal standards. The SIP must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution, using a combination of performance standards and market-based programs within the timeframe identified in the SIP.

State

ARB

The ARB, a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and State air pollution control programs within California. In this capacity, the ARB conducts research, sets California Ambient Air Quality Standards, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. The ARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hair spray, aerosol paints, and lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

Off-Road Diesel Engines

Off-road diesel vehicles, which include construction equipment, are also regulated by the ARB for both in-use (existing) and new engines. There have been four sets of standards implemented by the ARB for new off-road diesel engines, known as Tiers. Tier 1 standards began in 1996. Tier 2 and 3 were adopted in 2000 and were more stringent than the first tier. Tier 2 and 3 standards were completely phased in by 2006 and 2008, respectively. On December 9, 2004, the ARB adopted the Tier 4 or fourth phase of emission standards for late model year engines. These emission standards are nearly identical to those finalized by the US EPA in May 2004. These standards will decrease PM and NO_X emissions 90 percent below current levels beginning in 2011.

Since off-road vehicles that are used in construction and other related industries can last 30 years or longer, most of those that are in service today are still part of an older fleet that do not have emission controls. As such, the ARB approved, on July 26, 2007, a regulation to reduce emissions from existing (in-use) off-road diesel vehicles that are used in construction and other industries. This regulation was approved by the California Office of Administrative Law (OAL) on May 16, 2008 and it became effective on June 15, 2008. This regulation includes an anti-idling limit of five minutes for all off-road vehicles 25 horsepower and up. The regulation also establishes emission rates targets for the off-road vehicles that decline over time to accelerate turnover to newer, cleaner engines and require exhaust retrofits to meet these targets. The regulation will take affect on the larger fleets first with average compliance dates in 2010 while medium and small fleet requirements will achieve compliance in 2013 and 2015, respectively. This regulation also includes the Surplus Off-Road Opt-in for NO_x (SOON) program. The local air districts may opt into the SOON program to reduce NO_x emissions beyond what is required by the regulation. SCAQMD adopted Rule 2449 at its May 2, 2008 board meeting, which would implement the SOON program. Opting into this program is anticipated to achieve a 12 ton per day reduction in NO_x by 2014.

Regional

Southern California Association of Governments

The Southern California Association of Governments (SCAG) is a council of governments for Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties. It is a regional planning agency and serves as a forum for regional issues relating to transportation, the economy and community development, and the environment.

Although SCAG is not an air quality management agency, it is responsible for developing transportation, land use, and energy conservation measures that affect air quality. SCAG's Regional Comprehensive Plan and Guide (RCPG) provides growth forecasts that are used in the development of air quality-related land use and transportation control strategies by the SCAQMD. The RCPG is a framework for decision-making for local governments, assisting them in meeting federal and State mandates for growth management, mobility, and environmental standards, while maintaining consistency with regional goals regarding growth and changes through the year 2015, and beyond. Policies within the RCPG include consideration of air quality, land use, transportation, and economic relationships by all levels of government.

SCAQMD

The SCAQMD is the agency principally responsible for comprehensive air pollution control in the Basin. To that end, the SCAQMD, a regional agency, works directly with SCAG, county transportation commissions, and local governments, and cooperates actively with all State and federal government agencies. The SCAQMD develops rules and regulations, establishes permitting requirements, inspects emissions sources, and provides regulatory enforcement through such measures as educational programs or fines, when necessary.

The SCAQMD is directly responsible for reducing emissions from stationary (area and point), mobile, and indirect sources to meet federal and State ambient air quality standards. It has responded to this requirement by preparing a series of Air Quality Management Plans (AQMPs). The most recent of these was adopted by the Governing Board of the SCAQMD on June 1, 2007. This AQMP, referred to as the 2007 AQMP, was prepared to comply with the federal and State Clean Air Acts and amendments, to accommodate growth, to reduce the high levels of pollutants in the Basin, to meet federal and State air quality standards, and to minimize the fiscal impact that pollution control measures have on the local economy. The 2007 AQMP identifies the control measures that will be implemented over a 20-year horizon to reduce major sources of pollutants. Implementation of control measures established in the previous AQMPs has substantially decreased the population's exposure to unhealthful levels of pollutants, even while substantial population growth has occurred within the Basin. As discussed on

pages 2 through 6 of the 2007 AQMP, level of ambient pollutants monitored in the Basin have decreased substantially since 1985.

The future air quality levels projected in the 2007 AQMP are based on several assumptions. For example, the SCAQMD assumes that general new development within the Basin will occur in accordance with population growth and transportation projections identified by SCAG in its most current version of the RCPG, which was adopted in March 1996. The 2007 AQMP also assumes that general development projects will include feasible strategies (i.e., mitigation measures) to reduce emissions generated during construction and operation in accordance with SCAQMD and local jurisdiction regulations which are designed to address air quality impacts and pollution control measures.

The 2007 AQMP incorporates new scientific data, primarily in the form of updated emissions inventories, ambient measurements, new meteorological episodes, and new air quality modeling. General development projects would be affected in the form of any applicable rules and regulations – if any – that are adopted as a result of the 2007 AQMP.

Although the SCAQMD is responsible for regional air quality planning efforts, it does not have the authority to directly regulate the air quality issues associated with plans and new development projects within the Basin. Instead, the SCAQMD has prepared the *CEQA Air Quality Handbook* to assist lead agencies, as well as consultants, project proponents, and other interested parties, in evaluating potential air quality impacts of projects and plans proposed in the Basin.

Local

City of Los Angeles

Local jurisdictions, such as the City of Los Angeles, have the authority and responsibility to reduce air pollution through its police power and decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City of Los Angeles is also responsible for the implementation of transportation control measures as outlined in the AQMP. Examples of such measures include bus turnouts, energy-efficient streetlights, and synchronized traffic signals.

The Air Quality Element of the City of Los Angeles General Plan was adopted on November 24, 1992 and sets forth the goals, objectives and policies which will guide the City in the implementation of its air quality improvement programs and strategies. The Air Quality Element acknowledges that numerous efforts are underway at the regional, county and city levels addressing clean air concerns and that coordination of these various efforts and the involvement of the area's residents are crucial to the achievement of state and federal air quality standards.

The Air Quality Element acknowledges the interrelationships among transportation and land use planning in meeting the City's mobility and clean air goals. Mutually reinforcing strategies need to be developed which work to reduce the use of single occupant vehicles and which work to reduce vehicle trips and vehicle miles traveled.

The Air Quality Element establishes six goals:

- Good air quality in an environment of continued population growth and healthy economic structure;
- Less reliance on single-occupant vehicles with fewer commute and non-work trips;
- Efficient management of transportation facilities and system infrastructure using cost-effective system management and innovative demand-management techniques;
- Minimize impacts of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation and air quality;
- Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels and the implementation of conservation measures including passive measures such as site orientation and tree planting; and
- Citizen awareness of the linkages between personal behavior and air pollution and participation in efforts to reduce air pollution.

In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation. The City utilizes the *CEQA Air Quality Handbook* as the guidance document for the environmental review of plans and development proposals within its jurisdiction.

ENVIRONMENTAL IMPACTS

Methodology

This analysis focuses on the nature and magnitude of the change in the air quality environment due to implementation of the Proposed Project. Air pollutant emissions associated with the Proposed Project would result from Project operations and from Project-related traffic volumes. Construction activities would also generate air pollutant emissions at the project site and on roadways resulting from construction-related traffic. The net increase in project site emissions generated by these activities and other secondary sources have been quantitatively estimated and compared to thresholds of significance recommended by the SCAQMD (see Project Impacts subheading, below).

Construction Emissions

The regional construction emissions associated with the Proposed Project were calculated using the URBEMIS 2007 computer model developed for the ARB by estimating the types and number of pieces of equipment that would be used to grade and excavate the project site and construct the proposed development. These construction emissions were analyzed according to the regional thresholds established by the SCAQMD and published in the CEQA *Air Quality Handbook*. The construction activities associated with the Proposed Project would cause diesel emissions, and would generate emissions of dust. Construction equipment within the project site that would generate criteria air pollutants could include graders, backhoes, loaders, dump trucks, etc. Some of this equipment would be used during grading activities as well as when structures are constructed on the project site. It was assumed that all of the construction equipment used would be diesel-powered.

In addition to SCAQMD's regional significance thresholds, the SCAQMD has also developed localized significance thresholds (LSTs) that are based on the amount of pounds of emissions per day that can be generated by a project that would cause or contribute to adverse localized air quality impacts. These localized thresholds, which are found in the mass rate look-up tables in the "Final Localized Significance Threshold Methodology" document prepared by the SCAQMD,[5] are only applicable to the following criteria pollutants: NO_x, CO, PM_{10}, and $PM_{2.5}$. For the purposes of this analysis, the LSTs in the mass rate look-up tables are used to determine whether construction activities associated with the Proposed Project may potentially result in localized air quality impacts.

LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or State ambient air quality standards, and are developed based on the ambient concentrations of that pollutant for each SRA. In terms of NO_x emissions, the two principal species of NO_x are nitric oxide (NO) and nitrogen dioxide (NO_2), with the vast majority (95 percent) of the NO_x emissions being comprised of NO. However, because adverse health effects are associated with NO_2, not NO, the analysis of localized air quality impacts associated with NO_x emissions is focused on NO_2 levels. NO is converted to NO_2 by several processes, the two most important of these are (1) the reaction of NO with ozone, and (2) the photochemical reaction of NO with hydrocarbons. When modeling NO_2 emissions from combustion sources, the SCAQMD assumes that the conversion of NO to NO_2 is complete at a distance of 5,000 meters from the source. For PM_{10} LSTs, the thresholds were derived based on requirements in SCAQMD Rule 403 — Fugitive Dust. For $PM_{2.5}$ LSTs, the thresholds were derived based on a general ratio of $PM_{2.5}$ to PM_{10} for both fugitive dust and combustion emissions.

---

[5] *SCAQMD, Final Localized Significance Threshold Methodology, June 2003, Revised July 2008.*

The SCAQMD has developed five sample construction scenarios, one-acre, two-acre, three-acre, four-acre, and five-acre in size, where construction impacts do not exceed the most stringent LSTs. The sample scenarios were designed to be used as models or templates for analyzing construction air quality impacts by projects of similar size.

The Project Site is approximately 15 acres in size. For purposes of this analysis, the construction areas and phasing have been divided into three, approximate five-acre subareas referred to as Subarea 1 (containing the Sports Arena structure), Subarea 2 (containing the VIP Parking Lot, walkways and open space west of the Sports Arena), and Subarea 3 (containing additional parking, walkways and open space east of the Sports Arena structure). See Figure IV.B-1, Proposed Construction Subareas, for an illustration of these areas. At any given time during the construction process, no more than five acres of land would be disturbed. Accordingly, the five-acre sample construction scenario was used as a template to analyze the significance of the construction emissions generated by the Proposed Project on each subarea. In conducting the analysis, the parameters of the five-acre sample construction scenario were slightly modified such that they would apply to the Project-specific characteristics of the Proposed Project. The parameters that have been modified in the five-acre sample construction scenario for the Proposed Project analysis include the number of pieces of equipment, the construction schedule, the square footage of the proposed structures, and the amount of dirt that would be handled at the project site. The resulting construction emissions generated were then analyzed against the applicable LSTs for a five-acre site that are found in the SCAQMD's mass rate look-up tables.

It should be noted that the SCAQMD considers a sensitive receptor to be a receptor where it is possible that an individual could remain for 24 hours. Thus, according to the SCAQMD, the LSTs for PM_{10} and $PM_{2.5}$, which are based on a 24-hour averaging period, would be appropriate to evaluate the localized air quality impacts of a project on nearby sensitive receptors. Additionally, since a sensitive receptor is considered to be present on site for 24 hours, LSTs based on shorter averaging times, such as the one-hour NO_2 or the 1-hour and 8-hour CO ambient air quality standards, would also apply when evaluating localized air quality impacts on sensitive receptors. However, LSTs based on shorter averaging periods, such as the NO_2 and CO LSTs, are applied to receptors such as industrial or commercial facilities since it is reasonable to assume that workers at these sites could be present for periods of one to eight hours.[6] Therefore, this analysis evaluates localized air quality impacts from construction activities associated with the Proposed Project on sensitive receptors for NO_2, CO, PM_{10}, and $PM_{2.5}$, and on "non-sensitive" receptors (e.g., industrial or commercial facilities) for NO_2 and CO.

CAJA Environmental Services, LLC

Figure IV.B-1
Proposed Construction Subareas

Operational Emissions

Operational emissions comprise mobile source emissions and area source emissions. Mobile source emissions are generated by the increase in motor vehicle trips to and from the project site associated with operation of the Proposed Project. Area source emissions are generated by natural gas consumption for space and water heating, and landscape maintenance equipment. To determine if a regional air quality impact would occur, the Project's approximate emission levels would be compared against the existing conditions and operation of the Project Site.

Thresholds of Significance

L.A. CEQA Thresholds Guide

For air quality, the City has not adopted specific citywide significance thresholds but instead relies on regional significance thresholds identified by the SCAQMD in its CEQA *Air Quality Handbook* (SCAQMD CEQA Handbook), as revised in November 1993 and approved by the SCAQMD's Board of Directors. Thus, construction and operational emissions associated with the proposed project would be significant if emissions exceed the SCAQMD regional or localized significance thresholds.

Regional Mass Daily Emissions

The SCAQMD's regional emission thresholds apply to all federally regulated air pollutants except lead, which is not exceeded in the Basin. Table IV.B-6, SCAQMD's Regional Emission Thresholds of Significance, shows the thresholds of significance published by the SCAQMD for construction and operational emissions that apply to development projects.

Table IV.B-6
SCAQMD's Regional Emission Thresholds of Significance

Pollutant	Construction	Operation
	pounds/day	pounds/day
Carbon Monoxide (CO)	550	550
Sulfur Oxides (SO_x)	150	150
Respirable Particulate Matter (PM_{10})	150	150
Fine Particulate Matter (PM2.5)	55	55
Nitrogen Oxides (NO_x)	100	55
Reactive Organic Gases (ROG)	75	55

Source: SCAQMD CEQA Air Quality Handbook, 1993, website: http://aqmd.gov/ceqa/handbook/signthres.doc, December 14, 2009.

The SCAQMD also recommends that any construction-related and operational emissions from individual development projects that exceed the construction and operational thresholds, shown in Table IV.B-6, to be considered cumulatively considerable. These thresholds apply to individual development projects only; they do not apply to the combined emissions generated by a set of cumulative development projects.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Localized Pollutant Concentrations

The SCAQMD currently recommends that impacts to sensitive receptors be considered significant when a project generates localized pollutant concentrations of NO_2, CO, PM_{10}, or $PM_{2.5}$ at sensitive receptors near a project site that exceed the localized pollutant concentration thresholds listed above or when a project's traffic causes CO concentrations at sensitive receptors located near congested intersections to exceed the national or State ambient air quality standards. The roadway CO thresholds would also apply to the contribution of emissions associated with cumulative development.

As discussed previously, the SCAQMD's LSTs are only applicable to the following criteria pollutants: NO_x (in the form of NO_2), CO, PM_{10}, and $PM_{2.5}$. In addition, based on the size of the project site (i.e., approximately five acres), the five-acre sample construction scenario developed by the SCAQMD is used as a screening tool to analyze the significance of the emissions generated by the Proposed Project. As such, construction and operational emissions associated with the Proposed Project, which is located within SRA 1, would be significant if they exceed the LSTs shown in Table IV.B-7, SCAQMD's Localized Significance Thresholds.

Localized CO emissions would be considered significant if either of the following conditions would occur at an intersection or roadway within one-quarter mile of a sensitive receptor:

- The proposed project causes or contributes to an exceedance of the California 1-hour or 8-hour CO standards of 20 or 9.0 parts per million (ppm), respectively; or
- The incremental increase due to the project is equal to or greater than 1.0 ppm for the California 1-hour CO standard, or 0.45 ppm for the 8-hour CO standard.

Table IV.B-7
SCAQMD's Localized Significance Thresholds

Pollutant Monitored Within SRA 1 — Central LA	Five-Acre Site				
	Allowable emissions (pounds/day) as a function of receptor distance (feet) from site boundary				
	82 (ft)	164 (ft)	328 (ft)	656 (ft)	1,640 (ft)
Construction Thresholds					
Nitrogen Oxides (NO_x) [a]	161	157	165	173	212
Carbon Monoxide (CO)	1,861	2,331	3,030	4,547	10,666
Respirable Particulate Matter (PM_{10})	16	50	69	107	219
Fine Particulate Matter ($PM_{2.5}$)	8	11	18	36	126
Operational Thresholds					
Nitrogen Oxides (NO_x) [a]	161	157	165	173	212
Carbon Monoxide (CO)	1,861	2,331	3,030	4,547	10,666
Respirable Particulate Matter (PM_{10})	4	12	17	26	53
Fine Particulate Matter ($PM_{2.5}$)	2	3	5	9	31

[a] *The localized thresholds listed for NO_x in this table takes into consideration the gradual conversion of NO_x to NO_2. As discussed previously, the analysis of localized air quality impacts associated with NOx emissions is focused on NO_2 levels as they are associated with adverse health effects.*

Source: SCAQMD, Final Localized Significance Threshold Methodology, Appendix C (Localized Significance Threshold Mass Rate Look-up Table), June 2003, Revised July 2008; LST Mass Rate Look-up Tables updated October 21, 2009; accessed on September 8, 2010.

Toxic Air Contaminants

Furthermore, as set forth in the L.A. CEQA Thresholds Guide, the determination of significance of a project with respect to toxic air contaminants shall be made on a case-by-case basis, considering the following factors:

The regulatory framework for the toxic material(s) and process(es) involved;

The proximity of the toxic air contaminants to sensitive receptors;

The quantity, volume and toxicity of the contaminants expected to be emitted;

The likelihood and potential level of exposure; and

The degree to which project design will reduce the risk of exposure.

Consistency with the Applicable AQMP

The SCAQMD has adopted criteria for determining consistency with regional plans and the regional AQMP in its CEQA *Air Quality Handbook*, which the City has adopted as its thresholds. These include: (1) identifying whether a project would increase the frequency or severity of existing air quality violations or cause or contribute to new air quality violations and (2) identifying whether a project would exceed the assumptions utilized in preparing the AQMP. Under the second criterion, a significant impact would occur if a project is inconsistent with the growth assumptions upon which the regional AQMP was based.

Cumulatively Considerable Net Increase of Criteria Pollutants

The SCAQMD's *CEQA Air Quality Handbook* identifies several methods to determine the cumulative significance of land use projects (i.e., whether the contribution of a project is cumulatively considerable). However, the SCAQMD no longer recommends the use of these methodologies. Instead, the SCAQMD recommends that any construction-related emissions and operational emissions from individual development projects that exceed the project-specific mass daily emissions thresholds identified above also be considered cumulatively considerable.[7] The SCAQMD neither recommends quantified analyses of the emissions generated by a set of cumulative development projects nor provides thresholds of significance to be used to assess the impacts associated with these emissions.

Project Impacts

Construction Impacts

The Proposed Project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions throughout the project scoping and approval process, the Los Angeles Memorial Coliseum Commission (LAMCC) is considering two different and mutually exclusive future uses for the Project Site: Option 1, a Multiple Use Space or Option 2: a new professional 22,000 seat outdoor MLS Stadium.

Under Option 1, Multiple Use Space, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air amphitheater. The Multiple Use Space would be an open-air, all-grass amphitheater. The bowl-shaped amphitheater would be built into the depression currently occupied by the Sports Arena, although the hole would be partially filled requiring approximately 250,000 cubic yards of soil import. This would allow

---

[7] *White Paper on Regulatory Options for Addressing Cumulative Impacts from Air Pollution Emissions, SCAQMD Board Meeting, September 5, 2003, Agenda No. 29, Appendix D, p. D-3.*

Option 1 to take advantage of the existing topography of the Project Site. An approximate 800-square foot (40 feet x 20 feet) concrete pad would be located at the lowest elevation in the center of the amphitheater to serve as the stage and provide support for audio and visual equipment.

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a MLS Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with site's history. The VIP parking lot would remain to the west of the proposed stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on an north-south axis. The proposed outdoor soccer stadium would take advantage of the existing topography of the Project Site by constructing the stadium within the existing depression currently occupied by the Sports Arena, although the hole would need to be reconfigured to accommodate the different shape of the stadium.

As stated previously, the approximate 15-acre Project Site has been divided into three approximate 5-acre construction subareas identified as Subarea 1, Subarea 2 and Subarea 3 (see Figure IV.B-1 provided above). Construction activities at each subarea would generate pollutant emissions from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction, including the application of architectural coatings; paving and asphalting; construction workers traveling to and from the project site; delivery and hauling of construction supplies and debris to and from the project site; and, the fuel combustion generated by on-site construction equipment. These construction activities would temporarily create emissions of dusts, fumes, equipment exhaust, and other air contaminants. Construction activities involving site preparation and grading would primarily generate PM_{10} emissions. Mobile source emissions (use of diesel-fueled equipment on site, and traveling to and from the project site) would primarily generate NO_x emissions. The application of architectural coatings would primarily result in the release of ROG emissions. The amount of emissions generated on a daily basis would vary, depending on the amount and types of construction activities occurring at the same time.

For purposes of this analysis the following construction schedule, phasing, and assumptions have been utilized to quantify potential construction related air quality impacts. It should be noted that the proposed schedule would not include any overlap of these construction phases with the exception of the architectural coating phase occurring during the final month of building construction activities on Subarea 1. The modeling has accounted for this month of overlap in this phase only. As stated in detail below, the construction parameters have been crafted to illustrate the worst-case emissions for each phase under either Project Option 1 or 2.

Demolition/Site Clearing Phase

<u>May 2011 through July 2011: Demolition of Subarea 1</u>

Project Option 1 and 2 would require the same demolition characteristics for Subarea 1. This phase would include the demolition and removal of approximately 5.4 million cubic feet of debris over 3

months. The demolition is assumed to involve the use of the following pieces of equipment: 3 concrete/industrial saws, 1 crane, 2 rubber tired dozers, and 3 tractors/loaders/backhoes. It was assumed that these pieces of equipment would run for a maximum of six hours per day. The demolition debris will be hauled to a nearby dump site with 20 cubic yard-capacity trucks traveling for a round trip distance of 30 miles. It is anticipated that the truck hauling would be done over a three-month period with an approximate daily maximum of 33 round trips and 980 vehicle miles traveled for trucks.

August 2011: Demolition/Site Clearing of Subarea 2

Project Option 1 includes removal of VIP Lot while Option 2 would retain and resurface the lot. For purposes of presenting a worst case analysis for this phase, the characteristics of Option 1 resulting in more debris has been calculated in the modeling. This phase would include the demolition and removal of approximately 200,000 square feet of parking lot, walkways, and existing vegetation. The demolition is assumed to involve the use of the following pieces of equipment: 1 concrete/industrial saws, 1 rubber tired dozers, and 2 tractors/loaders/backhoes. It was assumed that these pieces of equipment would run for a maximum of six hours per day. The demolition debris will be hauled to a nearby dump site with 20 cubic yard-capacity trucks traveling for a round trip distance of 30 miles. It is anticipated that the truck hauling would be done over a one-month period with an approximate daily maximum of 30 roundtrips and 889 vehicle miles traveled for trucks.

September 2011: Demolition/Site Clearing of Subarea 3

Project Option 1 and 2 would require the same demolition characteristics for Subarea 3. This phase would include the demolition and removal of approximately 200,000 square feet of parking lot, walkways, and existing vegetation. The demolition is assumed to involve the use of the following pieces of equipment: 1 concrete/industrial saws, 1 rubber tired dozers, and 2 tractors/loaders/backhoes. It was assumed that these pieces of equipment would run for a maximum of six hours per day. The demolition debris will be hauled to a nearby dump site with 20 cubic yard-capacity trucks traveling for a roundtrip distance of 30 miles. It is anticipated that the truck hauling would be done over a one-month period with an approximate daily maximum of 30 round trips and 889 vehicle miles traveled for trucks.

Grading/Site Preparation Phase

October through December 2011: Grading/Site Preparation for Subarea 1

Project Option 1 would require partial filling of the existing hole with approximately 250,000 cubic yards of imported soil over three months, while Project Option 2 would require 125,000 cubic yards of imported soil over three months. For purposes of presenting a worst-case analysis for this phase, the characteristics of Option 1 resulting in more soil import has been calculated in the modeling. The grading/site preparation phase assumes the following pieces of equipment would be used: 1 grader, 1

rubber tired dozer, 2 tractors/loaders/backhoes, and 1 water truck. It was assumed that these pieces of equipment would run for a maximum of six hours per day. The imported soil would be hauled to the Project Site with 20 cubic yard-capacity trucks traveling for a round trip distance of 20 miles. It is anticipated that the soil hauling would be done over a three-month period with an approximate daily maximum of 189 round trips and 3,787 vehicle miles traveled for trucks.

January 2012: Grading/Site Preparation Subarea 2

The grading/site preparation on Subarea 2 assumes the following pieces of equipment would be used: 1 grader, 1 rubber tired dozer, 1 tractor/loader/backhoe, and 1 water truck. It was assumed that these pieces of equipment would run for a maximum of six hours per day.

February 2012: Grading/Site Preparation Subarea 3

The grading/site preparation on Subarea 2 assumes the following pieces of equipment would be used: 1 grader, 1 rubber tired dozer, 1 tractor/loader/backhoe, and 1 water truck. It was assumed that these pieces of equipment would run for a maximum of six hours per day.

Building Construction Phase

March 2012 through September 2012: Building/Construction for Subarea 1

Under Project Option 1, building would require the pouring of approximately 30 cubic yards of concrete for the stage area, the construction/configuration of grass seating area, the construction of restroom and press room facilities, and installation of grass and landscaping. Under Project Option 2, building would require the pouring of concrete for the stadium foundation; construction of the stadium and related facilities (20,000 seats), and installation of grass and landscaping. For purposes of presenting a worst-case analysis for this phase, the characteristics of Option 2 resulting in a longer duration and more building floor area has been calculated in the modeling. The maximum daily amount of equipment that would operate onsite would include: 2 cement and mortar mixers, 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 2 welders. All of the equipment is assumed to operate for a maximum of six hours per day. Additionally, architectural coatings for the new buildings are assumed to be applied during September 2012 at the end of this building phase.

October 2012: Installation of Grass/Landscaping on Subarea 2

The maximum daily amount of equipment that would operate onsite would include: 1 forklift, 1 tractor/loader/backhoe, 1 trencher, and 1 water truck. All of the equipment is assumed to operate for a maximum of six hours per day.

November 2012: Installation of Grass/Landscaping on Subarea 3

The maximum daily amount of equipment that would operate onsite would include: 1 forklift, 1 tractor/loader/backhoe, 1 trencher, and 1 water truck. All of the equipment is assumed to operate for a maximum of six hours per day.

December 2012: Paving

The maximum daily amount of equipment required to complete parking lot resurfacing and paving of walkways and storage areas would include: 2 cement and mortar mixers, 1 paver, 1 piece of paving equipment, 1 roller, and 1 tractor/loader/backhoe. All of the equipment is assumed to operate for a maximum of six hours per day.

Regional Air Quality Impacts

The analysis of regional daily construction emissions has been prepared utilizing the URBEMIS 2007 computer model recommended by the SCAQMD. Table IV.B-8, Estimated Peak Daily Construction Emissions, identifies daily emissions that are estimated to occur on peak construction days for each of the construction phases. These calculations assume that appropriate dust control measures would be implemented during each phase of development as required by SCAQMD Rule 403—Fugitive Dust.

Examples of the types of dust control measures currently required and recommended include, but are not limited to, the following:

- Water active grading/excavation sites and unpaved surfaces at least three times daily;
- Sweep daily (with water sweepers) all paved construction parking areas and staging areas;
- Provide daily clean-up of mud and dirt carried onto paved streets from the site;
- Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site;
- Suspend excavation and grading activity when winds (instantaneous gusts) exceed 15 miles per hour over a 30-minute period or more;
- An information sign shall be posted at the entrance to each construction site that identifies the permitted construction hours and provides a telephone number to call and receive information about the construction project or to report complaints regarding excessive fugitive dust generation. Any reasonable complaints shall be rectified within 24 hours of their receipt.

Table IV.B-8
Estimated Peak Daily Construction Emissions

Emissions Source	Emissions in Pounds per Day					
	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$

[a] *Dust control measures as required by SCAQMD Rule 403—Fugitive Dust.*
[b] *The project would use low VOC paints for exterior and interior surfaces.*
Source: Parker Environmental Consultants, September 2010. Calculation sheets are provided in Appendix B.

In addition, these calculations assume that the project would use low VOC paint for all exterior and interior surfaces during the architectural coating phase. As shown in Table IV.B-8, the peak daily emissions generated during project construction would exceed the regional emissions threshold recommended by the SCAQMD for NO_x during the grading/site preparation phase and ROG during the building and coating phase. As such, the regional air quality impacts associated with the project-related construction emissions would be potentially significant.

Local Air Quality Impacts

The daily construction emissions generated by the Proposed Project are also analyzed against SCAQMD's LSTs to determine whether the emissions would cause or contribute to adverse localized air quality impacts. As previously stated, the nearest sensitive receptors to the project site potentially subject to localized air quality impacts associated with construction of the Proposed Project include:[8]

- Passive recreational and open space areas in Exposition Park north and west of the Sports Arena;
- Los Angeles County and State Museums in Exposition Park;
- Residential uses located on the east side of Figueroa Street; and
- Residential uses located on the south side of Martin Luther King Jr. Boulevard between Figueroa Street and Menlo Avenue.

The closest receptor distance on the SCAQMD's Mass Rate LST Look-up Tables is 82 feet. In the event that a sensitive receptor is located closer than 82 feet, the SCAQMD's LST methodology states that projects with boundaries located closer than 82 feet (25 meters) to the nearest receptor should use the LSTs for receptors located at 82 feet.[9] As discussed previously under Methodology, the five-acre sample construction scenario developed by the SCAQMD was used to analyze the significance of the construction emissions generated by the Proposed Project. In conducting the analysis, the parameters of the five-acre sample construction scenario (e.g., construction schedule, number of equipment, amount of dirt handled, size of the areas disturbed, etc.) have been modified such that they would apply to the project-specific characteristics of the Proposed Project. Table IV.B-9, Localized Estimated Peak Daily Construction Emissions, identifies daily emissions that are estimated to occur during construction of the Proposed Project.

---

[8] *In addition to these specifically listed receptors, off-site receptors also evaluated in this localized air quality impacts analysis include the existing surrounding commercial, office, and retail uses because, as discussed previously, LSTs based on shorter averaging periods, such as the NO_2 and CO LSTs, should be applied to receptors such as industrial or commercial facilities based on the SCAQMD's recommendation.*

[9] *SCAQMD, Final Localized Significance Threshold Methodology, June 2003, Revised July 2008.*

As shown in Table IV.B-9, on-site emissions generated by the Proposed Project during the different phases of construction would not exceed the established SCAQMD localized thresholds for NO_x (in the form of NO_2), CO, PM_{10}, and $PM_{2.5}$ at a receptor distance of 82 feet. Thus, the on-site construction emissions would also not exceed the SCAQMD localized thresholds at receptor distances beyond 82 feet (i.e., 164, 328, 656, and 1,640 feet). Therefore, the localized air quality impacts resulting from construction emissions associated with the Proposed Project would be less than significant. Thus, impacts on sensitive receptors resulting from construction-related emissions would also be considered less than significant.

Table IV.B-9
Localized Estimated Peak Daily Construction Emissions

Construction Phase	Total On-site Emissions (Pounds per Day)			
	NO_x [a]	CO	PM_{10}	$PM_{2.5}$
Demolition & Site Clearing (2011) Emissions	***56.6***	***30.5***	***3.5***	***3.1***
SCAQMD Localized Thresholds [b]	161.00	1,861	16.00	8.00
Significant Impact?	No	No	No	No
Grading & Site Preparation (2011) Emissions	***35.7***	***17.3***	***5.1***	***2.4***

Source: Parker Environmental Consultants, September 2010. Calculation sheets are provided in Appendix B.

Operational Impacts

Operational emissions generated by both stationary and mobile sources would result from normal day-to-day activities on the project site after occupation. As stated previously, stationary area source emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile emissions would be generated by the motor vehicles traveling to and from the project site.

With respect to stationary sources, Project Option 1 would result in the development of a Multiple Use Space open-air, all-grass amphitheater. The maximum capacity of the Multiple Use Space for amphitheater events would be smaller than that of the existing Sports Arena, and thus the proposed

facilities under Option 1 would result in a reduction of stationary source emissions such as water and space heating, air conditioning, and cooking appliances. For joint events held at the Coliseum where the Multiple Use Space functions as either a parking lot or extended activity area, the maximum attendance levels would not exceed the current attendance levels for the Coliseum. For these events, the Multiple Use Space would serve as an accessory area for the primary Coliseum event.

Project Option 2 would result in the development of an open-air MLS stadium with a seating capacity of approximately 22,000. While the maximum capacity would be an increase compared to existing conditions, the proposed stadium would be an outdoor venue which would significantly reduce the amount of stationary source emissions associated with heating and air conditioning. In addition, under both options, the Proposed Project would replace an existing venue over 50 years old with a state-of-the art venue that would include numerous sustainability and design features that would result in significantly increased energy efficiencies at the Project Site. Therefore, as stationary source emissions would be reduced compared to existing conditions, impacts would be considered less than significant.

With respect to mobile sources, the proposed event/soccer stadium facility replacing the existing Sports Arena is not expected to generate significant new traffic impacts. As explained in more detail in Section IV.J, Transportation, Traffic and Parking, the new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility. Combined with the Coliseum, the Project Site supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new event/soccer stadium facility are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Accordingly, mobile source emissions would also not be increased as a result of the Proposed Project and operational impacts related to regional and localized emissions would be considered less than significant.

AQMP Consistency

The 2007 AQMP, discussed previously, was prepared to accommodate growth, to reduce the high levels of pollutants within the areas under the jurisdiction of SCAQMD, and to return clean air to the region. Projects that are considered to be consistent with the AQMP would not interfere with attainment, because this growth is included in the projections used to formulate the AQMP. Therefore, projects, land uses, and activities that are consistent with the applicable assumptions used in the development of the AQMP would not jeopardize attainment of the air quality levels identified in the AQMP, even if they exceed the SCAQMD's recommended daily emissions thresholds.

As discussed previously, the SCAQMD has adopted the following criteria for determining consistency with regional plans and the regional AQMP: (1) identifying whether a project would increase the frequency or severity of existing air quality violations or cause or contribute to new air quality violations

and (2) identifying whether a project would exceed the assumptions utilized in preparing the AQMP. Under the second criterion, a significant impact would occur if a project is inconsistent with the growth assumptions upon which the regional AQMP was based.

The Proposed Project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. As discussed above, the Proposed Project would include the implementation of either "Celebration Park" or an outdoor MLS stadium with a seating capacity of 22,000. Neither Project Option would be considered growth-inducing as both scenarios have been considered and planned in an effort to be responsive to changing community needs and market. As discussed above, both project options would result in similar, and in some areas, reduced long-term operational air quality impacts compared to the existing Project Site. Furthermore, as discussed in the Initial Study (see Appendix A), the Proposed Project would have a less than significant impact with respect to population, housing, and employment and the project would be within the SCAG and City of Los Angeles growth projections.

As the Proposed Project would be consistent with the underlying assumptions of the SCAQMD's 2007 AQMP and does not cause or worsen an exceedance of an ambient air quality standard, the Proposed Project is concluded to be consistent with that plan. This impact would be less than significant.

Toxic Air Contaminants

The Proposed Project would consist of the development of either "Celebration Park" or an outdoor MLS stadium and would not include any land uses involving the use, storage, or processing of carcinogenic or non-carcinogenic toxic air contaminants. As such, no toxic airborne emissions would result from its implementation. In addition, construction activities associated with the Proposed Project would be similar to other developments in the City, and would be subject to the regulations and laws relating to toxic air pollutants at the regional, State, and federal level that would protect sensitive receptors from substantial concentrations of these emissions. Therefore, impacts associated with the release of TACs by the Proposed Project would be less than significant.

MITIGATION MEASURES

As stated previously, the modeling conducted to assess construction impacts from the Proposed Project assumed that the Proposed Project would utilize low VOC paints and would comply with the required SCAQMD Rule 403 – Fugitive Dust. These measures have been listed below to ensure implementation.

MM B-1 The Project Applicant shall comply with SCAQMD Rule 403—Fugitive Dust. Examples of the types of dust control measures currently required and recommended include, but are not limited to, the following:

- Water active grading/excavation sites and unpaved surfaces at least three times daily;
- Sweep daily (with water sweepers) all paved construction parking areas and staging areas;
- Provide daily clean-up of mud and dirt carried onto paved streets from the site;
- Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site;
- Suspend excavation and grading activity when winds (instantaneous gusts) exceed 15 miles per hour over a 30-minute period or more; and
- An information sign shall be posted at the entrance to each construction site that identifies the permitted construction hours and provides a telephone number to call and receive information about the construction project or to report complaints regarding excessive fugitive dust generation. Any reasonable complaints shall be rectified within 24 hours of their receipt.

MM B-2 The Project Applicant shall use low VOC paints for all interior and exterior surfaces.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

With the implementation of Mitigation Measures C-1 and C-2, the Proposed project would still exceed the regional emissions threshold recommended by the SCAQMD for NO_x during the grading/site preparation phase and ROG during the building and coating phase. Therefore, regional construction-related air quality impacts would be considered significant and unavoidable. Operational impacts would be less than significant and no operational mitigation measures would be required.

IV. ENVIRONMENTAL IMPACT ANALYSIS
C. GREENHOUSE GAS EMISSIONS

ENVIRONMENTAL SETTING

The earth's natural warming process is known as the "greenhouse effect." This greenhouse effect compares the Earth and the atmosphere surrounding it to a greenhouse with glass panes. The glass allows solar radiation (sunlight) into the Earth's atmosphere, but prevents radiative heat from escaping, thus warming the Earth's atmosphere. Greenhouse gases (GHGs) keep the average surface temperature of the Earth close to a hospitable 60 degrees Fahrenheit. However, excessive concentrations of GHGs in the atmosphere can result in increased global mean temperatures, with associated adverse climatic and ecological consequences.

Scientists studying the particularly rapid rise in global temperatures have determined that human activity has resulted in increased emissions of GHGs, primarily from the burning of fossil fuels (during motorized transport, electricity generation, consumption of natural gas, industrial activity, manufacturing, etc.) and deforestation, as well as agricultural activity and the decomposition of solid waste.

Scientists refer to the global warming context of the past century as the "enhanced greenhouse effect" to distinguish it from the natural greenhouse effect.[12] While the increase in temperature is known as "global warming," the resulting change in weather patterns is known as "global climate change." Global climate change is evidenced in changes to wind patterns, storms, precipitation, and air temperature.

GHG Components

GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride.[13] Carbon dioxide is the most abundant GHG. Other GHGs are less abundant, but have higher global warming potential than CO_2. Thus, emissions of other GHGs are frequently expressed in the equivalent mass of CO_2, denoted as CO_2e. Forest fires, decomposition, industrial processes, landfills, and consumption of fossil fuels for power generation, transportation, heating, and cooking are the primary sources of GHG emissions. A general description of the GHGs discussed is provided in Table IV.C-1, Description of Identified Greenhouse Gases.

---

[12] *Climate Change 101: Understanding and Responding to Global Climate Change, published by the Pew Center on Global Climate Change and the Pew Center on the States.*

[13] *As defined by California AB 32AB 32 and SB104.*

Table IV.C-1
Description of Identified Greenhouse Gases

Greenhouse Gas	General Description
Carbon Dioxide (CO_2)	An odorless, colorless GHG, which has both natural and anthropocentric sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic (human caused) sources of carbon dioxide are burning coal, oil, natural gas, and wood.
Methane	A flammable gas and is the main component of natural gas. When one molecule of methane is burned in the presence of oxygen, one molecule of carbon dioxide and two molecules of water are released. There are no ill health effects from methane. A natural source of methane is the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain methane, which is extracted for fuel. Other sources are from landfills, fermentation of manure, and cattle.
Nitrous Oxide (N_2O)	A colorless GHG. High concentrations can cause dizziness, euphoria, and sometimes slight hallucinations. Nitrous oxide is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used in rocket engines, race cars, and as an aerosol spray propellant.
Hydrofluorocarbons (HFCs)	HFCs are synthetic man-made chemicals that are used as a substitute for chlorofluorocarbons (CFCs) for automobile air conditioners and refrigerants. CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were first synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. Because they destroy stratospheric ozone, the production of CFCs was stopped as required by the Montreal Protocol in 1987.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and do not break down though the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above the earth's surface are able to destroy the compounds. PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane and hexafluoroethane. The two main sources of PFCs are primary aluminum production and semiconductor manufacture.
Sulfur Hexafluoride (SF_6)	An inorganic, odorless, colorless, non-toxic, and nonflammable gas. SF_6 is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

Source: Association of Environment Professionals, Alternative Approaches to Analyze Greenhouse Gas Emissions and Global Climate Change in CEQA Documents, Final, June 29, 2007.

Global Warming Potential

Global Warming Potentials (GWPs) are one type of simplified index based upon radiative properties that can be used to estimate the potential future impacts of emissions of different gases upon the climate system in a relative sense. GWP is based on a number of factors, including the radiative efficiency (heat-absorbing ability) of each gas relative to that of carbon dioxide, as well as the decay rate of each gas (the amount removed from the atmosphere over a given number of years) relative to that of carbon dioxide. A summary of the atmospheric lifetime and GWP of selected gases is presented at Table IV.C-2. As indicated, GWP ranges from 1 to 23,900.

Table IV.C-2
Atmospheric Lifetimes and Global Warming Potentials

Gas	Atmospheric Lifetime (years)	Global Warming Potential (100 year time horizon)
Carbon Dioxide	50 – 200	1
Methane	12 (+/-3)	21
Nitrous Oxide	120	310
HFC-23	264	11,700
HFC-134a	14.6	1,300
HFC-152a	1.5	140
PFC: Tetrafluoromethane (CF_4)	50,000	6,500
PFC: Hexafluoroethane (C_2F_6)	10,000	9,200
Sulfur Hexafluoride (SF_6)	3,200	23,900

Source: IPCC, 2006.

Projected Impacts of Global Warming in California

According to the 2006 California Climate Action Team (CAT) Report, temperature increases arising from increased GHG emissions potentially could result in a variety of impacts to the people, economy, and environment of California associated with a projected increase in extreme conditions, with the severity of the impacts depending upon actual future emissions of GHGs and associated warming. If emissions from GHGs are not reduced significantly, the warming increase could have the following consequences in California[14]:

[14] *California Environmental Protection Agency, Climate Action Team Report to Governor Schwarzenegger and the Legislature, March 2006, p. 11.*

- The Sierra snowpack would decline between 70 and 90 percent, threatening California's water supply;
- Attainment of air quality standards would be impeded by increasing emissions, accelerating chemical processes, and raising inversion temperatures during stagnation episodes;
- Erosion of California's coastlines would increase as well as sea water intrusion;
- Pest infestation and vulnerability to fires of the State's forests would increase; and
- Rising temperatures would increase power demand, especially in the summer season.

California-Specific Adaptation Strategies

Because climate change is already affecting California and current emissions will continue to drive climate change in the coming decades, regardless of any mitigation measures that may be adopted, the necessity of adaptation to the impacts of climate change is recognized by the State of California. The 2009 California Climate Adaptation Strategy Discussion Draft begins what will be an ongoing process of adaptation, as directed by Gov. Schwarzenegger's Executive Order S-13-08. The goals of the strategy are to analyze risks and vulnerabilities and identify strategies to reduce the risks. Once the strategies are identified and prioritized, government resources would be identified. Finally, the strategy includes identifying research needs and educating the public.

Climate change risks are evaluated using two distinct approaches: (1) projecting the amount of climate change that may occur using computer-based global climate models and (2) assessing the natural or human system's ability to cope with and adapt to change by examining past experience with climate variability and extrapolating this to understand how the systems may respond to the additional impact of climate change. The major anticipated climate changes expected in the State of California include increases in temperature, decreases in precipitation, particularly as snowfall, and increases in sea level, as discussed above. These gradual changes will also lead to an increasing number of extreme events, such as heat waves, wildfires, droughts, and floods. This would impact public health, ocean and coast resources, water supply, agriculture, biodiversity, and the transportation and energy infrastructures.

Key preliminary adaptation recommendations included in the *Strategy* are as follows:

- Appointment of a Climate Adaptation Advisory Panel;
- Improved water management in anticipation of reduced water supplies, including a 20 percent reduction in per capita water use by 2020;

- Consideration of project alternatives that avoid significant new development in areas that cannot be adequately protected from flooding due to climate change;
- Preparation of agency-specific adaptation plans, guidance or criteria by September 2010;
- Consideration of climate change impacts for all significant state projects;
- Assessment of climate change impacts on emergency preparedness;
- Identification of key habitats and development of plans to minimize adverse effects from climate change;
- Development of guidance by the California Department of Public Health by September 2010 for use by local health departments to assess adaptation strategies;
- Amendment of Plans to assess climate change impacts and develop local risk reduction strategies by communities with General Plans and Local Coastal Plans; and
- Inclusion of climate change impact information into fire program planning by state fire fighting agencies.

Existing GHG Emissions in Project Vicinity

GHG emissions are generated in the local vicinity of the project site by stationary and area-wide sources, such as space and water heating, landscape maintenance from leaf blowers and lawn mowers, consumer products, and mobile sources, primarily automobile traffic. Overall, motor vehicles are the primary source of GHGs in the project site vicinity. A key characteristic of the Sports Arena is that it generates vehicle trips and high levels of traffic congestion for short periods on event days only. The attendance level and associated vehicle trips generated by specific events vary significantly. In the past five years, the Sports Arena held, on average, 69 events a year. Of the 69 events, 60 had an attendance of less than 10,000 people, six events had an attendance between 10,000 to 20,000 people, and three events had an attendance of more than 20,000 people.

Existing State-wide Greenhouse Gas Emissions

The California Energy Commission (CEC) published the *Inventory of California Greenhouse Gas Emissions and Sinks: 1990 to 2004* in December 2006. This report indicates that California emitted between 425 to 468 million metric tons of greenhouse gases in 1990. This seemingly large amount is a result of the large population residing in California. When considering fossil fuel emissions at the level of each individual person, California is second lowest in the nation in per capita CO_2 emissions, with only

the District of Columbia being lower. Between 1990 and 2000, California's population grew by 4.1 million people and during the 1990 to 2003 period, California's gross state product grew by 83 percent (in dollars, not adjusted for inflation). However, California's greenhouse gas emissions were calculated to have grown by only 12 percent over the same period. The report concluded that California's ability to slow the rate of growth of greenhouse gas emissions was largely due to the success of its energy efficiency, renewable energy programs, and commitment to clean air and clean energy. In fact, the State's programs and commitments were calculated to have lowered its greenhouse gas emissions rate of growth by more than half of what it would have been otherwise.

REGULATORY FRAMEWORK

In response to growing scientific and political concern with global climate change, Federal and State entities have adopted a series of laws to reduce emissions of GHGs to the atmosphere.

U.S. EPA

In the past, the U.S. EPA has not regulated GHGs under the Clean Air Act because it asserted that the Act did not authorize it to issue mandatory regulations to address global climate change. However, the U.S. Supreme Court recently held that the U.S. EPA must consider regulation of motor-vehicle GHG emissions.[15] The Court ruled that GHGs fit within the Clean Air Act's definition of a pollutant and that the U.S. EPA did not have a valid rationale for not regulating GHGs. In December 2009, the U.S. EPA issued an endangerment finding for GHGs under the Clean Air Act. This is the first step in regulating GHGs under the provisions of the Clean Air Act. In addition, on September 15, 2009, the National Highway Traffic Safety Administration and U.S. EPA announced a proposed joint rule that would explicitly tie fuel economy to GHG emissions reductions requirements. The proposed new Corporate Average Fuel Economy ("CAFE") Standards would cover automobiles for model years 2012 through 2016, and would require passenger cars and light trucks to meet a combined, per –mile, carbon dioxide emissions level. It is estimated that by 2016, this GHG emissions limit could equate to an overall light-duty vehicle fleet average fuel economy of as much as 35.5 miles per gallon.

State

California Global Warming Solutions Act

In response to growing scientific and political concern with global climate change, California has adopted a series of laws to reduce emissions of GHGs to the atmosphere from commercial and private activities

---

[15] *Massachusetts v. Environmental Protection Agency et al. (127 S. Ct. 1438 (2007))*

within the State. In September 2002, then-Governor Gray Davis signed Assembly Bill (AB) 1493, requiring the development and adoption of regulations to achieve "the maximum feasible reduction of greenhouse gases" emitted by noncommercial passenger vehicles, light-duty trucks, and other vehicles used primarily for personal transportation in the State. California Governor Arnold Schwarzenegger announced, on June 1, 2005, through Executive Order S-3-05, the following GHG emission reduction targets: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; by 2050, reduce GHG emissions to 80 percent below 1990 levels. In response to the Executive Order, the Secretary of Cal/EPA created the Climate Action Team (CAT), which, in March 2006, published the Climate Action Team Report to Governor Schwarzenegger and the Legislature (the "2006 CAT Report"). The 2006 CAT Report identified a recommended list of strategies that the State could pursue to reduce climate change GHG emissions. These are strategies that could be implemented by various State agencies to ensure that the Governor's targets are met and can be met with existing authority of the State agencies.

In September 2006, Governor Arnold Schwarzenegger signed the California Global Warming Solutions Act of 2006, also known as AB 32, into law. AB 32 focuses on reducing GHG emissions in California, and requires CARB, the State agency charged with regulating statewide air quality, to adopt rules and regulations that would achieve greenhouse gas emissions equivalent to statewide levels in 1990 by 2020. To achieve this goal, AB 32 mandates that CARB establish a quantified emissions cap, institute a schedule to meet the cap, implement regulations to reduce statewide GHG emissions from stationary sources, and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved. As the intent of AB 32 is to limit 2020 emissions to the equivalent of those from 1990, and the present year (2009) is beyond the midpoint of this timeframe, it is expected that the regulations would affect many existing sources of greenhouse and not just new general development projects.

As a central requirement of AB 32, the CARB was assigned the task of developing a Scoping Plan that outlines the State's strategy to achieve the 2020 greenhouse gas emissions limit. This Scoping Plan, which was developed by CARB in coordination with the CAT, was published in October 2008. The Scoping Plan proposed a comprehensive set of actions designed to reduce overall greenhouse gas emissions in California, improve the environment, reduce the State's dependence on oil, diversify the State's energy sources, save energy, create new jobs, and enhance public health. An important component of the plan is a cap-and-trade program covering 85 percent of the State's emissions. Additional key recommendations of the Scoping Plan include strategies to enhance and expand proven cost-saving energy efficiency programs; implementation of California's clean cars standards; increases in the amount of clean and renewable energy used to power the State; and implementation of a low-carbon fuel standard that will make the fuels used in the State cleaner. Furthermore, the Scoping Plan also proposes full deployment of the California Solar Initiative, high-speed rail, water-related energy efficiency measures, and a range of regulations to reduce emissions from trucks and from ships docked in California ports. The Proposed Scoping Plan was approved by CARB on December 11, 2008. The measures in the Scoping Plan would be developed over the next two years and be in place by 2012. As

required by AB 32, CARB must update its Scoping Plan every five years to ensure that California remains on the path toward a low carbon future.

In August 2007, the Legislature adopted Senate Bill 97 (SB 97), requiring the Office of Planning and Research (OPR) to prepare and transmit new CEQA guidelines for the mitigation of GHG emissions or the effects of GHG emissions to the Resources Agency by July 1, 2009. Following receipt of these guidelines, the Resources Agency must certify and adopt the guidelines prepared by OPR by January 1, 2010.

OPR submitted its proposed guidelines to the Secretary for Natural Resources on April 13, 2009. The Natural Resources Agency undertook the formal rulemaking process to certify and adopt the amendments as part of the state regulations implementing CEQA. The CEQA Guidelines Amendments were adopted on December 30, 2009 and became effective on March 18, 2010.

In the CEQA Guideline Amendments, a threshold of significance for greenhouse gas emissions was not specified, nor does it prescribe assessment methodologies or specific mitigation measures. Instead, the amendments encourage lead agencies to consider many factors in performing a CEQA analysis, but rely on the lead agencies in making their own significance threshold determinations based upon substantial evidence. The CEQA amendments also encourage public agencies to make use of programmatic mitigation plans and programs from which to tier when they perform individual project analyses.

Local

City of Los Angeles

The City of Los Angeles has begun to address the issue of global climate change by publishing *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming* (LA Green Plan). This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities. According to the LA Green Plan, the City of Los Angeles is committed to the goal of reducing emissions of CO_2 to 35 percent below 1990 levels. To achieve this, the City will:

- Increase the generation of renewable energy;
- Improve energy conservation and efficiency; and
- Change transportation and land use patterns to reduce dependence on automobiles.

City of Los Angeles Green Building Ordinance

On April 22, 2008 the Los Angeles City Council approved Ordinance No. 179,820 (the Green Building Ordinance). The goal of the Green Building Ordinance is to reduce the use of natural resources, create healthier living environments and minimize the negative impacts of development on local, regional and global ecosystems. To achieve these goals, it must be demonstrated that certain projects in the City meet the intent of the criteria for certification at the Leadership in Energy and Environmental Design (LEED) certified level. The ordinance applies to the following categories of projects in the City:

- A new non-residential building or structure of 50,000 gross square feet of more of floor area; or
- A new mixed use or residential building of 50,000 gross square feet or more of floor area in excess of six stories; or
- A new mixed use or residential building of six or fewer stories consisting of at least 50 dwelling units in a building, which has at least 50,000 gross square feet of floor area, and in which at least 80 percent of the building's floor area is dedicated to residential uses; or
- The alteration or rehabilitation of 50,000 gross square feet or more of floor area in an existing non-residential building for which construction costs exceed a valuation of 50 percent of the replacement cost of the existing building; or
- The alteration of at least 50 dwelling units in an existing mixed use or residential building, which has at least 50,000 gross square feet of floor area, for which construction costs exceed a valuation of 50 percent of the replacement cost of the existing building.

Unless these projects have been reviewed and the plans are stamped approved by the Director for LEED compliance, no building permits will be issued to these projects subject to the Ordinance. The Ordinance contains exceptions for the following projects:

- A historic resource, if the Department of City Planning finds that full LEED compliance would require alterations that conflict with the Secretary of the Interior's Standards for the Treatment of Historic Properties. In those cases, a LEED-AP, a person who has been designated a LEED Accredited Professional by the Green Building Certification Institute (GBCI), shall assert in writing that the project has incorporated all other reasonable measures to achieve LEED compliance, while avoiding adverse impacts to the Historic Resource's character-defining features.

- Any project where plans were accepted by the Department of Building and Safety for plan check and the appropriate fee is paid prior to November 1, 2008, provided no changes were made to the project that would increase the floor area by more than five percent. This exception shall no longer be valid if construction is not commenced within one year of the date of issuance of the permit.

- Any entitlement application for a project filed and deemed complete with the exception of CEQA review prior to November 1, 2008, provided no changes are made to the application that would increase the floor area by more than five percent.

- Any residential or mixed use project of six or fewer stories where plans were accepted by the Department of Building and Safety for plan check and the appropriate fee is paid prior to May 1, 2009, provided no changes were made to the project which increase the floor area by more than five percent. This exception shall no longer be valid if construction is not commenced within one year of the date of issuance of the permit.

- Any entitlement application for a residential or mixed use project of six or fewer stories filed and deemed complete with the exception of CEQA review prior to May 1, 2009, provided no changes are made to the application that would increase the floor area by more than five percent.

ENVIRONMENTAL IMPACTS

Thresholds of Significance

OPR's recommended Amendments to the CEQA Guidelines for GHGs were adopted by the Natural Resources Agency on December 30, 2009. The Amendments comprise relatively modest changes to various portions of the existing CEQA Guidelines. The Amendments add no additional substantive requirements; rather, the Guidelines merely assist lead agencies in complying with CEQA's existing requirements. Modifications address those issues where analysis of GHG emissions may differ in some respects from more traditional CEQA analysis. Other modifications clarify existing law that may apply both to an analysis of GHG emissions as well as more traditional CEQA analyses.

According to the revised Appendix G of the *CEQA Guidelines*, which recently added two questions relating to the effects of GHG, a project could have a significant environmental impact if it would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or

- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Project Impacts

Construction

Construction emissions were calculated using the URBEMIS2007 model which is based on OFFROAD2007 model outputs. OFFROAD2007 is an emissions estimation model developed by CARB to calculate emissions from construction activities. The output values used in this analysis were adjusted to be project-specific, based on usage rates, type of fuel, and construction schedule. These values were then applied to the construction phasing assumptions used in the criteria pollutant analysis to generate GHG emissions values for each construction year (refer to Appendix D). Mobile source emission methodology for on-road construction emissions, associated with worker commute and delivery of materials, uses a vehicle miles traveled rate calculated by URBEMIS2007 in order to generate values for annual emissions. Emission factors are derived from the EMFAC2007 model using light duty automobile factors for worker commute and heavy duty truck factors for deliveries. URBEMIS2007 only reports CO_2 emissions. Therefore, the CO_2 emissions were converted into metric tons of CO_2e by applying the proper global warming potential (GWP) value.[16]

Construction emissions represent an episodic, temporary source of GHG emissions. Emissions are generally associated with the operation of construction equipment and the disposal of construction waste.

To be consistent with the guidance from the SCAQMD for calculating criteria pollutants from construction activities, only GHG emissions from on-site demolition and construction activities and off-site hauling and construction worker commuting are considered as project-generated. As explained by the CAPCOA in its 2008 white paper, the information needed to characterize GHG emissions from manufacture, transport, and end-of-life of construction materials would be speculative at the CEQA analysis level. CEQA does not require an evaluation of speculative impacts (CEQA Guidelines § 15145). Therefore, the construction analysis does not assess such GHG emissions. All GHG emissions are reported on an annual basis as recommended by the CCAR Protocol.

Emissions of GHGs were calculated for each year of construction of the proposed project and the results of this analysis are presented Appendix C to this Draft EIR. In summary, the increase in GHG emissions from project construction activities would be 878 metric tons of CO_2e in 2011 and 451 metric tons of CO_2e

---

[16] *CO_2e was developed by the Intergovernmental Panel on Climate Change (IPCC), and published in its Second Assessment Report (SAR) 1996.*

in 2012, which would represent approximately 0.000002 percent and 0.000001 percent of the 2008 State-wide level, respectively.[17]

Operation

Operational GHG emissions generated by both stationary and mobile sources would result from future activities on the Project Site. Stationary area source GHG emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile GHG emissions would be generated by the motor vehicles traveling to and from the project site.

With respect to stationary GHG sources, Project Option 1 would result in the development of an open-air, all-grass amphitheater. The maximum capacity of would be smaller than that of the existing Sports Arena , and thus the proposed facilities under Option 1 would result in a substantial reduction of stationary source GHG emissions such as water and space heating, air conditioning, and cooking appliances. For joint events held at the Coliseum where the Multiple Use Space functions as either a parking lot or extended activity area, the maximum attendance levels would not exceed the current attendance levels for the Coliseum. For these events, the Multiple Use Space would serve as an accessory area for the primary Coliseum event.

Project Option 2 would result in the development of an open-air MLS Stadium with a seating capacity of approximately 22,000. While the maximum capacity would be an increase compared to existing conditions, the proposed stadium would be an outdoor venue which would significantly reduce the amount of stationary source GHG emissions associated with heating and air conditioning. In addition, under both options, the Proposed Project would replace an existing venue over 50 years old with a state-of-the art venue that would include numerous sustainability and design features that would result in significantly increased energy efficiencies at the Project Site. Therefore, stationary source GHG emissions would be reduced compared to existing conditions.

With respect to mobile sources, the proposed event/soccer stadium facility replacing the existing Sports Arena is not expected to generate significant new traffic impacts. As explained in more detail in Section IV.J, Transportation, Traffic and Parking, the new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility. Combined with the Coliseum, the Project Site supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new event/soccer

---

[17] *Statewide totals were derived from CARB's current California greenhouse gas inventory (http://www.arb.ca.gov/cc/inventory/data/data.htm), May 28, 2010 (473,760,000 metric tons).*

stadium facility are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Accordingly, mobile source GHG emissions would also not be increased as a result of the Proposed Project.

As the Proposed Project's GHG emissions would represent an improvement compared to existing conditions, the Proposed Project would contribute positively in meeting the goals and targets set forth in AB 32. Furthermore, the Proposed Project's sustainability features exhibit the general strategies and goals outlined in the 2006 CAT Report Strategies and ARB's Scoping Plan Recommended Measures. Accordingly, it is anticipated that the Proposed Project would be consistent with all feasible and applicable strategies to reduce greenhouse gas emissions in California. As such, it is not anticipated that the Proposed Project would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases and these impacts would be considered less than significant.

MITIGATION MEASURES

As the level of impact before mitigation would be less than significant, no mitigation measures are required. However, the Proposed Project would include several sustainability features identified in Section IV.I, Public Utilities that would serve to further reduce the project's generation of greenhouse gas emissions. See the water and energy conservation measures identified in Section IV.I, Public Utilities, in this EIR.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Impacts related to the generation of GHGs would be considered less than significant.

IV. ENVIRONMENTAL IMPACT ANALYSIS
D. HISTORIC RESOURCES

The following analysis pertaining to historic resources is based on the Historical Assessment for the Los Angeles Memorial Sports Arena, Prepared for the Los Angeles Memorial Coliseum Commission, prepared by ICF Jones & Stokes, July 2010. This report is included in its entirety as Appendix D of this Draft EIR.

ENVIRONMENTAL SETTING

Regulatory Setting

National Register of Historic Places

The National Register of Historic Places (National Register) is "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment." The National Register is administered by the National Park Service, which is part of the U.S. Department of the Interior. Typically, to be eligible for listing in the National Register, a property must be at least fifty years of age and possess significance in American history and culture, architecture, or archaeology. However, properties under fifty years of age can be determined eligible for listing if it can be determined that they are of "exceptional importance," or if they are contributors to a potential historic district. Properties may qualify for the National Register when they meet any of four basic criteria:

A. Are associated with events that have made a significant contribution to the broad patterns of history.

B. Are associated with the lives of persons significant in our past.

C. Embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction.

D. Have yielded, or may be likely to yield, information important in prehistory or history.

A final critical component of eligibility is integrity. Integrity is the ability of a property to convey its significance and whether the property retains the identity, including physical and visual attributes, for which it is significant under the four basic criteria. The National Register criteria recognize seven aspects or qualities of integrity: location, design, setting, materials, workmanship, feeling, and association.

California Register of Historical Places

The California Register of Historical Resources (California Register) is a state version of the National Register of Historic Places program. The California Register of Historical Resources was enacted in 1992, and became official January 1, 1998. The criteria for eligibility of listing in the California Register are based upon National Register criteria, but are identified as 1-4 instead of A-D. The California Register also requires application of integrity of criteria paralleling National Register criteria, as described above, with one exception. Title 14 of California Code of Regulations §4852 (c) provides, "It is possible that historical resources may not retain sufficient integrity to qualify to meet the criteria for listing in the National Register, but they may still be eligible for listing in the California Register." OHP has consistently interpreted this provision to require substantial integrity.

California State Historical Building Code

The California State Historical Building Code (SHBC)[1]1 protects California's architectural heritage by providing alternative building regulations for the rehabilitation, preservation, restoration or relocation of structures designated as historic buildings. SHBC regulations are intended to facilitate restoration or accommodate change of occupancy so as to preserve a historic structure's original or restored architectural elements and features. While the code provides for a cost-effective approach to preservation, it also provides for occupant safety, encourages energy conservation and facilitates access for people with disabilities. To be qualified, designation must come from federal, state or local authority and be given any level of significance other than "not eligible". Listed below are some of the issues the SHBC addresses, with the intent of encouraging sensitive and cost-effective rehabilitation:

- Accessibility - Both the Americans with Disabilities Act and the SHBC make provisions for reasonable levels of equivalency for, and - under special circumstances – exemption from, accessibility mandates.

- Seismic/Structural - SHBC governs these issues, permitting design based on real values of archaic materials, and solutions based on engineering principles and judgment rather than on prescriptive formulas.

- Energy - Qualified historic buildings are exempt from California energy standards, which most vintage structures cannot meet without alteration or loss of historic features.

- Triggers - The "triggers" for full upgrading to current standards, with respect to length of vacancy, change of occupancy, or percentage of value of the work proposed, and which exist in

---

[1] *Based in part on information contained on the State Architect's website, including material available at: http://www.dsa.dgs.ca.gov/SHBSB/shbsb_general.asp and, http://www.dsa.dgs.ca.gov/SHBSB/shbsb_incentives. asp.*

other codes, are not recognized by the SHBC, which concentrates instead on the sensitive resolution of genuine safety considerations.

Local Criteria

Because the Sports Arena itself is located on state land, it is not eligible for review at the local level, through the City of Los Angeles Cultural Heritage Commission. The County of Los Angeles does not have an independent designation program but relies on the National Register and State Landmark programs for designation.

Exposition Park, which includes the Sports Arena and numerous surrounding structures, has been designated as a Cultural and Historical Site by the County of Los Angeles. The Commission cannot designate buildings owned by the State independently. However, they may be recognized as "significant" to the County.

An historical or cultural monument is any site (including significant trees or other plant life located thereon), building or structure of particular historic or cultural significance to the City of Los Angeles, such as historic structures or sites in which the broad cultural, economic or social history of the nation, State or community is reflected or exemplified, or which are identified with historic personages or with important events in the main currents of national, State or local history or which embody the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period style or method of construction, or a notable work of a master builder, designer, or architect whose individual genius influenced his or her age.

Effects of Local Designation

Section 5024.f requires that alterations to a State Historical Landmark owned by the State, be reviewed by the State Historic Preservation Officer (SHPO). Section 5024.5 (a) and (b) require the state agency having jurisdiction over the Landmark give a summary of any proposed changes to the SHPO for review and comment. Because the state only owns the land that the Sports Arena sits on and not the Sports Arena, section 5024.5 should not apply.

Properties designated at the local level are subject to review by the Cultural Heritage Commission. This review includes evaluation of alterations to designated structures to ensure the alterations are appropriate to the historic character of the building. This type of review occurs only for individually designated properties based on the following factors:

- Eligibility to enter into the City of Los Angeles Property Contract Program (the Mills Act - See Appendix Seven);
- Local Building Official must grant code alternatives under the State Historical Building Code;

- Limited Protection: Environmental review may be required under CEQA if the property faces potential impacts as defined in the CEQA Guidelines.
- Locally designated resources or qualifying surveys can be listed in the California Register of Historical Resources.
- Designated resources proposed for demolition will be reviewed by the Commission. The Commission can object for 180 days with the option for extending another 180 days with Commission and Council approval, to allow alternative preservation solutions to be developed.

Context & Existing Conditions

The Sports Arena opened on July 4, 1959. It was the first modern indoor sports arena built in Los Angeles. Prior to the opening of the Sports Arena, the primary indoor sports arenas in Los Angeles were the Grand Olympic Auditorium, built in 1925, and the Pan Pacific Auditorium, built in 1935. The accepted definition of the word "arena" is an enclosed area, used for public entertainment, such as sporting events or spectacles. An increasing number of arenas were constructed throughout the United States from the late 1950s to the early 1960s. In a 1956 article in the Los Angeles Times, the Coliseum Commission chairman G.E. Kinsey noted that the "nation is currently experiencing a boom in auditorium construction, with 48 new arenas either under construction or in advanced planning stages.[2]"

Seating capacity of these venues ranged from 5,000 to 15,000. In California, there was the Cow Palace in San Francisco (1941), and the Sports Arena was soon followed by the Long Beach Sports Arena (1962) and Pauley Pavilion (1965). Although there wasn't much variety in the overall design of these structures, some were unusual and unique. This included the Mellon (Civic) Arena in Pittsburgh, Pennsylvania, which was recently listed on the local landmark list and was constructed with a stainless steel, retractable roof, supported by a large steel cantilever (1960), and the Dorton Arena at the North Carolina State Fairgrounds in Raleigh, constructed in 1952 and listed on the National Register of Historic Places. The Dorton Arena is a parabolic structure, and was declared one of the 10 twentieth-century buildings expected to influence the future of American architecture by the American Institute of Architects in 1957. But the archetype was Madison Square Garden in New York City.

Madison Square Garden ("The Garden") was identified numerous times as the model for a multipurpose facility in Los Angeles. It is the third Garden that is most often identified as setting the standard for these types of venues from the 1930s through the 1950s. The Garden has experienced four incarnations: Madison Square Garden (1871); Madison Square Garden II (1890-1925, designed by Stanford White);

---

[2] *"Officials Plan Tour of Arenas in Other Cities," Los Angeles Times, March 19, 1956, page A1, ProQuest Historical Newspapers Los Angeles Times (1881-1985).*

Madison Square Garden III (1925-1968); and "World Wide Plaza," (designed by Skidmore, Owings and Merrill, 1989). In 2006, there was discussion of moving the Garden to a new site.

Local boosters, including Supervisor Kenneth Hahn and Bill Nicholas of the Coliseum Commission, intended to build a stadium to rival Madison Square Garden. Although the third largest city in the country in 1956, Los Angeles still lacked the facilities to host a national convention or a great indoor sporting event. The citizens of Los Angeles three times voted against propositions intended to pay for the arena. Ultimately, a State Assembly bill was passed and signed by Governor Goodwin Knight, authorizing commissioners to issue revenue bonds to finance the construction. By March 21, 1958, $7,800,000 in revenue bonds were sold. For a time, the Sports Arena enjoyed popularity and success and was touted as the most modern sports facility in California. But after a defection by Jack Kent Cooke, owner of the Los Angeles Lakers basketball team and the new hockey franchise team, to build the Forum in Inglewood in late 1967, it lost an important regular client and two major sports teams.

The Sports Arena is operated under the authority of the Los Angeles Memorial Coliseum Commission, which was formed in 1945. The Los Angeles Coliseum was constructed in 1923.[3] The Commission was created under the Joint Exercise of Power Act, and is comprised of City of Los Angeles representatives, as well as representatives of the County of Los Angeles and the State of California, who are equal decision-makers. The two multi-use buildings are self-supporting, through revenues from events at the site.

Efforts to Build a Sports Arena in Los Angeles

Getting the Sports Arena constructed was a lengthy, difficult process. As Proquest/Historical Los Angeles Times articles reveal, plans to build a sports arena in Los Angeles originated as early as the 1930s. Neither the Grand Olympic Auditorium (built in 1925) nor the Pan Pacific Auditorium (built 1935) had the capacity to house a large indoor team sports event. In 1938, the Los Angeles Times reported that a $1,500,000 sports arena was planned, to be located on the Gilmore Tract at Third Street and Fairfax Avenue. A year later, Edward Metcalf, president of Sports Gardens, Inc., announced plans to build a $2,500,000 sports arena on a 97-acre parcel, located on a site bounded by Venice and La Cienega boulevards and 18th Street. The new arena's construction would be overseen by H. O. Davis, a veteran of the 1932 Olympics and the 1915 and 1935 San Diego Expositions. Architect Stiles O. Clements proposed a suspensionstyle construction for the 40,000-seat auditorium, with no beams or posts, which would allow for the division of the space into three separate arenas. The facility was named "The Gardens," and it was

[3] *The Coliseum was declared a National Historic Landmark in 1984. It hosted the 1932 and 1984 Olympics, as well as two Super Bowls, one World Series, and decades of USC football games. In addition, it was the home of the Los Angeles Raiders for 12 years. The Coliseum also hosted religious conventions and rock concerts. For more, see the Coliseum's website, located at: http://www.lacoliseum.com/pages/history.shtml*

intended for national championships, including football, wrestling and boxing. This project was not constructed.

In 1939, Walt Disney signed a lease for the Third and Fairfax site as president of Hollywood Sports Gardens, Inc., which intended to build the "largest covered stadium in the world" with Walker and Eisen hired as architects. The Fairfax site came up again in 1944, when business leaders announced the plans to build the "Pan Pacific Sports Arena," after the war, after purchasing the 35 acres of the Gilmore Tract. Yet another sports arena was proposed in 1946 in the South Gate area, to heavy community opposition.

By 1947 newspaper articles focused on Exposition Park, adjacent to the Coliseum, as a site for the proposed "Madison Square Garden of the West." Former Coliseum Commission president and Los Angeles County Supervisor Leonard J. Roach recommended "using Coliseum profits to finance the structure." Another site under consideration included 22 undeveloped acres in Los Feliz, property owned by the estate of Aline Barnsdall, but Barnsdall's will forbade sale of the land until 10 years after her death.

Yet another plan, to build the "Los Angeles War Memorial Auditorium," was announced in 1948 by a group called "Greater Los Angeles Plans, Inc." A nonprofit organization consisting of prominent architects and planners, they were committed to building an indoor sports arena downtown, on a 23-acre tract between Third and Fifth Streets, west of Flower Street. In 1948, the Los Angeles Memorial Coliseum Commission enlisted a public relations firm to conduct a feasibility study for an indoor sports arena in Los Angeles.

When the issue of funding a new sports arena finally went before the Los Angeles voters, the site on which they voted was the downtown site, located at 3rd, 5th, Flower and Fremont streets. Propositions A and B, in the amount of $25,000,000 and $10,000,000, were placed on the April 3, 1951, municipal ballot. The propositions included the construction of a music center.

After those propositions failed, Proposition B was introduced in 1953 to finance the construction of a sports arena, convention hall, and civic auditorium, in the amount of $27,000,000, to be repaid over a 30-year period. Los Angeles Police Chief William Parker "urged construction of the center on the basis of combating juvenile delinquency." The proposed site, located again at 3rd and 5th Streets and Flower and Fremont Streets, was praised for its convenient downtown location, adjacent to freeways and public transportation. Businessman Harry Volk, who spearheaded the measure, called the proposed auditorium "something this city needs, regardless of the possibility of complete 'payout' from revenues," according to the Los Angeles Times.

Again, the measure failed to get the two-thirds majority required. A third measure, Proposition F, was put on the ballot in June 1954 to finance a new auditorium, led by the group "Forward Los Angeles." In support of the attempted project, the president of the Los Angeles Rams (who had arrived in Los Angeles

in 1946) praised attempts to build an auditorium even greater than Cleveland's (former home of the Rams) to make Los Angeles the "sports capital of the West Coast."

After three proposition failures, in 1955 the Coliseum Commission and Supervisor Kenneth Hahn, its president, yet pursued the construction of a sports arena at Exposition Park. Architect Clements was enlisted to build a 22,000-seat arena that would be used for sports contests only, so as not to compete with the proposed downtown auditorium or the Hollywood Bowl. Another feasibility study to determine economic viability was underway. Influenced by Hahn, two State Assemblymen, Jesse M. Unruh and Augustus Hawkins, introduced a bill that would authorize the Los Angeles County Board of Supervisors to issue revenue bonds in order to finance the proposed $7,000,000 arena. The bill passed the Assembly and the Senate and was signed into law by Governor Goodwin G. Knight on April 29, 1955, after which the Sixth Agricultural District, owners of the land, extended its contract with the Coliseum Commission through 1985.

Although Coliseum General Manager Bill Nicholas predicted the new sports arena would open in 1957, contingencies like the rising cost of steel delayed its construction. Architects Stiles O. Clements and his son, Robert Clements, were fired for breach of contract, after failing to revise their architectural plans to accommodate the budget. Nine new firms were put forth as replacements; meanwhile, the Clements's sued the Commission for wrongful discharge, and the Commission countersued, charging negligence and irresponsible business practices.

In June 1957, the Coliseum Commission approved the plans submitted by Welton Becket, whose firm was chosen from the nine firms proposed in 1957. Becket (with partner William Wurdeman) was the architect of the successful Pan-Pacific Auditorium in the Fairfax area; his firm was employed as UCLA's master planner and had designed the Los Angeles Police Department's downtown Parker Center in 1955. Becket is considered one of the most prominent architects in Los Angeles, responsible for more than 150 building designs.

By the time construction was complete, the total cost was $7.4 million. Excavating for its construction resulted in a huge hole in Exposition Park for two years, referred to as the "famous hole," according to a Coliseum Commission publication. But the Sports Arena finally opened on July 5, 1959. On hand to deliver the celebratory address was Vice-President Richard M. Nixon, who exhorted the audience "never to quit." A few days later, on July 8, bantamweight Jose Becerra defeated Alphonse Halimi before a crowd of 13,675 people.

Other Local Venues

One of the reasons that civic leaders were anxious to have the Sports Arena constructed was a belief that Los Angeles was lacking the facilities that would attract professional basketball and hockey teams to the area. Semi-professional hockey, football and baseball were being played in Los Angeles are a variety of venues when the concept of the Sports Arena was beginning to be discussed; however, each was

considered deficient in some regard. Seven structures in the city existed for both sports and spectacles, all of which were constructed in the 1920s and 1930s.

Grand Olympic Auditorium, located at Grand Avenue and 18th Street, was built for the 1932Olympics and served as the "Mecca of Boxing" in Los Angeles for more than 70 years. From its opening in 1925 through 1987, when it closed (though still used for concerts and filming), it attracted Los Angeles' most famous stars, from Mae West to Barbara Stanwyck to Frank Sinatra, as well as mobster Mickey Cohen. After a brief attempt at reviving the Auditorium in 1994 with Oscar De La Hoya fighting Jimmy Bredahl of Denmark, attendance continued to decline. In 2005, the Grand Olympic Auditorium was purchased from downtown property owner Steven Needleman by a Korean-American church.

Gilmore Field was located near the intersection of Beverly and Fairfax and was the venue for the semi-professional Hollywood Stars baseball team, which played in the Pacific Coast League. The baseball field was constructed in 1939 and was demolished in 1959. Next to it was the Gilmore Stadium, built a few years earlier in 1934. The Los Angeles Bulldogs, a semiprofessional team and the first football team in Los Angeles, played for the American Football League (AFL) at the Gilmore Stadium in 1937. The AFL folded that year.

Wrigley Field, built by William Wrigley in 1925, was located south of downtown Los Angeles. The Los Angeles Angels, a minor league team, played there from 1925. When the Brooklyn Dodgers moved to Los Angeles, Wrigley Field was proposed for their use, but until Dodger Stadium opened in 1961, they chose to play at the Coliseum. The Los Angeles Angels continued to play at the baseball field until 1961, when the team was brought into the American League and played at Dodger Stadium. Wrigley Field was torn down in 1969.

There were two open-air stadiums: the Los Angeles Memorial Coliseum at Exposition Park and the Rose Bowl in Pasadena. The Coliseum dates to 1923 and held a variety of sporting events, including football (Los Angeles Rams, Chargers, Raiders), baseball (the Los Angeles Dodgers played there until Dodger Stadium opened), not to mention USC and UCLA football. It seats 93,000. It is listed on the National Register and is a National Historic Landmark, as well.

The Rose Bowl Stadium was designed in 1921 as a horseshoe-shaped stadium. Architect Myron Hunt, in association with then Tournament President William Leishman, prepared the original design. Original construction conformed to the horseshoe design, but the stadium was enclosed as a full bowl in 1928, increasing spectator capacity to 76,000. The Rose Bowl has hosted the Tournament of Roses Bowl football game since 1923. The Rose Bowl, 991 Rosemont Avenue, is listed in the National Register and also has been designated as a National Historic Landmark.

Finally, the Pan Pacific Auditorium, designed by Welton Becket with partner Walter Wurdeman, opened in 1935. The Los Angeles Monarchs, a hockey team in the Pacific Coast League, played there from 1938-1941. Also using the ice floor at this venue were the Ice Capades and collegiate ice hockey teams. The

Harlem Globetrotters appeared at the Pan Pacific on numerous occasions. In addition to sports, the space was utilized for home shows, conventions, musical shows and beauty contests. It only sat 6,000 within 100,000 square feet. Although the doors closed to the public in the early 1970s, it remained on site until a massive fire destroyed it in 1989.

Fate of Similar Venues across Country

In order to gather ideas for the new Los Angeles Memorial Sports Arena, Los Angeles officials traveled to 11 cities across the nation, including Chicago, Buffalo, Syracuse and Des Moines. Of the arenas that existed in those cities at that time, Union Center has replaced Chicago Stadium (1929), which was torn down in 1995; Marine Midland Arena replaced Buffalo Memorial Auditorium, which remains but is rarely used, though there are hopes of renovating it; Wells Fargo Arena replaced Veterans Memorial Auditorium (1955), which has been modernized; and in Syracuse, the Carrier Dome replaced Archbold Stadium (1907), which closed in 1978.

In 1965, the Harris County Domed Stadium, in Houston, Texas opened. At the time, the new arena, to become known as the Astrodome, was the largest enclosed stadium with 45,000 seats. It housed the Houston Astros baseball team and the Houston Oilers football team. The domed stadium, or "superstadium" is considered a watershed event in the evolution of sports facilities, made possible by new steel and concrete technologies and engineering advances. In 1966, synthetic nylon "grass" was installed on the playing field, another first. It became known as "Astro-Turf." The Astrodome has been vacant since 2003.

Exposition Park

Exposition Park is located in the City and County of Los Angeles, approximately 2 miles southwest of the city's central business district. Bordered by Exposition Boulevard to the north, Vermont Avenue to the west, Martin Luther King Boulevard to the south, and Figueroa Street on the east, Exposition Park encompasses approximately 65 hectares (160 acres). The park includes several major museum/educational institutions, recreational open space, surface parking lots, and sports facilities of regional significance, such as the Los Angeles Memorial Coliseum and the Sports Arena.[4]

Although it was not the original choice as the location for the new sports venue, finding enough land on which to build such a structure near established centers of populations was not an easy task for the boosters. The Coliseum Commission sponsored their own study to establish the viability of placing the structure at Exposition Park as early as the mid-1940s, but other sites still competed with it as the proposed sports facility was put to the local voters.

---

[4] *Myra L. Frank & Associates, "HPSR for the Exposition Park Master Plan Parking Facility," prepared for the State of California, Department of General Services, Real Estate Services Division, December 2000.*

Brief History of Exposition Park

Exposition Park, which is bounded by Exposition Boulevard on the north, Martin Luther King, Jr. Boulevard on the south, Vermont Avenue on the west and Figueroa Street on the east, is a mixture of public and privately owned structures and open space parkland. It was originally known as Agricultural Park, and it was developed in the 1870s as an agricultural fairground. In 1909, the 160-acre property developed into a park when California's Sixth District Agricultural Association (then owner of the property) and the county and city of Los Angeles agreed to a plan to transform it into a cultural center, and renamed it renamed Exposition Park a year later.

The state would build an exposition building and armory if the county would construct and operate a history and art museum and the city would maintain the grounds.[5] In 1913, the park was officially dedicated, for use as a recreational, educational and cultural gathering place. In 1922, the Exposition Club opened, followed a year later by the Los Angeles Memorial Coliseum, designed by noted Los Angeles and USC architect John Parkinson, on the grounds of Exposition Park. The park is right next to the USC campus. In addition to hosting USC sporting events, the Coliseum was enlarged for the 1932 Olympics; the Swimming Stadium was also constructed for the 1932 Olympics. The park continued to be occupied by culturally important buildings such as the County Museum of Natural History, the California African-American Museum and the Museum of Science and Industry (California Science Center). There is also the renowned Rose Garden and the Armory. In 1959, the Sports Arena was constructed. The park is still public space owned by the state of California, whose major cultural facilities mentioned above are operated by both the state and Los Angeles County.

The Exposition Park Historic District:[6]

The Exposition Park Historic District, which includes the Coliseum, Rose Garden, Natural History Museum; the Armory and Swimming Stadium; the Exposition Clubhouse; North and South Coliseum Drive; and the Exposition (Ahmanson Building), was established in the 2000 Historic Property Survey Report (HPSR), prepared for the State of California, Department of General Services, Real Estate Services Division, as part of an effects analysis of the proposed Exposition Park Master Plan Parking Facility, prepared by Myra L. Frank & Associates (now ICF).

No formal finding of National Register eligibility was made for the Exposition Park Historic District at a meeting among the review agencies on August 9, 2000. Furthermore, the Exposition Park Historic District has not been recorded in the California Historical Resources Inventory database.

---

[5] *"Natural History Museum Of Los Angeles County" located on the County's website at: http://www.nhm.org/expo/expopark.htm.*

[6] *Myra L. Frank & Associates, "HPSR for the Exposition Park Master Plan Parking Facility," December 2000.*

However, based on the information presented in the HPSR, the following conclusions were made: extensive changes occurred within the 1993 District boundary that were not previously reported, indicating that the integrity of the District was less intact than reported in 1993. Major demolition (most of the Exposition Building), alterations (the Coliseum and Coliseum sidewalks), and new construction (the California Science Center) occurred within the District boundary between 1993 and 2000, further diminishing the integrity of the District. At the time of the HPSR in 2000, the Sports Arena was not yet 50 years of age and was not considered a contributing structure to the historic district.

Significant Sports and Sporting Events

Because the Sports Arena was constructed with the concept that sports teams and sporting events would be the primary tenants for the facility, this section discusses the history of sports in the Sports Arena. This includes boxing, basketball, hockey and other events.

Boxing:

Boxing was expected to be one of the major sports events held at the Sports Arena. The first event held there after it opened was a boxing match. Joe Louis promoted multiple matches at the Sports Arena before moving the bouts to smaller venues in 1962, due to the cost of holding these events at the arena. Although professional bouts continued to be held at the arena after 1962, it doesn't appear from news accounts that any major events happened there.

- The first event held at the Sports Arena was a boxing match between Jose Becerra and Alphonse Halimi on July 8, 1959.
- Cassius Clay knocked out Archie Moore on November 15, 1962.
- 1984 Olympics boxing bouts were held in the Sports Arena.

Basketball:

Basketball was one of the main reasons the Arena boosters were keen to have the structure built. They were actively trying to get a professional team to play in Los Angeles. Before an official, Los Angeles-based team was located at the Sports Arena, several professional basketball games were played at the venue. Eventually, a semi-pro team, the Jets, began playing there. Then, in 1960, the Minneapolis Lakers moved to Los Angeles, keeping the name and playing at the Sports Arena. The Lakers stayed until 1967, when they moved to the Forum. Within a few years, another team moved to the city, the Anaheim Amigos, who played in the Sports Arena as the Los Angeles Stars for two years. Finally, a second professional basketball team came to Los Angeles – the San Diego Clippers. The new Los Angeles Clippers arrived in 1984. They played in the Sports Arena until 1999, when they moved into the Staples Center, a mile north on Figueroa Street.

At the same time, the arena provided space for high school tournaments and college games. USC has been playing basketball in the Sports Arena since it opened (until moving to Galen Center in 2006) and UCLA played there until Pauley Pavilion (also designed by Welton Becket) opened on the UCLA campus in 1966.

- USC Trojans basketball teams have been playing at the Sports Arena since 1960.
- Harlem Globetrotters played at the Sports Arena on several occasions.
- UCLA Bruins basketball was hosted by the Arena from 1959-1965 during the Golden Age of John Wooden, before Pauley Pavilion was constructed in 1965.
- Beloved and renowned UCLA Bruins men's basketball coach Forrest Twogood coached his last game for UCLA at the Sports Arena in 1966.
- The Los Angeles Jets, a semi-professional basketball team in the American Basketball League (ABL) debuted at the Sports Arena in 1961.
- Minneapolis Lakers moved to Los Angeles in 1960 to become the Los Angeles Lakers, who played in the Sports Arena until the 1967-68 season.
- Los Angeles Clippers arrived from San Diego in 1984. They moved to the Staples Center in 1999.
- The Anaheim Amigos moved to Los Angeles in 1968 and became the Los Angeles Stars. In 1970, they moved to Utah.
- LAUSD High School Championship Basketball was held in the Arean until 1995 because of high rent.
- The 1963 NBA All-Star Game was played at the arena
- Both the 1968 (won by UCLA) and 1972 Men's NCAA Final Four were played in the Arena.
- The 1992 NCAA Women's NCAA Final Four was held at the Arena.

<u>Hockey</u>

Getting a professional hockey team to Los Angeles was another one of the reasons behind the push for the Sports Arena. Semi-professional hockey teams had been established in Los Angeles previous to 1961, but boosters wanted a professional team associated with the National Hockey League (NHL), to be established here. According to some accounts, the Sports Arena was designed in accordance with the wishes of the NHL with the tacit understanding that when the league expanded from six teams, Los

Angeles would be well positioned to receive one of those additional teams. However, in 1959, the NHL was not ready to expand; the Western Hockey League (WHL), a semi-professional league, established a team in Los Angeles for the 1961-1962 season: the Los Angeles Blades. In 1966, when the NHL was prepared to add six teams to the roster, four groups representing individual interests for a team in Los Angeles went to New York City to present their cases. The Coliseum Commission backed Dan Reeves, owner of the Blades and his consortium. Jack Kent Cooke, another promoter who had recently obtained the Los Angeles Lakes basketball team, won the expansion rights. This was a major upset for the Commission.

- The Los Angeles Blades, a semi-pro team in the Western Hockey League, played at the Sports Arena between 1961 and 1967.
    - The Blades were owned by Dan Reeves and Jim Piggott; the former owned the Victoria team.
    - Willie O'Ree, the first African-American to play hockey for the National Hockey League, played for the Blades.
    - At one time, the Blades were a farm team for the New York Rangers.
- The Los Angeles Kings briefly played in 1967 and then moved to the Forum.

<u>Other Sporting Events</u>

Many other "sporting" events took place under the blue roof of the Sports Arena. Some of these included the following:

- Rodeos
- Water Follies
- Roller derbies
- Track meets
- Tennis

<u>Significant Rock Concerts, Political Events, and Shows</u>

The Sports Arena also hosted events such as the Ringling Brothers Circus, the Ice Follies and the Times Indoor Games. Major rock shows and concerts were held at the Sports Arena, from Pink Floyd to Bruce Springsteen, including Springsteen's 2009 shows in Los Angeles.

In 1960, the Democratic National Convention nominated John F. Kennedy as the Democratic Party's candidate for president in the Sports Arena. Kennedy gave his formal acceptance speech at the Coliseum.[7]

In 1961, the Sports Arena was filled to capacity (and overflowed into the parking area) when Martin Luther King, Jr. spoke at a civil rights rally sponsored by the Western Christian Leadership Conference. The Freedom Rally was considered the largest gathering of African Americans in Southern California at the time, with an estimated 25,000 people showing up. Loudspeakers were set up to project the speech to those who did not make it inside (close to 18,000 were admitted indoors). Those who had to listen from outside, through the entire four-hour program had an opportunity afterwards to come into the Sports Arena for an abbreviated version of the program.

The Sports Arena has long had a strong presence in the Los Angeles area by providing a social gathering place for a variety of events, including:

- Home shows
- Auto shows
- Conventions
- Fundraisers
- Educational programs/classes
- Filming – the Sports Arena has been featured in numerous movies and televisions shows, and this continues to be a major source of revenue for the Coliseum Commission. Some of the movies filmed there include scenes from Rocky (1976), Space Jam (1996), Escape from L.A. (1996), Ali (2001), Soylent Green (1973) and Almost Famous (2000).

History of Welton Becket and Associates

Because Welton Becket and Associates are considered one of the premier post-World War II architects of modern buildings in Los Angeles, a short history of the man and the firm are presented to below.

Welton Becket was born in Seattle, Washington, on August 8, 1902, the son of a builder. As a young man, he dreamed of becoming an architect. After graduating with a degree in architecture from the University of Washington in 1927, he studied for a year at the Ecole des Beaux Arts in Fontainebleau. Becket began his career in Los Angeles in 1929 as a designer-draftsman, and then returned to Seattle to work for his brother, Evro, a builder. During this early period, his work was small-scale and undistinguished. However, in 1933, he formed an auspicious partnership with fellow Washington

---

[7] *History of the Los Angeles Memorial Coliseum and the Sports Arena on the Coliseum website located at: http://www.lacoliseum.com/pages/history.shtml*

alumnae, Walter Wurdeman, and together the two men joined the office of a veteran Los Angeles commercial architect, Charles Plummer.

Wurdeman and Becket worked in relative obscurity as many as 80 hours a week, earning little money, in their early years with Plummer. By the late thirties, however, Wurdeman and Becket were designing period revival homes for film stars, including the Tudor Revival-style Montgomery House in Bel Air (1938). But it was their successful 1934 bid to design the Pan Pacific Auditorium in Los Angeles that would alter their future.

Wurdeman and Becket's concept for the auditorium, which they drafted and designed together, reflected the stylistic influences of the 1933 Chicago World's Fair. In an emphatic interpretation of the Streamline Moderne—four flagpole pylons, designed to resemble fins, jutting toward the sky, atop a graceful, curved façade—Wurdeman and Becket created their first iconic Los Angeles building for the automobile age.

As architectural historians David Gebhard and Harriette Von Breton wrote in Los Angeles in the Thirties, the Pan Pacific Auditorium was a "popular, much-admired classic of the new style." It was partially torn down in the mid-1980s, and the surviving façade burned down in 1989.

In 1936, Wurdeman and Becket received an Honor Award from the Southern California chapter of AIA for their design of the Pan Pacific Auditorium. New commissions and publicity helped to expand the office to more than 40 employees in only a few years.

After Charles Plummer died in 1939, Wurdeman and Becket continued their collaboration under the firm's new name, Wurdeman and Becket. During World War II, the firm constructed 14,000 housing units for military families and wartime workers. In 1943, the firm was chosen to design the "House of Tomorrow," a prototype for builder Fritz Burns, in which Wurdeman and Becket presented their vision of postwar living in Los Angeles. The project gained them much needed publicity and, once again, symbolically linked the firm with the future of Los Angeles.

In 1944, Wurdeman and Becket were chosen by P. G. Winnett, the president of Bullock's, to design the new Bullock's Pasadena. For the first time, the firm would also design the interior space of a building. Bullock's Pasadena became one of the first suburban department stores, an elegant building designed in the Late Moderne style that featured a main entrance and motor court in the rear. The parking lot covered nearly six acres. Every detail of the design was overseen by Wurdeman and Becket, including the murals, fixtures, counters and furniture. This concept would be known as "total design."

Wurdeman and Becket designed many more Bullock's stores, including Bullock's Westwood in 1950, considered their finest store. In total, the firm built more than 100 department stores in Southern California and pioneered the concept of the suburban shopping mall.

Through contacts made while working on Bullock's Pasadena, Wurdeman and Becket secured a commission from Mobil Oil Corporation to build their downtown Los Angeles headquarters. It would be

the firm's first office building. In the construction of the General Petroleum Building, Wurdeman and Becket pioneered the use of a lightweight concrete, which gave their buildings the appearance of white rock. The General Petroleum Building's design, with open floor plans consisting of movable partitions and walls, is now widely used within the industry. Their innovative design of the parking structure would also be widely imitated: the garage consisted of an open space, elevators and stairs contained at the center, surrounded by floors that spiraled upward to the top.

In 1947, Wurdeman and Becket constructed another large office building, the Western headquarters of Prudential Insurance Company of America, located at 5757 Wilshire Boulevard. The entire office and retail complex sprawled for two city blocks. In contrast to the General Petroleum Building, with its Art Deco vertical banding and terra cotta exterior, the Prudential Building was built in the International Style, with a solid shaft at its center, flanked by two wings of banded glass.

For the exterior of the building, Wurdeman and Becket again used lightweight concrete. Innovative horizontal sunshield were used on each floor. The 517,000-square-foot Prudential Square, located in the Miracle Mile area, heralded a departure for the Los Angeles business community from a centralized downtown model toward smaller, mini-downtowns, as would ultimately be established in Century City. Wurdeman and Becket began construction of their own office building at 5657 Wilshire Boulevard in 1948, and it was completed in 1949. Wurdeman and Becket would help to transform Wilshire Boulevard into a modern commercial corridor.

By 1949, Wurdeman and Becket had established expertise in building types such as department stores, office buildings, and private homes. With over $100 million worth of commissions, the firm employed 80 people and completely occupied its new five-story Wilshire office building. But personal tragedy struck when Walter Wurdeman died suddenly at the age of 46.

After Wurdeman's death, Welton Becket bought out Wurdeman's heirs and created Welton Becket and Associates, with himself as sole owner. Becket undertook the role of supervising architect for UCLA, which would occupy the bulk of his time until his own untimely death in 1969. The firm was chosen as the university's master planner in 1949 and would transform the UCLA campus over 20 years, responsible for such landmark buildings as the UCLA Center for Health Sciences (1948-1970), Schoenberg Hall (1955), Ackerman Union (1959-60), and Pauley Pavilion (1965).

During the 1950s, Welton Becket and Associates completed many important commissions, including the Beverly Hilton in 1955, LAPD's downtown headquarters at Parker Center in 1955, the Los Angeles Sports Arena in 1959, and perhaps their most iconic building, the Capitol Records Building, in 1955, which was designed by Louis Naidorf in its unique cylindrical shape.

In 1958, Welton Becket and Associates was chosen to oversee the largest urban development in the nation. Private investors paid $43 million in cash for the former 260-acre back lot of Twentieth Century Fox, located between Beverly Hills and Westwood. Developer William Zeckendorf claimed, "Century

City is the first completely planned community in Los Angeles designed specifically for the Freeway Age," in the West Los Angeles Citizen.

As Becket and his firm were responsible for reshaping Wilshire Boulevard, transforming the UCLA campus, inventing the suburban mall, and creating numerous postwar icons such as the Capitol Records Building, so would they transform the landscape of the Westside, effectively building a $500 million "city within a city." Tombstone Street, the Fox set where numerous western scenes were once filmed, would become "Avenue of the Stars." Under their design, 181 acres of the property would be converted into landscaped streets with 88 buildings, including a shopping center, a 600-room hotel, and high-rise apartments and office buildings. Fox retained a lease on the remaining 79 acres.

Becket chose 10,000 Santa Monica Boulevard, the northeast corner of Century City, for the location of Welton Becket and Associates' worldwide corporate headquarters, the first building to be erected on the new site. Costing $2.5 million, and containing 106,000 square feet of space, the Becket Building was constructed in 1960 of concrete and steel, its façade covered with mosaic art. An entrance bridge spanned a reflecting pool and fountains.

Century City's Gateway Buildings, prominently located at Santa Monica Boulevard and Avenue of the Stars, were constructed in 1964. Becket envisioned this section of office buildings as a "spacious collection of aluminum-faced structures comprising of a self-contained business center." The open–air Century City Shopping Center opened in 1964. David Gebhard and Robert Winter, Los Angeles' foremost architectural historians, considered the Century City development "problematic," without any of the "intimacy" and "human scale" of neighboring Beverly Hills. "In fact," they wrote in their book, An Architectural Guidebook to Los Angeles, "the governing idea seems to have been to inspire awe of corporate America via wide avenues and overscaled architecture" (Gehard and Winter).

As a master corporate architect, Welton Becket transformed the landscape of Southern California. By the 1960s, WB&A was internationally recognized, with 32 master plans and 150 additional buildings in progress. The firm had been awarded 66 design excellence awards, locally, nationally, and internationally. In the early 1960s, they completed several significant Los Angeles projects, including the Los Angeles International Airport Theme Building with Pereira & Luckman and Paul Williams; the Pacific Cinerama Dome, the only concrete geodesic dome in the world, according to the Los Angeles Conservancy's Modern Committee; and the Music Center, employing as many as 100 men to fulfill the "total design" concept of WB&A. By 1969 these projects generated nearly $1 billion in revenue. At the top of his profession, with more than 500 employees and operating offices in San Francisco, Chicago, Houston and New York, Becket died suddenly of a heart attack at the age of 66.

Sports Arena Description

The Sports Arena is an ellipse-shaped, multi-use facility, on a north-south axis. It is located in Exposition Park, at the northwest corner of Figueroa Street and Martin Luther King, Jr. Boulevard (formerly Santa

Barbara Avenue). It is the sister facility of the Los Angeles Memorial Coliseum, which is located just to the northwest across an access road.

The architect was Welton Becket & Associates of Los Angeles, hired in 1957, and the contractor was L.E. Dixon Co. from San Gabriel, California. Steel for the framing was purchased from Kaiser Steel, located in Fontana, California. The excavation was begun in 1956 by Guy F. Atkinson Company of Long Beach. In "Preview," a contemporary publicity brochure featuring the Sports Arena, the entrance to the Sports Arena is described:

> At the main east entry, centered between chocolate walkways, is a magnificent memorial fountain, dedicated like the Arena, to those who died in the armed services of our nation. This main entrance is served by a spacious 65-foot wide pedestrian bridge, which spans a sunken forecourt. Three equally commodious entrances are spaced on the south, west and north to facilitate normal pedestrian approach patterns and to permit total dispersal in 15 minutes.[8]

The roof is an elliptical transverse steel truss roof, spanning 315' x 430'. The exterior material of the lower walls is comprised of concrete block construction. There are no exterior windows.

According to articles/ads published at the time of construction, the interior length was 437 feet and the interior width was 317 feet (this assumes the statistic is referring to arena floor level without seating). It is 262 feet in length between permanent seat lines and 144 feet in width between permanent seat lines. Length of floor between columns is 278 feet and width between columns is 160 feet. Floor to roof height managed a 75-foot clearance to the first steel girder. Total arena floor space topped out at 130,000 square feet, with concourse level floor space totaling over 101,000 square feet. Further quotes from "Preview" provide historic details:

> …An exquisite blending of ceramic tile, rubberized terrazzo floors and indirect fluorescent lighting lends an atmosphere of refinement and elegance to all lobbies. Each lobby is readily accessible to recessed banks of concession vending machines and expansive individual counter service provides a diversification of unexcelled refreshments. Colorama seating – commencing with the premium 'golden circle' also includes gray, blue and red upholster – based on the Arena seat prices.
>
> From all four lobbies on the concourse level, the arena floor level is accessible by ramps, stairways or escalators. The lower level main entrance is served by two serpentine exterior ramps leading from the walkways to the sunken forecourt. This landscaped forecourt, flanked on each side by towering Palm trees, is adaptable for trade show displays with a total of 35,850 square feet. At both the north and south entries, 48-inch reversible escalators service the arena level as crowd movement dictates. At the

---

[8] *"Preview," Los Angeles Memorial Sports Arena publicity brochure published by the Coliseum Commission, circa 1959, courtesy of the Coliseum Commission.*

> south lobby is a gradual ramp to enable wheelchair spectators to gain easy access. A truck ramp 40 feet wide and 20 feet high permits entry on the west of large display items to the arena level. The permanent 200 feet by 85 feet ice rink can be frozen in six hours. Seating for athletic or production events commences at the area level with 12 rows of portable seats. They connect by a graduated slope to the 28 rows of permanent seats on the concourse level.
>
> …There are no posts to impair vision whether it be sports event, a convention, or an expansive production. Every seat is foam rubber, upholstered, arm chair, designed with 'fireside' viewing in mind.
>
> The Arena's conception and design was dictated to provide unexcelled facilities for press, television, tenant and performer. Permanent press spaces for 45 are on the east side and include a lounge. A convention plan will handle 1000 press representatives. Five radio and TV booths are on the west side. Space for perfect photographic angle are five permanent TV camera platforms. Ringing the arena is a seven foot wide suspended catwalk located to give unlimited TV and still camera positions plus spotlight locations for theatrical productions… A built-in vacuum system permits rapid clean-up.

According to information received from the Commission, there are currently multiple catwalks; the lower level measures six feet wide with 360-degree access and is 62 feet above the arena floor. The upper level catwalk is separated into four catwalks that run the sixth of the facility 75 feet above the arena floor. The permanent press areas are still located on the concourse level. There are four dressing rooms, one official's dressing room and a sixth dressing room reserved for theatrical/production/event personnel.

Character-Defining Features

The Secretary of the Interior's Standards for the Rehabilitation of Historic Properties, as defined in the National Park Service's Preservation Brief , identifies "character-defining features" of a building as the following:

> Character refers to all those visual aspects and physical features that comprise the appearance of every historic building. Character-defining elements include the overall shape of the building, its materials, craftsmanship, decorative details, interior spaces and features, as well as the various aspects of its site and environment.[9]
>
> The following is a preliminary list of the Sports Arena's character-defining features:
>
> - Setting and location

[9] *Lee H. Nelson, FAIA, Preservation Brief 17: Architectural Character: Identifying the Visual Aspects of Historic Buildings as an Aid to Identifying Their Character (Washington, D.C.: U.S. Department of the Interior, National Park Service, 1998), online version available on the National Park Service website at: http://www.nps.gov/hps/tps/briefs/brief17.htm.*

Alterations to Character-Defining Features

The Sports Arena has been altered, primarily on the interior. In the early 1980s, the Clippers moved to Los Angeles and the Sports Arena and required several upgrades to the building, including the locker rooms and the creation of the Clipper Club. The building was also damaged in the 1994 Northridge earthquake and required seismic retrofitting, which was accomplished in 2002. Other changes include the replacement of original signage and the original terrazzo floor. On the outside of the building, the most significant change occurred when the main entrance was moved from the east side to the south side of the parking lot. The move also introduced the only addition to the building, the ticket office. The other physical exterior change occurred when the original tile that covered the roof and gave it a blue tint was replaced with a different material that has a green tint. These alterations and modifications are discussed further below. Figures IV.D-1 through IV.D-4 beginning on page IV.D-24 illustrate most of the features discussed below. All photographs were taken on January 25, 2006.

Exterior

Roof

The original roof material, which was a blue tile specifically chosen for this structure, was replaced during the 2002 seismic retrofitting with a green Exterior Insulating Finishing System (EIFS). Currently, the roof consists of large vertical panels with standing seam between them. The new color and material were chosen to match the roof of the Swim Stadium and other structures on the Exposition Park campus. Additionally, the older material was in poor condition and the type of tile could not be replicated, in part due to cost. See View 1 in Figure IV.D-1.

Main entrance

As designed, the main entrance was located on the east side, facing Figueroa Street. This entrance was situated to take advantage of pedestrians and vehicles accessing the site from the boulevard. From Figueroa, patrons passed the memorial fountain (described below) and by parallel lines of palm trees and reached the 20 doors by passing over the forecourt on a 65-footwide pedestrian bridge. See View 2 in Figure IV.D-1.

Fountain

The fountain measures approximately 8' x 8', and is surrounded by a low, poured concrete wall. At the west side of the fountain is the original commemorative inscription, which measures 4' by 5', is constructed of bronze and is positioned on four solid concrete tubes (this last item being a more modern addition). The plaque was originally set in the grass on the front, or east side, of the fountain. The fountain appears to have been out of use since the 1970s. The raised inscription reads:

"LOS ANGELES MEMORIAL SPORTS ARENA
IN MEMORY OF THOSE WHO DIED AND IN RECOGNITION
OF THOSE WHO SERVED IN WORLD WAR II, KOREA AND VIETNAM"

Ticket Office(s)

Original ticket offices were located on the east and west facades of the building. The current, main ticket office is located just to the left of the south entrance. See View 3 in Figure IV.D-1.

Interior

Dressing Rooms/Locker Rooms

There were originally four dressing rooms located on the northwest corner of the Arena Level. While the location of the dressing rooms/locker rooms has remained the same, two additional locker rooms were added. There were actually at least two periods of remodeling: 1) when the Clippers moved into the Sports Arena, which required significant changes and upgrades (1984) and 2) when the seismic retrofitting was required and completed in 2002. See View 4 in Figure IV.D-1.

Concession areas

All the concession areas have been changed over time; most recently, a few were altered when the seismic retrofitting was completed in 2002. All are in the original location. See View 5 in Figure IV.D-2.

First Aid Office

The First Aid office is currently located on the north side of the east entrance. It was originally located in the Arena Level. See View 6 in Figure IV.D-2.

Restrooms

Arena Level: All four of the restrooms are located in the original locations. Concourse Level: All the restrooms on the Concourse Level have been altered in some manner, either with new sinks, toilets, tile or flooring. See View 7 in Figure IV.D-2.

Seats

Portable/Floor seats are apparently not the original folding chairs. Concourse seats are believed to be original. Loge: these are believed to be original. See View 8 in Figure IV.D-2.

Terrazzo

The original terrazzo floors have been removed and replaced with the current terrazzo in 2002, which is grey/white and red swirls with reflective pieces scattered about near the east entrance. See View 9 in Figure IV.D-3.

Plaques

These two original plaques have been moved to new locations in the venue (see Views 10 and 11 in Figure IV.D-3):

View 1: Close up view of roof material.

Figure IV.D-4
Photographs of Character Defining Features
Views 13 and 14

John F. Kennedy - the commemorative plaque honoring President John F. Kennedy was moved from the east entrance to the south concourse across from the lobby, and a portrait of the former President was placed inside an enclosed glass cabinet above it.

Richard M. Nixon – the plaque honoring former President Richard M. Nixon is just the right of the Kennedy plaque. It is located inside the enclosed glass cabinet containing his portrait.

Press Boxes

There were Press Boxes at the time the building opened. However, according to David Bentley, the east and west Press Boxes were added for the Clippers in 1984. The Working Press box was also added at a later date.

Camera Platforms

These have been added over time.

Lighting

The lighting for the concourses is located in the same location but elements have been changed. See View 12 in Figure IV.D-3.

Catwalk

According to the early drawings, data and conversation with David Bentley, the catwalk(s) are original.

Scoreboard

The scoreboard hanging center is original. See View 12 in Figure IV.D-3.

Escalators

Parts of the escalators have been removed and/or replaced over the course of time due to regular maintenance or required replacement. See View 13 in Figure IV.D-4.

Signage

According to David Bentley, all of the signage has been replaced with more modern panels, but these are mounted. See View 14 in Figure IV.D-4.

ENVIRONMENTAL IMPACTS

Thresholds of Significance

Pursuant to Section 15064.5 of the CEQA Guidelines, an historical resource is presumed significant if it is listed on the CRHR or has been determined to be eligible for listing by the SHRC. An historical resource may also be considered significant if the lead agency determines, based on substantial evidence, that the resource meets the criteria for inclusion in the CRHR. CEQA also contains the following additional guidelines for defining an historical resource:

- California properties formally determined eligible for, or listed in the NRHP (Section 5024.1.d.1);
- those resources included in a local register of historical resources, as defined in Section 5020.1(k) of the Public Resources Code, or identified as significant in an historical resources survey meeting the requirements of Section 5024.1(g) of the Public Resources Code;
- those resources that a lead agency determines to be historically significant (generally, if it meets criteria for listing on the CRHC), provided the determination is supported by substantial evidence; or
- those resources a local agency believes are historical for more broadly defined reasons than identified in the preceding criteria.

Section 15065 of the CEQA Guidelines mandates a finding of significance if a project would eliminate important examples of major periods of California history or prehistory. In addition, pursuant to Section 15064.5 of the CEQA Guidelines, a project could have a significant effect on the environment if it "may cause a substantial adverse change in the significance of an historical resource." A "substantial adverse change" means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource is impaired." Material impairment means altering "in an adverse manner those characteristics of an historical resource that convey its historical significance and its eligibility for inclusion in the California Register of Historical Resources."

Impacts to historical resources not determined to be significant according to any of the significance criteria described above are not considered significant for the purposes of CEQA.

Project Impacts

Determination of Eligibility

The Los Angeles Memorial Sports Arena is now more than 50 years of age and is being evaluated in this report to determine if it meets the criteria of eligibility for listing in the California Register of Historical

Resources. At the outset, it was established that several historical contexts would apply. This includes Exposition Park, in which the Sports Arena is located; the efforts to build an arena in Los Angeles; national examples of sports facilities; existing venues in Los Angeles before and after the Sports Arena was constructed; and events that took place at the venue since it opened in 1959. Within this last context, the Sports Arena appears to meet California Register Criterion 1, for its association with important social and cultural events in Los Angeles.

The Sports Arena was the first such venue in Los Angeles that could accommodate up to 18,000 seated patrons under one roof. The Sports Arena was constructed in 1959, after more than two decades of planning by various agencies and individuals, to provide the City of Los Angeles with a world-class facility for a variety of events. Civic boosters hoped this type of structure and the events it would attract would boost the city's reputation, to match the city's growing population and its status as the third largest city in the country.

The idea was put to the voters more than once, but in the end, it took some creative thinking and initiative, as well as an act of the governor to get the funding. The Sports Arena was built to accommodate basketball and hockey teams, as well as to present organizations such as the Democratic National Convention and Ringling Brothers & Barnum and Bailey Circus an indoor arena for their events which did not exist in Los Angeles at the time.

The period of significance for the Sports Arena has been established as 1959 to 1967. This eight-year span includes the opening of the structure by Vice President Nixon on July 4th of that year, and opening of the Great Western Forum in Inglewood. This end date also coincides with the beginning of the "superstadium" era, when venues such as the Sports Arena were becoming obsolete and outdated.

By the time the Sports Arena was built in 1959, there was one baseball field (Wrigley Field), one auditorium (Philharmonic), two indoor sports arenas (Grand Olympic Auditorium and Pan Pacific Auditorium) and one stadium (Coliseum) located in Los Angeles. By 1967, UCLA was ensconced in their own Pauley Pavilion sports facility to showcase their perennial national championship basketball team, Dodger Stadium was in use for major league baseball, and the Forum had opened for use by the Los Angeles Lakers and the Kings. By 1967, the Sports Arena was no longer the only "game" in town. Therefore, the building needs to retain integrity from that period of significance (1959-1967) if it is to be considered eligible for the California Register under any criterion.

Integrity. Integrity is the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance. Historical resources eligible for listing in the California Register must meet one of the criteria of significance described in section 4852 (b) and retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. Historical resources that have been rehabilitated or restored may be evaluated for listing.

Integrity is evaluated with regard to the retention of location, design, setting, materials, workmanship, feeling, and association. It must also be judged with reference to the particular criteria under which a resource is proposed for eligibility. Alterations over time to a resource or historic changes in its use may themselves have historical, cultural, or architectural significance.

The Sports Arena retains integrity of location, setting, feeling and association. Location is the place where the Sports Arena was constructed or the place where the historic events occurred. The Sports Arena has not been moved, the building is in the same location as when it was originally constructed, and the interior plan is largely unchanged.

As described in National Register Bulletin #15, setting is identified as the physical environment of the Sports Arena.[10] The setting refers not only to the site on which the Sports Arena was constructed, but also its relationship to surrounding features and open space. The immediate setting would include the Coliseum, Christmas Tree Lane, and the parking lot to the south. These are unchanged from the period of significance. Moreover, although there are newer buildings in the north part of Exposition Park these are not significant to the setting discussion. Although the neighborhood surrounding Exposition Park has changed since 1959, it is still both urban and collegiate, and dominated on the east by the broad Figueroa Street and the Harbor Freeway. The one change to the setting is the fountain and memorial plaque, located on the east side of the pedestrian walkway at the east entrance. The fountain has not been functional since the 1970s, and the plaque has been lifted from the ground and placed on several posts just on the west side of the fountain. However, because the fountain is still in situ, the fact that it is no longer functioning does not diminish the integrity of setting.

Association is defined as "the direct link between an important historic event or person and a historic property." Because the Sports Arena is sufficiently intact, in the sense that the building retains its original shape and size and the interior plan is largely unchanged from the end of the period of significance (1967) as it did during the period of significance, association is still retained.

Excerpted below are the descriptions of "design" according to National Register Bulletin #15:

> Design includes such elements as organization of space, proportion, scale, technology, ornamentation, and materials.

---

[10] *Patrick W. Andrus and Rebecca H. Shrimpton, National Register Bulletin 15: How to Apply the National Criteria for Evluaation (Washington, DC: U.S. Department of the Interior, National Park Service, 1990, rev. ed. 1998), 44-45.*

Design also:

> ...Reflects historic functions and technologies as well as aesthetics. It includes such considerations as the structural system; massing; arrangement of spaces; pattern of fenestration; textures and colors of surface materials; type, amount and style of ornamental detailing…

In this case, the exterior design of the Sports Arena does appear to be intact. The most significant change was the addition of the ticket office on the south side, which moved the main entrance from the east to the south. This should be a reversible change. Similarly, the blue tint of the roof is gone, because the blue tiles were removed. This, too, is a reversible alteration. The interior design, primarily the organization of space, proportion and scale are relatively unchanged since the building was opened to the public. Materials have been changed, and much of the original technology and ornamentation is gone. Therefore, the design of the interior is not intact.

Materials are the "physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property."

Externally, there have been several changes, such as the roof material, the moving of the main entrance from the east side to the south side and the addition of the ticket area to facilitate this change. The shape and size of the roof is intact; it is mainly the exterior material, the tiles, which have been replaced. The original blue tiles were apparently chosen specifically at the time. However, that material is no longer available and the contractors chose to replace it with a different matter. The color has changed from blue to green, which matches surrounding buildings and provides some continuity. From the outside, the integrity of design has been diminished.

Internally, there have been various changes over time, including the terrazzo floors, the concession stands, the bathrooms, the signage and the introduction of seismic braces elements. Original historic material remains, such as the original seats and the organization of space at the concourse level. Loss of historic fabric, part of the original design, affects the integrity of design.

Workmanship is defined as "the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory." This usually refers to craftsmanship, unique or artisan details, methods of construction and/or building techniques. Two construction items have been identified as important aspects of workmanship: the longest single truss ever erected at the time and the blue tile roof. The truss remains, but it is not the longest ever erected anymore, and the blue tiles have been removed and replaced with a different type and color of roof material.

Furthermore, the Sports Arena does not exhibit any of Welton Becket's innovative techniques that were used in earlier designs, such as overseeing every detail of the design ("total design"), or techniques used in the General Petroleum Building/Garage and the Prudential Building. The Sports Arena interior followed the design of most arenas of the period, although it may have been one of the earlier ones that

did not have obscured seating (due to support posts). Based on this information, it does not appear that there is overriding importance in the workmanship of the Sports Arena.

Therefore, the Sports Arena appears to retain integrity of setting, location and association, but lacks integrity of design, materials and workmanship.

Criteria for evaluating the significance of historical resources.[11]

To be eligible for the California Register of Historical Resources, an historical resource must be significant at the local, state or national level under one or more of the following four criteria:

1) *It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;*

The Sports Arena is a multi-purpose facility, despite its official name. However, it was the idea that Los Angeles needed professional sports teams that motivated civic leaders who saw the need for an enclosed sports structure as a way to lure professional sports teams to the area. These promoters saw the lack of professional sports in Los Angeles as a significant cultural inequality with cities of equal or even lesser population. There were several sports facilities in use from the time planning began until the arena was opened to the public, but none quite like the Sports Arena.

Local boosters recognized there was a gap between the enclosed Grand Olympic Auditorium downtown and the Pan Pacific Auditorium in the Fairfax area, which sat only 6,000 people, and the open-air Coliseum and Rose Bowl, which sat up to 90,000, located near downtown Los Angeles and in Pasadena, respectively. There was a recognized need by the civic leaders for a modern, enclosed facility that sat around 15,000-20,000 and would allow the city to compete with other cities for conventions, rallies, sports teams and exhibits.

The Sports Arena was to be modern, air-conditioned, and have the most up-to-date amenities; it was a venue that would attract audiences as well as organizations and the press (especially television media). The design would take into account the need for ample space for the media and would be multi-functional. At the time, there were no other facilities that could meet those requirements. It required many years and significant efforts to find a suitable location and creative ways to obtain the funding for construction.

Numerous events occurred at the Sports Arena that would be considered important to the history of both Los Angeles and Southern California, as well as to local, state and national politics and civil rights issues. In 1960, the Democratic National Convention nominated John F. Kennedy for the Democratic Party's

---

[11] *California Register of Historical Resources criteria: PRC Section 5024.1(c).*

candidate for President at the Sports Arena. The 1961 Freedom Rally, sponsored by the Western Christian Leadership Conference, featured Dr. Martin Luther King, Jr. as their primary speaker. At the time, it was believed to be the largest gathering of African Americans in Southern California. The Sports Arena was where Wilt "The Stilt" Chamberlain played his first professional basketball game, with the Philadelphia Warriors against the Los Angeles Lakers (although Chamberlain would later join the Lakers).

It was where the first professional hockey team in Los Angeles, the Kings, played until the Great Western Forum was finished and where semi-professional hockey was played from 1959 to 1967 (the Blades); it was where semi-professional and professional basketball teams such as the Jets, the Stars, the Clippers and the Lakers played; college basketball teams from UCLA and USC played here; the NCAA held their tournament here; as well as boxing matches. Other events that were held at the Sports Arena included rodeos, home shows, auto shows, circuses, water follies and roller derbies. Also, anti-communism classes, conventions, rallies, conventions and fundraisers were hosted at the Sports Arena.

Although the period of significance has been established as 1959 to 1967, the Sports Arena has continued to provide space and accommodation for local professional sports teams, college sports and tournaments, as well as fulfilling the function to house a variety of other exhibitions, shows and gatherings. Furthermore, although the building lacks integrity of materials and workmanship, it does retain enough integrity of exterior design to convey the original design.

Therefore, the Sports Arena appears eligible for the California Register of Historical Resources under Criterion 1 for its association with events that have made a significant contribution to Los Angeles history.

2) *It is associated with the lives of persons important to local, California, or national history;*

The Sports Arena has been visited or employed by or otherwise associated with many important persons in architecture, politics, sports and entertainment. In order for the Sports Arena to be eligible under this criterion, it is generally accepted that a resource illustrates a person's most important achievements, and had a close personal association. This usually reflects the time period during which the person achieves significance or during their productive life. The Sports Arena does not appear to meet this criterion because the appearances there by important persons such as John F. Kennedy and Martin Luther King, Jr. were of short duration.

3) *It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values;*

Welton Becket, a well-respected and well-known architect in the Los Angeles area, designed the Sports Arena. Although it was not the only indoor sports facility (Pan Pacific Auditorium and Pauley Pavilion), or structure used for musical events (the Music Center in downtown Los Angeles) Becket and his company designed, it was the recipient of a Southern California Chapter, American Institute of Architects Grand Prix award in 1963. Along with 30 other buildings in the Los Angeles region, the Sports Arena

was singled out as a "prime example of post-World War II architecture"; three other Becket designs also received this honor that year.

The Sports Arena was constructed in such a manner that there were no internal poles or posts that could obstruct view of the activities on the floor. It kept the cost of the building down by limiting the amount of steel needed for construction. At the time, this included the longest single truss ever erected on an arena. The Sports Arena also embodies the characteristics of an arena, as described above. However, there is no evidence that any of the innovative techniques that epitomized Becket's designs, particularly those constructed in the 1940s and 1950s, were employed in the design of the Sports Arena. The exterior design of the Sports Arena is intact or changes are reversible, but the materials are not intact. It does not represent the work of Welton Becket and his architecture firm, and it does not possess high artistic value. Therefore, the Sports Arena does not appear to meet this criterion.

4) *It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.*

There is no reason to believe that the Sports Arena has yielded, or will yield information important to the prehistory or history of the local area, California, or the nation.

Conclusion

In conclusion, the Los Angeles Memorial Sports Arena appears eligible for the California Register of Historical Resources under Criterion 1 for its association with events that have made a significant contribution to Los Angeles history. It does not appear to meet Criteria 2, 3, or 4. As such, the impacts associated with the proposed removal of the Sports Arena under Criterion 1 would be considered potentially significant.

MITIGATION MEASURES

The Proposed Project would result in the demolition of a significant historic resource, the demolition of which would constitute an unavoidable adverse impact upon the environment. There are no mitigation measures available for the loss of a facility, which has association with events that have made a significant contribution to Los Angeles history. Nevertheless, the following mitigation measures are recommended to document the Sports Arena for posterity:

MM D-1. Prior to the issuance of a demolition permit, a report documenting the architectural and historical features of the Sports Arena shall be prepared and offered to the Southern California Information Center at California State University, Fullerton, and the City. The report shall include the following:

a) A written report according to the Historic American Building Survey (HABS) narrative format, which includes historical and descriptive information;

b) Duplicates of historic photographs, if available;

c) Duplicates of original drawings, if available; and

d) Large format (4-inch by 5-inch negative or larger) black and white 35-millimeter photographs based on HABS guidelines. The photographs shall be keyed to a floor and site plan to show the location of each photograph taken. Views shall include the setting, important site features, all exterior elevations, detailed views of significant exterior architectural features, and interior views of significant spaces and features.

LEVEL OF IMPACT AFTER MITIGATION

The removal of the Sports Arena, which has association with events that have made a significant contribution to Los Angeles history, would be considered significant and unavoidable.

IV. ENVIRONMENTAL IMPACT ANALYSIS
E. HYDROLOGY AND WATER QUALITY

ENVIRONMENTAL SETTING

Regulatory Framework

The Project Site is subject to regulation of surface water by the United States Environmental Protection Agency (USEPA), the California State Water Resources Control Board (SWRCB), the Los Angeles Regional Water Quality Control Board (LARWQCB), and the County and City of Los Angeles. Regulations include both requirements for direct and indirect permits that regulate surface water discharges and other waster quality programs and requirements.

Applicable Federal Regulations

Clean Water Act

The USEPA regulates water quality under the Clean Water Act (also known as the Federal Water Pollution Control Act). Enacted in 1972, and significantly amended in subsequent years, the Clean Water Act is designed to restore and maintain the chemical, physical, and biological integrity of waters in the United States. The Clean Water Act provides the legal framework for several water quality regulations, including National Pollutant Discharge Elimination System (NPDES) Permits, effluent limitations, water quality standards, pretreatment standards, anti-degradation policy, non-point source discharge regulation, and wetlands protection.

The Clean Water Act requires NPDES permits for the discharge of pollutants to waters of the United States. In 1987, the Clean Water Act was amended to require that the USEPA establish regulations for permitting of municipal and industrial stormwater discharges under the NPDES permit program. The USEPA published final regulations regarding stormwater discharges on November 16, 1990. The regulations require that municipal separate storm sewer system (MS4) discharges to surface waters be regulated by a NPDES permit.

The USEPA has delegated the responsibility for administration of portions of the Clean Water Act to state and regional agencies. The Clean Water Act requires states to adopt water quality standards for receiving water bodies and to have those standards approved by the USEPA. Water quality standards consist of designated beneficial uses for a particular receiving water body (e.g., wildlife habitat, agricultural supply, fishing, etc.), along with water quality criteria necessary to support those uses. Water quality criteria are prescribed concentrations or levels of constituents, such as lead, suspended sediment, and fecal coliform bacteria, or narrative statements that represent the quality of water that support a particular use.

National and State Safe Drinking Water Acts

The Federal Safe Drinking Water Act, established in 1974, sets drinking water standards throughout the country and is administered by the USEPA. The drinking water standards established in the Act, as set forth in the Code of Federal Regulations (CFR), are referred to as the National Primary Drinking Water Regulations (Primary Standards, Title 40, CFR, Part 141) and the National Secondary Drinking Water Regulations (Secondary Standards, 40 CFR Part 143). California passed its own Safe Drinking Water Act in 1986 that authorizes the State's Department of Health Services (DHS) to protect the public from contaminants in drinking water by establishing maximum contaminants levels (MCLs), as set forth in the California Code of Regulations (CCR), Title 22, Division 4, Chapter 15, that are at least as stringent as those developed by the USEPA, as required by the federal Safe Drinking Water Act.

Federal Anti-degradation Policy

The Federal Anti-degradation Policy (Title 40, CFR §131.12) requires states to develop statewide anti-degradation policies and identify methods for implementing them. Pursuant to this policy, state anti-degradation policies and implementation methods shall, at a minimum, protect and maintain: (1) existing in-stream water uses; (2) existing water quality where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that allowing lower water quality is necessary to accommodate economic and social development in the area; and (3) water quality in waters considered an outstanding national resource. State permitting actions must be consistent with the Federal Anti-degradation Policy.

Applicable State and Local Regulations

California Toxics Rule

The California Environmental Protection Agency (CalEPA) has established water quality criteria for certain toxic substances via the California Toxics Rule. The California Toxics Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water, such as inland surface waters and enclosed bays and estuaries, that are designated by the LARWQCB as having beneficial uses protective of aquatic life or human health. Due to the intermittent nature of stormwater runoff, especially in southern California, the acute criteria are considered to be more relevant to stormwater than are the chronic criteria.

California Toxics Rule criteria for certain metals are expressed as a function of hardness because hardness and/or water quality characteristics that are usually correlated with hardness can reduce or increase the toxicities of some metals. Hardness is used as a surrogate for a number of water quality characteristics that affect the toxicity of metals; increasing hardness has the effect of decreasing the toxicity of metals. At higher hardness values for the receiving water, copper, lead, and zinc are more likely to be complexed (bound with) components in the water column; this, in turn, reduces the bioavailability and resulting potential toxicity of these metals.

California Porter-Cologne Act

The Porter-Cologne Water Quality Control Act (embodied in the California Water Code) established the principal California legal and regulatory framework for water quality control. The California Water Code authorizes the SWRCB to implement the provisions of the Federal Clean Water Act including the authority to regulate waste disposal sites and to require cleanup of discharges of hazardous materials and other pollutants. The California Water Code also establishes reporting requirements for unintended discharges of hazardous substance, sewage, or oil or petroleum products.

Under the California Water Code, the State of California is divided into nine regions governed by regional water quality control boards (RWQCB) and under the guidance and review of the SWRCB, implement and enforce provisions of the California Water Code and the Clean Water Act. Each RWQCB must formulate and adopt a water quality control plan (Basin Plan) for its region. The Basin Plan must conform to the policies set forth in the California Water Code and established by the SWRCB in its state water policy. The California Water Code also provides RWQCBs the authority to include within its regional plan water discharge prohibitions applicable to particular conditions, areas, or types of waste.

Construction Permits

Pursuant to the Clean Water Act Section 402(p), requiring regulations for permitting of certain stormwater discharges, the SWRCB has issued a statewide general NPDES Permit and Waste Discharge Requirements for stormwater discharges from construction sites (NPDES No. CAS000002) California Water Resources Control Board Resolution No. 2001-046, Modification of Water Quality Order 99-08-DWQ SWRCB NPDES General Permit for Stormwater Discharges Associated with Construction Activity (adopted by the SWRCB on April 26, 2001). Effective July 1, 2010 all dischargers are required to obtain coverage under the Construction General Permit Order 2009-0009-DWQ adopted on September 2, 2009. Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility.

Under this Construction General Permit, discharges of stormwater from construction sites with a disturbed area of one or more acres are required to either obtain individual NPDES permits for stormwater discharges or be covered by the Construction General Permit. Coverage under the Construction General Permit is accomplished by completing and filing a Notice of Intent with the SWRCB. Each Applicant under the Construction General Permit must ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared prior to grading and implemented during construction. The primary objective of the SWPPP is to identify, construct, implement, and maintain BMPs to reduce or eliminate pollutants in stormwater discharges and authorized non-stormwater discharges from the construction site during construction.

Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit

The State's Municipal Storm Water Permitting Program regulates stormwater discharges from MS4s. Under Phase I of the Program, which started in 1990, the RWQCBs have adopted NPDES stormwater permits for medium (serving between 100,000 and 250,000 people) and large (serving 250,000 people) municipalities. Most of these permits were issued to a group of co-permittees encompassing an entire metropolitan area.

In 2001, the LARWQCB issued an NPDES Permit and Waste Discharge Requirements (Order No. 01-182) under the Clean Water Act and the Porter-Cologne Act for discharges of urban runoff in public storm drains in Los Angeles County. The Permit was amended on September 14, 2006 by Order No. R4-2006-0074. The permittees are the Los Angeles County cities (including the City of Los Angeles) and the County (collectively "the Co-permittees"). The MS4 permit details requirements for new development and significant redevelopment, including specific sizing criteria for treatment BMPs and flow control requirements.

To implement the requirements of the NPDES permit, the Co-permittees have created development planning guidance and control measures that control and mitigate stormwater quality and quantity impacts to receiving waters as a result of new development and redevelopment. The Co-permittees are also required to implement other municipal source detection and elimination programs, as well as maintenance measures.

Stormwater Quality Management Program

The Los Angeles County MS4 Permit requires the Co-permittees to implement a Stormwater Quality Management Program (SQMP). The SQMP summarizes the program components the Co-permittees will implement to comply with the MS4 Permit. The Los Angeles County MS4 Permit contains the following provisions for implementation of the SQMP by the Co-permittees:

- General Requirements – Each Permittee is required to implement the SQMP to comply with applicable storm water program requirements and implement additional controls where necessary to reduce the discharge of pollutants in stormwater to the maximum extent practicable.

- BMP Implementation – Permittees are required to implement the most effective combination of BMPs for stormwater/urban runoff pollution control.

- SQMP Revision – Permittees are required to revise the SQMP to comply with regional, watershed specific requirements, and/or waste load allocations for implementation of TMDLs for impaired waterbodies.

- Responsibilities of the Principal Permittee – The responsibilities of the Los Angeles County Department of Public Works (as the Principal Permittee) include, but are not limited to,

coordinating activities necessary to comply with the NPDES permit, providing personnel and fiscal resources to prepare SQMP updates and annual reports and summaries of reports required under the SQMP, and implementing a County-wide Monitoring Program and evaluating results of the monitoring program.

- Responsibilities of Co-permittees – Each Co-permittee is required to comply with the requirements of the SQMP applicable to the discharges within its boundaries.
- Watershed Management Committees (WMCs) – WMCs are comprised of a voting representative from each Permittee within the Watershed Management Areas (WMAs). WMCs are required to facilitate efforts and exchange of information between Co-permittees, establish additional goals for WMAs, prioritize pollution control efforts, monitor implementation of tasks designated for the WMA, and assess the effectiveness of and recommend revisions to the SQMP.
- Legal Authority – Co-permittees are granted the necessary legal authority to prohibit non-storm water discharges to the storm-drain system.

The objective of the SQMP is to reduce pollutants in urban stormwater discharges to the maximum extent practicable in order to attain water quality objectives and to protect the beneficial uses of receiving waters in Los Angeles County. Special provisions are provided in the Los Angeles County MS4 Permit to facilitate implementation of the SQMP. These provisions include:

- BMP substitution;
- Public Information and Participation Program (PIPP);
- Industrial/Commercial Facilities Control Program;
- Development Planning Program;
- Development Construction Program;
- Public Agency Activities Program; and
- Illicit Connections and Illicit Discharges Elimination Program.

Standard Urban Stormwater Mitigation Plan (SUSMP)

On March 8, 2000, the development planning program requirements, including the SUSMP requirements (collectively, development planning program requirements, including SUSMP requirements, are referred to in this EIR/EIS as SUSMP requirements) were approved by the LARWQCB as part of the MS4 program to address stormwater pollution from new construction and redevelopment. The SUSMP contains a list of minimum BMPs that must be employed to infiltrate or treat stormwater runoff, control

peak flow discharge, and reduce the post-project discharge of pollutants from stormwater conveyance systems. The SUSMP defines, based upon land use type, the types of practices that must be included and issues that must be addressed as appropriate to the development type and size.

Finalized in September 2002, the County of Los Angeles' Manual for the Standard Urban Stormwater Mitigation Plan details the requirements for new development and significant redevelopment BMPs (Los Angeles County, 2002) (the "Manual"). The Manual is a model guidance document for use by the Co-permittees and certain individual project Applicants to select post-construction BMPs and otherwise comply with the SUSMP requirements. The Manual addresses water quality and drainage issues by specifying design standards for structural or treatment control BMPs that infiltrate or treat stormwater runoff and control peak flow discharge. BMPs are defined in the Manual and SUSMP requirements as "any program, technology, process, sizing criteria, operational methods or measures, or engineered systems, which, when implemented, prevent, control, remove, or reduce pollution." Treatment BMP design criteria and guidance are also contained in the Los Angeles County MS4 Permit, the Manual, and in the Technical Manual for Stormwater Best Management Practices in the County of Los Angeles, issued by the Los Angeles County Department of Public Works in February 2004.

General Waste Discharge Requirements for Dischargers of Groundwater From Construction and Project Dewatering

The LARWQCB has issued a General NPDES Permit and General Waste Discharge Requirements (WDRs) (Order No. R4-2003-0111, NPDES No. CAG994004) governing construction-related dewatering discharges (the "General Dewatering Permit"). This permit addresses discharges from temporary dewatering operations associated with construction and permanent dewatering operations associated with development. The discharge requirements include provisions mandating notification, sampling and analysis, and reporting of dewatering and testing-related discharges. The General Dewatering Permit authorizes such construction-related activities so long as all conditions of the permit are fulfilled.

City of Los Angeles Water Quality Compliance Master Plan for Urban Runoff (WQCMPUR)

The WQCMPUR was developed in response to City Council Motion CF 07-0663, dated March 2, 2007, calling for reducing pollution from urban runoff. The WQCMPUR was developed through a combined effort of the Management Committee (Mayor's Office, Council Districts 1 and 11, Office of the Chief Legislative Analyst, Board of Public Works, Bureau of Sanitation), the Project Team, and stakeholders. The WQCMPUR provides a description of the Los Angeles watersheds, the concerns about the quality of urban runoff, the ongoing City efforts to address those concerns, a strategy for future urban runoff management, and a financial plan to support this strategy.

The primary goal of the WQCMPUR is to help meet water quality regulations. Implementation of the WQCMPUR over the next 20 to 30 years is expected to result in cleaner neighborhoods, rivers, lakes and bays, augmented local water supply, reduced flood risk, more open space, and beaches that are safe for

swimming. The WQCMPUR also supports the Mayor and Council's efforts to make Los Angeles the greenest major city in the nation. The underlying themes of the WQCMPUR are as follows:

- Identifying where the beneficial uses of our waters are impaired, and applying technologies and strategies to improve water quality;
- Planning and building more livable, healthier and sustainable communities;
- Investing in research and technologies to support allocation of City tax dollars to work toward the most cost effective solutions;
- Reducing administrative barriers and fostering new partnerships among City departments, allowing for a clearer focus on water quality improvement;
- Increasing public involvement and participation through education and outreach, creating a strong stewardship mentality among citizens;
- Leveraging the strength and motivations of the residents of Los Angeles to build, support, and to share in the achieving of our mission; and
- Conducting assessments of the implementation of the plan, and the progress towards meeting water quality regulations in each watershed.

Chapters 1 through 8 of the WQCMPUR present an overview of the existing status of urban runoff management in the City. Some of the elements in this part include a description of the four watersheds in the City, urban runoff pollutant sources and their distribution over the City, regulatory requirements for water quality, existing watershed management, and related plans for compliance with regulatory requirements. Chapter 9 looks at the future of urban runoff management in the City and distinguishes between three initiatives, which include the following:

- Water Quality Management Initiative - discusses the various technical components that go into developing projects for the Water Quality Management Plans to comply with stormwater regulations;
- Citywide Collaboration Initiative – discusses what is needed to revise and develop City policies, ordinances, and guidelines for urban development and redevelopment to focus on green solutions, Low Impact Development (LID), and stormwater use while increasing coordination Citywide;
- Outreach Initiative – discusses how the City will enhance outreach activities to reach target audiences, and establish methods to quantify the water quality benefits achieved through outreach activities.

Chapter 10, the financial plan, evaluates current and future revenues, and provides an estimate of the costs needed for implementing the strategies proposed by the WQCMPUR as well as opportunities for funding.

In summary, the WQCMPUR takes a comprehensive view of our City and provides the strategic directions for managing urban runoff over the next 20 to 30 years. However, urban runoff management is an area with many remaining technical unknowns in an ever-changing public policy landscape. The WQCMPUR will be revisited to adjust its course in response to demographic, regulatory, political, and technological changes.

Existing Conditions at the Project Site

Surface Water

The 15-acre Project Site consists of mostly impermeable surfaces as the site is developed with the Sports Arena structure, concrete paved walkways and asphalt covered parking areas. It is estimated that approximately 10 to 15 percent of the 15-acre site is covered with permeable landscaped areas. Surface water from the site is conveyed in part to the landscaped areas, with excess runoff diverted to the surface gutters and storm drain inlets in Figueroa Street and Martin Luther King, Jr. Boulevard. Surface water runoff is conveyed from the site to the Los Angeles River Flood Control Channel through a network of reinforced concrete pipes.

THRESHOLDS OF SIGNIFICANCE

Surface Water Hydrology

The City of Los Angeles *CEQA Thresholds Guide* states that a project would normally have a significant impact on surface water hydrology if the project would result in the following:

(a) Cause flooding during the projected 50-year developed storm event, which would have the potential to harm people or damage property or sensitive biological resources;

(b) Substantially reduce or increase the amount of surface water in a water body; or

(c) Result in a permanent, adverse change to the movement of surface water sufficient to produce a substantial change in the current or direction of water flow.

Groundwater Level

The City of Los Angeles *CEQA Thresholds Guide* states that a project would normally have a significant impact on groundwater level if the project would result in the following:

(d) Change potable water level sufficiently to:

- Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported water, summer/winter peaking, or to respond to emergencies and drought;
- Reduce yields of adjacent wells or well fields (public or private); or
- Adversely change the rate or direction of flow of groundwater.

or

(e) Result in demonstrable and sustained reductions of groundwater recharge capacity.

Surface Water Quality

Based on the City of Los Angeles *CEQA Thresholds Guide*, a project would have a significant impact on water quality if:

(f) It discharges associated with the project would create pollution, contamination, or nuisance as defined in Section 13050 of the California Water Code or that cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body.

Groundwater Quality

Based on the City of Los Angeles *CEQA Thresholds Guide*, a project would result in a significant impact on groundwater quality if the project would result in the following:

(g) Expansion of an area affected by contaminants;

(h) Increase the level of groundwater contamination (including that from direct percolation, injection or salt water intrusion); or

(i) Cause regulatory water quality standards at an existing production well to be violated, as defined in the CCR, Title 22, Division 4, Chapter 15 and in the Safe Drinking Water Act.

ENVIRONMENTAL IMPACTS

Surface Water Quality

During construction, sediment is typically the constituent of greatest potential concern. The greatest risk of soil erosion during the construction phase occurs when site disturbance peaks due to grading activity and removal and re-compaction or replacement of fill areas. (Sediment is not typically a constituent of concern during the long-term operation of developments similar to the Project because sites are usually paved, and proper drainage infrastructure is installed.) Other pollutants that could affect surface-water

quality during the Project construction phase include petroleum products (gasoline, diesel, kerosene, oil, and grease), hydrocarbons from asphalt paving, paints and solvents, detergents, fertilizers, and pesticides (including insecticides, fungicides, herbicides, and rodenticides). As discussed above, discharges of stormwater from construction sites with a disturbed area of one or more acres are required to either obtain individual NPDES permits for stormwater discharges or be covered by the Construction General Permit. Coverage under the Construction General Permit is accomplished by completing and filing a Notice of Intent with the SWRCB. Under the Construction General Permit, the project contractor must ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared prior to grading and implemented during construction. The primary objective of the SWPPP is to identify, construct, implement, and maintain BMPs to reduce or eliminate pollutants in stormwater discharges and authorized non-stormwater discharges from the construction site during construction. Mitigation Measure E-1 provided below requires the Project Applicant to prepare a SWPPP to the satisfaction of the City of Los Angeles Department of Building and Safety prior to the issuance of building permits.

Once the Project has been constructed with either Options 1 or 2, urban runoff from the Project Site would have the potential to include all of the above contaminants. Trace metals from pavement runoff and landscape maintenance debris may be mobilized in wet-season storm runoff from driveway areas and landscaping, and in dry-season "nuisance flows" from landscape irrigation. Liquid product spills occurring at the Project Site could also enter the storm drain. Dry product spills could enter the storm drain via runoff in wet weather conditions or dry-season "nuisance flows."

The Project Applicant would be required to prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program for both Options 1 and 2. The SUSMP shall detail the treatment measures and BMPs to control pollutants associated with a storm event producing ¾-inch of rainfall in a period of 24 hours prior to its discharge to the public storm drainage system. The SUSMP also would include an erosion control plan that outlines erosion and sediment control measures that would be implemented during the post-construction phases of Project development. Table IV.E-1 outlines the SUSMP requirements and the corresponding BMPs that would be incorporated into the Project. In addition, the SUSMP would include construction-phase housekeeping measures for control of contaminants such as petroleum products, paints and solvents, detergents, fertilizers, and pesticides. It would also describes the post-construction BMPs (e.g., biofiltration swales, flow-through planters, and educational materials) used to reduce pollutant loadings in runoff and percolate once the site is occupied and would set forth the BMP monitoring and maintenance schedule and responsible entities during the post-construction phases. Preparation and implementation of the SUSMP would ensure that water quality impacts of the Project would be minimized and that the Project would not violate any water quality standards. Therefore, Project impacts related to surface water quality would be less than significant.

Table IV.E-1
SUSMP Requirements and Corresponding BMPs

SUSMP Requirement	Criteria/Description	Corresponding BMPs
1. Peak Stormwater Runoff Discharge Rates	To comply with Los Angeles County Urban Flood Protection requirements, the Post-development runoff from the 25-year storm shall not exceed the predevelopment peak flow rate, from the 25-year storm.	25-year post-development peak flows would be controlled to levels that are equal to or less than existing conditions.
2. Conserve Natural Areas	• Concentrate or cluster development on portions of a site while leaving the remaining land in a natural undisturbed condition. • Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection. • Maximize trees and other vegetation at each site, planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants. • Promote natural vegetation by using parking lot islands and other landscaped areas. • Preserve riparian areas and wetlands.	The Project Site is located in a densely urbanized setting. The Project entails redevelopment of existing areas that have a high level of impervious cover. There is limited existing open space on the Project Site, and no riparian features. Under both Option 1 and 2 the Proposed Project would result in an increase in pervious area and would thus decrease surface water runoff as more water would be able to be captured and filtered by landscaped areas. The Project would include landscape features with drought tolerant native vegetation and trees. Treatment BMPs would be incorporated into landscape areas that would help to reduce runoff volumes. And, as stated above, runoff under the Proposed Project would be reduced compared to existing conditions.
3. Minimize Stormwater Pollutants of Concern	• Minimize to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas, to the stormwater conveyance system as approved by the building official.	Treatment control BMPs would be selected to address the pollutants of concern for the Project. These BMPs would be selected to minimize introduction of pollutants to the maximum extent practicable and to promote treatment and volume reduction to a level that satisfies the minimum SUSMP requirement. As noted in Project Requirement E-2, a SUSMP would be prepared for the Project and would include a number of source control measures to control

Table IV.E-1
SUSMP Requirements and Corresponding BMPs

SUSMP Requirement	Criteria/Description	Corresponding BMPs
		pollutants to the maximum extent practicable, including proper design of loading docks and trash storage areas, regular street sweeping of streets, parking areas, and pedestrian areas, proper storage and use of fertilizers and pesticides used in common area landscaping, use of native and/or non-invasive vegetation, and directing parking lot and road runoff to vegetated areas as feasible. Roof runoff would be directed to vegetated planter boxes located in common areas. The Project would comply with all NPDES Permit and waste discharge requirements for temporary or permanent groundwater dewatering (if required) and with the Construction General Permit. See Groundwater Quality subheading in this section for a detailed discussion.
4. Protect Slopes and Channels	Project plans must include BMPs consistent with local codes and ordinances and the SUSMP to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff.	The potential for soil erosion as a result of runoff from the Project Site limited by the high impervious cover and the topography of the depression created by the demolition and excavation of the Sports Arena foundation, which lies below grade. The amphitheater under Option 1 and the Soccer field level under Option 2 would retain the current topographical depression thus minimizing off site erosion. The Project Contractor would be required to implement a SWPPP to the satisfaction of the Department of Building and Safety.
5. Provide Storm Drain System Stenciling and Signage	• All storm drain inlets and catch basins within the Project area must be stenciled with prohibitive language and/or graphical icons to discourage illegal dumping. • Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at	All storm drain inlets and water quality inlets would be stenciled or labeled. No public access points are or would be located along channels within the Project area. The Project contractor would be responsible for maintaining storm drain stencils within their property. The City would be responsible for maintaining storm drain stencils within the public

Table IV.E-1
SUSMP Requirements and Corresponding BMPs

SUSMP Requirement	Criteria/Description	Corresponding BMPs
	public access points along channels and creeks within the Project area. • Legibility of stencils and signs must be maintained.	right-of-way.
6. Properly Design Outdoor Material Storage Areas	Where Project plans include outdoor areas for storage of materials that may contribute pollutants to the storm water conveyance system, measures to mitigate impacts must be included.	Outdoor materials storage areas would be covered and isolated from stormwater runoff.
7. Properly Design Trash Storage Areas	All trash containers must meet the following structural or treatment control BMP requirements: • Trash container areas must have drainage from adjoining roofs and pavement diverter around the areas. • Trash container areas must be screened or walled to prevent offsite transport of trash.	All trash facilities would be covered and isolated from stormwater runoff.
8. Provide Proof of Ongoing BMP Maintenance	Applicant required is required to provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, and/or Conditional Use Permits.	The Project Contractor would be responsible for ensuring the ongoing maintenance of BMPs. As stated in the SUSMP Manual, verification would include the developer's signed statement, as part of the Project application, accepting responsibility for all structural and treatment control BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance.
9. Design Standards for Structural or Treatment Control BMPs	Post-construction Structural or Treatment Control BMPs shall be designed to: Mitigate (infiltrate or treat) stormwater runoff from either: a) Volumetric Treatment Control BMPs; or b) Flow-based Treatment Control BMPs;	Stormwater treatment facilities would be designed to meet or exceed the sizing standards outlined in the SUSMP manual. Volume-based treatment control BMPs for the Project would be designed to collect and treat, at a minimum, the volume of runoff produced from a 0.75-inch storm event at a minimum, prior to its discharge to a stormwater

Table IV.E-1
SUSMP Requirements and Corresponding BMPs

SUSMP Requirement	Criteria/Description	Corresponding BMPs
	AND Control peak-flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.	conveyance system. Flow-based BMPs would be sized to collect and treat the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity. The size of the facilities would be finalized during the design stage by the Project engineer with the final hydrology study, which would be prepared and approved to ensure consistency with the EIR analysis prior to issuance of a final grading permit. The types of treatment control BMPs that would be employed are bioretention (stormwater boxes) and media filtration.
10.F.1. Properly Design Parking Area (Parking Lots)	• Reduce impervious land coverage of parking areas. • Infiltrate runoff before it reaches the storm drain system. • Treat runoff before it reaches storm drain system.	Under Option 1, Multiple Use Space, the fully landscaped Project Site would be capable of providing surplus parking for Coliseum events. The amount of pervious land coverage would be increased, thus allowing increased infiltration of runoff. The turf covered landscaping would also serve to capture and treat oil and grease deposits and would serve to reduce the pollutant loads entering the storm drains. Under Option 2, MLS Stadium, the amount of landscaping would be increased as compared to existing conditions, but less parking would be provided as compared to Option1. The Project under both options would improve water quality.
10.F.2. Properly Design to Limit Oil Contamination and Perform Maintenance (Parking Lots)	• Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used. • Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal	Stormwater runoff from parking areas would be minimal, as the overflow parking area under Option 1 would be fully landscaped with turf. Any parking areas developed under Option 2 would direct surface flows to adjacent planter boxes and landscaped areas to capture, retain and treat surface water flows.

Sources: Development Best Management Practices Handbook, Part B Planning Activities, City of Los Angeles Department of Public Works, Bureau of Sanitation Stormwater Program; and Development Planning for Storm Water Management, September 2002, Los Angeles County Department of Public Works.

Groundwater Quality

In its existing condition, the Project Site is mostly impervious, and all runoff is directed toward landscaped areas or the local stormdrain system. Thus, the site is not an area that provides any groundwater recharge, and the Project would not affect this condition. No groundwater wells are located within the project boundaries and the project would not impact any groundwater wells. As discussed above, the Project Contractor would be required to comply with existing regulatory requirements pertaining to water quality that would ensure the Project would not result in any significant groundwater quality impacts.

Groundwater Supply/Recharge

The Project Site is mostly impervious, and all runoff is directed toward landscaped areas or the local stormdrain system; the site is not an area that provides any substantial groundwater recharge. The development of the Project under either Option 1 or 2 would increase the amount of pervious areas and stormwater conditions would be improved compared to existing conditions. The Project Site is not a source of groundwater pumping for potable water usage. Therefore, Project impacts related to groundwater supply/recharge would be less than significant.

Alteration of Drainage Causing Erosion/Siltation

As stated previously, the Project Site in its existing state is mostly impervious. Stormwater runoff from the site discharges to landscaped areas or to the local stormdrain system. Development of Option 1 would greatly increase the permeability of the site, as most of the 15-acre site would be converted to landscaped areas. Minimal paving would be required for pedestrian pathways and for the concrete stage/foundation within the amphitheater. Under Option 2, MLS Stadium, permeable areas would be only slightly increased as compared to the existing conditions, and the Stadium would be an open air and uncovered stadium. Thus, under either Option, the project design would not increase the amount of impervious areas and stormwater conditions would be improved compared to existing conditions. The potential for erosion/siltation as a result of runoff from the Project Site would be limited by the increased landscaped cover of the site. The landscaped areas would be designed and maintained to limit soil erosion. With respect to project construction, as noted in Project Requirement E-1, the Project Applicant would be required to implement a SWPPP to the satisfaction of the Department of Building and Safety. Therefore, impacts associated with erosion/siltation would be less than significant with mitigation.

MITIGATION MEASURES

MM E-1 The Project Applicant shall ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared and implemented during construction. The SWPPP shall be prepared to the satisfaction of the City of Los Angeles Department of Building and Safety prior to the issuance of building permits.

MM E-2 The Project Applicant must prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program. The SUSMP shall be submitted and prepared to the satisfaction of the City of Los Angeles Department of Building and Safety.

MM E-3 The Project Applicant must comply with LARWQCB's General NPDES Permit and General Waste Discharge Requirements (WDRs) (Order No. R4-2003-0111, NPDES No. CAG994004) governing construction-related dewatering discharges (the "General Dewatering Permit").

Level of Significance After Mitigation

With the implementation of Mitigation Measures E-1 through E-3, impacts related to hydrology and water quality would be less than significant.

IV. ENVIRONMENTAL IMPACT ANALYSIS
F. LAND USE PLANNING

ENVIRONMENTAL SETTING

Existing Land Uses

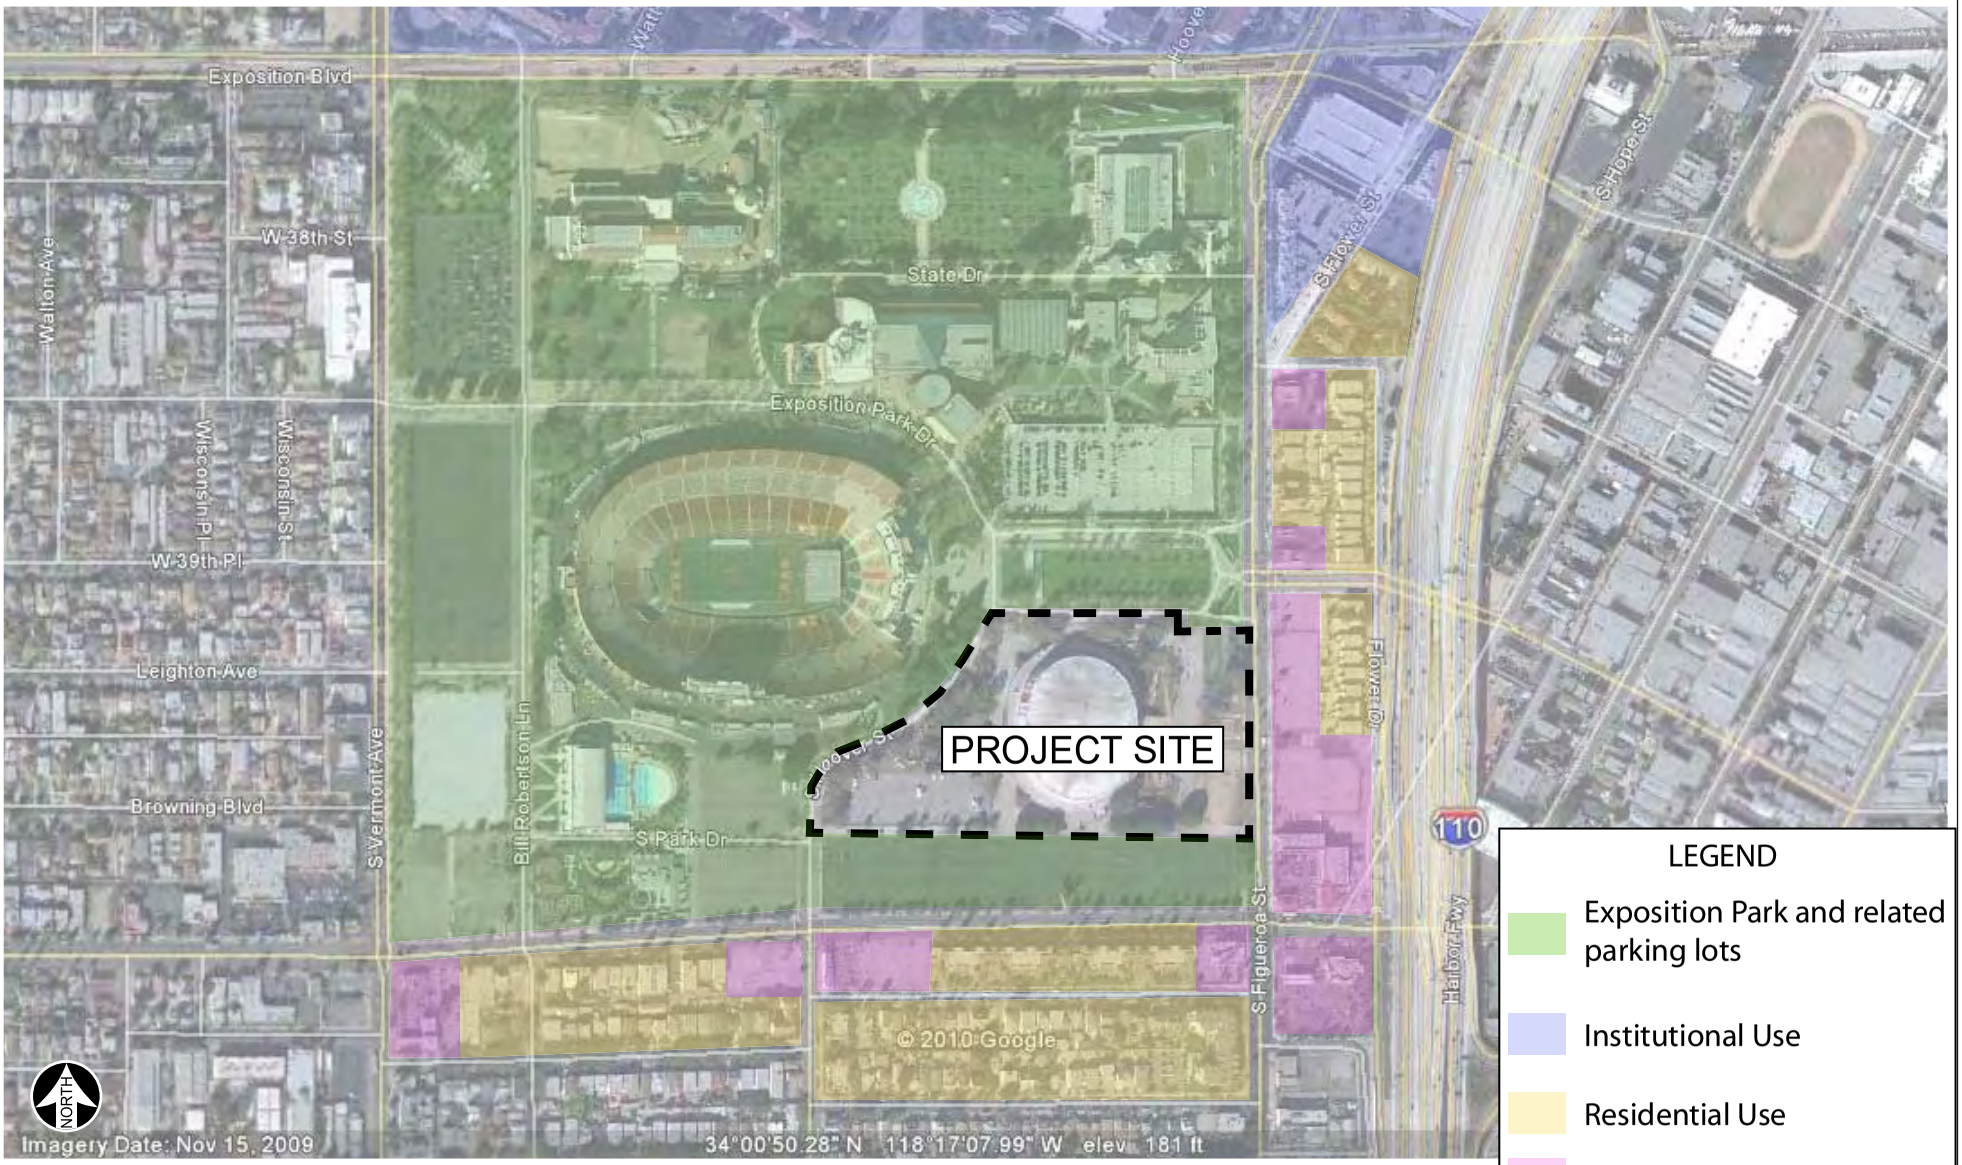
The Project Site is located within the South Los Angeles Community of the City of Los Angeles. It consists of an approximately 15-acre parcel of land occupied by the Sports Arena and associated surface parking and landscaped areas within the southeastern portion of Exposition Park, an approximately 160-acre reservation of public land established in 1908, providing cultural, entertainment, and sporting facilities in a landscaped setting for community public recreation. The Project Site is generally bounded by South Coliseum Drive on the west and north, Figueroa Street on the east, and Parking Lot 6 on the south. The Project Site is generally flat, with the exception of the Sports Arena structure and associated sunken court area.

The Los Angeles Memorial Sports Arena was originally constructed in 1959 and underwent seismic retrofit and remodeling in 2002. It is owned by the Los Angeles Memorial Coliseum Commission, which leases the parcels occupied by the Sports Arena from the State. The Sports Arena is a multi-purpose sports and entertainment facility that is currently, hosts high school basketball championships, filming, and the occasional concert and convention. In the history of its operations, the 16,740 seat indoor arena has hosted a variety of sporting events, including boxing, basketball (professional and college), and hockey, and has been home to both the Lakers and Clippers as well as to UCLA and USC basketball. It has also hosted a number of major civic events including the 1960 Democratic National Convention and the 1961 Freedom Rally, as well as numerous rock concerts, track meets, rodeos, home shows, auto shows, roller derbies, rallies, fundraisers, and Latin dances. A detailed description of the Project Site is presented in Section II. Existing Environment.

An aerial map of the Project Site and the immediately surrounding areas indicating the existing arrangement of facilities, access routes and land uses within and adjacent to the Sports Arena is provided in Figure IV.F-1, Aerial Photograph of the Project Site and Surrounding Land Uses.

Surrounding Land Uses

The Project Site is located in a developed area which is supported by existing urban infrastructure. Land uses that surround the Project Site to the north, south, and west consist of the cultural, entertainment, and sporting facilities and associated surface parking and landscaped areas that comprise Exposition Park, the largest park in the Central Los Angeles area of the City of Los Angeles. These land uses include: the Los Angeles Swim Stadium, the Los Angeles Memorial Coliseum, and associated surface parking to the west



Source: Google Earth, 2010; PARKER Environmental Consultants October 2010.

CAJA Environmental Services, LLC

Figure IV.F-1
Aerial Photograph of the Project Site and Surrounding Land Uses

and southwest; the California Science Center, the Rose Garden, the Los Angeles County Museum of Natural History, the Expo Center, the California African-American Museum, the IMAX Theater, the Wallis Annenberg Building for Science Learning and Innovation, the Dr. Theodore T. Alexander Jr. Science Center School (a Los Angeles Unified School District school), and associated surface and structure parking to the north and northwest, and; Parking Lot 6, an approximately 268,000 square foot surface parking lot, directly to the south. Immediately to the east of the Project Site is Figueroa Street, a Major Highway Class II, which is generally developed along its east side with surface parking, a USC school related use, multi-family residential uses, fast food restaurants, and a retail center. To the south of Parking Lot 6 is Martin Luther King Jr. Boulevard, a Major Highway Class II, which is generally developed with commercial and multi-family residential uses, surface parking, and retail shops along its south side. The University of Southern California (USC), a private university, is located directly north of Exposition Park, across Exposition Boulevard, a Secondary Highway. To the west of Exposition Park is Vermont Avenue, a Major Highway Class II, which is generally developed with commercial office and retail uses along its west side.

Relevant Land Use Policies

The Project Site and many of the other land uses within Exposition Park are owned or operated by the State of California. The land under which the Sports Arena (and the Coliseum) is developed is owned by the Sixth District Agricultural Association of the State of California, also known as the "California Museum of Science and Industry" (CMSI) or the "California Science Center." It is in the State and Consumer Services Agency and is deemed to be a tax-exempt organization as an instrumentality of this State in accordance with Section 23706 of the Revenue and Taxation Code (See Food and Agricultural Code Section 4101-4108). The Sports Arena is operated by the Los Angeles Memorial Coliseum Commission, a joint powers authority of the State of California, Los Angeles County and the City of Los Angeles. As a State entity, the Coliseum Commission is not subject to local General Plan and Zoning Code requirements for new development or redevelopment. Nevertheless, a conformity analysis of the Proposed Project with local plans and policies is presented in this Section.

At the regional level, the Project Site is located within the planning area of the Southern California Association of Governments (SCAG), the region's federally-designated metropolitan planning organization. The Proposed Project is also located within the South Coast Air Basin (SCAB) and therefore is within the jurisdiction of the South Coast Air Quality Management District (SCAQMD). As such, the Proposed Project is subject to SCAQMD's Air Quality Management Plan (AQMP). The Project Site is within the jurisdiction of the Los Angeles Regional Water Quality Control Board (RWQCB). In addition, the Project Site is subject to the Congestion Management Plan (CMP) for Los Angeles County.

On a local level, the Project Site is located within the South Los Angeles Community Planning Area of the City of Los Angeles. It is also located within the Exposition/University Park Redevelopment Project area, which is administered by the Community Redevelopment Agency of Los Angeles (CRA/LA).

State Plans

CMSI/Exposition Park Master Plan

As noted above, the Project Site is owned and operated under the auspices of the State of California. The CMSI/Exposition Park Master Plan is the overriding land use planning document for State-owned property and uses within Exposition Park. In 1987, the California Legislature and the Governor approved the development of the CMSI/Exposition Park Master Plan ("Master Plan"). The Master Plan included goals and objectives oriented around developing, preserving and restoring the following areas within Exposition Park: (1) the California Museum of Science and Industry; (2) the Science Museum School; (3) the Science Educational Resource Center; (4) the California African-American Museum; (5) park landscaping and open space areas, (6) parking facilities and circulation; and (7) ancillary infrastructure improvements. Although the Master Plan did address ancillary issues such as infrastructure and landscaping improvements throughout Exposition Park, it did not address or left unchanged the following facilities: (1) the Rose Garden; (2) the Natural History Museum; (3) the Coliseum; and (4) the Sports Arena.

Regional Plans

Southern California Association of Governments

Regional Comprehensive Plan and Guide

The Regional Comprehensive Plan and Guide (RCPG) was adopted in 1994 and amended in 1996 by the member agencies of SCAG to set broad goals for the Southern California region and identify strategies for agencies at all levels of government to use in guiding their decision-making. It includes input from each of the 14 subregions that make up the Southern California region (comprised of Los Angeles, Orange, San Bernardino, Riverside, Imperial and Ventura Counties). The Proposed Project is located within the City of Los Angeles subregion, which encompasses the entire City of Los Angeles. The RCPG serves as a policy document that sets broad goals for the Southern California region and identifies strategies for agencies at all levels of government to use in guiding their decision-making with respect to the significant issues and changes, including growth management, that can be anticipated by the year 2015 and beyond. The RCPG is also used in the review of projects determined to be regionally significant by SCAG. In its response to the City's Notice of Preparation of a Draft EIR for the Proposed Project, the SCAG acknowledged that the Proposed Project is not regionally significant.

2008 Regional Comprehensive Plan (RCP)

The 2008 Regional Comprehensive Plan (RCPG) was accepted by SCAG in October of 2008 and serves as an advisory document for (voluntary) use by local governments in the SCAG region as an informational resource, and as a reference document for their use in developing plans and addressing local issues of regional significance. As an advisory document, it is not used in SCAG's Inter-Governmental

Review (IGR) of regionally significant projects. Rather, the RCP is a voluntary framework that links broad principles to an action plan that moves the region towards balanced goals.

SCAG's Compass Growth Vision Strategy

SCAG's Compass Growth Vision, adopted in 2004, encourages better relationships between housing, transportation, and employment. The Growth Vision is driven by four key principles: (1) Mobility – Getting where we want to go, (2) Livability – Creating positive communities, (3) Prosperity – Long-term health for the region, and (4) Sustainability – Preserving natural surroundings. Additionally, the Compass Growth Vision incorporates a 2% Growth Strategy that will increase the region's mobility by:

- Putting new employment centers and new neighborhoods near major transit systems so that people can have transportation choices other than their cars.
- Designing safe, attractive transit centers and plazas that people enjoy using.
- Creating mini-communities around transit stations, with small businesses, urban housing and restaurants all within an easy walk.

South Coast Air Quality Management District

The Proposed Project is located within the South Coast Air Basin (SCAB) and is therefore within the jurisdiction of the South Coast Air Quality Management District (SCAQMD). In conjunction with SCAG, the SCAQMD is responsible for formulating and implementing air pollution control strategies. The Final 2007 Air Quality Management Plan (AQMP) is intended to establish a comprehensive regional air pollution control program leading to the attainment of both state and federal air quality standards in the SCAB.[1] The AQMP also includes significant new scientific data, emission inventories, ambient measurements, control strategies, and air quality modeling. Air quality impacts by the Proposed Project and consistency of the Project with the AQMP is analyzed in greater detail in Section IV.B, Air Quality, of this EIR.

Regional Water Quality Control Board

The Project Site is within the jurisdiction of the Regional Water Quality Control Board (RWQCB). The RWQCB authorizes National Pollutant Discharge Elimination System (NPDES) permits that ensure compliance with wastewater treatment and discharge requirements. The Los Angeles Regional Water

[1] *South Coast Air Quality Management District, 2007 Air Quality Management Plan, website: http://www.aqmd.gov/aqmp/07aqmp/index.html, accessed January 13, 2009.*

Quality Control Board (LARWQCB) enforces wastewater treatment and discharge requirements for properties in the Project Area. Water quality impacts of the Proposed Project and consistency of the Project with the RWQCB's requirements are analyzed in greater detail in Section IV.E, Hydrology/Water Quality, of this EIR.

Congestion Management Plan

Within Los Angeles County, the Metropolitan Transportation Authority (MTA) is the designated congestion management agency responsible for coordinating regional transportation policies. The 2004 Congestion Management Plan (CMP) for Los Angeles County, adopted July 22, 2004, was developed in accordance with Section 65089 of the California Government Code. The CMP is intended to address vehicular congestion relief by linking land use, transportation and air quality decisions. Further, the program seeks to develop a partnership among transportation decision-makers to devise appropriate transportation solutions that include all modes of travel and to propose transportation projects which are eligible to compete for state gas tax funds. To receive funds from Proposition 111 (i.e., state gasoline taxes designated for transportation improvements) cities, counties, and other eligible agencies must implement the requirements of the CMP. The Proposed Project's Traffic Impact Analysis which is presented in Section IV.J, Transportation, Traffic and Parking of this EIR, was prepared in accordance with the County of Los Angeles CMP and City of Los Angeles Department of Transportation (LADOT) Guidelines, and includes an analysis of the Proposed Project's consistency with the CMP.

Local Plans

City of Los Angeles General Plan

General Plan Framework

The City of Los Angeles General Plan Framework Element sets forth a citywide comprehensive long-range growth strategy. It defines citywide policies that will be implemented through subsequent amendments of the City's community plans, zoning ordinances, and other pertinent programs. The General Plan Framework Element also contains policies that are intended to maintain the City of Los Angeles's cultural and natural diversity. The General Plan Framework Element provides guidelines for future updates of the City's community plans. It does not supersede the more detailed community and specific plans.

Land Use Element

The Project Site is located within the South Los Angeles Community Plan Area, one of 35 Community Plans established for different areas of the City that are intended to implement the policies of the General Plan Framework, and collectively are considered the Land Use Element. The South Los Angeles Community Plan was adopted by the Los Angeles City Council on October 26, 1979, was most recently amended March 22, 2000, and is currently identified as one of nine Community Plans currently under study by the Department of City Planning's New Community Plan Program. Until such time as a new

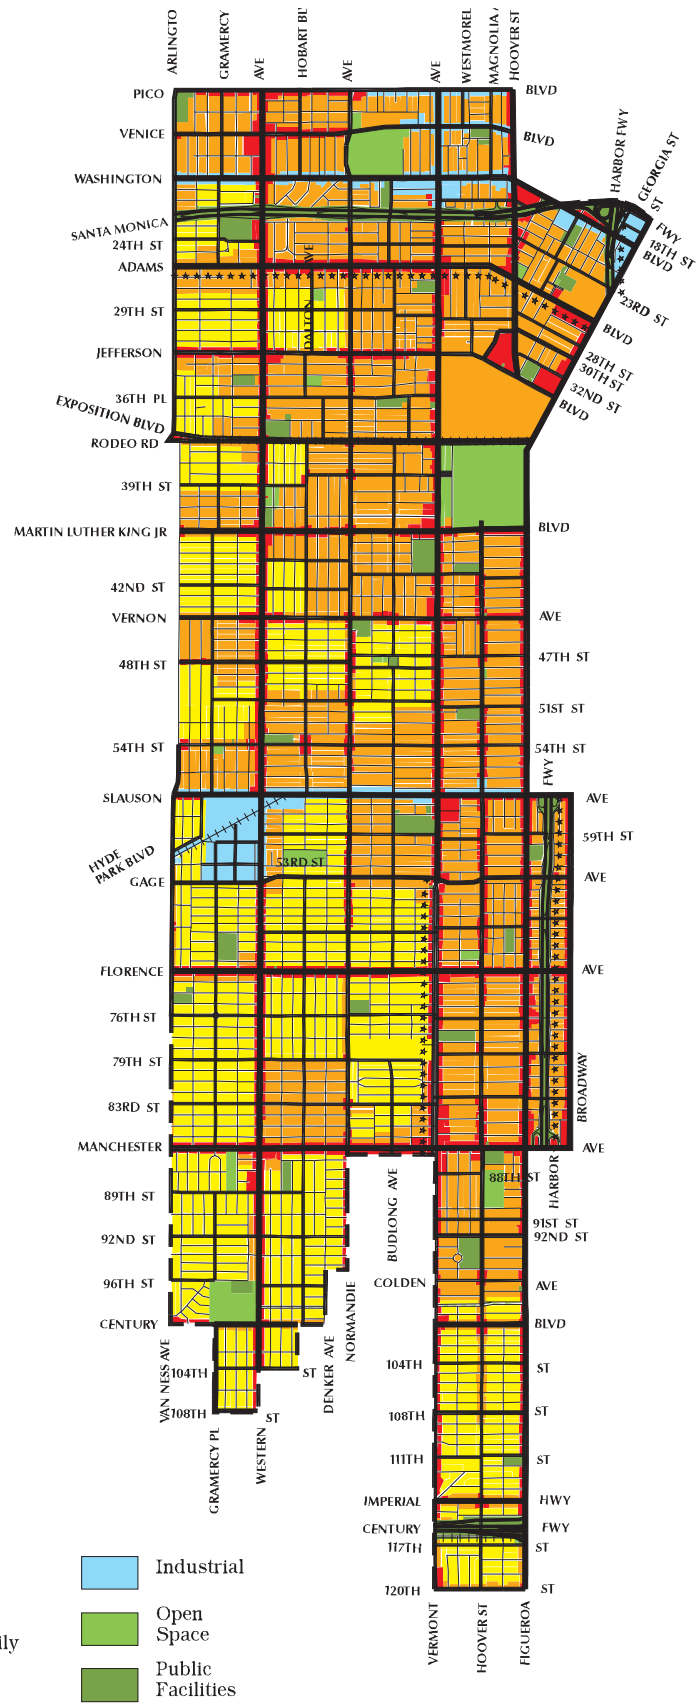
Community Plan is adopted, the existing South Los Angeles Community Plan will continue to be the source document for land use designations and policy applicable to new development within the South Los Angeles Community Plan Area.

The South Los Angeles Community Plan Land Use Map was most recently amended March 5, 2008. It designates the entire Project Site, as well as the majority of Exposition Park (generally to the north and west of the Project Site), as "Open Space" and a Regional Recreational Site. The Open Space land use designation is reserved for public land and does not allow any residential or commercial development that is not associated with a public-oriented facility. The identified corresponding zoning for this land use designation is Open Space (OS) and Agricultural (A1). The Community Plan also identifies the Project Site as a Cultural and Historical Site (see Section IV.D, Cultural and Historic Resources). That portion of the Project Site located adjacent to Figueroa Street is identified as an Opportunity Area. Figure IV.F-2 shows the existing Community Plan designations for the Project Site and the immediately surrounding areas.

As shown in Figure IV.F-2, land use designations proximate to the Project Site along Martin Luther King, Jr. Boulevard are predominately designated as "Community Commercial" with the exception of a small area, which is designated "High-Medium" residential on the south side of Martin Luther King, Jr. Boulevard between Hoover Street and Menlo Avenue. The area further to the south beyond Martin Luther King, Jr. Boulevard is predominantly designated for "Low Medium II" and "Medium" multiple family residential land use. Along the west side of Figueroa Street south of Martin Luther King, Jr. Boulevard, the land use designation is "Community Commercial" closest to the Project Site, and "General Commercial" further distant from the Project Site. Areas to the east of Figueroa Street (the eastern boundary of Exposition Park) are located in the Southeast Los Angeles Community Plan area and are designated with respect to land use by the Southeast Los Angeles Community Plan. Properties along the east side of Figueroa Street, between Exposition and Martin Luther King, Jr. Boulevards, are designated for Community Commercial uses. The land strip containing the Harbor Freeway (Interstate 110) is located immediately to the east of these properties and is designated as Public Facility. Areas east of the Harbor Freeway are generally designated for Limited Industrial uses (with corresponding zoning of CM, MR1, and M1).

Other prominent land use designations in the general vicinity of the Project Site include the University of Southern California (USC) campus, located north of Exposition Boulevard, which is designated as "High Medium" multiple-family residential, and Manual Arts High School, located on the west side of Vermont Avenue south of Martin Luther King Jr. Boulevard, which is designated as "Public Facilities." The location of the USC Campus, an educational institution adjacent to Exposition Park containing recreational and cultural facilities, together with Exposition Park, creates a large public and quasi-public land reservation that dominates the Project Site vicinity, and is predominantly surrounded by non-related residential and commercial land uses.

As identified by the Community Plan, Exposition Park is defined as a "major opportunity site." A major opportunity site is an area that has the potential to generate significant impacts within the surrounding



Source: City of L.A., Department of City Planning, GIS; and PARKER Environmental Concultants, LLC, 2010.

CAJA Environmental Services, LLC

Figure IV. F-2
South Los Angeles Community Plan Land Use Map

neighborhoods. According to the Community Plan, the Exposition Park Master Plan shall provide the following guiding principles in the development of this area and the facilities it holds:

- The need for community empowerment regarding future development;
- The opportunity for a variety of jobs and job training for community residents;
- Development reflective of community needs; and
- The need for appropriate development plans to prevent incongruent, incremental development.

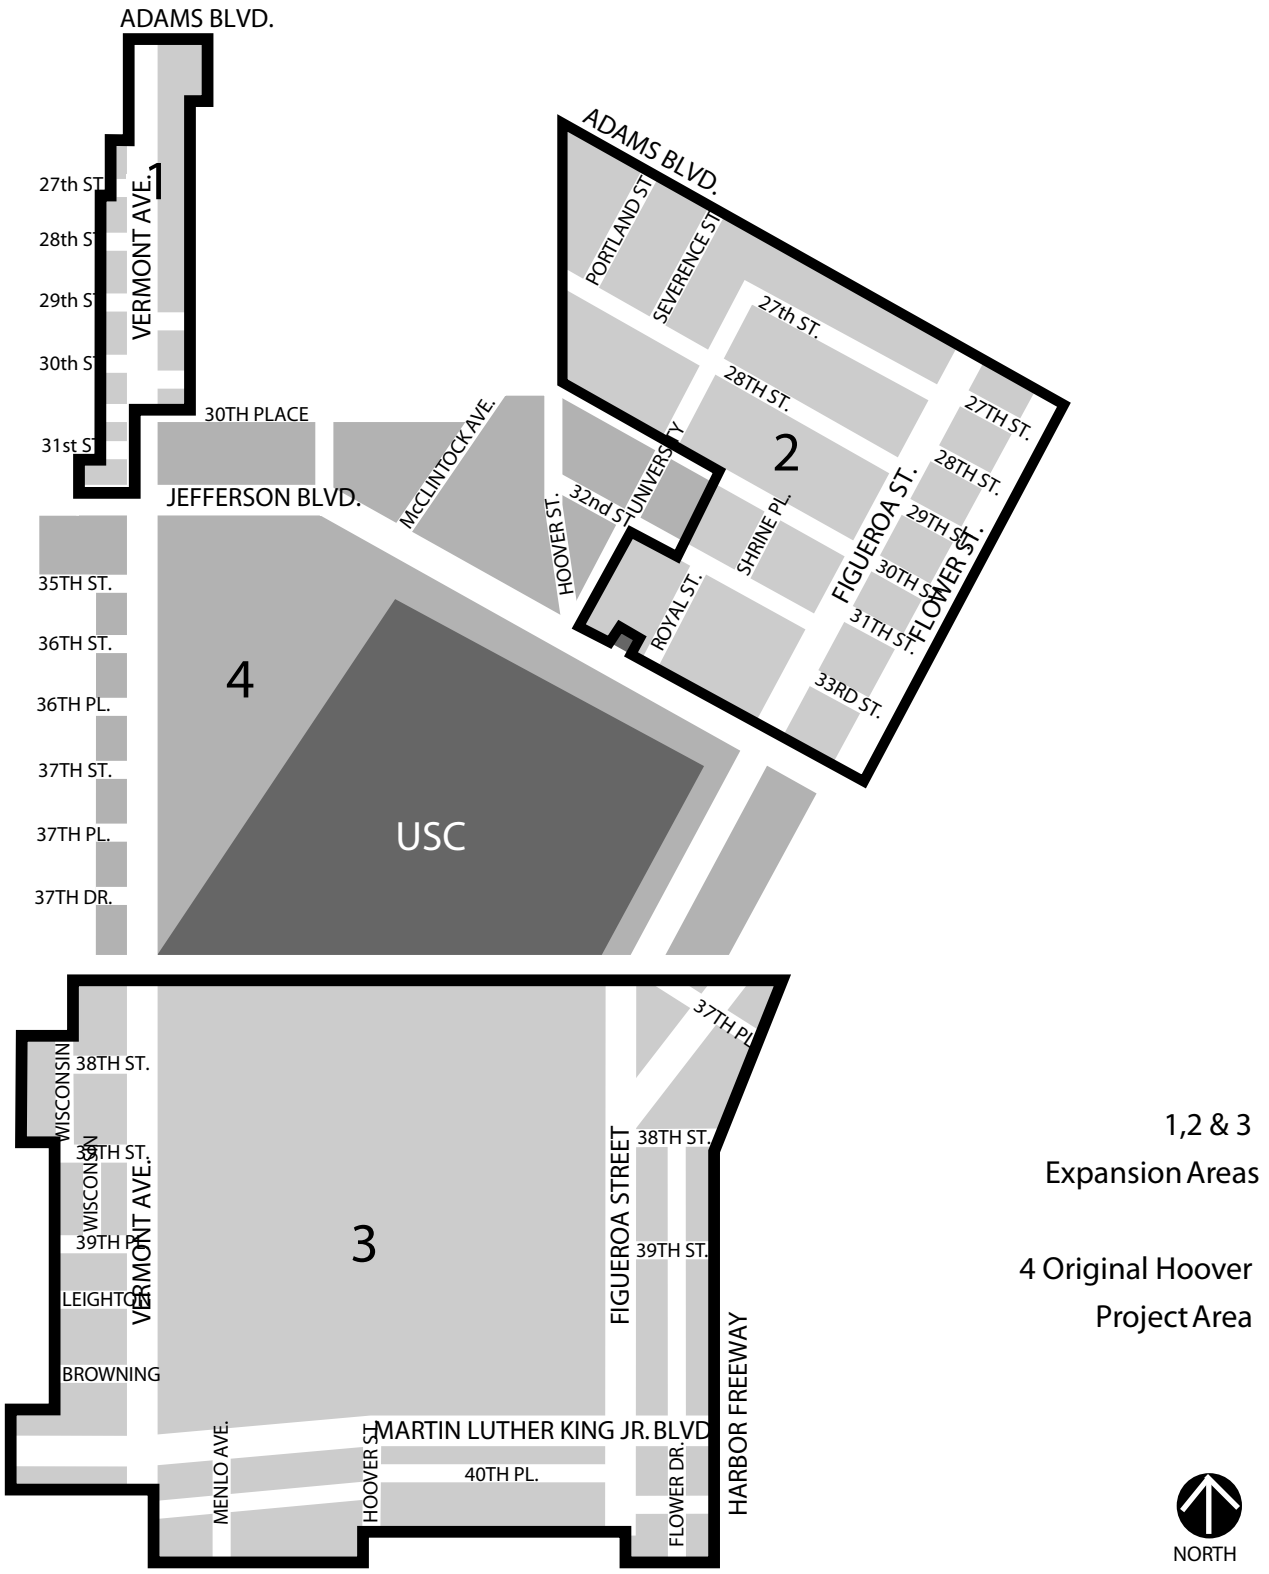
Exposition/University Park Redevelopment Project

The Project Site is located within the CRA/LA's Exposition/University Park Redevelopment Project area (Redevelopment Plan). Originally known as the Hoover/Hoover Expansion Redevelopment Project, the 574-acre Exposition/University Park Redevelopment Project is located just southwest of Downtown Los Angeles. The original Redevelopment Plan was established by the Los Angeles City Council on January 27, 1966 and covered 165 acres surrounding the USC Campus. The project was expanded in 1983 and again in 1989. Its name was changed to Exposition/University Park Redevelopment Project in 2005. The Redevelopment Plan area is generally bounded by Adams Boulevard on the north, Flower Street on the east, 41st Street on the south, and Walton Avenue and Catalina Street on the west. The boundaries of the Redevelopment Plan project area are depicted in Figure IV.F-3, and include the Project Site (as well as all other areas of Exposition Park).

As shown in Figure IV.F-3, the Redevelopment Plan is divided into four subareas, including the Exposition Sub Area, in which the Project Site is located. The Redevelopment Plan governs development within the project area and is administered by the CRA. The Redevelopment Plan was designed to promote revitalization and development within the Exposition/University Park Project area. The Redevelopment Plan designates the Project Site for Public Use. According to the Redevelopment Plan, permitted uses of land designated as Public- and Quasi-Public include the establishment, maintenance, or enlargement of public uses including, but not limited to, park and recreational facilities, libraries, educational or fraternal facilities, parking and parking structures, housing, philanthropic and charitable or other institutions, and facilities of other similar associations or organizations.[2]

Goals identified for the Redevelopment Plan in the Five Year Implementation Plan (FY 2010 – FY 2014)

[2] *Redevelopment Plan for the Expanded Project Area of the Hoover Redevelopment Project, adopted January 1, 1969; Fifth Amendment to the Redevelopment Plan for the Hoover Redevelopment Project, adopted May 9, 1989.*



Source: CRA/LA; and PARKER Environmental Concultants, LLC, 2010.

CAJA Environmental Services, LLC

Figure IV.F-3
Exposition/University Park Redevelopment Project Area

which are relevant to the Proposed Project include the following:

- Make Exposition Park a viable recreational and cultural resource for the immediate community as well as for the total city.
- Find methods of channeling the economic growth of the Central Business District along that portion of the Figueroa Corridor, located within the Hoover Project.

It should be noted that real property owned or controlled by the Los Angeles Memorial Coliseum Commission, which is a Joint Powers Authority under the State of California, is not subject to requirements and policies of the Redevelopment Plan, nor is it subject to review and/or approval by the CRA/LA.[3] Nevertheless, current uses on the Project Site are evaluated herein to determine consistency with the Redevelopment Plan's Public Use designation for the property.

City of Los Angeles Planning and Zoning Code

The Project Site is in the OS-1XL (Open Space) Zoning District, as is the majority of Exposition Park. The City of Los Angeles Zoning Map for the Project Site and surrounding area is depicted in Figure IV.F-4. The OS-1XL designation refers to a zoning designation of Open Space with a corresponding Height District of 1XL, Extra Limited Height District (XL). The OS zone permits a limited amount of uses under the City's Planning and Zoning Code (L.A.M.C. Section 12.04.05), including parks and recreation facilities (i.e. bicycle trails, equestrian trails, walking trails, nature trails, park land/lawn areas, children's play areas, picnic facilities, and athletic fields), natural resource preserves, marine and ecological preserves, sanitary landfill sites, and water conservation areas. Height District No. 1 limits development to a Floor Area Ratio (FAR) of 3:1. The XL allows a building height of two-stories, which shall not exceed a height of 30 feet. Like a number of other older buildings which pre-date the Planning and Zoning Code, the Sports Arena is "grandfathered" into the zoning code because it was constructed prior to establishment of the code.

Properties surrounding the Project Site to the north, west, and south are located within Exposition Park and are also zoned OS-1XL. Those properties directly east of the Project Site across Figueroa Street are zoned C2-1L. The parcels fronting on the south side of Martin Luther King Jr. Boulevard, across the street and south of Parking Lot 6, are zoned C2-1.

[3] *Exposition Park was added to the Hoover Redevelopment Plan Area in 1983, and in 1984 the CRA/LA prepared a Master Plan for Exposition Park. However, the Master Plan was contested and was never formally adopted. In 1985, the CRA/LA and the State of California reached a settlement agreement that voided CRA/LA consultation, review, or control over State of California or Los Angeles Memorial Coliseum Commission properties within Exposition Park. City of Los Angeles Zoning Map

ENVIRONMENTAL IMPACTS

Thresholds of Significance

State CEQA Guidelines – Initial Study Checklist Questionnaire

In accordance with Appendix G of the State CEQA Guidelines, a project may have a significant environmental impact if it were to:

(a) Physically divide an established community;

(b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or

(c) Conflict with any applicable habitat conservation plan or natural community conservation plan.

City of Los Angeles CEQA Thresholds Guide

In accordance with the *City of Los Angeles CEQA Thresholds Guide*, the determination of significance regarding land use consistency and compatibility shall be made on a case-by-case basis, considering the following factors:

(a) Whether the proposal is inconsistent with the adopted land use/density designation in the Community Plan, redevelopment plan or specific plan for the site;

(b) Whether the proposal is inconsistent with the General Plan or adopted environmental goals or policies contained in other applicable plans;

(c) The extent of the area that would be impacted, the nature and degree of impacts, and the type of land uses within that area;

(d) The extent to which existing neighborhoods, communities, or land uses would be disrupted, divided or isolated, and the duration of the disruptions; and

(e) The number, degree, and type of secondary impacts to surrounding land uses that could result from implementation of the Proposed Project.

Project Impacts

Construction Impacts

Construction of the Proposed Project under either Option (the Multiple Use Space or the MLS Stadium) would cause temporary and intermittent impacts to adjacent land uses due to temporary increases in air emissions (including fugitive dust), noise, and traffic congestion. These potential effects are discussed in

detail in Sections IV.B, Air Quality; IV.G, Noise; and IV.J.1, Traffic, Transportation and Parking, of this EIR. Uses that are considered especially sensitive to noise and air pollution by the SCAQMD include residences, schools, churches, hospitals, and convalescent care facilities. Sensitive land uses located in the vicinity of the Proposed Project include the multi-family residential uses along Martin Luther King, Jr. Blvd and Figueroa Street. There are no hospitals or convalescent care facilities located in the immediate vicinity of the Project Site. Construction activities could necessitate temporary lane closures on streets adjacent to the Project Site on a temporary and intermittent basis for utility relocations/hook-ups, delivery of materials, and other construction activities as may be required. In accordance with the City of Los Angeles Department of Building and Safety "Good Neighbor" Construction Practices,[4] site deliveries and the staging of all equipment and materials would be organized in the most efficient manner possible to avoid any impacts to the neighborhood and surrounding traffic. In the event, however, that partial roadway lane or sidewalk closures become necessary, the proposed closures would be in conformance with the latest Manual on Work Area Traffic Control and reviewed and approved by the appropriate City agency prior to any closures.[5] Additionally, implementation of the recommended construction related mitigation measures pertaining to air quality, traffic, and noise impacts would further reduce construction impacts upon adjacent land uses. (See each respective Section of this EIR for a list of the applicable construction related mitigation measures.) From a land use compatibility standpoint, construction impacts would be significant and unavoidable, though the extent of impacts would be temporary and sporadic and would only persist through the construction period.

Operational Impacts

Land Use Compatibility

The Project Site is located within Exposition Park and as such is a part of Master Planned facilities and improvements identified for the Exposition Park in the CMSI/Exposition Park Master Plan. From a land use compatibility perspective, both options proposed under the Project would be consistent with the planned physical arrangement of facilities and improvements as identified in the Master Plan. Both Option 1 and Option 2 would maintain the existing general purpose use of the site as a venue for sporting and entertainment events, cultural events, and civic events. Importantly, the Proposed Project would continue to function as an integral part of the Exposition Park Master Plan as a public entertainment and civic space. Though the project would be redeveloped in a different for, the general purpose public venue use would remain unchanged.

[4] *The City of Los Angeles Department of Building and Safety "Good Neighbor" Construction Practices identifies practices to minimize the negative impact of construction project on the surrounding community, and includes citations from the municipal code as applicable.*

[5] *LAMC 62.61(b),1 and 62.107.*

With regard to compatibility of the Proposed Project with surrounding land uses, a variety of land uses are generally located within the vicinity of the Project Site, including the cultural, entertainment, and sporting facilities of Exposition Park to the north, and west, surface parking to the south, Figueroa Street to the east, and development along Figueroa Street and Martin Luther King Jr. Boulevards to the east and south (respectively) which includes surface parking lots, a USC school related use, commercial retail and restaurant uses, and multi-family housing. The Proposed Project would redevelop the site with a similar serving land use and thus would be consistent with the existing composition of land uses within Exposition Park, and compatible with the existing community in the vicinity of the Project Site. The redevelopment of the site with a Multiple Use Space (Option 1) or MLS Stadium (Option 2) would reactivate the underutilized Project Site and provide a viable updated public venue for outdoor recreational opportunities and/or civic gatherings in response to changing community needs and market conditions, thereby contributing to the revitalization of the Redevelopment Project area and providing a source of economic growth along the Figueroa Corridor. More importantly, the land uses that surround the site have long become accustomed to and have co-existed with the operations of the Sports Arena. As such, no new significant or substantially altered land use compatibility impacts on the existing surrounding land uses are anticipated.

With respect to the design, height and massing of the Multiple Space Use (Option 1), the development of a open air amphitheater would be consistent with existing park-like setting of Exposition Park, specifically the adjacent Olympic Promenade that borders the Project Site to the north. This option would provide a lower scale development, which emphasizes landscaped areas and greenscape, when compared to the Sports Arena's higher profile and minimal landscaped areas. Through its proposed uses, site plan and landscape design, the Proposed Project would become fully integrated into the existing configuration of uses and improvements within Exposition Park and the surrounding community.

Consistency with Land Use Policies and Regulations

This Section analyzes the consistency of the Proposed Project with the provisions and requirements of the applicable regional and local plans that currently govern development of the Project Site and surrounding areas.

Consistency with State Land Use Policies and Regulations

CMSI/Exposition Park Master Plan

As stated previously, the CMSI/Exposition Park Master Plan (1993) did not include any specific alterations or renovation for the Sports Arena, and made no specific reference with respect to goals or objectives for the long-term use of the Sports Arena. Nevertheless, the following six general objectives of the Master Plan are relevant to development within Exposition Park and are described and evaluated with respect to the Proposed Project as follows:

Objective 1: Provide a vision and depict the limits for the future development of the institutional uses of the park while reinforcing its dual role as a regional and community resource.

Consistent. Option 1, Multiple Use Space would reinforce Exposition Park's role as a major regional community resource in the southern California region. Over the past several decades, the Sports Arena has site has become increasingly underutilized and unable to compete with other modern sports and entertainment venues in the southern California region. Originally constructed in 1959 as a modern, large-scale, indoor venue for sports and other major events, the Sports Arena has more recently experienced home teams leaving for other comparable venues such as Pauley Pavilion, the Forum, and the Los Angeles Convention Center. The Sports Arena now competes with these venues as well as the Staples Center and the Galen Center. Without the Proposed Project, the Sports Arena would continue to be underutilized and non-competitive in today's market. Therefore, the Proposed Project would be consistent with this objective.

Objective 2: Enhance the park's character and landscape features by increasing the area available for passive and recreational uses, defining entrances to the park and facilities, providing a clearly delineated system of pedestrian walkways and minimizing vehicular uses.

Consistent. One of two Options would be developed under the Proposed Project. Under Option 1, all existing improvements on the Project Site would be removed and the site would be redeveloped with a Multiple Use Space open-air amphitheater providing a much needed public venue for civic announcements, as well as a location to host a variety of City-sponsored celebratory and entertainment events such as parades, concerts, rallies, public gatherings, and performances, as well as a source of overflow parking available for use by all facilities within Exposition Park. Alternatively, under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Major League Soccer (MLS) Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accordance with site's history. The VIP parking lot would remain to the west of the proposed stadium. The state-of-the art venue would host MLS games, USC soccer games, open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. The stadium would also serve as a practice facility for local soccer teams.

Under both Option 1 and Option 2, pedestrian and vehicular access and circulation routes would connect to existing sidewalks and streets, creating a well-designed and orderly circulation pattern. In addition, under both Options, landscaped areas would dominate the Project Site, with an open-air all grass amphitheater and lawn areas comprising a majority of the site development plan for the Multiple Use Space (Option 1), and a recessed design for the MLS Stadium (Option 2) featuring landscaped plazas and perimeter landscaping (see Section III.C, Project Characteristics). The public venues developed under both Option 1 and Option 2 would be supported by ancillary uses including bathroom facilities and a press room or ticket office, with the additional ancillary use of on-site concession facilities being provided under Option 2. Therefore, the Proposed Project would be consistent with this objective.

Objective 3: Integrate the park with adjacent neighborhoods by providing convenient pedestrian transit linkages, minimizing traffic and parking impacts and developing employment, recreational, educational, and cultural opportunities within the park jointly with area residents.

Consistent. While this objective is not specifically oriented towards redevelopment of the Sports Arena site, the Proposed Project would, as needed, coordinate with other park stakeholders and implement a traffic management plan to minimize traffic and parking impacts on days when major events are scheduled. The traffic management plan would include but not be limited to the following measures: implementing ride share incentives for ticket holders, provide a shuttle system to facilitate and promote the use of satellite parking lots, provide assignable parking lots for ticket holders, and manage parking and traffic patterns and conditions on the surrounding roadways. (See Section V.I.J, Traffic, Transportation and Parking for additional details on traffic and parking management). Therefore, the Proposed Project would be consistent with this objective.

Objective 4: Preserve and interpret the historical legacy of the Park allowing the memories of the Park to be relived through appreciation of the historical significance of features such as the Rose Garden, the Coliseum, and other sites.

Consistent. Not Applicable.

Objective 5: Establish a framework of consistent and compatible design standards for future facilities in the park, including criteria for siting, massing, circulation, landscape and orientation elements of the plan.

Consistent. The Proposed Project would be compatible in scale, height, materials, architectural quality and site orientation within the context of Exposition Park as well as the surrounding built environment as it would replace the existing north-south oriented Sports Arena with either a Multiple Use Space, providing a recessed, open-air all-grass amphitheater surrounded by grass landscaped areas (Option 1), or a MLS Stadium constructed mostly below grade and providing a modern, world-class sports complex on the Project Site. The orientation of both the amphitheater (under Option 1) and the stadium (under Option 2) would be along an east-west axis, in acknowledgement of the architectural form of the proposed facilities as well as the configuration and function of the existing Project Site within the context of Exposition Park. Both Option 1 and 2 would result in developments which would be lower in scale than the existing Sports Arena, and would provide considerably more landscaped area when compared to the existing Sports Arena complex. Thus, the Proposed Project would be consistent with this objective.

Objective 6: Strengthen and centralize park management to encourage cooperation among institutional users and the effective management of park resources such as circulation, parking, transit access, programming, security, maintenance and marketing.

Consistent. With implementation of either Option 1 or Option 2 of the Proposed Project, ongoing coordination with the operators of the other facilities within Exposition Park would be expected to continue. The Proposed Project would not change the existing management and operation arrangement currently in place at the Project Site, and with respect to the other facilities within Exposition Park. The Proposed Project will strengthen and centralize park management and encourage cooperation among park stakeholders as the Project will redevelop the currently underutilized Sports Arena site and help re-establish Exposition Park as a lively regional recreational center. Such activity will promote and encourage cooperation in management as each park stakeholder will need to coordinate major event operations. Provisions for coordinated marketing, security, maintenance arrangements, parking, transit access, and programming, as needed for the redeveloped Project Site would be expected with implementation of either Option 1 or Option 2 of the Proposed Project. Thus, the Proposed Project would be consistent with this objective.

Los Angeles State Enterprise Zone

The Proposed Project is located within the Los Angeles State Enterprise Zone.[6] While not a requirement, the Proposed Project may incorporate the specific business incentives available to Projects located within the Los Angeles State Enterprise Zone including hiring credits, State and/or federal tax credits and expense and interest deductions. The Proposed Project may also participate with the additional local incentives offered by the City of Los Angeles including the Department of Water and Power rate discount, fee waivers, sewer facility hookup payment plans, Work Opportunity Tax Credit, and reduced parking rates. Thus, the Proposed Project would be consistent with the goals of the Enterprise Zone to stimulate business attraction, growth, and increased employment opportunities within economically challenged areas of the City. Therefore, no impact to land use planning would result with implementation of the Proposed Project.

Consistency with Regional Land Use Policies and Regulations

Southern California Association of Governments (SCAG)

In response to the NOP for the Proposed Project, SCAG has determined that the Proposed Project is not regionally significant per SCAG Intergovernmental Review (IGR) Criteria and the California Environmental Quality Act (CEQA), Section 15206. Nevertheless, an analysis of the Proposed Project's conformity with the 2008 RTP and Compass Growth Vision Strategy is presented below in Table IV.F-1 As Table IV.F-1 demonstrates, the Proposed Project would substantially conform with and contribute to

[6] *Zoning Information (ZI) 2374.*

Table IV.F-1
Comparison of Project Characteristics to SCAG Regional Transportation Plan (RTP) Goals and Growth Visioning Principles

RTP Goal	Consistency of the Proposed Project
1. Maximize mobility and accessibility for all people and goods in the region.	The Project Site is well served by the MTA's regional and local transit lines including Metro Local and Limited Line 102 and the Metro Express Line 550 along Exposition Boulevard (north of the Project Site), the Metro Silver Line as well as Metro Local and Limited Line 81 along Figueroa Street (immediately adjacent to the east of the Project Site), and Metro Rapid Line 740 as well as the Metro Local and Limited Lines 40 and 42 along Martin Luther King Jr. Boulevard (south of the Project Site). In the near future, regional access would also be provided by way of the MTA's light rail line (Metro Rail Expo Corridor) to Culver City, connecting Downtown Los Angeles to Culver City (Phase I) and Santa Monica (Phase II). A dedicated station (the Expo/Vermont) will serve Exposition Park. As such, the Proposed Project would be consistent with this RTP goal.
2. Ensure travel safety and reliability for all people and goods in the region.	While not directly applicable to the Proposed Project, the Proposed Project would not impede attainment of this RCP goal. As the project would not result in any change to the public roadways or right-of-ways in the project area.
3. Preserve and ensure a sustainable regional transportation system.	The Proposed Project would support attainment of this goal in that the Project Site is served by the MTA's Metro Express Line from downtown Los Angeles, and will be served by the Metro Rail Expo Corridor to Culver City, planned for completion in 2010. In addition, the Proposed Project would incrementally contribute to Los Angeles' ability to receive Proposition 111 funds (i.e., state gasoline taxes designated for transportation improvements) by demonstrating consistency with the CMP (see Section IV.J. Traffic and Transportation). Thus, the Proposed Project would be consistent with this goal.
4. Maximize the productivity of our transportation system.	As stated above, the Proposed Project's consistency with the CMP would incrementally contribute to Los Angeles' ability to receive Proposition 111 funds (i.e., state gasoline taxes designated for transportation improvements) for transportation system improvements, thereby furthering the goal of transportation system productivity. Thus, the Proposed Project would be consistent with this goal.

Table IV.F-1 (continued)
Comparison of Project Characteristics to SCAG Regional Transportation Plan (RTP) Goals and Growth Visioning Principles

RTP Goal	Consistency of the Proposed Project
5. Protect the environment, improve air quality and promote energy efficiency.	As identified in this Draft EIR, the Proposed Project would comply with Title 20 and Title 24 standards pertaining to water and energy efficiency standards. Mitigation measures are recommended to reduce the potentially significant environmental impacts of Project implementation including those related to Air Quality and Utilities. As such, the Proposed Project would be consistent with this goal.
6. Encourage land use and growth patterns that complement our transportation investments.	The proposed redevelopment of the Sports Arena as either a Multiple Use Space (Option 1) or a MLS Stadium (Option 2) would support the use of existing and future public transportation systems located proximate to the Project Site. As such, the Proposed Project would be consistent with this goal.
Growth Visioning Principle	**Consistency of the Proposed Project**
1. Improve Mobility for all Residents.	See consistency analysis for RTP Goal No. 1 above.
2. Foster Livability in all communities.	The Proposed Project (Option 1 or Option 2) would provide an updated public venue for outdoor recreational opportunities or civic events in response to changing community needs and market conditions, revitalizing the Project Site and providing enhanced landscape and community use options when compared to the existing Sports Arena facility and associated site improvements. As such, the Proposed Project would be consistent with this goal.
3. Enable prosperity for all people.	The Proposed Project would provide employment opportunities as identified in Section VI.B. Growth Inducing Impacts. As such, the Proposed project would be consistent with this goal.
4. Promote sustainability for future generations.	As identified in Section IV.I Utilities of this Draft EIR, the Proposed Project would comply with Title 20 and Title 24 standards pertaining to water and energy efficiency standards. In addition, the Proposed Project will be designed to meet applicable provisions of the California Green Building Standards Code. Thus, the Proposed project would be consistent with this goal.

achievement of the RTP goals and Growth Vision Principles. As such, impacts of the Proposed Project would be less than significant.

South Coast Air Quality Management District

The Proposed Project is located within the South Coast Air Basin (SCAB) and therefore within the jurisdiction of the South Coast Air Quality Management District (SCAQMD). In conjunction with SCAG, the SCAQMD is responsible for formulating and implementing air pollution control strategies.

The Air Quality Management Plan (AQMP), adopted in 1997 by SCAQMD and SCAG to assist in fulfilling these responsibilities, is intended to establish a comprehensive regional air pollution control program leading to the attainment of state and federal air quality standards in the SCAB area. Air quality impacts of the Proposed Project and consistency of the project impacts with the AQMP is analyzed in greater detail in Section V.B, Air Quality.

Regional Water Quality Control Board

As discussed in greater detail in Section E of this EIR, the Project Contractor will be required to obtain a National Pollution Discharge Elimination System (NPDES) statewide General Construction Activity Permit from the RWQCB prior to commencing any construction activities. In accordance with the RWQCB requirements, the Project Contractor would need to file a Notice of Intent and prepare a Storm Water Pollution Prevention Plan (SWPPP) prior to any construction activity. As part of the SWPPP, the Proposed Project would be required to implement effective best management practices (BMPs) to minimize water pollution to the maximum extent practical. In addition, the final drainage plans would be required to provide structural or treatment control BMPs to mitigate (infiltrate or treat) storm water runoff. Implementation of the BMPs in the project SWPPP and compliance with the City's surface water discharge requirements would ensure that Project construction would not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality. As such the Project would be consistent with the applicable water quality policies of the RWQCB and impacts upon water quality would be less than significant.

Congestion Management Plan

The Proposed Project's Traffic Impact Analysis presented in greater detail in Section IV.J.1, Traffic/Transportation, of this EIR, was prepared in accordance with the County of Los Angeles CMP and City of Los Angeles Department of Transportation (LADOT) Guidelines. As discussed in Section IV.J.1, Traffic/Transportation, the Proposed Project would not significantly impact any CMP roadway segments or freeway on-/off-ramps. Therefore the Proposed Project would be consistent with the CMP.

Consistency with Local Land Use Policies and Regulations: City of Los Angeles

South Los Angeles Community Plan

The General Plan Framework is implemented through the 35 Community/District Plans. As such, consistency with the applicable Community Plan would also establish consistency with the General Plan Framework.

As stated previously, the City of Los Angeles General Plan designation for the Project Site is OS, Open Space. This designation permits parks and community centers under the ownership and operation of a public agency. The South Los Angeles Community Plan sets forth numerous policy guidelines that are designed to govern land use decisions made within the South Los Angeles Community Plan area. Those Community Plan policies which are generally relevant to the Project Site are described and evaluated with

respect to the Proposed Project. As shown in the following discussion, the Proposed Project would be consistent with applicable policies. Thus, no impact with regard to consistency of the Proposed Project with the South Los Angeles Community Plan would result:

- Policy 4-1.1: Preserve the existing recreational facilities and park space.

  Consistent. The Proposed Project would continue to provide recreational uses for the local and regional community in the form of civic gatherings and sporting events held at either the Multiple Use Space (Option 1), or the MLS Stadium (Option 2). The existing adjacent facilities within Exposition Park would continue to provide public recreation opportunities to the community and would not be adversely impacted by the Proposed Project. Therefore, the project would be considered to be consistent with this policy.

- Policy 19-1.2: Identify all designated City of Los Angeles Historic and Cultural Monuments in order to foster public appreciation of the City of Los Angeles' valuable historic resources and to promote education of the public by preserving Los Angeles' historic past and to promote that any other appropriate landmarks of unique architectural and historical significance continue to be identified for the purpose of inclusion in the list.

  Consistent. While this policy is directed at the City to identify historic and cultural monuments, an analysis of the Proposed Project's potential to impact cultural resources is provided in Section IV.D, Cultural and Historic Resources, which includes a discussion of the historical and cultural significance of Exposition Park and specific venues, including the Coliseum. The proposed use and design of the Proposed Project is consistent with the intent of this policy in that the Proposed Project would not introduce elements within Exposition Park that would have a detrimental effect on existing historic/cultural resources within Exposition Park. As concluded in Section IV.D, Cultural and Historic Resources, the Proposed Project would not jeopardize the Coliseum's listing on the National Register of Historic Places. Therefore the Proposed Project would be consistent with the intent of this policy.

<u>Exposition/University Park Redevelopment Plan</u>

The Project Site is designated for Public Uses by the Redevelopment Plan, consistent with the current and historic use of the Project Site. The Proposed Project would consist of the demolition and removal of the existing Sports Arena, and redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site in response to changing community needs and market conditions. One of two Options would be developed under the Proposed Project. Under Option 1, all existing improvements on the Project Site would be removed and the site would be redeveloped with a Multiple Use Space open-air amphitheater providing a much needed public venue for civic announcements, as well as a location to host a variety of City-sponsored celebratory and entertainment events such as parades, concerts, rallies, public gatherings, and performances. Alternatively, under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Major League Soccer (MLS) Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accordance with site's history. The

VIP parking lot would remain to the west of the proposed stadium. The state-of-the art venue would host MLS games, USC soccer games, open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. The stadium would also serve as a practice facility for local soccer teams. Under either Option, the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operation, partnering with the City to produce civic events (Option 1), or with the City and the League to produce civic events and soccer games (Option 2). The Proposed Project (either Option1 or 2) would be consistent with the Public Use designation of the Redevelopment Plan in that it would result in development of a public venue for public, private and civic use. Importantly, with implementation of either Option 1 or Option 2, economic growth would be fostered along the Figueroa corridor within the Redevelopment Plan area, consistent with the goals identified in the CRA's Five Year Implementation Plan. As a result, the Proposed Project would be consistent with the Redevelopment Plan and no impacts are anticipated.

The Redevelopment Plan contains several goals which are generally applicable to the Project or project vicinity. These goals are described and evaluated with respect to the Proposed Project as follows:

Goal: To eliminate and prevent the spread of blight and deterioration and to conserve, rehabilitate, and redevelop the Expanded Project Area in accordance with the Plan.

Consistent. The Proposed Project would redevelop the Sports Arena as either a Multiple Use Space (Option 1) or a MLS Stadium (Option 2), transforming the existing outdated and underutilized Project Site within Exposition Park into a modern, state-of-the-art public use facility. Originally constructed in 1959 as a modern, large-scale, indoor venue for sports and other major events, the Sports Arena has more recently experienced home teams leaving for other comparable venues such as Pauley Pavilion, the Forum, and the Los Angeles Convention Center. The Sports Arena now competes with these venues as well as the Staples Center and the Galen Center. Thus, to the extent that the proposed redevelopment would preclude the potential for blight and deterioration of the exiting outdated and underutilized Sports Arena, it would be consistent with this goal.

Goal: To make provisions, throughout the Expanded Project Area, for well-planned community uses, facilities, pedestrian and vehicular, circulation, and adequate parking, particularly as these relate to Exposition Park.

Consistent. Both Options 1 and 2 of the Proposed Project would provide public venues for community use designed to complement and integrate within existing Exposition Park facilities and improvements. Under both Option 1 and Option 2, pedestrian and vehicular access and circulation routes would connect to existing sidewalks and streets, creating a well-designed and orderly circulation pattern. In addition, under both Options, landscaped areas would predominate the Project Site, with an open-air all grass amphitheater and lawn areas comprising a majority of the site development plan for a Multiple Use Space (Option 1), and a recessed design for the MLS Stadium (Option 2) featuring landscaped plazas and perimeter landscaping (see Section III.C, Project

Characteristics). Under Option 1, Multiple Use Space, would be served by existing parking facilities in and around Exposition Park including surface and subterranean parking within Exposition Park, USC parking lots to the north, and private lots in the project vicinity, as well as the grass areas for overflow parking. Under Option 2, these existing parking facilities in and around Exposition Park would continue to be available, and the existing VIP parking lot west of the existing Sports Arena would also be retained, providing an additional source of parking to serve the needs of the MLS Stadium use. The public venues developed under both Option 1 and Option 2 would be supported by ancillary uses including bathroom facilities, with the additional ancillary use of on-site concession facilities being provided under Option 2. Therefore, the Proposed Project would be consistent with this goal.

Goal: To provide a basis for the location and programming of public service facilities, parks, and recreation facilities.

Consistent. The Proposed Project would facilitate a continuance of the existing publicly- oriented use of the site and would therefore be consistent with the general aim of this goal.

Goal: To encourage the cooperation and participation of residents, property owners, business persons, public agencies, and community organizations in the revitalization of the area.

Consistent. The Coliseum Commission would be expected to continue their current efforts to involve community organizations, business persons, residents, and adjacent property owners, and to work cooperatively with relevant public agencies, in the planning for redevelopment of the Project Site. Ongoing coordination with the operators of the other facilities within Exposition Park would similarly be expected to continue. Therefore, the project would be considered to be consistent with this goal.

Goal: To promote coordinated management of Exposition Park with specific attention given to facility use, development, parking, circulation, security, and maintenance.

Consistent. The Proposed Project would not change the existing management and operation arrangement currently in place at the Project Site, and with respect to the other facilities within Exposition Park. Provisions for coordinated security and maintenance arrangements as needed for the redeveloped Project Site would be expected with implementation of either Option 1 or Option 2 of the Proposed Project, as would parking and traffic circulation measures designed to mitigate potentially significant impacts (see Section IV.A. Aesthetics, Section IV.H. Public Services, and Section IV.J. Traffic and Transportation). Therefore, the Proposed Project would be consistent with this goal.

Goal: To encourage the preservation of historic monuments, landmarks, and buildings, particularly those affected by new development subject to an owner participation or disposition and development agreement.

Consistent. The Proposed Project would include demolition of the Sports Arena and redevelopment of the Project Site with either a Multiple Use Space (Option 1) or a MLS Stadium (Option 2). Both the Sports Arena and Exposition Park are not listed as historic landmarks or buildings at the national, state, or local levels, and the Sports Arena is not designated as a Historic-Cultural Monument by the City of Los Angeles. As concluded in Section V.D Cultural and Historic Resources, while the Coliseum is listed on the National Register of Historic Places as a Historic Monument, the Proposed Project would not jeopardize this listing. Thus, the Proposed Project would be consistent with this goal.

Goal: To promote compatible development, with consideration to scale, height, material, architectural quality, and site orientation.

Consistent. The Proposed Project would be compatible in scale, height, materials, architectural quality and site orientation within the context of Exposition Park as well as the surrounding built environment as it would replace the existing north-south oriented Sports Arena with either a Multiple Use Space, providing a recessed, open-air all-grass amphitheater surrounded by grass landscaped areas (Option 1), or a MLS Stadium constructed mostly below grade and providing a modern, world-class sports complex on the Project Site. The orientation of both the amphitheater (under Option 1) and the stadium (under Option 2) would be along an north-south axis, in acknowledgement of the architectural form of the proposed facilities as well as the configuration and function of the existing Project Site within the context of Exposition Park. Both Option 1 and 2 would result in developments which would be lower in scale than the existing Sports Arena, and would provide considerably more landscaped area when compared to the existing Sports Arena complex. Thus, the Proposed Project would be consistent with this goal.

The Proposed Project would be generally consistent with the relevant goals of the Redevelopment Plan. As discussed in Section IV.J, Traffic and Transportation, existing parking available within and around Exposition Park would be adequate for the Proposed Project uses. Therefore, impacts on the Redevelopment Plan goals from implementation of the Proposed Project would be less than significant.

City of Los Angeles Planning and Zoning Code

Zoning/Allowable Uses: The Project Site is zoned OS-1XL (Open Space), as is the majority of Exposition Park. The OS zone permits a limited amount of designated uses under the City of Los Angeles Planning and Zoning Code, including parks and recreation facilities (i.e. bicycle trails, equestrian trails, walking trails, nature trails, park land/lawn areas, children's play areas, picnic facilities, and athletic fields), natural resource preserves, marine and ecological preserves, sanitary landfill sites, and water conservation areas. The land uses identified under Option 1 and Option 2 of the Proposed Project are parks and recreation facilities, and as such would be permitted uses in the OS zone. Under both Options, the existing management and operation arrangement within Exposition Park that is currently in place would continue with redevelopment of the Project Site. With regard to the Project Site's height district of

1XL, which limits the maximum FAR to 3:1 and the height of a building or structure to two stories and 30 feet, the Proposed Project would exceed this height. The Proposed Project would therefore need to seek discretionary relief form the Planning and Zoning Code from the Department of City Planning. With procurement of all applicable variances and/or approvals, the Proposed Project would then be made consistent with the provisions of the Planning and Zoning Code, and no land use impact would occur.

Parking

Parking needs of the Proposed Project would be met by a combination of sources including the overflow parking areas available as a part of a Multiple Use Space (Option 1), or the VIP parking area retained as a part of the MLS Stadium development (Option 2); existing parking spaces within Exposition Park surface and subterranean parking lots; and, adjacent off-site commercial surface parking lots along Figueroa Street and Martin Luther King Jr. Boulevard. Further, events at the redeveloped Project Site would be scheduled such that they would not be held concurrently with other events occurring within Exposition Park, thereby assuring an adequate supply of available parking. In addition, the parking developed as a part of the Proposed Project (i.e., overflow parking areas within the Multiple Use Space, or the VIP parking area retained as a part of the MLS Stadium) would be made available to the other venues and facilities within Exposition Park on an as needed basis. As discussed in Section IV.J, Traffic, Transportation and Parking, the parking needs for a Multiple Use Space (Option 1) would be reduced when compared to those of the existing Sports Arena complex. The parking needs of either Option (i.e., Multiple Use Space or the MLS Stadium) would not exceed the existing combined parking capacity available within the redeveloped Project Site, Exposition Park, and the surrounding area. Therefore, no impact with regard to parking would result from implementation of the Proposed Project.

Landscape

The Proposed Project would provide for landscape consistent with the existing landscaped plan and improvements within Exposition Park, and the Exposition Park Master Plan, which would be substantially increased in area when compared to the existing landscape provided on the Project Site. Therefore, no impact with regard to provision for landscape would result from implementation of the Proposed Project.

Requested Permits

The Los Angeles Memorial Coliseum Commission will obtain all applicable permits from the Building and Safety Department (and other state and municipal agencies, as may be required) for Project construction actions associated with implementation of either Option 1 or Option 2 including, but not limited to the following: demolition, grading, excavation, shoring, foundation, haul route approval and structural building improvements.

MITIGATION MEASURES

With respect to temporary land use compatibility impacts associated with construction-related air quality emissions, construction noise, and partial sidewalk and roadway lane closures, mitigation measures have

been identified in the respective chapters of this EIR. (See Sections IV.B, Air Quality, IV.G, Noise, and IV.J, Traffic, Transportation and Parking.)

With respect to operational impacts, the following mitigation measure is required.

F-1. The Los Angeles Memorial Coliseum Commission shall obtain all applicable permits from the Building and Safety Department (and other state and municipal agencies, as may be required) for Project construction actions associated with implementation of either Option 1 or Option 2 including, but not limited to a height variance.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Incorporation of the mitigation measures for construction-related traffic, noise, and air quality impacts identified in Sections IV.B, Air Quality, IV.G, Noise and IV.J, Traffic, Transportation and Parking of this Draft EIR would serve to reduce the Proposed Project's anticipated construction impacts, but significant and unavoidable impacts would result on a temporary basis during the construction period.

The proposed project under Option 1 (Multiple Use Space) and Option 2 (MLS Stadium) would be consistent with the underlying General Plan and Zone Designation, the Redevelopment Plan, the Exposition Park Master Plan, and applicable regional plans and regulations. As such, impacts to operational land use compatibility and consistency with the applicable land use plans and the zoning code would be less than significant prior to mitigation and no mitigation measures are required.

IV. ENVIRONMENTAL IMPACT ANALYSIS
G. NOISE

ENVIRONMENTAL SETTING

Fundamentals of Sound and Environmental Noise

Sound is technically described in terms of amplitude (loudness) and frequency (pitch). The standard unit of sound amplitude measurement is the decibel (dB). The decibel scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound. The pitch of the sound is related to the frequency of the pressure vibration. Since the human ear is not equally sensitive to a given sound level at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) provides this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear.

Noise, on the other hand, is typically defined as unwanted sound. A typical noise environment consists of a base of steady ambient noise that is the sum of many distant and indistinguishable noise sources. Superimposed on this background noise is the sound from individual local sources. These can vary from an occasional aircraft or train passing by to virtually continuous noise from, for example, traffic on a major highway. Table IV.G-1, Representative Environmental Noise Levels, illustrates representative noise levels in the environment.

Several rating scales have been developed to analyze the adverse effect of community noise on people. Because environmental noise fluctuates over time, these scales consider that the effect of noise upon people is largely dependent upon the total acoustical energy content of the noise, as well as the time of day when the noise occurs. The equivalent energy noise level (L_{eq}) is a measure of ambient noise, while the day-night average level (L_{dn}) and community noise exposure level (CNEL) are measures of community noise. Each is applicable to this analysis and defined as follows:

- L_{eq}, the equivalent energy noise level, is the average acoustic energy content of noise for a stated period of time. Thus, the L_{eq} of a time-varying noise and that of a steady noise are the same if they deliver the same acoustic energy to the ear during exposure. For evaluating community impacts, this rating scale does not vary, regardless of whether the noise occurs during the day or the night.

- L_{dn}, the Day-Night Average Level, is a 24-hour average L_{eq} with a 10 dBA "weighting" added to noise during the hours of 10:00 p.m. to 7:00 a.m. to account for noise sensitivity in the nighttime. The logarithmic effect of these additions is that a 60 dBA 24 hour L_{eq} would result in a measurement of 66.4 dBA L_{dn}.

- CNEL is a 24-hour average L_{eq} with a 5 dBA "weighting" during the hours of 7:00 P.M. to 10:00 P.M. and a 10 dBA "weighting" added to noise during the hours of 10:00 p.m. to 7:00 a.m. to account for noise sensitivity in the evening and nighttime, respectively. The logarithmic effect of these additions is that a 60 dBA 24 hour L_{eq} would result in a measurement of 66.7 dBA CNEL.

- L_{min} expresses a measurement of the minimum instantaneous noise level experienced during a given period of time.

- L_{max} expresses a measurement of the maximum instantaneous noise level experienced during a given period of time.

Table IV.G-1
Representative Environmental Noise Levels

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	—110—	Rock Band
Jet Fly-over at 100 feet		
	—100—	
Gas Lawnmower at 3 feet		
	—90—	
		Food Blender at 3 feet
Diesel Truck going 50 mph at 50 feet	—80—	Garbage Disposal at 3 feet

	—10—	
Lowest Threshold of Human Hearing	—0—	Lowest Threshold of Human Hearing

Source: California Department of Transportation, 1998.

Noise environments and consequences of human activities are usually well represented by median noise levels during the day, night, or over a 24-hour period. Environmental noise levels are generally considered low when the CNEL is below 60 dBA, moderate in the 60–70 dBA range, and high above 70 dBA. Noise levels greater than 85 dBA can cause temporary or permanent hearing loss. Examples of low daytime levels are isolated, natural settings with noise levels as low as 20 dBA and quiet suburban residential streets with noise levels around 40 dBA. Noise levels above 45 dBA at night can disrupt sleep. Examples of moderate level noise environments are urban residential or semi-commercial areas

(typically 55–60 dBA) and commercial locations (typically 60 dBA). People may consider louder environments adverse, but most will accept the higher levels associated with more noisy urban residential or residential-commercial areas (60–75 dBA) or dense urban or industrial areas (65–80 dBA).

When evaluating changes in 24-hour community noise levels, a difference of 3 dBA is a barely perceptible increase to most people. A 5 dBA increase is readily noticeable, while a difference of 10 dBA would be perceived as a doubling of loudness.

Noise levels from a particular source decline as distance to the receptor increases. Other factors, such as the weather and reflecting or shielding, also help intensify or reduce the noise level at any given location. A commonly used rule of thumb for roadway noise is that for every doubling of distance from the source, the noise level is reduced by about 3 dBA at acoustically "hard" locations (i.e., the area between the noise source and the receptor is nearly complete asphalt, concrete, hard-packed soil, or other solid materials) and 4.5 dBA at acoustically "soft" locations (i.e., the area between the source and receptor is earth or has vegetation, including grass). Noise from stationary or point sources is reduced by about 6 to 7.5 dBA for every doubling of distance at acoustically hard and soft locations, respectively. Noise levels may also be reduced by intervening structures; generally, a single row of buildings between the receptor and the noise source reduces the noise level by about 5 dBA, while a solid wall or berm reduces noise levels by 5 to 10 dBA. The normal noise attenuation within residential structures with open windows is about 17 dBA, while the noise attenuation with closed windows is about 25 dBA.[1]

Fundamentals of Environmental Groundborne Vibration

Vibration is sound radiated through the ground. The rumbling sound caused by the vibration of room surfaces is called groundborne noise. The ground motion caused by vibration is measured as particle velocity in inches per second and, in the U.S., is referenced as vibration decibels (VdB).

The background vibration velocity level in residential and educational areas is usually around 50 VdB. The vibration velocity level threshold of perception for humans is approximately 65 VdB. A vibration velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels for many people. Most perceptible indoor vibration is caused by sources within buildings, such as operation of mechanical equipment, movement of people, or the slamming of doors. Typical outdoor sources of perceptible groundborne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the groundborne vibration from traffic is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings.

---

[1] *National Cooperative Highway Research Program Report 117, Highway Noise: A Design Guide for Highway Engineers, 1971.*

The general human response to different levels of groundborne vibration velocity levels is described in Table IV.G-2, Human Response to Different Levels of Groundborne Vibration.

Table IV.G-2
Human Response to Different Levels of Groundborne Vibration

Vibration Velocity Level	Human Reaction
65 VdB	Approximate threshold of perception for many people.
75 VdB	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find that transportation-related vibration at this level is unacceptable.
85 VdB	Vibration acceptable only if there are an infrequent number of events per day.

Source: Federal Railroad Administration, 1998.

Regulatory Framework

Federal

The City of Los Angeles has not adopted any thresholds for groundborne vibration impacts. Therefore, this analysis uses the Federal Railway Administration's vibration impact thresholds during construction and operation for sensitive buildings. The Federal Railway Administration has developed vibration impact thresholds for noise-sensitive buildings, residences, and institutional land uses. These thresholds are 80 VdB at residences and buildings where people normally sleep (e.g., nearby residences and daycare facility) and 83 VdB at institutional buildings (e.g., schools and churches). These thresholds apply to conditions where there are an infrequent number of events per day.[2]

State

Title 24 of the California Code of Regulations codifies Sound Transmission Control requirements, which establishes uniform minimum noise insulation performance standards for new hotels, motels, dormitories, apartment houses, and dwellings other than detached single-family dwellings. Specifically, Title 24 states that interior noise levels attributable to exterior sources shall not exceed 45 dBA CNEL in any habitable room of new multi-family dwellings. Dwellings are to be designed so that interior noise levels will meet this standard for at least 10 years from the time of building permit application.

Local

City of Los Angeles Noise Regulation

The City of Los Angeles is the local agency responsible for adopting and implementing policies as they relate to noise levels and its effect on land uses within its jurisdiction. Both acceptable and unacceptable

[2] *"Infrequent events" is defined by the Federal Railroad Administration as being fewer than 70 vibration events per day.*

noise levels associated with construction activities, roadway noise levels and ambient noise levels must be defined and quantified. The City of Los Angeles has numerous ordinances and enforcement practices that apply to intrusive noise as well as ones that guide new construction. The City's comprehensive noise ordinance (Chapter XI of the LAMC) sets forth sound measurement and criteria, maximum ambient noise levels for different land use zoning classifications, sound emission levels for specific uses, hours of operation for certain uses, standards for determining when noise is deemed to be a disturbance to the peace, and legal remedies for violations.

In particular, Section 41.40 of the LAMC prohibits construction activity (including demolition) and repair work, where the use of any power tool, device, or equipment would disturb persons occupying sleeping quarters in any dwelling hotel, apartment, or other place of residence, between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, and between 6 p.m. and 8 a.m. on Saturday. All such activities are also prohibited on Sundays and all federal holidays.

Section 112.05 of the LAMC prohibits the operation of any powered equipment or powered hand tools that exceed the following noise limits at a distance of 50 feet between the hours of 7:00 a.m. and 10:00 p.m.:

- 75 dB(A) for construction, industrial, and agricultural machinery including crawler-tractors, dozers, rotary drills and augers, loaders, power shovels, cranes, derricks, motor graders, paving machines, off-highway trucks, ditchers, trenchers, compactors, scrapers, wagons, pavement breakers, compressors and pneumatic or other powered equipment;

- 75 dB(A) for powered equipment of 20 horsepower or less intended for infrequent use in residential areas, including chain saws, log chippers and powered hand tools; or

- 65 dB(A) for powered equipment intended for repetitive use in residential areas, including lawn mowers, backpack blowers, small lawn and garden tools and riding tractors.

However, the noise limitations above would not apply where compliance is deemed to be technically infeasible, which means that said noise limitations cannot be complied with despite the use of mufflers, shields, sound barriers, and/or other noise reduction devices or techniques during the operation of the equipment.

City of Los Angeles General Plan Noise Element

The California Government Code Section 65302(g) requires that a noise element be included in the General Plan of each county and city in the state. The Noise Element of the City of Los Angeles General Plan is intended to identify sources of noise and provide objectives and policies that ensure that noise from various sources does not create an unacceptable noise environment. Overall, the City's Noise Element describes the noise environment (including noise sources) in the City, addresses noise mitigation regulations, strategies, and programs as well as delineating federal, State, and City jurisdiction relative to rail, automotive, aircraft, and nuisance noise. It is a tool that City planners use to achieve and maintain compatible land uses with environmental noise levels.

The City's noise standards are correlated with land use zoning classifications in order to maintain identified ambient noise levels and to limit, mitigate, or eliminate intrusive noise that exceeds the ambient noise levels within a specified zone. Table IV.G-3, Guidelines for Noise Compatible Land Uses - Community Noise Exposure (CNEL), lists the noise/land use compatibility guidelines for land uses within the City of Los Angeles.[3]

Table IV.G-3
Guidelines for Noise Compatible Land Uses -Community Noise Exposure (CNEL)

Land Use	Normally Acceptable[a]	Conditionally Acceptable[b]	Normally Unacceptable[c]	Clearly Unacceptable[d]
Single-family, Duplex, Mobile Homes	50 - 60	55 - 70	70 - 75	above 70
Multi-Family Homes	50 - 65	60 - 70	70 - 75	above 70
Schools, Libraries, Churches, Hospitals, Nursing Homes	50 - 70	60 - 70	70 - 80	above 80
Transient Lodging – Motels, Hotels	50 - 65	60 - 70	70 - 80	above 80
Auditoriums, Concert Halls, Amphitheaters	---	50 - 70	---	above 65
Sports Arena, Outdoor Spectator Sports	---	50 - 75	---	above 70
Playgrounds, Neighborhood Parks	50 - 70	---	67 - 75	above 72
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50 - 75	---	70 - 80	above 80
Office Buildings, Business and Professional Commercial	50 - 70	67 - 77	above 75	---
Industrial, Manufacturing, Utilities, Agriculture	50 - 75	70 - 80	above 75	---

[a] Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
[b] Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
[c] Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
[d] Clearly Unacceptable: New construction or development should generally not be undertaken.
Source: Office of Noise Control, California Department of Health Services (DHS).

In accordance with the Noise Element of the City of Los Angeles General Plan, a noise exposure of up to 60 dB CNEL is considered to be the most desirable target for the exterior of noise-sensitive land uses, or sensitive receptors, such as homes, schools, churches, libraries, etc. It is also recognized that such a level may not always be possible in areas of substantial traffic noise intrusion. Exposures up to 70 dB CNEL for noise-sensitive uses are considered conditionally acceptable if all measures to reduce such exposure have

[3] *The City's noise/land use compatibility guidelines for land uses are taken from the guidelines prepared by the California Department of Health Services (DHS), Office of Noise Control.*

been taken. Noise levels above 70 dB CNEL are normally unacceptable for sensitive receptors except in unusual circumstances.

Existing Ambient Daytime Noise Levels

The Project Site is located in an urbanized environment with the following primary noise sources in the vicinity: Coliseum/Sports Arena activities during special events, traffic on the elevated Harbor Freeway (Interstate 110) located to the east of the Project Site, and traffic on the surface streets of Figueroa Street and Martin Luther King Jr. Boulevard. The Sports Arena is located within Exposition Park, which includes passive recreational spaces as well as County and State Museums. These areas are located north and west of the Sports Arena. Within this park/institutional setting, the ambient noise environment is dominated by the Coliseum and Sports Arena activities during special events.

To establish baseline noise conditions within the vicinity of the Project Site, existing daytime noise levels were documented by taking noise measurements at four locations during a non-event weekday on September 9, 2010 from approximately 11:30 a.m. to 12:50 p.m. A non-event weekday was selected to establish baseline conditions for the project vicinity as it would be most representative of the majority of the year. In the past five years, the Sports Arena and Coliseum held, on average, 69 events a year. As such, these measurements reflect the ambient weekday conditions for approximately 81% of the year. The 15-minute average noise levels measured at each of these locations are identified in Table IV.G-4, which are generally characteristic of an urban environment. The monitoring locations are illustrated in Figure IV.G-1, Noise Monitoring Location Map (see Appendix D to this Draft EIR for noise level measurement data).

Table IV.G-4
Existing Daytime Noise Levels

Noise Measurement Location[a]	Primary Noise Sources	Noise Levels		
		L_{eq}	L_{min}	L_{max}
1) Southwest corner of Project Site.	Light vehicle traffic and pedestrians.	60.4	52.3	71.0
2) Northern-central boundary of Project Site.	Light vehicle traffic and pedestrians.	57.9	50.1	72.7
3) Southeast corner of Project Site near Figueroa Street	Heavy vehicle traffic from Figueroa Street and pedestrian activity.	67.4	57.7	76.5
4) South of Project Site on sidewalk fronting MLK Blvd.	Heavy vehicle traffic on MLK Blvd. and pedestrian activity.	76.3	59.5	87.9

[a] *Refer to Figure IV.G-1 for locations.*

Source: Google Earth, 2010; PARKER Environmental Consultants September 2010.

CAJA Environmental Services, LLC

Figure IV.G-1
Noise Monitoring Location Map

The noise-sensitive receptors within the vicinity of the Project Site are as follows: Passive recreational and open space areas in Exposition Park north and west of the Sports Arena, Los Angeles County and State Museums in Exposition Park (including Ralph M. Parsons Pre-School located within Expo-Center west of Sports Arena), Residential uses located on the east side of Figueroa Street, and Residential uses located on the south side of Martin Luther King Jr. Boulevard between Figueroa Street and Menlo Avenue. These uses were identified as noise-sensitive receptors because they are located near the Project Site where construction activities would occur for the Proposed Project. These uses are considered to be sensitive to noise because they are places that people have a reasonable expectation for quiet hours necessary for sleep, relaxation, reading and other noise-sensitive activities.

Existing Groundborne Vibration Levels

Aside from seismic events, the greatest regular sources of groundborne vibration in the vicinity of the Project site are construction activities and roadway truck traffic. At the time that this EIR was prepared, no major construction activities likely to generate high groundborne vibration velocity levels (e.g., demolition, or pile driving) were occurring in the vicinity of the Project Site. Although there is anticipated construction activity associated with the Metro Light Rail Project located along Exposition Boulevard, this construction area is located more than 1,500 feet north of the Project Site and it is not expected construction-related vibration would be experienced at the Project Site from this related project. However, Medium to Heavy trucks and numerous buses currently travel along the streets adjacent to the Project Site, which do contribute to existing levels of groundborne vibration. These trucks typically generate groundborne vibration velocity levels of around 63 vibration decibels (VdB), and these levels could reach 72 VdB where trucks pass over bumps in the road.[4]

ENVIRONMENTAL IMPACTS

Thresholds of Significance

Construction Noise

Based upon the criteria established in the City of Los Angeles L.A. CEQA Thresholds Guide, a project would normally have a significant impact on noise levels from construction if:

- Construction activities lasting more than one day would exceed existing ambient exterior noise levels by 10 dBA or more at a noise sensitive use;
- Construction activities lasting more than 10 days in a three month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise sensitive use; or

[4] *Federal Railroad Administration, 1998, High Speed Ground Transportation Noise and Vibration Impact Assessment.*

- Construction activities would exceed the ambient noise level by 5dBA at a noise sensitive use between the hours of 9:00 PM and 7:00 AM Monday through Friday, before 8:00 AM or after 6:00 PM on Saturday, or at any time on Sunday.

Construction Groundborne Vibration

Although not specified in the City of Los Angeles L.A. CEQA Thresholds Guide, a project would typically have a significant impact if project construction activities would generate and expose persons to excessive groundborne vibration or groundborne noise levels.

The City of Los Angeles has not adopted any thresholds for groundborne vibration impacts. Therefore, this analysis uses the Federal Railway Administration's vibration impact thresholds for sensitive buildings. These thresholds are 80 VdB at residences and buildings where people normally sleep (e.g., nearby residences). No thresholds have been adopted or recommended for commercial uses.

Operational Noise

Based upon the criteria established in the City of Los Angeles L.A. CEQA Thresholds Guide, a project would normally have a significant impact on noise levels from project operations if the project would increase the ambient noise levels by 3 dBA CNEL at the property line of homes where the resulting noise level would be at least 70 dBA CNEL or at the property line of commercial buildings where the resulting noise level is at least 75 dBA CNEL. In addition, any long-term increase of 5 dBA CNEL or more is considered to cause a significant impact.

Project Impacts

Construction Noise

Construction activities with the Proposed Project would generate noise from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction; paving and asphalting; construction workers traveling to and from the project site; and delivery and hauling of construction supplies and debris to and from the project site. During each stage of development, there would be a different mix of equipment operating and noise levels would vary based on the amount of equipment in operation and the location of the activity. The projected haul route that would be used by haul and delivery trucks for the Proposed Project during construction is anticipated to be east/west bound on MLK Boulevard to/from the Project Site utilizing the 110 Freeway. Although noise sensitive receptors and other land uses along the haul route could see an increased amount of truck activity during times of construction, the noise levels generated by the passing trucks to the receptor locations would be substantially similar to the existing noise levels generated by other buses, trucks, and automobiles along this route. In addition, these noise levels would not be greater than the levels generated by construction equipment and activity on the Project Site. These potential noise levels are discussed in further detail below. Additionally, it should be noted that the Proposed Project will require the approval of a haul route application which will require the project construction and associated hauling

activities to occur in accordance with the permissible hours of operation and trip characteristics as approved in the haul route administered by the Department of Building and Safety.

The U.S. EPA has compiled data regarding the noise generating characteristics of typical construction activities. These data are presented in IV.G-5, Typical Outdoor Construction Noise Levels. These noise levels would diminish rapidly with distance from the construction site at a rate of approximately 6 dBA per doubling of distance. For example, a noise level of 84 dBA Leq measured at 50 feet from the noise source to the receptor would reduce to 78 dBA Leq at 100 feet from the source to the receptor, and reduce by another 6 dBA Leq to 72 dBA Leq at 200 feet from the source to the receptor.

Table IV.G-5
Typical Outdoor Construction Noise Levels

Construction Phase	Noise Levels at 50 Feet with Mufflers (dBA L_{eq})	Noise Levels at 60 Feet with Mufflers (dBA L_{eq})	Noise Levels at 100 Feet with Mufflers (dBA L_{eq})	Noise Levels at 200 Feet with Mufflers (dBA L_{eq})
Ground Clearing	82	80	76	70
Excavation, Grading	86	84	80	74
Foundations	77	75	71	65
Structural	83	81	77	71
Finishing	86	84	80	74

Source: U.S. EPA, 1971.

Due to the use of construction equipment during the construction phase, the Proposed Project could expose patrons at the previously stated noise-sensitive receptors to increased ambient exterior noise levels comparable to those listed in Table IV.G-5, or higher. As shown in Table IV.G-5, outdoor noise levels at noise-sensitive receptors 50 feet from the noise source could range from 77 dBA to 86 dBA L_{eq} with the use of noise-attenuating devices. Table IV.G-7, Exterior Noise at Off-Site Sensitive Uses from Project Construction, shows the construction noise levels that could occur at the off-site sensitive uses during construction at the Project Site and the nearest approximate ambient recorded daytime L_{eq} for comparative purposes.

As shown in Table IV.G-6, the construction noise levels experienced by the off-site sensitive receptors would range from 67.9 dBA L_{eq} to 83.1 dBA L_{eq}. Thus, construction activities associated with the Proposed Project would result in a temporary or periodic increase in noise levels at some of the off-site noise sensitive receptor locations.

Based on criteria established in the L.A. CEQA Threshold Guide, construction activities lasting more than 10 days in a three month period that would exceed existing ambient exterior noise levels by 5 dBA or more at a noise sensitive use, would normally result in a significant impact. As shown in Table IV.G-6, the estimated construction noise levels would exceed the measured ambient noise levels by more than 5 dBA at Sensitive Receptor Locations 1 & 2. Therefore, potentially significant short-term noise impacts

would occur with respect to the thresholds established in the L.A. CEQA Threshold Guide. It should be noted, however, that the increase in noise levels at the off-site locations during construction at the Project Site would be temporary in nature, and would not generate continuously high noise levels, although occasional single-event disturbances are possible. Accordingly, construction activities associated with the Proposed Project would generate a substantial temporary or periodic increase in ambient noise levels in the Proposed Project vicinity, and impacts would be considered potentially significant.

Table IV.G-6
Exterior Noise at Off-Site Sensitive Uses From Project Construction

Sensitive Receptor Location	Sensitive Land Use	Approx. Distance to Project Site (ft.) [a]	Estimated Construction Noise Levels (dBA L_{eq}) [b]	Measured Ambient Daytime Noise Levels (dBA L_{eq})
1	Passive recreational and open space areas in Exposition Park north and west of the Sports Arena.	70	83.1	57.9
2	Los Angeles County and State Museums in Exposition Park (including Ralph M. Parsons Pre-School located within Expo-Center west of Sports Arena).	400	67.9	60.4
3	Residential uses located on the east side of Figueroa Street.	250	72.0	67.4
4	Residential uses located on the south side of Martin Luther King Jr. Boulevard between Figueroa Street and Menlo Avenue.	325	69.7	76.3

[a] *The distance is estimated based on the nearest direct line from the sensitive receptor to the Project Site boundary.*

[b] *The noise level was determined with the following equation from Harris Miller Miller & Hanson Inc.'s (HMMH) Transit Noise and Vibration Impact Assessment, Final Report: $L_{eq} = L_{eq}$ at 50 ft. – 20 Log(D/50), where L_{eq} = noise level of noise source, D = distance from the noise source to the receiver, L_{eq} at 50 ft.= noise level of source at 50 feet.*

Source: Parker Environmental Consultants, September 2010.

Construction-Related Groundborne Vibration

Construction activities that would occur within the Project Site would include demolition and excavation, which would have the potential to generate low levels of groundborne vibration. Table IV.G-7, Vibration Source Levels for Construction Equipment, identifies various vibration velocity levels for the types of construction equipment that would operate during the construction of the Proposed Project. Based on the information presented in Table IV.G-7, vibration levels could reach as high as approximately 87 VdB within 25 feet of the Project Site from the operation of construction equipment.

Table IV.G-7
Vibration Source Levels for Construction Equipment

Construction Equipment	Approximate VdB at 25 feet
Large Bulldozer	87
Caisson Drilling	87
Loaded Trucks	86
Jackhammer	79
Small Bulldozer	58

Source: *Harris Miller Miller Hanson, Transit Noise and Vibration Impact Assessment, Final Report, April 1995.*

Construction activities would have the potential to impact the nearest off-site sensitive receptors to the Project Site. As discussed under Thresholds of Significance above, the Federal Railway Administration has established vibration impact thresholds for sensitive buildings, residences, and institutional land uses. These thresholds are 65 VdB at buildings where vibration would interfere with interior operations, 80 VdB at residences and buildings where people normally sleep, and 83 VdB at other institutional buildings. The 65 VdB threshold applies to typical land uses where vibration would interfere with interior operations, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes. The 80 VdB threshold applies to all residential land uses and any buildings where people sleep, such as hotels and hospitals. The 83 VdB threshold applies to institutional land uses such as schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment, but still have the potential for activity interference. For purposes of this analysis, the 80 VdB threshold would be applicable to the residential uses and the 83 VdB threshold would be applicable to passive recreation areas and structures located in Exposition Park. Table IV.G-8, below, provides estimated groundborne vibration levels at off-site sensitive uses from construction activities. As shown, the nearest sensitive uses would not experience construction related vibration levels above 78.1 VdB. Consequently, the vibration level that would be experienced by these uses would not exceed the Federal Railway Administration's vibration impact thresholds, and this impact would be considered less than significant.

Table IV.G-8
Groundborne Vibration at Off-Site Sensitive Uses From Construction Activities

Sensitive Land Use	Approx. Distance to Project Site (ft.)	Estimated Construction Vibration Levels (VdB) [a]
Passive recreational and open space areas in Exposition Park north and west of the Sports Arena.	70	78.1
Los Angeles County and State Museums in Exposition Park (including Ralph M. Parsons Pre-School located within Expo-Center west of Sports Arena).	400	63.0
Residential uses located on the east side of Figueroa Street.	250	67.0
Residential uses located on the south side of Martin Luther King Jr. Boulevard between Figueroa Street and Menlo Avenue.	325	64.7

[a] *The vibration levels at the off-site sensitive uses are determined with the following equation from Harris Miller & Hanson Inc.'s (HMMH) Transit Noise and Vibration Impact Assessment, Final Report: Lv(D)=Lv(25 ft) – 20log(D/25), where Lv = vibration level of equipment, D = distance from the equipment to the receiver, Lv(25 ft) = vibration level of equipment at 25 feet.*

Operational Noise – Special Event Noise

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air amphitheater. The bowl-shaped amphitheater would be built into the depression currently occupied by the Sports Arena, although the hole would be partially filled requiring approximately 250,000 cubic yards of soil import. This would allow Option 1 to take advantage of the existing topography of the Project Site. An approximate 800-square foot (40 feet x 20 feet) concrete pad would be located at the lowest elevation in the center of the amphitheater to serve as the stage and provide support for audio and visual equipment.

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Major League Soccer (MLS) Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with site's history. The VIP parking lot would remain to the west of the proposed stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on an east-west axis and would have a permanent seating capacity of approximately 22,000. The proposed outdoor soccer stadium would take advantage of the existing topography of the Project Site by constructing the stadium within the existing depression currently occupied by the Sports Arena, although the hole would need to be reconfigured to accommodate the different shape of the stadium.

Under both project options, the existing indoor venue would be replaced with an outdoor venue. Noise sources from special events at the open-air amphitheater or soccer stadium would include:

- Crowd noise (particularly yells and cheers at high attendance soccer or concert events);

- Public Address System (amplified public announcements and/or play-by-play announcements).
- Amplified concert music;
- Traffic-related noise from motorists traveling to and from events (discussed in detail below); and
- Helicopters and other aircrafts covering events.

It is anticipated that noise levels during soccer games and related sporting events would be substantially similar to the peak noise generating events currently occurring at the Coliseum. However, noise levels generated during concert and related events that would involve the use of amplified music and announcements would be increased compared to existing conditions and could have the potential to adversely impact neighboring uses to the east and south of the Project Site. It is typically expected that the sound level achieved for concert music, particularly popular or rock type music, would be in the 95 to 110 decibel range within the venue boundaries. The lower end of the range would be representative of ballad-type popular music while the upper end is representative of very loud rock or soul music.[5] Accordingly, music concert noise is likely to exceed ambient conditions by five decibels in residential adjacent areas during off-peak traffic times when noise levels in surrounding communities are low. As a result, some residents may continue to occasionally find evening concert noise intrusive or annoying. Therefore, as the Proposed Project would involve the replacement of an existing indoor venue with an outdoor venue generating a new source of noise exceeding the ambient conditions by five decibels, operational noise impacts from special events would be considered potentially significant.

Noise from Event Traffic & Parking Lots

With respect to vehicle and parking lot noise, the proposed event/soccer stadium facility replacing the existing Sports Arena is not expected to generate significant new traffic trips. As explained in more detail in Section IV.K, Transportation/Traffic, the new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility. Combined with the Coliseum, the Project Site supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new event/soccer stadium facility are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people (or motor vehicles) for individual events at the Sports Arena. Accordingly, vehicular and parking related noise would not be increased as a result of the Proposed Project and noise from event traffic would be considered less than significant.

---

[5] *Los Angeles Memorial Coliseum Renovation Project, Draft EIR, SCH# 1990011065.*

MITIGATION MEASURES

Code Required Measures

CR G-1 The Applicant shall comply with the City of Los Angeles Noise Ordinance No. 144,331 and 161,574, and any subsequent ordinances, which prohibit the emission or creation of noise beyond certain levels at adjacent uses unless technically infeasible.

CR G-2 The Applicant shall ensure construction and demolition be restricted to the hours of 7:00 AM to 6:00 PM Monday through Friday, and 8:00 AM to 6:00 PM on Saturday.

Project-Specific Mitigation Measures

MM G-1 The Applicant shall prepare a construction-related traffic plan detailing proposed haul routes and staging areas for the transportation of materials and equipment, with consideration for sensitive uses in the neighborhood. A traffic and parking plan for the construction phase will be submitted for approval by LADOT and the Department of Building and Safety prior to the issuance of any permits.

MM G-2 The Applicant shall ensure all construction equipment engines be properly tuned and muffled according to manufacturers' specifications. For example, Table IV.G-6 indicates that noise levels of 82 dBA at 50 feet could be reduced to a noise level of 76 dBA at 100 feet with the proper use of mufflers.

MM G-3 Adjacent museums and residents shall be given regular notification of major construction activities and their durations. A visible and readable sign (at a distance of 50 feet) shall be posted on the construction site identifying a telephone number where residents can inquire about the construction process and register complaints.

MM G-4 The perimeter of the Project Site shall be enclosed with a temporary barrier wall for security and noise protection purposes. This barrier wall shall consist of a solid, heavy vinyl material or ¾-inch plywood positioned to block direct line of sight from the active construction areas and other open space areas and sensitive uses.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Construction

With compliance with Section 41.40 of the LAMC and the implementation of the Mitigation Measures G-1 through G-6, listed above, which would require the implementation of noise reduction devices and techniques during construction at the project site, construction-related noise impacts associated with the Proposed Project would be reduced to the maximum extent feasible. Nevertheless, because construction

noise levels are likely to exceed existing ambient noise levels by more than 5 dBA for more than 10 days in a three-month period, construction noise impacts would be significant and unavoidable.

Construction related vibration levels would not exceed the Federal Railway Administration's thresholds of significance, and thus, these impacts would be considered less than significant.

Operational Noise – Special Event Noise

The Proposed Project would involve the replacement of an existing indoor venue with an outdoor venue generating a new source of noise exceeding the ambient conditions by five decibels. No feasible mitigation has been identified to reduce these noise levels below five decibels. As such, operational noise impacts from special events would be considered significant and unavoidable.

Noise from Event Traffic & Parking Lots

Vehicular and parking related noise would not be increased as a result of the Proposed Project and noise from event traffic would be considered less than significant.

IV. ENVIRONMENTAL IMPACT ANALYSIS
H. PUBLIC SERVICES
1. FIRE SERVICES

ENVIRONMENTAL SETTING

Fire prevention, fire suppression, and life safety services are provided throughout the City of Los Angeles, including the Project Site, by the Los Angeles City Fire Department (LAFD). These services are governed by the Fire Protection and Prevention Plan (Plan), an element of the City's General Plan, as well as the Fire Code section of the Los Angeles Municipal Code (LAMC). The Plan and the Fire Code serve as guides to City Departments, government offices, developers, and establish standards for the design, construction, maintenance, and operation of fire protection facilities including systems incorporated into private developments. These standards specify fire-flow criteria, minimum distances to fire stations, public and private hydrant specifications and location criteria, and access provisions for fire fighting vehicles and personnel. The adequacy of fire protection for a given area is based on response distance from existing fire stations, required fire-flow, and the Fire Department's judgment for needs in the area.

Citywide, the LAFD has 3,586 uniformed personnel and 353 non-uniformed support staff. Provided services include fire prevention, firefighting, emergency medical care, technical rescue, hazardous materials mitigation, disaster response, public education, and community service. A professionally trained staff of 1,104 firefighters (including 242 paramedic-trained personnel) is on duty at all times at 106 neighborhood fire stations located across the LAFD's 471-square-mile jurisdiction.[1] At present, there are no immediate plans to increase Fire Department staffing or resources in those areas, which will serve the Proposed Project.[2]

Fire Stations

The LAFD has fire stations at the following three locations for initial response service to the Project Site:[3]

Fire Station No. 46 – This station is located at 4370 S. Hoover Street, approximately 0.8 miles from the Project Site. It is staffed with 9 members and is equipped with an Engine and 2 Rescue Ambulances.

Fire Station No. 15 – This station is located at 915 W. Jefferson Boulevard, approximately 0.9 miles from the Project Site. It is staffed with 12 members and is equipped with an Engine, an Assessment Light Force, and a Paramedic Ambulance.

---

1 *Los Angeles Fire Department, website: http://www.lafd.org/about.htm, accessed September 21, 2010.*

2 *Written correspondence from John Dallas, Inspector I, Hydrants and Access Unit, Los Angeles Fire Department, May 20, 2010.*

3 *Ibid.*

Fire Station No. 14 – This station is located at 3401 S. Central Avenue, approximately 1.6 miles from the Project Site. It is staffed with 14 members and is equipped with a Task Force Station, Engine and Truck Companies, and Paramedic Ambulances.

Fire station locations are shown in Figure IV.H-1, Fire Station Locations. The above distances were computed to 3939 Figueroa Street, the address of the existing Sports Arena.

Fire Flow and Fire Hydrants

In general, the required fire-flow is closely related to land use. The quantity of water necessary for fire protection varies with the type of development, life hazard, occupancy and degree of fire hazard. Fire-flow requirements vary from 2,000 gallons per minute (gpm) in low-density residential areas to 12,000 gpm in high-density commercial or industrial areas. According to the Los Angeles Fire Department, the required fire-flow for the Proposed Project has been set at 6,000 gpm from 4 fire hydrants flowing simultaneously. Improvements to the water system in this area may be required to provide 6,000 gpm fire-flow. The cost of improving the water system may be charged to the developer.[4]

There is a fire hydrant directly north of the Sports Arena on the west side of Figueroa Street. This hydrant is on a 16-inch water main. In addition, there is one hydrant on the southwest corner of Martin Luther King, Jr. Boulevard, and one hydrant on the southeast corner of Martin Luther King, Jr. Boulevard and Figueroa Street. These hydrants are situated on 8-inch mains and 12-inch mains, respectively.

Response Distance and Emergency Access

The City of Los Angeles Fire Code specifies the maximum response distances allowed between specific sites and engine and truck companies, based upon land use and fire flow requirements. Table IV.H-1 provides the maximum response distance for fire stations based on a project's proposed land use. When response distances exceed these requirements, all structures must be equipped with automatic fire sprinkler systems and any other fire protection devices deemed necessary by the Fire Chief (e.g., fire signaling systems, fire extinguishers, smoke removal systems, etc.). Based on the required fire-flow of 6,000 gpm, the first-due Engine company should be within 1 mile, and the first-due Truck Company should be within 1.5 mile. Based on the response distance from existing fire stations, fire protection is considered adequate.[5]

Not to Scale

CAJA Environmental Services, LLC

Figure IV.H-1
Fire Station Location Map

Access to the Project Site for the purposes of fire suppression and emergency medical service (EMS) vehicles is currently provided via public roadways located directly adjacent to the Project Site, including primary access from Martin Luther King Jr. Boulevard to the south and Figueroa Street to the east.

Table IV.H-1

Maximum Response Distance (miles)

Land Use	Fire Station	
	Engine Company	Truck Company
Low Density Residential High Density Residential Neighborhood Commercial	1.0 - 1.5	1.0 - 1.5
Industrial and Commercial	1.0	1.0 - 1.5
High Density Commercial High Density Industrial Commercial and Industrial Centers	0.75	1.0

Source: City of Los Angeles Fire Code, Los Angeles Municipal Code (LAMC), Section 57.09.06.C

The three identified fire stations serving the site currently have established emergency response plans for the Sports Arena.

The current maximum capacity for Sports Arena events is approximately 16,740 persons. Under existing operations, fire and emergency medical services are adequately provided on-site or available within an acceptable response time during sporting and special events.

ENVIRONMENTAL IMPACT

Threshold of Significance

City of Los Angeles CEQA Thresholds Guide

In accordance with the City of Los Angeles CEQA Thresholds Guide (2006), a project would normally have a significant impact on fire protection if:

(a) The project requires the addition of a new fire station or the expansion, consolidation or relocation of an existing facility to maintain service.

PROJECT IMPACTS

Under Option 1 (Multiple Use Space) and Option 2 (MLS Stadium), the demands placed upon the Los Angeles Fire Department would be substantially similar to the current conditions, as all of the aforementioned uses would generate large public gatherings. Public events with large crowds generate

demands for increased life safety planning and staffing at event operations. The Proposed Project under either Option would be required to comply with all applicable State and local codes and ordinances, and the guidelines found in the Fire Protection and Fire Prevention Plan, as well as the Safety Plan, both of which are elements of the General Plan of the City of Los Angeles.[6]

With regard to emergency services access to the Proposed Project, and consistent with the Fire Protection and Prevention Plan (an element of the General Plan), at least two different ingress/egress roads for each area will be provided. Such access roads will accommodate major fire apparatus and provide for major evacuation during emergency situations.[7]

Definitive plans and specifications shall be submitted to the Fire Department and requirements for necessary permits satisfied prior to commencement of any portion of the Proposed Project. In addition, compliance with the listed Code-Required Measures, as well as any additional recommendations made during later reviews of the Proposed Project by the Fire Department will reduce potential impacts to less than significant levels.[8]

MITIGATION MEASURES

The Proposed Project will be constructed in accordance with all applicable standard building and safety requirements for new construction (i.e., Uniform Building Code, Fire Code, etc.), including the following:

MM H.1-1. Sprinkler systems will be required throughout any structure to be built, consistent with the LAMC requirements for public venue structures (Section 57.09.07).

MM H.1-2. All first-story portions of any commercial or industrial building must be within 300 feet of an approved fire hydrant (Section 57.09.06, Subsection B-1).

MM H.1-3. The maximum distance between fire-flow hydrants on the roads and fire lanes in a high-density residential and commercial area is 300 feet.

MM H.1-4. Any person owning or having control of any facility, structure, group of structures or premises shall provide and maintain Fire Department access (Section 57.09.03, Subsection A).

MM H.1-5. If any portion of the first story exterior walls of any building structure is more than 150 feet from the edge of the roadway of an approved street, an approved fire lane shall be provided so that such portion is within 150 feet of the edge of the fire lane. (Section 57.09.03, Subsection B.)

---

6 *Ibid.*

7 *Ibid.*

8 *Ibid.*

MM H.1-6. When required access is provided by an improved street, fire lane or combination of both which results in a dead-end in access of 700 feet in length from the nearest cross street, at least one additional ingress-egress roadway shall be provided in such a manner that an alternative means of ingress-egress is accomplished (Section 57.09.03, Subsection C).

MM H.1-7. All public and private streets shall be dedicated and improved in conformance with Board of Public Works, Standard Dimension Plan, Number D-22549.

MM H.1-8. Construction of public or private roadways in the proposed development shall not exceed 15 percent in grade.

MM H.1-9. Fire lanes, where required, and dead ending streets, shall terminate in a cul-de-sac or other approved turning area.

MM H.1-10. All access roads, including fire lanes, shall be maintained in an unobstructed manner. Removal of obstructions shall be at the owner's expense. The entrance to all required fire lanes or required private driveways shall be posted with a sign no less than three square feet in area (Section 57.09.05).

MM H.1-11. Fire lane width shall not be less than 20 feet. When a fire lane must accommodate the operation of Fire Department aerial ladder apparatus or where fire hydrants are installed, those portions shall not be less than 28 feet in width. The Fire Department may require additional vehicular access where buildings exceed 28 feet in height.

MM H.1-12. In the event that a subterranean parking structure is included as a part of the Proposed Project, and where fire apparatus will be driven onto the road level surface of such subterranean parking structure, that structure shall be engineered to withstand a bearing pressure of 8,600 pounds per square foot.

LEVEL OF IMPACT AFTER MITIGATION

Project impacts upon fire services under Option 1 and 2 would be mitigated to less than significant levels with implementation of the mitigation measures MM I-1 through MM I -12, above.

IV. ENVIRONMENTAL IMPACT ANALYSIS
H. PUBLIC SERVICES
2. POLICE PROTECTION

ENVIRONMENTAL SETTING

The Los Angeles Police Department (LAPD) is the local law enforcement agency responsible for providing police protection services to the Project Site and immediate Project Vicinity. The site is located within LAPD Reporting District (RD) 378, which consists entirely of Exposition Park. The boundaries of RD 378 are Exposition Boulevard to the north, Figueroa Street to the east, Martin Luther King, Jr. Boulevard to the south, and Vermont Avenue to the west. RD 378 is located within the Southwest Area, one of the LAPD's 18 area divisions within the City. The Southwest Area is bounded by the Santa Monica Freeway (Interstate 10) to the north, the Harbor Freeway (Interstate 110) to the east, Vernon Avenue to the South, and S. La Cienega Boulevard to the west.

As shown in Figure IV.H-2, Police Station Locations, the Southwest Area police station is located at 1546 W. Martin Luther King Jr. Boulevard, approximately 1.2 miles west of the site. The Southwest Area currently staffs 347 sworn officers and 26 civilian support staff deployed over three watches.[9] The Project Site is routinely patrolled at all times by officers assigned to the Southwest Area.

The crime rate, which is based on the number of crimes reported within a specified area with a given population, affects the "needs" projection for staff, facilities, and equipment for the LAPD. Annual crime statistics reported for the year 2008 for the Southwest Area indicate a crime rate of 53.8 per 1,000 persons, which is above the reported 2008 citywide crime rate of 41.6 per 1,000 persons (for all arrests).[10] Increases in the crime rate are not necessarily directly proportional to increases in land use activity. This is due to other factors contributing to the crime rate such as police presence, crime prevention measures, and on-going legislation/funding for public safety and community policing programs.

No Scale

CAJA Environmental Services, LLC

Figure IV.H-2
Police Station Location Map

Table IV.H-2, Los Angeles Crime Statistics Citywide and Southwest Area - 2008, provides 2008 crime statistics for the City as well as the Southwest Area (which includes the Project Site). As shown in Table IV.H-2, a total of 137,979 crimes occurred citywide in 2008, of which 13,968 occurred in the Southwest Area. The predominant crimes most often committed citywide and in the Southwest Area are larceny, auto theft, burglary, and robbery.

Table IV.H-2
Los Angeles Crime Statistics
Citywide and Southwest Area - 2008

Type of Crime	Citywide Year 2008	Southwest Area Year 2008
Homicide	381	34
Rape	786	82
Robbery	13,354	1,404
Aggravated Assults[1]	11,993	942
Total Violent Crimes	**26,514**	**2,462**
Burglary	19,402	1,391
Larceny	56,982	3,255
Auto Theft	22,268	1,392
Total Property Crimes	**98,652**	**6,038**
Total Part I Crimes	**125,166**	**8,500**
Population	4,004,000	191,041
Total Number of Sworn	9,830	347
Child/Spousal Abuse[1]	12,813	5,468
TOTAL	**137,979**	**13,968**

Notes:

1 Prior to 2005, the Aggravated Assaults included Child/Spousal Simple Assaults. Part II Child/Spousal Abuse Simple Assaults are not included in Part I Aggravated Assaults above to comply with the FBI's Uniform Crime Reporting Guidelines.

Source: Los Angeles Police Department, Statistical Digest 2008; Los Angeles Police Department, Crime and Arrest Weekly Statistics, January 19, 2010.

ENVIRONMENTAL IMPACT

Thresholds of Significance

As set forth in the City of Los Angeles CEQA Thresholds Guide (2006), the determination of significance shall be made on a case-by-case basis, considering the following factors:

(a) The population increase resulting from the Proposed Project, based on the net increase of residential units or square footage of non-residential floor area;

(b) The demand for police services anticipated at the time of project build-out compared to the expected level of service available. Consider, as applicable, scheduled improvements to LAPD services (i.e., facilities, equipment, and officers) and the project's proportional contribution to the demand; and

(c) Whether the project includes security and/or design features that would reduce the demand for police services.

Project Impacts

Construction Impacts

The Proposed Project has the potential to adversely affect police services during the construction period due to an increased potential for theft and vandalism. Construction sites can be sources of nuisances, providing hazards and inviting theft and vandalism. Therefore, when not properly secured, construction sites can attract criminal activity and become a distraction for local law enforcement. The demolition of the Sports Arena and redevelopment of the site with Option 1 (Multiple Use Site) or 2 (MLS Stadium) would therefore present a potentially significant impact on police protection services. However, the Proposed Project would employ mitigation measures including erecting temporary fencing around the construction site, and installing a security camera to discourage trespassers as well as deploying security guards to monitor the construction site and deter any potential criminal activity (see mitigation measures H.2-1 and H.2-2, below). Implementation of these mitigation measures would diminish the need for police services during construction of the Proposed Project and reduce the potentially significant impact to a less-than-significant level.

Operational Impacts

The Proposed Project has the potential to place high demands upon police protection services during operation as a result of the redevelopment of the site as a public venue. However, the Proposed Project includes security/design features that would reduce the demand for police service to less than significant levels. In addition private security staff will be employed for special events, in a manner that is consistent with the current operations.

The Proposed Project would introduce crowds of up to 93,000 people during Coliseum events in conjunction with the Multiple Use Space Option and crowds of up to 22,000 for the MLS Stadium Option. While there is not a directly proportional relationship between increases in land use activity and increases in demand for police protection services, the number of calls requesting police responses to retail burglaries, vehicle burglaries, damage to vehicles, traffic-related incidents, and crimes against persons would be anticipated to increase with the increase in on-site activity and increase in traffic on adjacent streets and arterials. Such calls are typical of problems experienced in the existing

neighborhood, and do not represent unique law enforcement issues specific to the Proposed Project. Nevertheless, to further reduce demands upon police services in the area, the Proposed Project would include strategically positioned low-level and security lighting to enhance public safety (see Mitigation Measure H.2-3).

Planning for the Multiple Use Space and the MLS Stadium would be designed to maximize public safety by limiting visually obstructed and infrequently accessed "dead zones," where ever possible. Security guards and ticket turnstiles would be employed to limit public access. The building and layout design of the MLS Stadium would also include crime prevention features, such as nighttime security lighting, full-time on-site professional security, security cameras monitored by on-site professional security, intrusion prevention systems, and secure parking facilities. As part of the Proposed Project, an on-site security plan would be conceived and implemented by the Coliseum Commission and various event coordinator(s) in consultation with the LAPD to minimize the potential for on-site crime and reduce demands upon additional LAPD services. While a security plan has not yet been finalized, such a plan would be required as a condition of project approval and would be developed in consultation with the LAPD Crime Prevention Unit (CPU) as part of the final site plan review process. Impacts related to police services would be considered less than significant, and the implementation of Mitigation Measures H.2-1 through H.2-3 would further reduce impacts upon police services.

The Proposed Project would not be expected to result in a substantial increase in the demand for police services from the LAPD such that a new police station or sub-station would need to be developed. Overall, police service impacts and staffing needs are based on the population served, which would not substantially increase as a result of the development of the Proposed Project, and the officer-to-population ratio would stay roughly the same. It is not anticipated that a new police facility would be necessary due to the Proposed Project and there are no known plans to construct any new police facilities in the Project area. Furthermore, the Proposed Project would be subject to LAPD review, and would be required to comply with all applicable safety requirements of the LAPD and the City of Los Angeles in order to address police protection service demands adequately. Thus, the Proposed Project would not necessitate new or expanded police facilities, and impacts to police services and facilities would be less than significant.

MITIGATION MEASURES

To ensure that potentially significant project impacts to police protection services would be less than significant; the following mitigation measures would be implemented as part of the Proposed Project:

H.2-1 The Project shall erect temporary fencing around the Project Site during construction activities to secure the Project Site and discourage trespassers.

H.2-2: Project Event Sponsors shall employ private security guards to monitor and secure the Project Site during events to secure the site and deter any potential criminal activity.

H.2-3: The Project Applicant shall develop and implement a Security Plan in consultation with the LAPD outlining the security services and features to be provided in conjunction with the Proposed Project. The plan shall be coordinated with the LAPD and a copy of said plan shall be filed with the LAPD Central Bureau Commanding Officer. Said security plan may include some or all of the following components:

i. Provisions for an on-site private security force for the mixed-use trade school. Through individual lease agreements for the proposed trade school/retail uses, private on-site security services shall provide a 24-hour presence. Security officers shall be responsible for patrolling all common areas including the back service corridors and alleys, parking garages, and stairwells.

ii. The parking garage shall be fitted with emergency features such as closed circuit television (CCTV) or emergency call boxes that would provide a direct connection with the on-site security force or the LAPD 911 emergency response system.

iii. The proposed security plan shall incorporate low-level and directional security lighting features to effectively illuminate project entryways, seating areas, lobbies, elevators, service areas, and parking areas with sufficient illumination and minimum dead space to eliminate areas of concealment. Full cut-off fixtures shall be installed that minimize glare from the light source and provide light downward and inward to structures to maximize visibility.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

With the implementation of the mitigation measures identified above, the Proposed Project would not significantly increase the demand for police services in the Project Area beyond what is currently experienced. The Proposed Project would not result in the provision of new or physically altered police protection facilities or the need for new facilities, the construction of which could cause significant environmental impacts. Therefore, the Proposed Project's operational impacts to police protection services would be less than significant after mitigation.

IV. ENVIRONMENTAL IMPACT ANALYSIS
I. PUBLIC UTILITIES
1. WASTEWATER

ENVIRONMENTAL SETTING

Existing Conditions

The City of Los Angeles Department of Public Works, Bureau of Sanitation Division, (the "Bureau of Sanitation") provides sewer conveyance infrastructure and wastewater treatment services to the Project Site and regulates the process of wastewater into the system. The Department of Public Works consists of five bureaus that design, build, inspect, and maintain the city's sewers, treatment plants, streets and street lighting systems. Engineering, Sanitation, and Contract Administration are the three bureaus that do most of the work involved with wastewater facility construction and operation.[1]

The Proposed Project would be served by the Hyperion Treatment Plant (HTP), the City's oldest and largest wastewater treatment facility, located southwest of the Los Angeles International Airport in Playa Del Rey. The Hyperion service area encompasses approximately 328,000 acres, or approximately 515 square miles, of the greater Los Angeles area and serves approximately four million people, 96 percent of the total area served by the City. The Hyperion service area also includes 53,000 acres outside the jurisdiction of the City on a contract basis. In November 1998, the HTP was upgraded to provide full secondary treatment for all wastewater based on an average dry weather flow of 450 million gallons per day (mgd). HTP currently processes average wastewater flows of approximately 340 mgd,[2] resulting in a remaining capacity of approximately 110 mgd.

The sewer infrastructure serving the Sports Arena consists of an existing 9- to 15-inch pipe originating from the northwest area of the Sports Arena and flowing in a southwestern direction into a 15- to 30-inch pipe under Hoover Street. The sewage from this pipe flows south along Hoover Street into a pipe greater than 45 inches near the intersection of Hoover Street and 41st Place.[3] Additional sewer infrastructure in vicinity of Exposition Park includes a network of six-, eight-, and ten-, twelve-, and 18-inch lines which feed into a 44-inch pipe under Exposition Boulevard and a 75-inch pipe in Rodeo Road.

Sewage is currently being generated on the Project Site from a variety of uses, the most significant of these being public restrooms, showers in the locker rooms, and concession stand/food preparation uses. In addition to these event-specific uses, the daily operation of the staff offices and ticket offices generate a

---

[1] *City of Los Angeles Department of Public Works Bureau of Sanitation, LA Sewers, website: http://www.lasewers.org/, September 28, 2010.*

[2] *City of Los Angeles Department of Public Works, Bureau of Sanitation, website: http://www.lastormwater.org/siteorg/general/hypern1.htm, September 28, 2010.*

[3] *City of Los Angeles, Bureau of Engineering, Navigate LA, website: http://navigatela.lacity.org/index01.cfm, September 28, 2010.*

comparatively small amount of sewage. It should be noted that the majority of annual on-site sewage generation occurs during events. Specifically, as stated in Section II, Project Description, the Sports Arena hosts on average 29 events per year during the week (M-F). The maximum attendance was recorded at 52,234 attendees while the average attendance levels ranged from 3,591 (in year 2005) to 11,862 (in year 2009) over the five-year history. The five year historic weekend events and attendance levels had higher utilization rates, with a maximum attendance level recorded at 55,132 attendees and an average attendance level ranging from 5,550 (in year 2005) to 11,367 (in year 2009). Consequently, existing sewage generation on the Project Site varies significantly depending on attendance levels. Sewage generation on-site is significantly reduced during periods when no events are being held.

Regulatory Framework

The HTP is subject to a number of federal, State and local regulations. Some of the most applicable policies and plans are discussed in greater detail below.

Title 40, Code of Federal Regulations

The Code of Federal Regulations (CFR) is the codification of the general and permanent rules and regulations published in the Federal Register by the executive departments and agencies of the Federal Government. Title 40 is the section of the CFR that deals with the protection of the environment and human health. It mainly contains the national environmental regulations enacted by the Environmental Protection Agency (EPA). The Los Angeles Regional Water Quality Control Board enforces Section 122.41(m) of Part 40 of the CFR, which among many water quality controls, prohibits the bypassing of treatment facilities and sanitary sewer overflows.

Clean Water Act

The Clean Water Act (CWA), enacted in 1972, is the principal federal regulation governing water pollution in the United States. The Act established the basic structure for regulating discharges of pollutants into the waters of the United States and gave the Environmental Protection Agency (EPA) the authority to implement pollution control programs such as setting wastewater standards for industry. The CWA also continued to set requirements for water quality standards for all contaminants in surface waters.

National Pollution Discharge Elimination System (NPDES)

As authorized by the CWA, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. Point sources are discrete conveyances such as pipes or man-made ditches. Individual homes that are connected to a municipal system, use a septic system, or do not have a surface discharge do not need an NPDES permit; however, industrial, municipal and other facilities must obtain permits if their discharges go directly to surface waters. In most cases, the NPDES permit program is administered

by authorized states. Since its introduction in 1972, the NPDES permit program is responsible for significant improvements to our nation's water quality.

California Water Code

California law consists of 29 codes, covering various subject areas, the State Constitution and Statutes. The California Water Code is the element which covers the issue of water in the State.

California Ocean Plan

Section 13170.2 of the California Water Code (CWC) directs the State Water Resources Control Board (State Water Board) to formulate and adopt a water quality control plan for ocean waters of California. The State Water Board first adopted this plan, known as the California Ocean Plan, in 1972. The California Ocean Plan establishes water quality objectives for California's ocean waters and provides the basis for regulation of wastes discharged into the State's coastal waters. The plan applies to point and nonpoint source discharges. Both the State Water Board and the six coastal Regional Water Quality Control Boards (Regional Water Boards) implement and interpret the California Ocean Plan.

Clean Water Enforcement and Pollution Prevention Act of 1999 (SB 709)

The Clean Water Enforcement and Pollution Prevention Act of 1999 (Senate Bill 709) amended the CWC by adding Section 13263.3. CWC Section 13263.3(d)(1) authorizes the State Water Resources Control Board (SWRCB), a Regional Water Quality Control Board (RWQCB), or a publicly owned treatment works (POTW) to require a discharger to prepare and implement a pollution prevention plan. CWC Section 13263.3(c) defines a discharger as any entity required to obtain NPDES permit or any entity subject to the federal pretreatment program.

Local Policies

Sewer Allocation Ordinance

To respond to the problem of insufficient sewer capacity, the City of Los Angeles has taken various steps to limit growth in the system. Ordinance No. 166,060, (also known as the Sewer Allocation Ordinance) adopted on June 27, 1990 by the City Council, established sewer permit allocation regulations for projects which discharge sewage into the HTP. Allocation is based on a City Council determination of "priority" and "non-priority" projects. "Priority" projects, which include such uses as nonprofit hospitals, emergency medical trauma centers, and affordable rental housing projects, are allocated a monthly sewage allotment of 143,750 gallons per day. The remaining "Non-Priority" projects receive a monthly sewage allotment of 239,583 gallons per day, of which 65 percent goes to residential projects and 35

percent goes to nonresidential. Los Angeles Ordinance No. 166,060 limits the annual increase in wastewater discharge from HTP to five million gallons per day (mgd).[4]

Wastewater Facilities Plan/Integrated Resources Plan

The City's sewer system is subject to Section 201 of the federal CWA. According to the CWA, the City must adopt a facilities plan in accordance with the United States Environmental Protection Agency (USEPA) Rules and Regulations, 40 CFR, Section 35.917. Section 201 specifies the following: facilities planning will demonstrate the need for facilities and, by a systematic evaluation of feasible alternatives, will also demonstrate that the proposed measures represent the most cost-effective means of meeting established effluent and water quality goals while recognizing environmental and social considerations.[5] The City prepared a Wastewater Facilities Plan (WFP) in 1982 and updated it in 1991. The WFP is focused primarily on developing cost-effective construction improvements and analyzes wastewater, water recycling, and stormwater services in the City.[6]

As a follow-up, the City adopted the Integrated Resources Plan in 2006. The Integrated Resources Plan incorporates a new City-prepared Wastewater Facilities Plan to address demand and capacity through 2020. The Integrated Resources Plan serves to update the information prepared in the 1991 Wastewater Facilities Plan, while also considering the needs of the City's recycled water and urban runoff systems. Specifically, the Integrated Resources Plan was developed to accommodate the projected increase in wastewater flow over the next 20 years while maximizing the beneficial reuse of recycled water and urban runoff and, as a result, optimizing the use of the City's existing facilities and water resources. Growth projections and data sources used in the Integrated Resources Plan were based on the Southern California Association of Governments (SCAG) 2001 Regional Transportation Plan, which estimated that the population of Los Angeles would reach almost 4.3 million people by 2020.

In order to meet the future demands posed by increased wastewater generation, the City chose to expand its current overall treatment capacity, while maximizing the potential to reuse recycled water through irrigation and other approved uses, including groundwater replenishment. According to the Integrated Resources Plan, the only water reclamation plant capable of providing recycled water for replenishment at existing spreading grounds is the Donald Tillman Water Reclamation Plant in the Sepulveda Basin in Van Nuys. The Tillman Water Reclamation Plant may be increased in size to convey approximately 100 million gallons per day of wastewater by 2020. These improvements, along with new sewer pipelines,

[4] *City of Los Angeles, LA CEQA Thresholds Guide, 2006, page K.2-6.*

[5] *City of Los Angeles Integrated Resources Plan Facilities Plan, Volume 1, July 2004, Revised November 2005, page 3-1.*

[6] *City of Los Angeles Department of Public Works Bureau of Sanitation, Integrated Resources Program, website: http://www.lacity.org/san/irp/About_IRP.htm, September 28, 2010.*

will ensure that untreated wastewater is not discharged to rivers or the ocean, thereby protecting the environment.

The Integrated Resources Plan also proposes to maximize recycled water reuse through groundwater replenishment. This is considered a valuable potential benefit, since it would allow the City to reduce the need to import water from other regions. However, the Integrated Resources Plan states that if the City does not implement groundwater replenishment by the time additional treatment capacity is needed, the expansion of wastewater treatment capacity would occur at the Hyperion Treatment Plant rather than at the Tillman Water Reclamation Plant. This will result in additional wastewater capacity levels at the Hyperion Treatment Plant and improved sewer facilities.

In general, implementation of the Integrated Resources Plan will enable the City to adequately convey wastewater to the treatment plants with minimal potential for sewage spills. It will also enable the City to treat future wastewater flows while protecting public health and safety and meeting regulatory requirements, thereby protecting the environment and surface waters.[7]

Sewer System Management Plan (SSMP)

On May 2, 2006, the State Water Resources Control Board (SWRCB) adopted the Statewide General Waste Discharge Requirements (WDRs) for publicly owned sanitary sewer systems with greater than one mile in length that collect and/or convey untreated or partially treated wastewater to a publicly owned treatment facility in California. Under WDRs, the owners of such systems must comply with the following requirements:

1. Acquire an online account from the State Water Board and report all sanitary sewer overflows (SSOs) online.

2. Develop and implement a written plan called a Sewer System Management Plan (SSMP) to control and mitigate SSOs and make it available to any member of the public upon request in writing.

Los Angeles has one of the largest sewer systems in the world including more than 6,600 miles of sewers serving a population of more than four million. The sewer system consists of three separate sanitary sewer systems: Hyperion Sanitary Sewer System, Terminal Island Water Reclamation Plant Sanitary Sewer System, and City of Los Angeles Regional Sanitary Sewer System.

To comply with the State Waste Discharge Requirements, the City acquired online accounts from the State Water Board and began reporting SSOs by the due date of January 2, 2007. A Sewer System

---

[7] *City of Los Angeles Integrated Resources Plan, IRP Findings and Statement of Overriding Considerations, September 2006, page 33.*

Management Plan was prepared for each of the three sanitary sewer systems and approved by the City's Board of Public Works on February 18, 2009.[8]

ENVIRONMENTAL IMPACTS

Thresholds of Significance

As set forth in the City of Los Angeles L.A. CEQA Thresholds Guide, a project would normally have a significant wastewater impact if:

(a) The project would cause a measurable increase in wastewater flows at a point where, and a time when, a sewer's capacity is already constrained or that would cause a sewer's capacity to become constrained; or

(b) The project's additional wastewater flows would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the Wastewater Facilities Plan or General Plan and its elements.

Project Impacts

Implementation of the Proposed Project would demolish the existing Sports Arena and replace the use with either an open-air amphitheater (Option 1) or a major league soccer stadium with approximately 22,000 fixed seats (Option 2). While the fixed seating capacities would be decreased in Option 1 and increased in Option 2 compared to the existing 16,740 fixed seating capacity of the Sports Arena, the average and maximum attendance levels at the Project Site would be substantially similar to the existing conditions discussed previously and in Section II, Project Description. As a result, the peak and average wastewater flows from the Project Site would not be increased compared to existing conditions and it is anticipated that the existing wastewater infrastructure in the vicinity would be able to accommodate the Proposed Project. Through the rules and regulations established in the City of Los Angeles Sewer Allocation Ordinance (Ord. 166,060), the Bureau of Sanitation does not make a determination of sewer capacity until LADBS has established that the project's plans and specifications are acceptable for plan check. This process ensures the system can accept the anticipated wastewater flows from the Project at the time of connection, as opposed to prematurely committing to projects that are in the environmental review or entitlement process. At the time of connection, the Bureau of Sanitation will check the gauging of the sewer lines and make the appropriate decisions on how best to connect to the local sewer lines at the time of construction. If the public sewer lines serving the Project Site are found to have insufficient capacity at the time of connection, the applicant would be required to build secondary sewer lines to a point in the sewer system with sufficient capacity. The installation of a secondary line, if needed, would

---

[8] *City of Los Angeles, Department of Public Works, Sewer System Management Plan, website: http://www.lasewers.org/ssmp/index.htm, September 28, 2010.*

require minimal trenching and pipeline installation and would not result in any adverse environmental impacts. As such, impacts with respect to local sewer capacity would be less than significant.

With respect to wastewater treatment facilities, as stated above, the HTP currently processes average wastewater flows of approximately 340 mgd, resulting in a remaining capacity of approximately 110 mgd. The peak and average wastewater flows from the Proposed Project would not be increased compared to existing conditions and would not substantially alter the treatment capacity presently available at the Hyperion Treatment Plant. Thus, impacts are considered to be less than significant.

MITIGATION MEASURES

No mitigation measures are required.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Impacts related to wastewater infrastructure and treatment would be less than significant.

IV. ENVIRONMENTAL IMPACT ANALYSIS
I. PUBLIC UTILITIES
2. WATER

ENVIRONMENTAL SETTING

Existing Project Site

The Project Site's current water supply demand is generated from the operation a variety of uses, the most significant of these being public restrooms, showers in the locker rooms, and concession stand/food preparation uses. In addition to these event-specific uses, irrigation for on-site vegetation and the daily operation of the staff offices and ticket offices demand a comparatively small amount of water. It should be noted that the majority of annual on-site water demand is created during events. Specifically, as stated in Section II, Project Description, the Sports Arena hosts on average 29 events per year during the week (M-F). The maximum attendance was recorded at 52,234 attendees while the average attendance levels ranged from 3,591 (in year 2005) to 11,862 (in year 2009) over the five-year history. The five year historic weekend events and attendance levels had higher utilization rates, with a maximum attendance level recorded at 55,132 attendees and an average attendance level ranging from 5,550 (in year 2005) to 11,367 (in year 2009). Consequently, existing water demand on the Project Site varies significantly depending on attendance levels. [check attendance levels]

Regional Water Supply

Water is currently supplied to the Project Area by the City of Los Angeles Department of Water and Power (LADWP). The LADWP is the nation's largest municipal utility, and serves the water and electricity needs of the City of Los Angeles.[9] The LADWP is responsible for ensuring that water demands within the City are met and that State and Federal water quality standards are achieved. In addition to supplying water for domestic uses, LADWP also supplies water for fire protection services, in accordance with Los Angeles Fire Department (LAFD) requirements (see discussion in Section IV.H.2, Fire Protection), as well as recycled water for irrigation and industrial uses in conjunction with the Department of Public Works.

City water supplies for the Fiscal year 2008-2009 were derived from the following sources: (1) the Los Angeles Aqueduct (approximately 18 percent), (2) the Metropolitan Water District (MWD, approximately 71 percent), (3) groundwater (10 percent), and (4) recycled water, (approximately 1 percent).[10] Water availability from these sources varies from year to year and is primarily dependent on weather conditions and demand.

Water Supply Sources

The City of Los Angeles receives water from five major sources: 1) the Eastern Sierra Nevada watershed, via the Los Angeles Aqueduct (LAA); 2) the Colorado River, via the Colorado River Aqueduct; 3) the Sacramento-San Joaquin Delta, via the State Water Project (SWP) and the California Aqueduct; 4) local groundwater; and 5) recycled water. The amount of water obtained from these sources varies from year to year and is primarily dependent on weather conditions and demand.

In recent years, various factors have converged to threaten the long-term availability of Los Angeles' traditional water supplies. The Eastern Sierras, which historically provided the greatest share of Los Angeles' water supply, recorded their lowest snowpack ever in 2007. The year 2007 was also the driest year on record for the City of Los Angeles. In August of that year, a Federal Court issued a ruling that limited water exports from the Sacramento-San Joaquin Delta by as much as one-third in order to protect endangered delta smelt. Additionally, contamination in the San Fernando Valley groundwater supply restricted the City's ability to fully utilize that local resource. Ongoing commitments to environmental mitigation in the Owens Valley and Mono Lake Basin, which supply nearly half of the historic water supplies from the Eastern Sierra watershed, have further threatened local water supplies. On June 4, 2008, Governor Arnold Schwarzenegger declared a statewide drought for California.

Metropolitan Water District

As stated above, in the fiscal year 2008-2009 the MWD supplied approximately 71% of Los Angeles' domestic water. The MWD is a consortium of 26 cities and water districts (including the LADWP) that provides wholesale water to Los Angeles, Orange, San Diego, Riverside, San Bernardino and Ventura counties. It is the largest municipal water wholesaler in the world, providing an average of 2.3 million acre-feet of water per year to a 5,200 square-mile service area. MWD's sources of imported supplies are the Colorado River, the SWP (through the Sacramento/San Joaquin River Delta), local surface and groundwater storage, and storage transfer agreements with Central and Sacramento Valley agencies and Colorado River agencies. The City of Los Angeles typically purchases MWD water to make up the difference between local demand and other city water supplies. Over the last two decades, while these resources have proven a key component of the City's water supply, they have also been subject to uncertainty due to climate variability and environmental issues.[11]

MWD has approximately 1.7 million acre-feet in surface and groundwater storage accounts – including Diamond Valley Lake near Hemet – and 600,000 acre-feet of storage reserved for emergencies. In total, this reserve of water supplies buffers the severity of a potential shortage, allows for a less severe water shortage allocation if required, and keeps the region prepared for a major earthquake or other events.[12]

---

[11] *City of Los Angeles Department of Water and Power, Securing L.A.'s Water Supply, May 2008.*

[12] *Ibid.*

To help ensure reliable deliveries of imported water to its 26 member agencies, the MWD has implemented a variety of storage projects and water transfer programs. The MWD is also actively pursuing improvements in the way the SWP operates and solutions for the Bay-Delta that would not only improve the environment, but provide more flexibility and reliability in SWP supplies.[13]

Los Angeles Aqueduct

Over the last two decades, the City's water deliveries from the LAA have dropped dramatically due to the reallocation of water for environmental mitigation and enhancement in the Eastern Sierra. From 1995 through 2000, the City received 63 percent of its water from the Eastern Sierra through the LAA. From 2001 through 2004, however, only 34 percent of the City's water came through the LAA.

The quantity of water delivered by the LAA varies each year based on the snowpack in the Eastern Sierra. Annual variations in LAA deliveries are inversely proportional to MWD water purchases, highlighting the City's strong reliance on MWD, especially during dry years.

Reductions in LAA deliveries are largely due to the reallocation of water for environmental mitigation and enhancement. Among these environmental requirements are: the State Water Resources Control Board (SWRCB) Mono Lake decision, which permanently limited LADWP's ability to export water from the Mono Basin; implementation of the Owens Lake Dust Mitigation Project; rewatering of the Lower Owens River, and a number of other environmental restoration projects in the Owens Valley that require water. Due to these commitments and climate change impacts, LADWP projects that average deliveries from the LAA will supply approximately one-third of the city's water needs.[14]

Local Groundwater

Los Angeles relies upon local groundwater for an average of 11 percent of its total water supply, and historically more during emergencies and drought years. The City's water rights pertain to groundwater basins in the San Fernando Valley as well as the Central and West Coast Basins. However, groundwater contamination in the San Fernando Valley, where the majority of the City's groundwater supply is produced, has limited water available for pumping.[15]

The City owns water rights in three Upper Los Angeles River Area (ULARA) groundwater basins: San Fernando, Sylmar, and Eagle Rock, as well as Central and West Coast Basins. On average, about 86 percent (90,755 AFY) of the City's groundwater supply is extracted from ULARA groundwater basins, while the Central Basin provides 14 percent (15,000 AFY). The City also owns 1,503 AFY of West

[14] *City of Los Angeles Department of Water and Power, Securing L.A.'s Water Supply, May 2008.*

[15] *Ibid.*

Coast Basin groundwater rights. However, localized water quality issues have impacted the exercise of LADWP's water rights in the West Coast Basin.[16]

Recycled Water

Water recycling offers a reliable, economically feasible and environmentally sensitive way to augment the city's water supplies. Recycling programs treat wastewater so that it can be used safely for irrigating landscape, golf courses, crops, and freeway medians, as well as to act as a barrier against seawater intrusion. Los Angeles has used recycled water since 1979 for irrigation and industrial purposes. Recycled water keeps the landscape healthy in areas such as Griffith Park, along with the Mount Sinai and Forest Lawn Memorial Parks. Currently, LADWP oversees distribution of recycled water from four reclamation plants for irrigation, industry, habitat development and recreation.[17]

Water Treatment

Prior to being used or consumed, water must be treated at a water treatment plant. The Los Angeles Filtration Plant is the primary water treatment plant that would serve the Project Site.

Future Demand Projections

Water use in the City of Los Angeles peaked in 1986, at just over 700,000 acre-feet per year (AFY). What followed was five years of severe drought, widespread water shortages, and the implementation of mandatory conversation measures. Due to conservation, a boost in rainfall in 1992 and 1993, and tough economic times, water use dropped by more than 17 percent in the following years.[18]

Since the early 1980s, the City has invested millions of dollars in conservation measures, particularly the installation of low-flow toilets and shower heads. Thanks to these efforts, Los Angeles' water demand is about the same as it was 25 years ago, despite a population increase of 1 million people.[19]

Projections of the City's growth show that Los Angeles' total water demand (including all customer sectors) will increase about 0.4 percent annually – from just under 670,000 acre-feet a year (AFY) in 2006-07 to a projected 776,000 AFY in 2030 (based on normal weather conditions and with projected conservation).[20] The UWMP projects total water demands at 683,000 AFY for 2010, 705,000 AFY for 2015, 731,000 AFY for 2020, and 755,000 AFY for the year 2025.[21]

[19] *Ibid.*

[20] *Ibid.*

[21] *City of Los Angeles Department of Water and Power, 2005 Urban Water Management Plan, Chapter One – Water Demand, page 1-10.*

Infrastructure

The infrastructure needed to supply water to residents and businesses includes: water storage facilities, transmission and distribution pipelines, booster pumping stations, pressure reducing stations, and other related facilities. Water storage is essential for the conservation of water to supply daily peaks, meet high demand conditions and provide for firefighting and emergencies. The City water system has 114 tanks and reservoirs ranging in size from 10 thousand to 60 billion gallons with a total capacity of 109 billion gallons. Water is distributed through a network of over 7,200 miles of water mains ranging from 4 inches to 120 inches in diameter. Because of the size and range in elevation (0 to 2,400 feet), the system has been divided into 102 pressure zones, with almost 90 booster pumping stations to provide water service at higher elevations.[22] The LADWP also has 716,531 water service connections and 59,605 fire hydrants.[23]

Existing water lines serving the Project Site include a 16-inch main under Figueroa Street and a 12-inch main under Martin Luther King Jr. Boulevard. Additional nearby lines include a 61-inch main under the Figueroa Street easement and an eight-inch main under Bill Robertson Lane (formerly Menlo Avenue).

Regulatory Framework

State

California Code of Regulations

The California Code of Regulations, Title 20, Chapter 4, Article 4, Section 1605 establishes water efficiency standards (i.e., maximum flow rates, maximum gallons per flush) for all new plumbing fittings and fixtures (e.g., showerheads, sink faucets, water closets, urinals), and Section 1608 prohibits the sale of fixtures that do not comply with the regulations. In addition, the Energy/Policy Act of 1992 mandated low-flush toilets.

The 2007 California Green Building Standards Code, CCR, Title 24, Part 11, adopted July 17, 2008, requires that indoor water use be cut by 20%. The code will take effect in 2010 and will apply to single-family homes, state buildings, heath facilities and commercial buildings.

Urban Water Management Planning Act

In accordance with the State of California's Urban Water Management Planning Act of 1984, all public water suppliers that provide municipal and industrial water to more than 3,000 customers, or supply more than 3,000 acre feet per year (AFY) of water, are required to prepare and adopt an Urban Water Management Plan (UWMP). LADWP, which provides over 700,000 water service connections, most

---

[22] *City of Los Angeles, LA CEQA Thresholds Guide, 2006, page M.1-7.*

[23] *Los Angeles Department of Water and Power, LADWP Quick Facts and Figures, website: http://www.ladwp.com/ladwp/cms/ladwp000509.jsp, accessed September 29, 2010.*

recently updated its UWMP in December 2005. The next Water Plan Update is scheduled for completion by December 31, 2010.

Senate Bill 610 and Senate Bill 221 - Water Supply Assessments

Since Senate Bill 910 was passed in 1995, land use agencies have been required to consider available water supply when approving larger development projects. Historically, public water suppliers (PWS) provided "will serve" letters to developers to meet this requirement. Senate Bill Nos. 221 and 610, approved October 9, 2001, require a more formal and detailed analysis called a water supply assessment (WSA). The main planning tool in creating the water supply assessment is the UWMP. If the demands expected from the development are accounted for in the UWMP, it may be used – in whole or in part – to establish supply availability under normal and drought conditions.

SB 610, Public Resources Code (PRC) and Section 10910-10915 of the State Water Code require lead agencies to request a WSA from the local water purveyor prior to approval of specified large development projects. Also, per California Water Code Section 10910, if the projected water demand associated with a proposed development project is covered under the most recently adopted UWMP, that development project is considered to have sufficient available water supply and does not require a Water Supply Assessment. Of the two bills, SB 610 has the broadest applicability. All "projects" that meet any of the following criteria require the assessment:

- a proposed residential development of more than 500 dwelling units;
- a proposed shopping center or business establishment of more than 500,000 square feet of floor space or employing more than 1,000 persons;
- a proposed commercial office building of more than 250,000 square feet of floor space or employing more than 1,000 persons;
- a proposed hotel or motel of more than 500 rooms;
- a proposed industrial, manufacturing, or processing plant or industrial park of more than 40 acres of land, more than 650,000 square feet of floor area, or employing more than 1,000 persons;
- a mixed-use project that falls in one or more of the above-identified categories; or
- a project not falling in one of the above-identified categories but that would demand water equal or greater than the amount required by a 500-dwelling unit project.

The Proposed Project falls below the thresholds of a "Project" as defined by SB 610 and SB 221 and, therefore, is not subject to a water supply assessment.

Securing L.A.'s Water Supply

In May 2008, the LADWP and the Mayor's Office unveiled a 20-year water strategy that calls for meeting 100 percent of all new water demand by 2030 with a combination of conservation and recycling. "Securing L.A.'s Water Supply" is a blueprint for creating sustainable sources of water for the future of Los Angeles. It is an aggressive multi-pronged approach that includes: investments in state-of-the-art technology; a combination of rebates and incentives; the installation of smart sprinklers, efficient washers and urinals; and long-term measures such as expansion of water recycling and investment in cleaning up the local groundwater supply. The premise of the Water Supply Plan is that the City will meet all new demand for water—about 100,000 acre-feet per year (AFY)—through a combination of water conservation, a six-fold increase in water recycling, and ramped up enforcement of water restrictions.[24]

Global Warming

On June 1, 2005, Governor Arnold Schwarzenegger issued Executive Order S-3-05, establishing greenhouse gas emissions targets for California and requiring biennial reports on potential climate change effects on several areas, including water resources. The potential effects of increasing atmospheric concentrations of carbon dioxide and other 'greenhouse gases' and the observed increase in the average temperature of the Earth's atmosphere and oceans have been the subject of considerable technical analysis and political debate. The natural phenomena (e.g. temperature, rainfall) that together form the climate of a particular region vary from day-to-day and year-to-year. The variation in climate can be a result of natural, internal processes or in response to external forces from both human and non-human causes, including solar activity, volcanic emissions, and greenhouse gases.

Although experts generally agree that the earth's atmosphere has warmed over the last century and will likely continue to warm in the future, there is substantial uncertainty as to how this warming will quantitatively affect future water supplies, and specifically, how this warming will affect State Water Project supplies. The California Department of Water Resources (DWR) is the state agency charged with the statutory responsibility to build, manage, and operate the State Water Project. DWR, as the owner and operator of the State Water Project and the agency with a statewide perspective and most relevant technical expertise, is in the best position to determine the effects of global warming on State Water Project supplies.[25]

In June 2006, DWR published a Technical Memorandum Report entitled *Progress on Incorporating Climate Change into Planning and Management of California's Water Resources* in response to the

---

[24] *City of Los Angeles Department of Water and Power, Securing L.A.'s Water Supply, May 2008.*

[25] *The Los Angeles Superior Court issued a statement of decision (Case No. BS 084677) on August 15, 2007, which upheld the City of Santa Clarita's Return to a Writ of Mandate and Final Additional Analysis to an EIR for a local development project. The court stated that DWR has the most expertise on water supplies in California, DWR has determined that the science on global warming has not reached a point where it can be quantified and incorporated into delivery projections of the State Water Project and CEQA does not require the City to undertake such an analysis.*

Executive Order. The Report describes progress made incorporating climate change into existing water resources planning and management tools and methodologies. Some preliminary results on the potential effects of climate change are presented. While the analyses presented in the Technical Memorandum Report used the most current scientific techniques and were reviewed by experts, all of the results are preliminary. The Technical Memorandum Report incorporates several assumptions, reflects a limited number of climate change scenarios, and does not address the likelihood of each scenario. Policy implications of climate change and recommendations to respond to the future demands for water are identified as beyond the scope of the Technical Memorandum Report. The Technical Memorandum Report acknowledges that there are substantial uncertainties regarding the effects of global warming on State Water Project supplies and suggests additional analysis to reduce this uncertainty.

Regarding the purpose and use of the Technical Memorandum Report in the analysis of climate change, the Technical Memorandum Report states that:

> *"The purpose of this report is to demonstrate how various analysis tools currently used by DWR could be used to address issues related to climate change. The methods and results presented in this report could be used to guide future climate change analysis and to identify areas where more information is needed. All results presented in this report are preliminary, incorporate several assumptions, reflect a limited number of climate change scenarios, and do not address the likelihood of each scenario. Therefore, these results are not sufficient by themselves to make policy decisions."*[26]

It is therefore premature to make an assessment of how, for example, snow melt will affect water availability. It is noted that increased use of groundwater storage is a potential strategy identified in the referenced Technical Memorandum Report to mitigate potential impacts of global warming.[27]

The *2005 State Water Project Delivery Reliability Report* addressed the need to incorporate some of the uncertainties of global warming with regard to planning and operation of the State Water Project, and stated that, "Until the impacts of climate change on precipitation and runoff patterns in California are better quantified, future weather patterns are usually assumed to be similar to those in the past, especially where there is a significant historical rainfall record."[28]

DWR is actively engaged in developing a set of water management policies that will provide a comprehensive approach to climate change. The science regarding global warming is still evolving and policy recommendations on how to incorporate potential changes to water supply due to climate change are being developed. However, the importance of conservation and maintaining a reliable water supply in the context of global warming is recognized by DWR and water planners.

---

[26] *State of California, Department of Water Resources, Progress on Incorporating Climate Change into Planning and Management of California's Water Resources, June 2006, at page 2.*

[27] *Ibid, See Tables 2-3 on pages 2-15.*

[28] *State of California, Department of Water Resources, 2005 State Water Project Delivery Reliability Report, at pages 3-4.*

The Global Warming Solutions Act of 2006 (Health and Safety Code Sections 38500 *et seq.*) requires the California Air Resources Board (CARB) to adopt regulations requiring monitoring and annual reporting of greenhouse gas emissions from the most important sources or categories of sources. By January 1, 2011, CARB must establish greenhouse gas emissions limits and emission reduction measures necessary to achieve the 1990 levels by 2020. It is therefore anticipated that California agencies will more precisely quantify impacts of climate change in various regions of the State and that DWR will formalize anticipated effects of climate change on water supply. Once DWR provides this assessment, it may be used by local water agencies to determine to what extent the supplies will be affected by global climate change impacts. As DWR develops more specific assessments of the potential effects of climate change on State Water Project delivery reliability and water demands, local purveyors can update their plans accordingly.

Regional

Metropolitan Water District

MWD has adopted a series of official reports on the state of its water supplies. Specifically, the Report on Metropolitan Water Supplies: A Blueprint for Water Reliability, MWD has consistently stated that its water supplies are fully reliable to meet the demands of the customers, including LADWP, in all hydrologic conditions through at least 2030. MWD is also engaged in identifying solutions that will ensure a reliable long-term water supply for its member agencies. In the near-term, MWD will continue to rely on the plans and policies outlined in its Regional Urban Water Management Plan, Water Surplus and Drought Management Plan, Water Supply Allocation Plan, and Integrated Resources Plan to address water supply shortages and interruptions to meet water demands.

Local

Los Angeles Municipal Code

The City of Los Angeles has adopted several ordinances in the LAMC in an effort to reduce water consumption. Specifically, the City of Los Angeles Ordinance No. 172,075, adopted in 1998, (Chapter Xll, Article ll, of the LAMC) requires all building owners to install low-flow showerheads (with a maximum flow of 2.5 gpm), water closets (with a maximum flow of 3.5 gpm), and low flow urinals (with a maximum 1.5 gallons per flush) prior to obtaining building permits. City Ordinance No. 163,532 (Chapter XII, Article IV, of the LAMC) also requires a 10 percent reduction in irrigation for large turf areas (three acres of turf or greater). Further, the City has recently begun enforcement of prohibited water uses as defined in the City's Emergency Water Conservation Plan Ordinance (Chapter XIII, Article I, of the LAMC). When the City's Emergency Water Conservation Plan Ordinance is in effect, LADWP customers cannot:

- Use water on hard surfaces (e.g., sidewalks, walkways, driveways, or parking areas);

- Water lawns between 10:00 A.M. and 5:00 P.M., April 1 to September 30, and between 11:00 A.M. and 3:00 P.M., October 1 to March 31;
- Allow excess water from sprinklers to flood gutters;
- Use water to clean, fill, or maintain decorate fountains unless the water is part of a recycling system;
- Serve water to customers in eating establishments, unless requested; and
- Allow leaks to go unattended

In addition to the above, additional restrictions instituted in the City's Emergency Water Conservation Plan Ordinance were recently adopted in August 2008 and include:

- Limiting watering times are limited to before 9 AM. and after 4 P.M. and to 15 minutes per station for rotating sprinklers and 10 minutes per station for other types of sprinklers 12 months a year;
- Prohibiting landscape watering during rain;
- Prohibiting washing/rinsing vehicles with a hose when the hose does not have a functioning self-closing nozzle attached or allowing the hose to run continuously;
- Requiring hotels and motels to offer guests the option of reusing linen and towels;
- Limiting watering days to Monday, Thursday, and Saturday.
- Limiting watering days to Monday and Thursday only.
- Failure to comply with the above requirements would result in penalties per violation.

ENVIRONMENTAL IMPACTS

Thresholds of Significance

As set forth in the City of Los Angeles CEQA Thresholds Guide (2006), the determination of significance shall be made on a case-by-case basis, considering the following factors:

(a) The total estimated water demand for the project;

(b) Whether sufficient capacity exists in the water infrastructure that would serve the project, taking into account the anticipated conditions at project buildout;

(c) The amount by which the project would cause the projected growth in population, housing or employment for the Community Plan area to be exceeded in the year of the project completion; and

(d) The degree to which scheduled water infrastructure improvements or project design features would reduce or offset service impacts.

Project Impacts

Construction

The Project Area is currently served by adequate potable water infrastructure. Construction of the Proposed Project would require connection to the existing potable water infrastructure in the Project's service area to serve the Project's operational demands. The Project's water demands (i.e., quantity, size and type of infrastructure) will be determined by the Applicant's engineering consultants in consultation with the Los Angeles Department of Building and Safety based on applicable building code requirements. The on-site and off-site fire flow demands are determined based on the Los Angeles City Fire Department and applicable building code requirements. Specific fire-flow tests are typically conducted during the civil engineering review phase of the Project, after Project approval. Once a determination of the Project's domestic and fire demands has been made, LADWP will assess the need for additional facilities. If the estimated water requirements for the Proposed Project can be served by existing water mains in the adjacent streets, water service will be provided routinely in accordance with the LADWP's rules and regulations. If the estimated water requirements are greater than the available capacity of the existing distribution facilities, special arrangements must be made with the Department to enlarge the flow capacity or pressure in supply line(s). In this case, upgrades to the supply main may cause temporary impacts on the adjacent land uses during construction. Although new service connections may occasionally result in temporary interruptions in water services for existing customers, new water service installations are generally "hot tapped" so as to avoid water service interruption. Therefore, temporary disruptions in local water service during the construction period are not anticipated and impacts would be less than significant.

Operation

Implementation of the Proposed Project would demolish the existing Sports Arena and replace the use with either an open-air amphitheater (Option 1) or a major league soccer stadium with approximately 22,000 fixed seats (Option 2). While the fixed seating capacities would be decreased in Option 1 and increased in Option 2 compared to the existing 16,740 fixed seating capacity of the Sports Arena, the average and maximum attendance levels at the Project Site would be substantially similar to the existing conditions discussed previously and in Section II, Project Description. Furthermore, any increases to water demand associated with the increase in seating capacity would be off set by the water conservation features set forth below as project mitigation measures. As a result, the peak and average water demand for the Project Site would not be increased compared to existing conditions and it is anticipated that the existing water supply infrastructure in the vicinity would be able to accommodate the Proposed Project. In addition, and as discussed previously, the Proposed Project falls below the thresholds of a "Project" as defined by SB 610 and SB 221, and is not subject to a water supply assessment. As the projected water demand of the Proposed Project would be similar to existing conditions at the Project Site, it is

anticipated the future water demand be within the 20-year water demand growth projected in the City of Los Angeles' Year 2005 Urban Water Management Plan.

Furthermore, as stated above, the Los Angeles Filtration Plant is the primary water treatment plant that would serve the Project Site. Because the water demands of the Proposed Project are within the 20-year water demand growth projected in the UWMP and water supplies are considered to be reliable, impacts associated with regional water supplies would be less than significant. Although water supplies are currently available and adequate, as stated in the discussion above, several uncertainties exist with respect to the long-term availability of projected water supplies. As such, the LADWP imposes water conservation mitigation measures for all projects within its jurisdiction (identified under the "Mitigation Measures" subheading, below). Implementation of these water conservation measures would ensure impacts related to water supply would be less than significant.

MITIGATION MEASURES

Although the Proposed Project would have less-than-significant impacts related to water supply, the LADWP imposes the following standard water conservation measures on all projects within its jurisdiction.

MM I.2-1: The Project shall comply with Ordinance No. 170,978 (Water Management Ordinance), which imposes numerous water conservation measures in landscape, installation, and maintenance (e.g., use drip irrigation and soak hoses in lieu of sprinklers to lower the amount of water lost to evaporation and overspray, set automatic sprinkler systems to irrigate during the early morning or evening hours to minimize water loss due to evaporation, and water less in the cooler months and during the rainy season). In addition, the Department of Water and Power requires the following conservation measures for all new development in the City of Los Angeles:

- High efficiency toilets (1.28 gallons per flush or less, includes dual flush);
- High efficiency urinals (0.5 gallons per flush or less, includes waterless);
- Restroom faucet flow rate of 1.5 gallons per minute or less;
- Public restroom self-closing faucets;
- Showerhead flow rate of 2.0 gallons per minute or less;
- Limit of one showerhead per shower stall;
- High efficiency clothes washers (water factor of 6.0 or less);
- High efficiency dishwashers (Energy Star rated);

- Use of tankless and on-demand water heaters as feasible;
- Cooling towers must be operated at a minimum of 5.5 cycles of concentration;
- Require onsite water recycling systems for wastewater discharge for commercial laundries, dye houses, food processing, certain manufacturing operations, etc. (subject to a payback threshold of five years or less). Mandate water recycling system for all new car wash facilities.
- Strict prohibition of single-pass cooling; (Note: Single pass cooling refers to the use of potable water to extract heat from process equipment)
- Irrigation system requirements:

  o Weather-based irrigation controller with rain shutoff;

  o Flow sensor and master valve shutoff (large landscapes);

  o Matched precipitation (flow) rates for sprinkler heads;

  o Drip/microspray/subsurface irrigation where appropriate;

  o Minimum irrigation system distribution uniformity of 75 percent;

  o Proper hydro-zoning, turf minimization and use of native/drought tolerant plant materials;

  o Use of landscape contouring to minimize precipitation runoff;
- Metering:

  o All irrigated landscapes of 5,000 square feet or more require separate metering or submetering;
- Mandated use of recycled water (where available) for appropriate end uses (irrigation, cooling towers, sanitary);
- Standard Urban Stormwater Mitigation Plan (SUSMP): Compliance with all City of Los Angeles SUSMP requirements, and encouraging implementation of Best Management Practices that have stormwater recharge or reuse benefits.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Impacts related to water supplies and infrastructure would be less than significant without mitigation. The required mitigation measures would further reduce water demand and ensure impacts would remain less than significant.

ENVIRONMENTAL SETTING

Electricity

The Los Angeles Department of Water and Power's (LADWP) power system serves approximately 4 million people, and is the nation's largest municipal utility. Its service territory covers the City of Los Angeles and many areas of the Owens Valley, with annual sales exceeding 24 million Mega Watt-hours (MWh). LADWP is a "vertically integrated" utility, both owning and operating the majority of its generation, transmission and distribution systems. LADWP strives to be self-sufficient in providing electricity to its customers, and does so by maintaining generation resources that are equal to or greater than its customers' electrical needs.[29]

LADWP has located a significant amount of generating resources within the Los Angeles area (west of the San Andreas fault zone), totaling 4,618 MW capacity out of a total of 7,323 MW capacity. By locating these generation sources within LADWP's service territory, LADWP ensures that it can produce electricity in the event of potential earthquakes or other situations that could interrupt LADWP's transmission system from importing power from external sources. Additionally, LADWP's new combined cycle and peaker plants, which normally operate on natural gas, also have a supply of backup fuel for use in emergency situations.[30]

LADWP provides electricity service to the City of Los Angeles. LADWP obtains electricity from various generating sources that utilize coal, nuclear, natural gas, hydroelectric, and renewable resources to generate power. The LADWP obtains power from four municipally owned power plants within the Los Angeles Basin, LADWP Hydro-generators on the Los Angeles Aqueduct, and shared-ownership generating facilities in the Southwest, and also purchases power from the Southwest and Pacific Northwest. LADWP also purchases excess power, as it is made available, from self-generators interconnected with the LADWP within the City.

Currently during major events, electricity is consumed for a variety of uses, the most significant of these being arena lighting, scoreboard, and video board operations. Other less intensive event-associated uses of electricity on-site include public address/sound system operation, television and radio transmission equipment, internal lighting (locker rooms, press box, etc.), maintenance equipment, and food preparation. The primary electricity-consumptive on-site use not associated with events is the daily

---

[29] *City of Los Angeles Department of Water and Power, 2007 Integrated Resource Plan (Final), p.4, December 2007.*

[30] *City of Los Angeles Department of Water and Power, 2007 Integrated Resource Plan (Final), p.9, December 2007.*

lighting of the administrative offices, continual security and maintenance lighting, and the operation of office equipment. It should be noted that the majority of annual on-site electricity consumption occurs during events, consistent with the existing events described in Section II, Project Description of this Draft EIR.

Natural Gas

The Southern California Gas Company (SCG) provides natural gas to the City of Los Angeles through existing gas mains located under the streets. Natural gas service is provided in accordance with the Gas Company's policies and extension rules on file with the California Public Utilities Commission (PUC) at the time contractual agreements are made. In 2006, 13.5 percent of the natural gas consumption in California came from in-state production. The remaining 86.5 percent is obtained from sources outside of the state: 40 percent from the Southwest, 23.5 percent from Canada, and 23 percent from the Rocky Mountain area.[31] However, the availability of natural gas is based upon present conditions of gas supply and regulatory policies. As a public utility, SCG is under the jurisdiction of the PUC, but can also be affected by actions of federal regulatory agencies. Should these agencies take any action that affects gas supply or the conditions under which service is available, gas service would be provided in accordance with those revised conditions.

Natural gas is currently consumed at the Sports Arena for water heating; space heating in the arena area and offices, locker rooms, and press box; and boiler operation. It should be noted that the majority of natural gas consumption on-site occurs during events, consistent with the existing events described in Section II, Project Description of this Draft EIR. Natural gas usage on-site is reduced substantially during periods when no events are scheduled.

ENVIRONMENTAL IMPACT

Thresholds of Significance

As set forth in the City of Los Angeles CEQA Thresholds Guide (2006), the determination of significance shall be made on a case-by-case basis, considering the following factors:

(a) Whether the project design or operation would conflict with adopted energy conservation plans or policies of the City, or exceed the growth anticipated in the applicable Community Plan;

(b) Whether the project would result in the need for new (off-site) energy supply facilities, or major capacity enhancing alterations to existing facilities.

---

[31] *California Natural Gas Data and Statistics, 2007 Integrated Energy Policy Report http://energyalmanac.ca.gov/naturalgas/index.html, accessed September 29, 2010.*

Project Impacts

Construction

Energy would be consumed during the demolition, excavation, and construction phases of the Proposed Project for grading and materials transfer by heavy-duty equipment, which is usually diesel powered. Although exact figures cannot be determined until building permits are issued, it is expected that the heavy equipment involved in the demolition, excavation, and construction phases of the Project would include crawler-excavators, loaders, bulldozers, graders, water trucks, street sweepers, tractors, cranes, and fork lifts. In addition, dump trucks would be used to haul excavated earth and building material. It is assumed that the majority of hauling would occur during the demolition and site preparation phases, which are expected to occur during the first portion of the construction period. Construction worker travel to and from the Project Site would result in the additional consumption of vehicular unleaded gasoline fuel during the construction period. In addition to diesel fuel and vehicular fuel, an unquantifiable amount of electricity and natural gas would be consumed as a result of the temporary construction process. Due to the relatively short duration of the construction process, and the fact that the extent of fuel consumption is inherent to construction projects of this size and nature, fuel consumption impacts would not be considered excessive or substantial with respect to regional fuel supplies. The energy demands during construction would be typical of construction projects for projects of this size and would not necessitate additional energy facilities or distribution infrastructure. Accordingly, energy demands during construction would be less than significant.

Operation - Electricity

Implementation of the Proposed Project would demolish the existing Sports Arena and replace the use with either an open-air amphitheater (Option 1) or a major league soccer stadium with approximately 22,000 fixed seats (Option 2). While the fixed seating capacities would be decreased in Option 1 and increased in Option 2 compared to the existing 16,740 fixed seating capacity of the Sports Arena, the average and maximum attendance levels at the Project Site would be substantially similar to the existing conditions discussed previously and in Section II, Project Description. As a result, the peak and average electricity demand for the Project Site would not be substantially increased compared to existing conditions and it is anticipated that the existing electrical infrastructure in the vicinity would be able to accommodate the Proposed Project. Depending on the exact location and size of the requested services (to be determined as site plans are finalized), the Project Applicant may be financially responsible for some infrastructure improvements (e.g. installation of electric power facilities or service connections) necessary to serve the Proposed Project.

New service connections may occasionally result in temporary disruptions in electrical services for existing customers. However, no outages or short outage is anticipated to occur when hooking up the Proposed Project. Energy supplies are adequate to serve the Project and the installation of needed new infrastructure would not be expected to result in any significant secondary environmental effects. Therefore, impacts would be less than significant.

With modern energy-efficient construction materials and operating equipment, the Proposed Project would promote conservation in accordance with the policies identified in Title 24 and in the City of Los Angeles General Plan Framework. While impacts upon regional energy resources are expected to be less than significant, the LADWP imposes standard mitigation measures for all new projects to further reduce project impacts and promote conservation efforts. Implementation of mitigation measures I-2 through I- reduce demand for electricity.

Natural Gas

Implementation of the Proposed Project would demolish the existing Sports Arena and replace the use with either an open-air amphitheater (Option 1) or a major league soccer stadium with approximately 22,000 fixed seats (Option 2). While the fixed seating capacities would be decreased in Option 1 and increased in Option 2 compared to the existing 16,740 fixed seating capacity of the Sports Arena, the average and maximum attendance levels at the Project Site would be substantially similar to the existing conditions discussed previously and in Section II, Project Description. As a result, the peak and average natural gas demand for the Project Site would not be substantially increased compared to existing conditions and it is anticipated that the existing natural gas infrastructure in the vicinity would be able to accommodate the Proposed Project. The Southern California Gas Company manages the pipelines adjacent to the Project Site. It is anticipated that the SCG would be able to meet the natural gas demands of the Proposed Project; based on SCG policy, a natural gas survey of equipment will have to be completed before confirming the current infrastructure will sustain the demand for the Project.

Since the Proposed Project is located in an area already served by existing natural gas infrastructure, the Project would not require extensive infrastructure improvement to serve the Project Site. It is not anticipated that any new natural gas distribution pipelines or infrastructure facilities would be constructed or expanded as a result of the Project. The project would however, require local infrastructure improvements to connect to the existing infrastructure serving the project area. “Hooking-up” disruptions cannot be determined until the actual natural gas demand is known. However, impacts associated with utility upgrades or additional connections would be temporary in nature and thus result in less than significant impacts upon the environment. Therefore, impacts associated with natural gas consumption would be less than significant.

MITIGATION MEASURES

Project Mitigation Measures

The applicant shall incorporate measures to meet or, if possible, exceed minimum efficiency standards for Title 24. While the project’s impacts upon energy resources are anticipated to be less than significant, the LADWP recommends that the following mitigation measures be imposed to further reduce the projects impacts upon regional energy resources.

MM I.3-1: Built-in appliances, refrigerators, and space-conditioning equipment shall exceed the minimum efficiency levels mandated in the California Code of Regulations.

MM I.3-2: The Project Applicant shall install high-efficiency air conditioning controlled by a computerized energy-management system in the office and retail spaces that provides the following:

- A variable air-volume system that results in minimum energy consumption and avoids hot water energy consumption for terminal reheat;
- A 100-percent outdoor air-economizer cycle to obtain free cooling in appropriate climate zones during dry climatic periods;
- Sequentially staged operation of air-conditioning equipment in accordance with building demands; and
- The isolation of air conditioning to any selected floor or floors.

MM I.3-3: The project shall be designed in a manner that utilizes Cascade (i.e., passively transferred) ventilation air from high-priority areas before being exhausted, thereby decreasing the volume of ventilation air required. For example, air could be passively transferred from occupied space to corridors and then to mechanical spaces before being exhausted.

MM I.3-4: The Applicant shall incorporate a recycle lighting system heat for space heating during cool weather. Exhaust lighting-system heat from the buildings, via ceiling plenums, shall be used to reduce cooling loads in warm weather.

MM I.3-5: The Applicant shall install low and medium static-pressure terminal units and ductwork to reduce energy consumption by air-distribution systems.

MM I.3-6: The Applicant shall ensure that buildings are well sealed to prevent outside air from infiltrating and increasing interior space-conditioning loads. Where applicable, building entrances shall be designed with vestibules to restrict infiltration of unconditioned air and exhausting of conditioned air.

MM I.3-7: The Applicant shall conduct a performance check of the installed space-conditioning system prior to issuance of the certificate of occupancy to ensure that energy-efficiency measures incorporated into the Project operate as designed.

MM I.3-8: Exterior walls shall be finished with light-colored materials and high-emissivity characteristics to reduce cooling loads. Interior walls shall be finished with light-colored materials to reflect more light and, thus, increase lighting efficiency.

MM I.3-9: White, high albedo, and reflective material shall be used for roofing in order to meet California standards for reflectivity and emissivity to reject heat.

MM I.3-10: Thermal insulation that exceeds requirements established by the California Code of Regulations shall be installed in walls and ceilings.

MM I.3-11: Window systems shall be designed to reduce thermal gain and loss, thus reducing cooling loads during warm weather and heating loads during cool weather.

MM I.3-12: The Project Applicant shall install heat-rejecting window treatments, such as films, blinds, draperies, or others on appropriate exposures.

MM I.3-13: The Project Applicant shall install fluorescent and high-intensity-discharge (HID) lamps, which give the highest light output per watt of electricity consumed, wherever possible including all street and parking lot lighting to reduce electricity consumption. Reflectors shall be used to direct maximum levels of light to work surfaces.

MM I.3-14: The Project Applicant shall install photosensitive controls and dimmable electronic ballasts to maximize the use of natural daylight available and reduce artificial lighting load.

MM I.3-15: The Project Applicant shall install occupant-controlled light switches and thermostats to permit individual adjustment of lighting, heating, and cooling to avoid unnecessary energy consumption.

MM I.3-16: The Project Applicant shall install time-controlled interior and exterior public area lighting limited to that necessary for safety and security.

MM I.3-17: Mechanical systems (HVAC) and lighting buildings shall be controlled with timing systems to prevent accidental or inappropriate conditioning or lighting of unoccupied space.

MM I.3-18: The Project Applicant shall incorporate windowless walls or passive solar inset of windows into the Project for appropriate exposures.

MM I.3-19: Design Project shall focus pedestrian activity within sheltered outdoor areas.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Project impacts on energy resources or infrastructure systems would be less than significant without mitigation. The proposed mitigation measures would further reduce energy demand.

ENVIRONMENTAL SETTING

Solid Waste Collection and Disposal

The management of solid waste in the City of Los Angeles involves public and private refuse collection services as well as public and private operation of solid waste transfer, resource recovery, and disposal facilities. The Bureau of Sanitation provides collection services primarily to single family residences and some of the smaller multi-family residences. The City is also responsible for collecting waste from the City Hall complex, some public buildings, parks and fire stations. Multifamily residences, such as apartment complexes and condominiums, and commercial and industrial buildings, contract with a private company to collect and transport their materials for disposal or recycling.[32]

The solid waste management hierarchy encompasses the system of solid waste source reduction, composting, transformation and disposal. The demolition, construction, and operation of projects results in the generation of solid waste. Project impacts are related to: the amount of waste generated and diverted; the need for additional solid waste collection routes or disposal facilities; and compliance with adopted policies and objectives.[33]

Landfills

Waste disposal sites (i.e., landfills) are operated by the City and County of Los Angeles as well as by private companies. In addition, transfer stations are utilized to temporarily store debris until larger haul trucks are available to transport the materials directly to the landfills. Landfill availability is limited by several factors, including: (1) restrictions to accepting waste generated only within a particular landfill's jurisdiction and/or wasteshed boundary, (2) tonnage permit limitations, (3) types of waste, and (4) operational constraints. Planning to serve long-term disposal needs is constantly being conducted at the regional level (e.g., siting new landfills within the County and transporting waste outside the region). Most commonly, the City of Los Angeles is serviced by the Sunshine Canyon Landfill and the Chiquita Canyon Landfill. Both landfills accept residential, commercial, and construction waste.

---

[32] *City of Los Angeles, LA CEQA Thresholds Guide, 2006.*
[33] *Ibid.*

Sunshine Canyon Landfill

The Sunshine Canyon Landfill is owned and operated by Browning-Ferris Industries (BFI) of California. BFI's parent company, Allied Waste, Inc., is the second largest integrated waste management company in the United States and for more than three decades has provided a wide range of residential and commercial waste disposal and recycling services to Los Angeles communities. The Sunshine Canyon Landfill is located within two jurisdictions: the City of Los Angeles and the County of Los Angeles. Final steps in combining the separate City (5,500 tons per day (TPD)) and County (6,600 TPD) Landfill operations into a single landfill are underway. BFI is working with the LA County Regional Planning Commission for a replacement CUP that will provide conformance between the County's 1993 CUP and the City's 1999 approvals. The joint City/County Landfill will handle 12,100 TPD within a single working face.[34]

As of March 31, 2010, Sunshine Canyon Landfill continues to operate six days a week. The combined City/County Landfill averages 8,500 to 9,200 tons per day Monday through Friday, and is currently operating on City/County boundary area of the site. Saturday waste volumes average less than 3,000 tons due to reduced hours of operation.[35]

Chiquita Canyon Landfill

The Chiquita Canyon Landfill in Santa Clarita is owned and operated by Waste Connections, Inc., and has provided the Santa Clarita Valley and surrounding Los Angeles communities with waste disposal services for more than 30 years.[36] The facility typically accepts between 5,000 and 6,000 tons per day. Landfill permits limit the operation to receive no more than 6,000 tons per day or 30,000 tons per week.[37]

Regulatory Setting

The California Integrated Waste Management Act of 1989 (AB 939) was enacted to reduce, recycle, and reuse solid waste generated in the State to the maximum amount feasible. Specifically, the Act required city and county jurisdictions to identify an implementation schedule to divert 50 percent of the total waste stream from landfill disposal by the year 2000 and 70 percent by the year 2020. The Act also requires each city and county to promote source reduction, recycling, and safe disposal or transformation.

---

[34] *Sunshine Canyon Landfill, About Sunshine Canyon Landfill, History, website: www.sunshinecanyonlandfill.com/about/history.shtml, accessed October 4, 2010.*

[35] *Sunshine Canyon Landfill, Update, Thoughts from Dave Hauser, Project Director, website: http://www.sunshinecanyonlandfill.com/update/_index.htm, accessed October 4, 2010.*

[36] *Waste Connections, Inc., Chiquita Canyon Landfill, Welcome, website: http://www.chiquitacanyon.com, accessed October 4, 2010.*

[37] *Waste Connections, Inc., Frequently Asked Questions, website: http://www.chiquitacanyon.com/faq.php, accessed October 4, 2010.*

Further, AB 939 requires each city to conduct a Solid Waste Generation Study and to prepare a Source Reduction and Recycling Element (SRRE) to describe how it would reach its goals. The SRRE contains programs and policies for fulfillment of the goals of the Act, including the above-noted diversion goals, and must be updated annually to account for changing market and infrastructure conditions. As projects and programs are implemented, the characteristics of the waste stream, the capacities of the current solid waste disposal facilities, and the operational status of those facilities are upgraded as appropriate.

City of Los Angeles Solid Waste Integrated Resources Plan

The City of Los Angeles Solid Waste Integrated Resources Plan (SWIRP) is a six year planning effort that outlines the City's objectives to provide sustainability, resource conservation, source reduction, recycling, renewable energy, maximum material recovery, public health and environmental protection for solid waste management planning through 2030 — leading Los Angeles towards being a "zero waste" city.[38] The SWIRP process, composed of three phases, aims to develop and implement a 20-year Zero Waste Master Plan (Master Plan) by 2013. Phase I, initiated in 2007, employed stakeholder input to determine the guiding principles and vision of the SWIRP. Phase II, initiated in 2008 and which is currently in process, involves the actual preparation of the Master Plan. Using the guiding principles developed in Phase I, it will develop a Policy, Program, and Facility Plan, Environmental Impact Report, and Financial Plan. These documents will detail the infrastructure, programs, policies, regulations, incentives, technological innovation and financial strategies necessary to: (i) eliminate the use of urban landfills; (ii) develop alternative technologies to convert waste to renewable energy fuels and products; (iii) increase recycling and resource recovery; (iv) convert Bureau of Sanitation trucks to clean renewable alternative fuels; and (v) lead the way for Los Angeles to become a zerowaste City.[39] Phase III, will implement the Master Plan. It may involve the implementation of new Bureau of Sanitation programs, the addition or modification of solid waste infrastructure, and new solid waste legislation.

ENVIRONMENTAL IMPACT

Thresholds of Significance

As set forth in the City of Los Angeles CEQA Thresholds Guide (2006), the determination of significance shall be made on a case-by-case basis, considering the following factors:

(a) Amount of projected waste generation, diversion, and disposal during demolition, construction, and operation of the project, considering proposed design and operational features that could reduce typical waste generation rates;

---

[38] *The SWIRP superseded the City's Solid Waste Management Policy Plan (CiSWMPP) that was adopted in 1994.*

[39] *City of Los Angeles, Department of Public Works, Welcome to SWIRP: A Zero Waste Plan for Los Angeles, accessed online at: http://www.zerowaste.lacity.org/about/welcome.html, accessed September 30, 2009*

(b) Need for an additional solid waste collection route, or recycling or disposal facility to adequately handle project-generated waste; and

(c) Whether the project conflicts with solid waste policies and objectives in the SRRE or its updates, City of Los Angeles Solid Waste Management Policy Plan, Framework Element, or the Curbside Recycling Program, including consideration of the land use-specific waste diversion goals contained in Volume 4 of the SRRE.[40]

Project Impacts

Construction

Construction of the Proposed Project would require the demolition of the existing Sports Arena. Approximately 5.4 million cubic feet of debris would be generated from this activity. Construction debris from building activities would also be generated which includes concrete, asphalt, wood, drywall, metals, and a variety of other miscellaneous and composite materials. As such, construction of the Proposed Project would generate construction debris that would need to be disposed of at area landfills and/or recycled. Construction debris includes concrete, asphalt, wood, drywall, metals, and a variety of other miscellaneous and composite materials.

The Sunshine and Chiquita Canyon Landfills are likely disposal and recycling sites for the Project's demolition and construction debris. The Sunshine Canyon Landfill has a remaining permitted daily intake capacity of 5,659 tons daily through the year 2024. The Paramount Resource Recycling center has a daily permitted intake of 2,400 tons. The amount of solid waste generated during construction would fall within the available permitted daily intake capacity of area landfills and recycling centers. Therefore, impacts associated with demolition and construction debris would be less than significant.

Operational Impacts

Implementation of the Proposed Project would demolish the existing Sports Arena and replace the use with either an open-air amphitheater (Option 1) or a major league soccer stadium with approximately 22,000 fixed seats (Option 2). While the fixed seating capacities would be decreased in Option 1 and increased in Option 2 compared to the existing 16,740 fixed seating capacity of the Sports Arena, the average and maximum attendance levels at the Project Site would be substantially similar to the existing conditions discussed previously and in Section II, Project Description. As a result, the peak and average solid waste generated by the Project Site would not be substantially increased compared to existing conditions. It is anticipated that the solid waste demands generated by the Proposed Project could be readily accommodated by the existing regional landfill operations without the need to expand operations or divert existing waste streams to alternative locations. However, because the existing landfill capacity is finite and its overall capacity will be reduced over time, additional landfills and solutions to address the

---

[40] *The SWIRP superseded the City's Solid Waste Management Policy Plan (CiSWMPP) that was adopted in 1994.*

ongoing regional solid waste demands of the City beyond 2024 will need to be addressed on a regional basis. This issue, however, is more appropriately addressed in the cumulative impacts discussion below. For purposes of a Project-specific impact conclusion, the Project's impact upon solid waste disposal facilities would be considered less than significant.

MITIGATION MEASURES

MM I.4-1: The Project Applicant shall develop a construction and demolition debris recycling program to divert construction related solid waste and demolition debris from area landfills.

MM.I.4-2: The Project Applicant shall develop an operational project recycling plan that includes the design and allocation of recycling collection and storage space in the Project.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Project impacts and cumulative impacts with respect to solid waste would be less than significant.

IV. J. TRAFFIC, TRANSPORTATION AND PARKING

The following section is based in part on the findings and conclusions provided in the Draft Technical Memorandum, dated October 25, 2010, to the Los Angeles Department of Transportation from Fehr & Peers, Transportation Consultants, for the Proposed Redevelopment of the Los Angeles Memorial Sports Arena (Ref: SM10-2413). (See Appendix F to this EIR). The traffic assessment involved a review of existing schedule and attendance level of events held at the Sports Arena and assessment of the potential traffic related impacts resulting from the proposed redevelopment of the Sports Arena.

ENVIRONMENTAL SETTING

The existing Sports Arena is located at 3939 South Figueroa Street in Exposition Park in the City of Los Angeles, California and occupies an approximately 15-acre parcel of land within the boundaries of the Exposition Parking Master Plan Area. Exposition Park is approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street to the east, Martin Luther King, Jr. Boulevard to the south, and Vermont Avenue to the west. The Sports Arena is located generally in the southeastern portion of Exposition Park. The project site is bounded by South Coliseum Drive to the west and north, Figueroa Street to the east, and Parking Lot 6 to the south.

Regional Access

Regional and local access to the Project Site is provided by the Los Angeles County Metropolitan Transit Authority's (MTA) bus and light rail lines. To the north of the Project Site, Exposition Boulevard is served by Metro Local and Limited Line 102 and the Metro Express Line 550. Immediately adjacent to the east, Figueroa Street is served by the Metro Silver Line (from downtown Los Angeles) as well as Metro Local and Limited Line 81. To the south of the Project Site, Martin Luther King Jr. Boulevard is served by the Metro Rapid Line 740 as well as the Metro Local and Limited Lines 40 and 42. In the future, regional access would also be provided by way of the MTA's light rail line (Metro Rail Expo Corridor) to Culver City, connecting Downtown Los Angeles to Culver City (Phase I) and Santa Monica (Phase II). A dedicated station (the Expo/Vermont) will serve Exposition Park. Phase I of the MTA's "Exposition Park Light Rail Transit Project" is scheduled to open in 2011.[1]

Automobile access to the Project Site is provided from the east off of Figueroa Street at 39th Street, and from the south access is provided off of Martin Luther King Jr. Boulevard at Hoover Street. From the north, access to the Project Site is provided off of Exposition Boulevard at Victory Walk by way of South Coliseum Drive. From the west, access is provided off of Vermont Avenue at 39th Street by way of

[1] *http://www.expositionpark.org/park-history.*

Exposition Park Drive and South Coliseum Drive.

Parking

There are approximately 27 parking lots and structures in the vicinity of the Project Site that are generally able to accommodate events held within the Exposition Park and the USC Campus area. Ten lots are within Exposition Park and provide parking for the museums and recreational areas as well as for the events at the Coliseum and the Sports Arena. A County of Los Angeles parking lot is located on the west side of Vermont Avenue, and two private parking areas are located on the south side of 40th Place. Four private parking lots, including one USC lot, are located on the east side of Figueroa Street, directly adjacent to Exposition Park, between Martin Luther King, Jr. Boulevard and Figueroa Street. The parking lot for the Department of Motor Vehicles is located east of the I-110 off of Exposition Boulevard, and the USC Parking Center is located north of the DMV's site on Jefferson Boulevard. Eight more parking areas are located to the north of Exposition Park, six of which are on the USC campus. The other two are located near the intersection of Jefferson Boulevard and Figueroa Street; one lot is located at the Shrine Auditorium, the other is private and is adjacent to the Shrine. Figure IV.J-1 depicts the supply of off-street parking available for spectators at events in the Coliseum. The total number of existing parking spaces in the Coliseum, Exposition Park, and University Park (USC Campus) is 19,981.

Existing Operations

The Los Angeles Memorial Sports Arena is owned by the Los Angeles Memorial Coliseum Commission, which leases the parcels occupied by the Sports Arena and the Coliseum from the State. The existing Sports Arena is an indoor facility with 16,740 seats and has hosted a variety of sporting events including boxing, professional and college basketball, and hockey. It has also hosted a number of civic events including the 1960 Democratic Convention as well as numerous rock concerts, track meets, rodeos, home shows, auto shows, roller derbies, rallies, fundraisers, Latin dances, etc. Summary tables of the existing events on an annual basis and separated by weekday/weekend events, are provided in Section II, Project Description.

1. N. Coliseum Drive 250 spaces	10. Lot 6 1,100 spaces	19. USC Lot B 1,056 spaces
2. S. Coliseum Drive 210 spaces	11. County 180 spaces	20. USC Surface 738 spaces
3. Coliseum Service Lot 60 spaces	12. Private 120 spaces	21. USC Lot D 1,345 spaces
4. California Science Center 2,160 spaces	13. Private 110 spaces	22. USC Lot X 1,013 spaces
5. Lot 1 930 spaces	14. Private 300 spaces	23. USC PS2 1,193 spaces
6. Lot 2 880 spaces	15. Private 200 spaces	24. USC Parking Center 1,800 spaces
7. Lot 3 950 spaces	16. Private 150 spaces	25. Shrine Auditorium 1,000 spaces
8. Lot 4 450 spaces	17. DMV 250 spaces	26. USC PS1 1,153 spaces
9. Lot 5 350 spaces	18. USC 1,713 spaces	27. Private 320 spaces

Figure IV.J-2
Parking Inventory

Existing Schedule Of Events And Attendance

An analysis of existing schedule of events and attendance levels was conducted to develop an understanding of existing operations of the Sports Arena. Actual schedule and attendance data from the past five years (Years 2005 through 2009) for both the Sports Arena and the Coliseum were reviewed and summarized in Table II-1 in Section II, Project Description. As shown in the table, in the past five years, the Sports Arena held, on average, 69 events a year. Of the 69 events, 60 had an attendance of less than 10,000 people, six events had an attendance between 10,000 to 20,000 people, and three events had an attendance of more than 20,000 people.

The data was analyzed to determine the number of events and their respective average attendance on a weekday vs. weekend. Table II-2 in Section II, Project Description, shows number of events held at the Sports Arena on a weekday or weekend during the period between Years 2005 and 2009. As shown, on average, 29 events were held per year on a weekday vs. 40 events per year on a weekend. The maximum attendance size of events on a weekday ranged from 14,588 people in 2006 to 52,234 people in Year 2005. The maximum attendance size for a weekend event ranged from 17,351 people in Year 2005 to 55,132 people in Year 2009.

ENVIRONMENTAL IMPACTS

Thresholds of Significance

Traffic

LADOT has established criteria to determine if a detailed traffic study is warranted. A Technical Memorandum addressing the project's traffic impacts is warranted when the project is likely to add 25 to 42 a.m. or p.m. peak hour trips, and the adjacent intersection(s) are presently estimated to be operating at LOS E or F. The scope for preparing a Technical Memorandum must be reviewed and approved by LADOT.

A detailed Traffic Study is generally warranted when the project is likely to add 500 or more daily trips, or likely to add 43 or more a.m. or p.m. peak hour trips.

Los Angeles County Congestion Management Plan

The Los Angeles County Congestion Management Plan (CMP) requires that new development projects analyze potential project impacts on CMP monitoring locations, if an EIR is prepared for the project. In such instances, the CMP requires that the Traffic Study analyze traffic conditions at all CMP monitoring arterial monitoring intersections where the Proposed Project would add 50 or more trips during either the A.M. or P.M. weekday peak hours of adjacent street traffic. The CMP also requires traffic studies to analyze mainline freeway monitoring locations where the project would add 150 or more trips in either

direction during either A.M. or P.M. weekday peak hours. If, based on these criteria, the Traffic Study identifies no facilities for study, then no further traffic analysis is required.

Based on factors in the City of Los Angeles CEQA Thresholds Guide (2006), the following criterion was established to determine if there would be any significant transit impacts due to the Project:

- The capacity of the transit system serving the Project area would be substantially exceeded.

Parking

The project would be considered to have a significant impact with regard to parking if the parking requirements of the Zoning Code are not met or if the anticipated parking demand, as provided through an appropriate analysis for the project, is not met by the supply of available on-site parking spaces. For purposes of this analysis, the provisions for providing parking for off site uses in accordance with pre-existing covenants and agreements shall be considered.

Under LAMC Section 12.21.A.4.(e), one automobile space is required for each five fixed seats contained within a stadium use. Based on this provision, the project would require 4,400 parking spaces to meet the code required parking demand.

PROJECT IMPACTS

Traffic Impacts

The proposed event/soccer stadium under Option 2 would provide a maximum of 22,000 seats. The soccer stadium could become home to a Major League Soccer (MLS) team. Two MLS teams currently utilize the Home Depot Center, a multi-sport facility located on the campus of California State University, Dominguez Hills in the city of Carson, California. Thus, there is high demand for another MLS stadium in the Los Angeles region.

Based on information provided by the Coliseum Commission, in addition to hosting MLS games, the proposed event/soccer stadium would continue to host events of attendance levels similar to the ones held at the existing Sports Arena facility except that the events would be held in the open-air facility instead.

Year 2010 schedule and attendance data of local MLS teams were analyzed to determine the traffic impact of additional soccer events on neighborhood streets and roadways. Based on information obtained from www.mls-daily.com, 10 of 15 home games are typically scheduled to occur on Saturday, three games on Sunday, and two games on Friday. For the first seven games of the year (March through July 2010) a local MLS soccer team had an average attendance of 14,450 people per game, ranging from 12,597 to 18,653 (opening home game).

Based on this information, the proposed event/soccer stadium could host approximately two MLS games during a weekday and 13 MLS games on weekends in addition to non-soccer events similar in attendance size to historic operations of the Sports Arena. Taking a conservative approach, even if all the MLS games on both weekdays and weekends were attended by 22,000 people (proposed maximum seating capacity of the soccer stadium), the additional events would not exceed the size of events the Sports Arena has historically been hosting at its existing facility.

Based on the above assessment, the new event/soccer stadium facility replacing the Sports Arena is not expected to generate significant new traffic impacts, for the following reasons:

- With the addition of MLS soccer games, the new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility.

- Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new Multiple Use Space (Option 1) or MLS Stadium facility (Option 2) are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena.

- The Coliseum Commission will schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.

The anticipated opening of Phase I of the Exposition Light Rail Transit (LRT) Line (currently under construction) would provide event attendees with access to an ever-expanding regional rail and bus transit system, providing service to downtown Los Angeles and Culver City with direct connections to the Blue Line and Red Lines, which in turn have connections to Union Station, the Gold Line and the Green Line. It is anticipated that the Exposition LRT would result in reduced auto usage by the attendees and employees at Exposition Park, providing them with an alternative mode of travel to events and reducing traffic for both ongoing and new events.

Parking Impacts

The Proposed Project does not include any major changes to existing parking facilities at the Coliseum, Exposition Park, USC, or the surrounding area. Under the Multiple Use Space (Option 1), the existing Sports Arena will be demolished and replaced with an open-air venue for civic gatherings and entertainment events. The Multiple Use Space will also be developed to provide overflow surface parking for the Coliseum events. Under this Option, the parking inventory would be increased for major events held at the Coliseum and no new significant parking impacts would occur. Under Option 2, the Sports Arena would be demolished and redeveloped with a MLS Stadium with a seating capacity of 22,000. As noted above, the existing parking inventory is capable of supporting events with up to 93,000 attendees for the Coliseum. Thus, smaller events held at the Multiple Use Space (Option 1) or a MLS

Stadium event (Option2), would be supported by adequate parking facilities. As the owner/operator of both the Coliseum and the Sports Arena, the Los Angeles Memorial Coliseum Commission will have direct control over programming events such that attendance at both uses operating concurrently would not exceed the current maximum capacity of the Coliseum (i.e., 93,000 attendees). Therefore, no parking impacts would occur.

As stated above, the code-required parking demand under Section 12.21.A.4.(e) of the LAMC requires one automobile space for each five fixed seats contained within a stadium use. Based on this provision, the project would require 4,400 parking spaces to meet the code required parking demand. There are approximately 19,981 parking spaces available within the Exposition Park and USC Campus area that are generally available to meet the parking demands of the land uses within the general vicinity of the project site. Specifically there are approximately 7,340 parking spaces within the Exposition Park area alone that are able to meet the demands of the Coliseum, Sports Arena and other Exposition Park uses. As such, an adequate supply of parking exists within the area to meet the Code required parking and the parking demands of future events held at the Sports Arena Project Site under either Option 1 (Multiple Use Space) or Option 2 (MLS Stadium). Parking impacts would therefore be less than significant.

MITIGATION MEASURES

The following mitigation measures are recommended to ensure traffic impacts do not rise to a level of significance.

MM J-1: Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. The Coliseum Commission shall schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.

LEVEL OF IMPACTR AFTER MITIGATION

Traffic and parking impacts would be less than significant.

CUMULATIVE IMPACTS

Cumulative impacts refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts (CEQA Guidelines Section 15355). Cumulative impacts may be analyzed by considering a list of past, present, and probable future projects producing related or cumulative impacts (CEQA Guidelines Section 15130 (b)(1)(A)).

Pursuant to Section 15130 of the State CEQA Guidelines, the discussion of cumulative impacts shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (CEQA Guidelines Section 15065(a)(3)). The cumulative analysis should also be guided by standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects which do not contribute to the cumulative impact. The following elements are necessary to an adequate discussion of significant cumulative impacts: Either: (A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or (B) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact.

The following analysis is based in part on a list of known individual projects within the study area, and growth projections adopted as part of prior environmental documents for applicable public services, utility infrastructure plans, and General Plan planning areas. The list of identified related projects is provided in Table IV.K-1, on the following page.

Table IV.K-1
Related Projects List

#	Location	Land Use	Size
1	Los Angeles Trade-Technical College	Community College/Trade School	1,300 ksf
2	3434 S, Grand Ave.	University/Education	347 ksf
3	435 20th Street Apts.	Multi-Family Residential (Apts.)	143 Dwelling units

30	3025 S. Figueroa Street	Student Housing	30 Dwelling Units
31	USC Development Plan	Campus Development	2,500 ksf sf of academic uses; 350 ksf retail/ commercial uses; 2,135 ksf of student and faculty housing (5,400 student beds and 250 faculty housing units; 165 ksf hotel and conference center with up to 150 rooms; and an 80 ksf K-8 laboratory and community educational academy.
Source: Fehr and Peers, USC Development Plan EIR, City of Los Angeles Department of City Planning, May 2010.			

AESTHETICS

Development of the Proposed Project, in conjunction with other projects in the general project vicinity, could cumulatively contribute to alterations in visual character, viewshed and lighting in and around the Exposition Park area. The Proposed Project would alter the aesthetic character of the Project Site, as the Sports Arena would be demolished and redeveloped with either an MLS Stadium or an open-air amphitheater. There are no other related development projects identified within Exposition Park or the immediate viewshed that would cumulatively add to the change in character. Moreover, the Proposed Project would be developed in a manner that is consistent with the stated objectives of the Exposition Park Master Plan with respect o landscaping and signage. The objectives of the Plan include enhancing the Park's character, preserving the historical legacy of the Park and generally encouraging recreational uses in the Park. The cumulative effects of this development would thus be experienced as gradual and independent modifications in an effort to improve the aesthetics in the general project vicinity. The Proposed Project would serve to improve the aesthetic quality of the project area and no significant aesthetic impacts would be expected to occur. Since the Proposed Project will result in less than significant project-level aesthetic impacts, the Proposed Project would not result in a cumulatively considerable significant aesthetic impact.

AIR QULAITY

Construction

As the Basin is currently in non-attainment for ozone, PM_{10}, and $PM_{2.5}$, cumulative development could violate an air quality standard or contribute to an existing or projected air quality violation. This is considered to be a significant cumulative impact. With respect to determining the significance of the Proposed Project's contribution to regional emissions, the SCAQMD neither recommends quantified

analyses of cumulative construction emissions nor provides methodologies or thresholds of significance to be used to assess cumulative construction impacts. According to the SCAQMD, individual construction projects that exceed the SCAQMD recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the Basin is in non-attainment. As discussed previously, the peak daily emissions generated during project construction would exceed the regional emissions threshold recommended by the SCAQMD for NO_x during the grading/site preparation phase and ROG during the building and coating phase. As the Basin is currently in non-attainment for NO_x the daily construction emissions associated with this criteria pollutant would be cumulatively considerable. Therefore, the cumulative impact of the Proposed Project for construction emissions (i.e., NO_x,) would be significant.

Operational Impacts

Due to the non-attainment of ozone, PM_{10}, and $PM_{2.5}$ standards in the Basin, the generation of daily operational emissions associated with cumulative development would result in a cumulative significant impact associated with the cumulative net increase of any criteria pollutant for which the region is in non-attainment. With respect to operational emissions, the SCAQMD has indicated that if an individual project results in air emissions of criteria pollutants (CO, ROG, NO_x, SO_x, PM_{10}, and $PM_{2.5}$) that exceed the SCAQMD recommended daily thresholds for project-specific impacts, then it would also result in a cumulatively considerable net increase of these criteria pollutants for which the Proposed Project region is in non-attainment under an applicable federal or state ambient air quality standard. The operational emissions associated with the Proposed Project would not be increased as compared to existing conditions. Thus, the daily operational emissions associated with the criteria pollutants generated by the Proposed Project would not be cumulatively considerable. Therefore, the cumulative impact of the Proposed Project for the operational emissions would be less than significant.

AQMP Consistency

The Proposed Project would not increase the frequency or severity of existing air quality violations or cause or contribute to new air quality violations, and would be consistent with the SCAG population and housing growth projections utilized to prepare the AQMP. The 2007 AQMP was prepared to accommodate growth, to reduce the high levels of pollutants within the areas under the jurisdiction of SCAQMD, to return clean air to the region, and to minimize the impact on the economy. Growth considered to be consistent with the 2007 AQMP would not interfere with attainment because this growth is included in the projections utilized in the formulation of the AQMP. Consequently, as long as growth in the Basin is within the projections for growth identified by SCAG, implementation of the 2007 AQMP will not be obstructed by such growth. Since the Proposed Project would not jeopardize attainment of air quality standards in the 2007 AQMP for the Basin and the Los Angeles County portion of the Basin, the Proposed Project would not have a cumulatively considerable contribution to this impact regarding a potential conflict with or obstruction of the implementation of the applicable air quality plan.

GREENHOUSE GAS EMISSIONS

In analyzing the potential impacts of the Proposed Project, Sections 15126 and 15130 of the State CEQA Guidelines require that cumulative impacts (impacts associated with other geographically or characteristically related projects) also be analyzed. In the absence of established quantitative thresholds to evaluate impacts associated with GHG emissions, consistency with adopted programs and policies to reduce GHG emissions has been suggested as a method to qualitatively evaluate the significance of cumulative impacts. A project's consistency with the implementing programs and regulations to achieve the statewide GHG emission reduction goals established under AB 32 cannot yet be evaluated because they are still under development. Nonetheless, as discussed above, the Proposed Project is anticipated to be consistent with all feasible and applicable strategies and measures to reduce GHG emissions in the City of Los Angeles and California. Therefore, the potential impact on global warming resulting from implementation of the Proposed Project is not expected to be cumulatively considerable.

HISTORIC RESOURCES

To analyze potential cumulative historical impacts, the list of related projects within the area were reviewed against a list of designated State Historic Monuments, Los Angeles Historic-Cultural Monuments, and National Register of Historic Places properties. As stated previously, Exposition Park was determined eligible for listing on the National Register in 1993 as a Historic District. To date it has not been a formally listed on the National Register. The Exposition Park Historic District includes all of Exposition Park and a number of buildings located within it are listed as contributing structures to the District. The Exposition Building, the Natural History Museum, the California State Armory, the Rose Garden, the Memorial Coliseum, the Los Angeles Swimming Stadium and the Park Clubhouse were all determined to be contributing elements to the District. The California Science Center, the Los Angeles Memorial Sports Arena, the California Aerospace Museum and the California African American Museum were identified as non-contributing elements of the District. The historic Exposition Building was effectively demolished in 1995 for the Science Center and the Swimming Stadium has been substantially altered. Whether or not these changes would jeopardize the designation status of the Exposition Park Historic District in the judgment of SHPO cannot be determined prior to their evaluation. Notwithstanding the fact that the Los Angeles Memorial Sports Arena has been identified as a historic resource pursuant to CEQA, and that the demolition of this building would result in a significant impact on the environment, the effects would not be cumulatively significant because the Sports Arena is not considered to be a contributing element to the Exposition Park Historic District. The cumulative impact of the Proposed Project would therefore be less than significant.

LAND USE

Cumulative land use impacts could occur if other projects located in the vicinity of the Project Site would

result in land use incompatibility effects in conjunction with the impacts of the Proposed Project. The Proposed Project (Option 1 or Option 2) would result in redevelopment of the Project Site with a public use parks and recreation venue consistent with the goals of the Exposition Park Master Plan, and in keeping with the goals and objectives identified for the South Los Angeles Community Plan, and the Redevelopment Plan, thereby fostering economic growth along the Figueroa corridor within the Redevelopment Plan area, and benefitting the land uses in the surrounding community area. In both cases, bathroom facilities would be provided, as well as low-level security lighting. In addition, landscaped areas would be a predominant feature under either Option, with an open-air all grass amphitheater and lawn areas comprising a majority of the site development plan for the Multiple Use Space (Option 1), and a recessed design for the MLS Stadium featuring landscaped plazas and perimeter landscaping (Option 2), as described in detail in Section II, Project Description. As such, the Proposed Project would be complementary to and compatible with Exposition Park facilities and improvements, as well as the commercial, educational institution, and multi-family residential uses within the surrounding community and in the greater South Los Angeles Community Plan area.

Future development of related projects located both within the Redevelopment Plan Area, the broader South Los Angeles Community Plan Area, and within the immediately adjacent Southeast Los Angeles Community Plan Area would foster economic growth, collectively supporting redevelopment of the South Los Angeles area. Furthermore, all related projects would be evaluated on a case-by-case basis by the City of Los Angeles for conformity with land use controls and regulations, and would be subject to the same site plan review process applicable to the Proposed Project, specifically with respect to the South Los Angeles Community Plan, the Planning and Zoning Code, the Redevelopment Plan, and the other regional land use plans. Therefore, no significant cumulative land use impacts are anticipated.

NOISE

Short-term cumulative construction-noise impacts in the immediate vicinity of the Project Site could occur if related projects in close proximity to the Project Site are under construction during the same time period as the Proposed Project. At the time that this EIR was prepared, no major construction activities likely to generate high noise levels were occurring in the vicinity of the Project Site. Although there is anticipated construction activity associated with the Metro Light Rail Project located along Exposition Boulevard, this construction area is located more than 1,500 feet north of the Project Site and it is not expected that noise levels from this location would have the potential to combine with any construction noise generated on the Project Site. The heavy earthmoving phase of the Metro Light Rail Project located along Exposition Boulevard is also anticipated to be completed prior to the construction of the Proposed Project so the construction periods would not overlap. For other projects within the general area, each would be required to comply with the City's Noise Ordinance regulations, along with implementation of reasonable noise reduction control measures as applicable. As such, cumulative construction noise impacts would be considered less than significant.

Future traffic growth and associated noise from related projects would not result in significant changes in ambient noise levels. Generally speaking, vehicle trips on local roadways would need to double in volume in order to create a perceptible change in noise volume to the average person. As noted in the Technical Traffic Memorandum prepared by Fehr and Peers, and included in Section IV.K, of this EIR, the Proposed Project would not generate a substantial increase in vehicle trips as compared to the current average attendance levels at the Coliseum and Sports Arena sites. Cumulative noise impacts from traffic would therefore be less than significant.

PUBLIC SERVICES

Fire Protection

The Proposed Project would have a cumulative impact on fire protection services. No related projects have been identified within the immediate project vicinity that, when combined with the Proposed Project would create an adverse effect upon fire access, emergency routes or availability to adequate fire-flow. While it is acknowledged that Project implementation will generally increase the need for fire protection and emergency medical services in this area, the Los Angeles Fire Department continually evaluates fire station placement and overall Department services for the entire City, as well as specific areas. The development of this Proposed Project, along with other approved and planned projects in the immediate area, may result in the need for increased staffing for existing facilities, additional fire protection facilities, and/or the relocation of present fire protection facilities. However, the extent of such impacts are not immediately foreseeable and would be evaluated on a project-by-project basis and on an annual basis in accordance with the City's annual evaluation of services. Cumulative impacts upon fire services would therefore be less than significant.

PUBLIC UTILITIES

Wastewater

The Proposed Project is not expected to significantly impact wastewater infrastructure or treatment facilities. Similar to the Proposed Project, each related project would be evaluated on a case-by-case basis and would be required to consult with the Bureau of Sanitation and comply with all applicable City and State water conservation programs and sewer allocation ordinances. Therefore, cumulative impacts upon the wastewater conveyance infrastructure and HTP treatment capacity would be less than significant. Additionally, while water quality in the Santa Monica Bay is impaired by treated wastewater, urban water runoff, industrial and other discharge sources, the cumulative impact of contributing pollutants generated by the Proposed Project and related projects would not result in a significant water quality impacts within the Santa Monica Bay since the HTP would continue to operate in full compliance with their regulatory discharge requirements. Therefore, cumulative impacts on water quality would be less than significant.

Water

In terms of the City's overall water supply condition, the water demands for projects that are consistent with the City's General Plan have been taken into account in the planned growth of the Water System. For projects that are not consistent with the General Plan or that meet the requirements established in Sections 10910-10915 of the State Water Code, a WSA demonstrating sufficient water availability would be required on a project-by-project basis. LADWP's 2005 UWMP projects yearly water demand to reach 776,000 acre-feet by 2030, or an increase of 17% from 2005. Water demand projections in 5-year increments through 2030 are available in the 2005 UWMP for each of the major customer classes – namely single family, multi-family, commercial, governmental, and industrial. Demographic data from SCAG's Regional Transportation Plan as well as billing information for each major customer class, weather, and conservation were factors used in forecasting future water demand growth. It is anticipated that the projected water supplies during normal, single-dry, and multiple-dry water years as included in the 20-year projection contained in its Urban Water Management Plan will meet the expected water demands associated with the Proposed Project in addition to the demands of current and future related projects. Because the Proposed Project is consistent with the General Plan, and would not result in a substantial change to the water demand that is currently generated by the Sports Arena operations, the Proposed Project is within the growth projections of the Regional Transportation Plan, and growth projections of the Urban Water Management Plan. Therefore, cumulative impacts to water service and regional supplies would be less than significant.

Electricity

According to the Citywide General Plan Framework EIR (1995), LADWP anticipates that it can support future growth within the City in accordance with projected growth rates. However, the cumulative effect of the Proposed Project and related projects will require continued near term and/or future additions to the distribution system capacity. Any required near term and/or future additions to the distribution system will be carried out by LADWP and each addition will be completed subject to LADWP review and approval. In accordance with current building codes and construction standards, each of the related projects would be required to comply with the energy conservation standards established in Title 24 of the California Administrative Code. Compliance with Title 24 energy conservation standards and other energy conservation programs on the local level will further reduce cumulative energy demands. Cumulative impacts to electricity service would therefore be less than significant.

Natural Gas

As a public utility provider, the SCG continuously analyzes increases in natural gas demands resulting from projected population and employment growth in its service area and it is anticipated that it would be able to meet the needs of future development within the region. Additionally, compliance with energy conservation standards pursuant to Title 24 of the California Administrative Code would reduce

cumulative demands for natural gas resources. Cumulative impacts upon natural gas resources and infrastructure would therefore be less than significant.

Solid Waste

Implementation of the Proposed Project in conjunction with cumulative growth would further increase regional demands on landfill capacity. Although it is impossible to calculate at present, the impact of the continued growth of the region would likely have the effect of diminishing the daily excess capacity of the landfills. Furthermore, although there are several proposals for new landfills in the region, there are currently few viable options for City of Los Angeles waste past 2029. The Proposed Project would generate approximately the same solid waste compared to existing conditions and would not substantially jeopardize the current excess remaining capacity. Because the change in volume associated with the Proposed Project is not substantial in relation to the region as a whole, and solid waste disposal solutions are continuously being sought after on the regional level, the Project's contribution to cumulative impacts would be considered less than significant.

Parking

The existing parking infrastructure meets the City's code for required parking for the project. In addition, the parking demand created by the Proposed Project can be adequately met by the parking supply provided on and around the Project Site. Therefore, the project would not contribute to a cumulative shortage of parking in the area. As such, cumulative impacts would be less than significant.

Traffic

As noted in Section IV.J, of this EIR, the new event/soccer stadium facility replacing the Sports Arena is not expected to generate any new significant traffic impacts. Moreover, the anticipated opening of Phase I of the Exposition Light Rail Transit (LRT) Line (currently under construction) would provide event attendees with access to an ever-expanding regional rail and bus transit system, providing service to downtown Los Angeles and Culver City with direct connections to the Blue Line and Red Lines, which in turn have connections to Union Station, the Gold Line and the Green Line. It is anticipated that the Exposition LRT would result in reduced auto usage by the attendees and employees at Exposition Park, providing them with an alternative mode of travel to events and reducing traffic for both ongoing and new events. The cumulative effect of operating a regional sports and entertainment venue in walking distance to the Exposition Light Rail Transit Line would result in a net beneficial impact upon traffic congestion as patrons and visitors to the Project Site would be able to take mass transit to access the Project Site. This opportunity would decrease traffic volumes on local roadways. As such, cumulative traffic impacts would be less than significant.

V. GENERAL IMPACT CATEGORIES
A. EFFECTS FOUND TO BE LESS THAN SIGNIFICANT

As a part of the EIR scoping process, it was determined that development and operation of the Proposed Project would not result in potentially significant impacts to the environmental impact topics listed below. Section 15128 of the CEQA Guidelines states:

> *"An EIR shall contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR. "*

It has been determined that there is no evidence that the Proposed Project would cause significant environmental effects in the following areas and that no further environmental review of these issues is necessary for the reasons described below.

Agricultural Resources

The Project Site is leased from the Sixth District Agricultural Association of the State of California and is currently developed with the Los Angeles Memorial Sports Arena. There have been no agricultural uses on the Project Site since before 1958, when construction of the Sports Arena began. The Proposed Project would not involve any changes to the use of the Project Site, and the Sports Arena would continue hosting the same general types of sporting, entertainment and civic events as it currently does. Therefore, the Proposed Project would not result in any potentially significant impacts to agricultural resources and no further analysis of this issue is warranted.

Biological Resources

The Project Site is a developed parcel, with urban development surrounding it in a highly urbanized area and does not contain any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game (Fish and Game), or the U. S. Fish and Wildlife Service. In addition, there are no known locally designated natural communities on the site or in the project vicinity.

The Proposed Project would not result in the direct removal, filling or hydrological interruption of a federally protected wetland as defined by Section 404 of the Clean Water Act. Due to the highly urbanized surroundings, there are no wildlife corridors or native wildlife nursery sites in the project vicinity. The Proposed Project would not interfere with the movement of any resident or migratory fish or wildlife species. Because there are no known locally designated natural communities on the Project Site or in the project vicinity, the Proposed Project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state habitat conservation plan.

Vegetation within the Project Site consists primarily of various forms of landscaping including several native trees such as eucalyptus, deodar, yucca, agave, and palm trees. These species will not be affected by the development of the Proposed Project. No State or Federally protected plant species are currently known to exist on the immediate Project Site. The Proposed Project will not adversely impact biological resources on or around the Project Site.

Hazards and Hazardous Materials

The Project Site has been developed as a stadium since 1959. The Proposed Project would not alter existing land use on the site, and would not use, store or transport significant amounts of hazardous materials. The Sports Arena was heavily retrofitted following the Northridge earthquake. Nearly all asbestos-containing materials (ACMs) were removed at that time; however, if ACMs or lead are present in the structures, the materials must be removed by licensed contractors using control methods prescribed in SCAQMD Rule 1403. This is a potentially significant impact that can be mitigated to a less than significant level via mandatory compliance with SCAQMD Rule 1403, which would insure safe exposure for both abatement workers as well as the general public. Additionally, minor amounts of hazardous materials may be used including motor oil, grease, paints, solvents, pesticides, herbicides, and fertilizers. However, the use and disposal of such materials would be required to be in compliance with the State Health and Safety Code, the City of Los Angeles Municipal Code, and the Uniform Fire Code (UFC). Therefore, the Proposed Project would not result in any potentially significant impacts to hazards or hazardous materials.

Mineral Resources

A portion of Exposition Park has been designated by the Los Angeles City Planning Department as an area containing significant mineral deposits. However, the area containing such deposits is located at a southeast portion of Exposition Park, which is not occupied by the Project Site. As the Proposed Project is not located on the designated land, and would not alter existing uses, no impacts to these identified mineral resources will occur. Additionally, the Project Site is not in an area of potential petroleum resources. Therefore, the Proposed Project would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state. The Proposed Project would not result in the loss of availability of a locally important mineral resource recovery site, as no recovery site exists on the Project Site. The Proposed Project would not result in any potentially significant impacts to mineral resources and no further analysis of this issue is warranted.

Population and Housing

The Proposed Project is a renovation of the existing Sports Arena site and would not alter the type of general public venue use on the Project Site. There are no residential properties on the Project Site and none are planned as part of the development of the Proposed Project. As the Proposed Project is not proposing any alterations to existing housing nor proposing the addition of new housing, implementation of the Proposed Project would not result in a permanent population increase nor would it displace any existing housing in the area.

Construction of the Proposed Project would result in an increase of employment opportunities in the construction field, which could potentially result in an increased permanent population and a demand for housing in the vicinity of the Project Site. However, the employment patterns of the construction workers in Southern California are such that construction workers would not likely, to any significant degree, to relocate their households as a consequence of the construction employment associated with the Proposed Project.

Implementation of the Proposed Project may also provide employment after project completion in the form of ongoing event operations. However, since the Project Site is currently developed with the same general use as would be provided under the Proposed Project, a substantial change or increase in local employment opportunities is not anticipated to result. Any additional employment opportunities created by the Proposed Project will not significantly affect housing supply or demand in the area. Therefore, the Proposed Project would not have a potentially significant impact on population and housing levels in the City of Los Angeles and no further analysis of this issue is warranted.

V. GENERAL IMPACT CATEGORIES
B. SIGNIFICANT AND UNAVOIDABLE IMPACTS

Section 15126.2(b) of the State CEQA Guidelines requires that an EIR describe any significant impacts which cannot be avoided. Specifically, Section 15126.2(b) states:

> *Describe any significant impacts, including those which can be mitigated but not reduced to a level of insignificance. Where there are impacts that cannot be alleviated without imposing an alternative design, their implications and the reasons why the project is being proposed, notwithstanding their effect, should be described.*

Based on the analysis contained in Section IV of this EIR, implementation of the Proposed Project would result in significant unavoidable environmental impacts relative to: regional construction-related air quality emissions, construction-related noise impacts, and the demolition of an historic resource.

Air Quality

Regional Construction Impacts

With the implementation of Mitigation Measures C-1 and C-2, the Proposed project would still exceed the regional emissions threshold recommended by the SCAQMD for NO_x during the grading/site preparation phase and ROG during the building and coating phase. Therefore, regional construction-related air quality impacts would be considered significant and unavoidable.

Noise

Construction Noise

Construction activities with the Proposed Project would generate noise from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction; paving and asphalting; construction workers traveling to and from the project site; and delivery and hauling of construction supplies and debris to and from the project site. During each stage of development, there would be a different mix of equipment operating and noise levels would vary based on the amount of equipment in operation and the location of the activity. The construction noise levels experienced by the off-site sensitive receptors would range from 67.9 dBA L_{eq} to 83.1 dBA L_{eq}. Thus, construction activities associated with the Proposed Project would result in a temporary or periodic increase in noise levels at some of the off-site noise sensitive receptor locations.

With compliance with Section 41.40 of the LAMC and the implementation of the Mitigation Measures G-1 through G-6, which would require the implementation of noise reduction devices and techniques during construction at the project site, construction-related noise impacts associated with the Proposed Project would be reduced to the maximum extent feasible. Nevertheless, because construction noise levels are

likely to exceed existing ambient noise levels by more than 5 dBA for more than 10 days in a three-month period, construction noise impacts would be significant and unavoidable.

Operational Noise

Under both project options, the existing indoor venue would be replaced with an outdoor venue. Noise sources from special events at the open-air amphitheater or soccer stadium would include:

- Crowd noise (particularly yells and cheers at high attendance soccer or concert events);
- Public Address System (amplified public announcements and/or play-by-play announcements).
- Amplified concert music;
- Traffic-related noise from motorists traveling to and from events (discussed in detail below); and
- Helicopters and other aircrafts covering events.

It is anticipated that noise levels during soccer games and related sporting events would be substantially similar to the peak noise generating events currently occurring at the Coliseum. However, noise levels generated during concert and related events that would involve the use of amplified music and announcements would be increased compared to existing conditions and could have the potential to adversely impact neighboring uses to the east and south of the Project Site. It is typically expected that the sound level achieved for concert music, particularly popular or rock type music, would be in the 95 to 110 decibel range within the venue boundaries. The lower end of the range would be representative of ballad-type popular music while the upper end is representative of very loud rock or soul music.[1] Accordingly, music concert noise is likely to exceed ambient conditions by five decibels in residential adjacent areas during off-peak traffic times when noise levels in surrounding communities are low. As a result, some residents may continue to occasionally find evening concert noise intrusive or annoying. Therefore, as the Proposed Project would involve the replacement of an existing indoor venue with an outdoor venue generating a new source of noise exceeding the ambient conditions by five decibels, operational noise impacts from special events would be considered potentially significant.

Historic Resources

The Los Angeles Memorial Sports Arena is now more than 50 years of age and is being evaluated in this report to determine if it meets the criteria of eligibility for listing in the California Register of Historical Resources. The period of significance for the Sports Arena has been established as 1959 to 1967. This eight-year span includes the opening of the structure by Vice President Nixon on July 4th of that year, and

---

[1] *Los Angeles Memorial Coliseum Renovation Project, Draft EIR, SCH# 1990011065.*

opening of the Great Western Forum in Inglewood. This end date also coincides with the beginning of the "superstadium" era, when venues such as the Sports Arena were becoming obsolete and outdated.

With respect to evaluating the integrity of the Sports Arena, historians at ICF concluded that it retains integrity of location, setting, feeling and association, but lacks integrity of design, materials and workmanship. To be eligible for the California Register of Historical Resources, an historical resource must be significant at the local, state or national level under one or more of the following four criteria:

1) *It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;*

2) *It is associated with the lives of persons important to local, California, or national history;*

3) *It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values;*

4) *It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.*

Based on a historic resource evaluation performed by ICF, the Los Angeles Memorial Sports Arena appears eligible for the California Register of Historical Resources under Criterion 1 for its association with events that have made a significant contribution to Los Angeles history. It does not appear to meet Criteria 2, 3, or 4. As such, the impacts associated with the proposed removal of the Sports Arena under Criterion 1 would be considered potentially significant. The removal of the Sports Arena, which has association with events that have made a significant contribution to Los Angeles history, would therefore be considered significant and unavoidable.

SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Section 15126.2(c) of the State CEQA Guidelines states that the "uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely." Section 15126.2(c) further states that "irretrievable commitments of resources should be evaluated to assure that such current consumption is justified."

Development of the Proposed Project would consume limited, slowly renewable, and non-renewable resources. This consumption would occur during construction of the Proposed Project and would continue throughout its operational lifetime. The development of the Proposed Project would require a commitment of resources that would include (1) building materials, (2) fuel and operational materials/resources and (3) the transportation of goods and people to and from the project site.

Construction of the Proposed Project would require consumption of resources that are not replenishable or which may renew slowly as to be considered non-renewable. These resources would include certain

types of lumber and other forest products, aggregate materials used in concrete and asphalt (e.g., sand, gravel and stone), metals (e.g., steel, copper and lead), petrochemical construction materials (e.g., plastics) and water. Fossil fuels, such as gasoline and oil, would also be consumed in the use of construction vehicles and equipment.

The commitment of resources required for the type and level of proposed development would limit the availability of these resources for future generations for other uses during the operation of the Proposed Project. However, this resource consumption would be consistent with growth and anticipated change in the Los Angeles region, and the resources are available for the reasonably foreseeable future.

GROWTH INDUCING IMPACTS OF THE PROPOSED PROJECT

Section 15126.2(d) of the *CEQA Guidelines* requires a discussion of the ways in which a Proposed Project could induce growth. This includes ways in which a project would foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Section 12126.2(d) of the *CEQA Guidelines* states:

> *Discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth (a major expansion of a waste water treatment plant might, for example, allow for more construction in service areas). Increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. Also discuss the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.*

The Proposed Project could foster economic growth by increasing the number of visitors to the Project Site, mainly on weekends and weekday evenings. In addition, employment opportunities would be provided during the construction and operation of either of the two Options that are proposed by the Coliseum Commission. The Proposed Project would provide increased operating revenue for the Los Angeles Memorial Coliseum Commission, which operates the Coliseum and the Sports Arena venues without any public funding or tax revenues. Thus the ability for the Coliseum Commission to demolish the Sports Arena and develop another beneficial use in its place is vital to its continued success as an economically viable and self-sustaining operation. The Proposed Project could stimulate redevelopment and revitalization of the immediate neighborhood and contribute to the overall economy of the broader local community and redevelopment zone.

Also, the roadways and other infrastructure (e.g., water facilities, electricity transmission lines, natural gas lines, etc.) serving the Proposed Project would not induce growth since they are existing and adequate to serve the project. No new significant impacts would arise with respect to infrastructure support systems

and thus no new physical improvements to surrounding roadways or other infrastructure systems would be constructed. As such the Proposed project would not induce additional growth beyond what is currently serving the Project Site.

VI. ALTERNATIVES TO THE PROPOSED PROJECT

INTRODUCTION

An EIR is required to describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. The discussion of alternatives need not be exhaustive, but rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. An EIR must also evaluate the "no project" alternative. An EIR is not required to consider alternatives that are infeasible.

To provide a framework for understanding how the Alternatives to the Proposed Project were developed, the following provides a brief summary of the proposed project, the project objectives and the significant unavoidable impacts that would result under the Proposed Project. As stated above, the objective of the Project Alternatives analysis is to identify alternatives that could feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.

Alternatives Considered but Rejected

"The key question and first step in analysis is whether any of the significant effects of the project would be avoided or substantially lessened by putting the project in another location. Only locations that would substantially avoid or substantially lessen any of the significant effects of the project need to be considered for inclusion in the EIR" [CEQA Guidelines Section 15126.6(f)(2)(A)]. An Alternative Project Site was precluded from further analysis because the Proposed Project is a redevelopment project with the specific intent to provide for the better utilization of the Sports Arena Project Site in accordance with the Coliseum Commission Joint Powers Agreement. The Project Site is controlled and operated by the Los Angeles Memorial Coliseum Commission, which exists and operates for the sole purpose of operating and maintaining the Los Angeles Memorial Coliseum and Sports Arena complex. As such, the evaluation of an alternative project site outside the Coliseum and Sports Arena site premises was precluded from further analysis. Furthermore, due to the physical site constrains imposed by the Los Angeles Memorial Coliseum and Sports Arena structures, a suitable site large enough to support the development of either Option 1 or 2 while retaining both the Coliseum and the Sports Arena structures does not exist.

Project Characteristics

The Proposed Project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the LAMCC is considering two different and mutually exclusive future uses for the Project Site: Option 1, which consists of a Multiple Use Space for civic and special event gatherings; or Option 2: a Major League Soccer

Stadium with approximately 22,000 seats. Both of these development options are analyzed in an equal level of detail in this Draft EIR to allow flexibility for the decision–makers to select either one of the two projects.

Project Objectives

The range of alternatives to be included in the analysis shall include those that could feasibly accomplish most of the basic objectives of the Proposed Project and could avoid or substantially lessen one or more of the Project's significant effects. As stated in Section II, Project Description, the Sports Arena and the Coliseum operate under the authority of the Los Angeles Coliseum Commission, which was formed under the Joint Exercise of Powers Act on September 25, 1945. The complex is supported solely by revenue generated from its operations and no taxpayer funds are used to support the existing facilities. Constructed in 1959, the Sports Arena is in need of major repairs and renovation to extend its structural lifespan and increase programming options in order to generate the necessary revenues to become an economically self-sufficient sports and entertainment venue. As a result, the Los Angeles Memorial Coliseum Commission's primary objectives are as follows:

- To plan for the long-term use and operation of the Sports Arena property to fulfill the duties of the Coliseum Commission as identified in the Joint Powers Agreement. Specifically, the Coliseum Commission seeks to evaluate and develop a successful plan that will enable the Coliseum Commission to manage and use the Sports Arena property for competitive sports, athletics, games, pageants, plays, celebrations, patriotic or religious gatherings, festivals, exhibits, industrial, trade, horticultural or agricultural shows, conventions, and exhibitions and productions of a local, regional, national, or international character in a manner that is economically self-sufficient and consistent with the terms of the Sports Arena round lease between the Coliseum Commission and the Sixth District Agricultural Association.

- To enhance the prestige and visibility of Exposition Park and the City of Los Angeles through the development of a modern, world-class sports, entertainment, and cultural use complex.

- To assure that Project Site operations generate enough revenue to enable the Coliseum Commission to preserve and maintain the Project Site and its sister facility, the Coliseum, in a self-sufficient manner.

In furtherance of the primary project objectives identified above, the Coliseum Commission has identified two potentially viable options: Option 1 (Multiple Use Space) and Option 2 (MLS Stadium). The specific set of objectives for the two development options being considered are as follows:

Option 1 (Multiple Use Space)

- To expand the function of the Sports Arena Site within the community as a gathering place for civic events that celebrate community achievements.

- To construct an open-air venue that provides maximum flexibility for the dual use of the site to support overflow parking needs for Coliseum events and to be utilized as an outdoor venue for public entertainment and cultural events.

- To utilize the existing topography of the Project Site without the need for a substantial amount of additional grading.

- To serve the community's need for public outdoor gathering spaces.

Option 2 (MLS Stadium)

- To provide a stadium venue in conformance with the generally accepted standards of design for Major League Soccer (MSL) stadiums, thus enabling the Coliseum Commission to host MSL games in Exposition Park.

- To provide a stadium venue in conformance with the generally accepted standards of design for collegiate soccer, thus enabling a landlord/tenant relationship with a USC soccer team.

- To provide spectators and users of the stadium with the amenities and conveniences consistent with a state-of-the-art facility, including restrooms, concession, and press facilities; spectator viewing; luxury suites and club seating; locker and dressing facilities; and parking and circulation space.

- To utilize the existing topography of the Project Site without the need for a substantial amount of additional grading.

Overview of Selected Alternatives

The project alternatives should feasibly attain "most of the basic objectives of the project," even though implementation of the project alternatives might, to some degree, impede the attainment of some of those objectives or be more costly. Therefore, in order to compare the merits of the various alternatives' ability to reduce environmental impacts and meet or attain as many of the project's objectives as possible, the following alternatives were selected:

- **No Project Alternative:** The No Project Alternative would be the result of not approving the Proposed Project. Under this scenario, the Los Angeles Memorial Sports Arena would continue operating as it currently is without any physical improvements or renovation projects.

- **Historic Retention Alternative.** This Alternative would consist of renovating the Los Angeles Sports Arena in accordance with the Secretary of Interior's Standards for the Rehabilitation and Renovation of Historic Structures. The existing structure would not be demolished and renovation efforts would be aimed at maintenance projects and providing modern amenities to make the facility an attractive and desirable location for sporting, entertainment and civic events.

Analytical Assumptions and Methodology

The alternatives analysis presented below provides a comparative qualitative and quantitative comparison to the Proposed Project, and assumes that all applicable mitigation measures proposed for the Proposed Project would apply to each alternative. Impacts associated with each alternative are compared to the Proposed Project's impacts and are classified as increased, reduced, or essentially equivalent to the level of impact associated with the Proposed Project.

Section 15126.6 of the State CEQA Guidelines requires lead agencies to evaluate a No Project Alternative for the purpose of allowing the decision makers to compare the impacts of the Proposed Project with the impacts of not approving the Proposed Project. The State CEQA Guidelines provide further guidance in that when the project involves the revision of an existing land use, such as in the case of the Los Angeles Memorial Sports Arena Redevelopment Project, the No Project Alternative should be the continuation of the existing operation into the future. For purposes of defining the ongoing operations that would occur under the No Project Alternative for the Los Angeles Memorial Sports Arena Redevelopment Project, no demolition would take place and the current utilization of the Sports Arena would continue into the foreseeable future.

The current utilization of the Sports Arena includes hosting on average, approximately 69 events a year with an average of approximately 60 events (or approximately 87 percent of the annual bookings) attracting fewer than 10,000 attendees, 6 events (or approximately 9 percent of the annual bookings) attracting crowds between 10,000 and 20,000 attendees, and an average of 3 events per year (or roughly 4 percent of the total annual bookings) with attendance levels above 20,000. (See Table VI-1, below.) Theses attendance records generally project continued use and operations at the Sports Arena under the No Project Alternative.

Table VI-1
Historic Attendance Levels at the Sports Arena (2005-2009)

Year	<10,000 Attendees		10,000 – 20,000 Attendees		> 20,000 Attendees	
	No. Events	Ave. Attendance	No. Events	Ave. Attendance	No. Events	Ave. Attendance
2005	69	3,925	7	11,185	0	0
2006	73	3,945	4	15,128	3	33,410
2007	67	3,838	6	14,438	4	32,844
2008	71	2,923	8	12,680	3	37,915
2009	20	5,695	4	14,117	3	47,165
AVERAGE	60	4,100	6	13,500	3	37,800

Source: Los Angeles Memorial Coliseum Commission, 2010

Aesthetics

Visual Character/Views

Under the No Project Alternative, the existing Sports Arena building and landscaping features on the Project Site would remain and no new construction would take place. The existing uses on the Project Site have remained relatively unchanged for the past 50 years and thus no adverse significant aesthetic impacts with respect to visual character, views, or value would be created by the continued presence of

these features. It is anticipated that this Alternative would require continued maintenance of the facility and grounds to maintain an acceptable and attractive landscaped environment, keeping up with the overall character of Exposition Park. Thus, the No Project Alternative would result in no impact to the aesthetic character of the surrounding neighborhood.

Light and Glare

Under the No Project Alternative, the existing Sports Arena building and surface parking uses would remain on the Project Site. These uses currently generate a moderate amount of nighttime lighting and daytime glare associated with the vehicles on passing streets and illuminated parking lots. As such, the No Project Alternative would not result in any changes to the ambient lighting conditions and no impact would occur with respect to spillover lighting onto adjacent properties.

Air Quality

Under the No Project Alternative, no demolition of the Sports Arena would occur and no new construction impacts would be generated. Accordingly, construction-related air quality impacts under the Proposed Project, which were determined to be significant and unavoidable, would be avoided under this Alternative.

The No Project Alternative would involve the continued use and operation of the Sports Arena, which generates on average 29 events per year during the week (M-F). The maximum attendance was recorded at 52,234 attendees while the average attendance levels ranged from 3,591 (in year 2005) to 11,862 (in year 2009) over the five-year history. The vehicle emissions associated with vehicle trips from these operations would continue at their current levels and would not be expected to increase. By comparison, the Proposed Project is not expected to increase the overall attendance levels or generate a substantial increase in air quality emissions. Thus, the operational air quality impacts under the No Project Alternative would be less than significant and the same as the Project.

Greenhouse Gases

The amount of GHG emissions from project construction activities would be 878 metric tons of CO_2e in 2011 and 451 metric tons of CO_2e in 2012, which would represent approximately 0.000002 percent and 0.000001 percent of the 2008 State-wide level, respectively. While this is considered to be a less-than-significant impact, these emissions would be completely avoided under the No Project Alternative, as no new construction activities would take place. Thus, impacts under the No Project Alternative would be less than significant and reduced as compared to the Proposed Project.

Operational GHG emissions generated by both stationary and mobile sources would continue to be generated by the No Project Alternative, as the site would continue its current operations. Stationary area source GHG emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile GHG emissions would be generated by the motor vehicles traveling to and from the project site. With respect to stationary sources,

the No Project Alternative is expected to generate more GHG emissions because it is an indoor facility and would demand more energy use and the associated consumption of fossil fuels) for heating and cooling. Thus GHG emissions from stationary sources would be increased as compared to the Proposed Project under either option.

With respect to mobile sources, the Proposed Project (under either Option) would not generate significant new traffic impacts. Events and attendance proposed under the Proposed project would continue to fall within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Accordingly, mobile source GHG emissions would be less than significant and the same under the No Project Alternative.

Historic Resources

The No Project Alternative would result in the continued use of the Sports Arena as is with no major alterations or improvements. As such, no demolition would occur and the loss of a significant historic resource would be avoided. Impacts under the No Project Alternative would be less than significant and substantially reduced as compared to the significant and unavoidable impact that would result with implementation of either option proposed under the Project.

Hydrology/Water Quality

Under the No Project Alternative, the existing site would remain intact and no changes to the permeable surface area would occur. However, while the No Project Alternative would have no impact with respect to hydrology and flooding (as no changes to surface water volumes or water quality would occur), it would preclude the benefits associated with improved water quality runoff that would occur under the Proposed Project. Compliance with stringent BMPs and regulatory code-required measures would provide and added benefit with respect to treating surface water flows prior to discharging into the off site storm drain system. Accordingly, although the No Project Alternative would result in a less-than-significant impact, the No Project Alternative would result in increased impacts associated with operational water quality as compared to the Proposed Project.

Noise

Under the No Project Alternative, no demolition, excavation, or building construction would take place; thus, no impacts associated with construction noise or vibration would occur. Therefore, no impacts from construction activities would occur as a result of the No Project Alternative. No impacts would occur and the mitigation measures recommended for the Proposed Project would not apply.

With respect to event operations, the No Project Alternative would continue to operate based on the five-year average attendance levels. As compared to the MLS Stadium, the No Project Alternative would generate less noise, as the existing venue is an indoor arena and is acoustically insulated from the surrounding neighborhood. The MLS Stadium would be an open-air outdoor soccer stadium, which

would generate exterior noise from the music, soccer and civic events with crowds up to 22,000 attendees. While the noise attenuation of the indoor facility under the No Project Alternative would generate fewer noise impacts during events (typically lasting 2-3 hours at a time), but the exterior noises associated with vehicles and pedestrians entering and leaving the facility would remain the same. Accordingly, the operational noise levels associated with traffic under the No Project Alternative would be reduced as compared to those of the Proposed Project.

Land Use and Planning

Under the No Project Alternative, the existing Sports Arena would remain on the Project Site, which would be consistent with the underlying zoning code regulations. With respect to zoning and consistency with applicable land use plans, the No Project Alternative would not require any variances or discretionary actions associated with the redevelopment of the Project Site. Impacts related to land use and planning would therefore be reduced under the No Project Alternative, as compared to the MLS Stadium Option, which may require a variance to exceed the 35-foot height limitation established by the current zoning. Land Use impacts would be the same as compared to the Multiple Use Space Option as no new variances or discretionary actions would be required.

Public Utilities

Water

Under the No Project Alternative, no changes to the existing land uses or operations at the Project Site would occur. Therefore, with respect to water demands, this Alternative would be comparable to the less-than-significant water demand impacts associated with the Proposed Project. Although no new impact would occur, this Alternative would not implement any of the water conservation efforts recommended for the Proposed Project.

Wastewater

Under the No Project Alternative, no changes to the existing land uses or operations at the Project Site would occur and no new or expanded wastewater facilities would be needed. Therefore, with respect to wastewater, this Alternative would have the same impacts as compared to the less-than-significant wastewater impacts associated with the Proposed Project. No impact would occur and the mitigation measures recommended for the Proposed Project would not apply.

Energy

<u>Electricity</u>

Under the No Project Alternative, the existing Sports Arena would remain on the Project Site and no new or increased demand for electricity would occur. The cooling required for the ongoing use of the Sports Arena would generate increased demands for electricity as compared to the open-air venues proposed

under the Project. Therefore, with respect to electricity, this Alternative would have increased impacts as compared to the less-than-significant impacts associated with the Proposed Project.

Natural Gas

Under the No Project Alternative, the existing Sports Arena would remain on the Project Site and no new or increased demand for natural gas would occur. However, similar to the electricity demands, the heating required for the ongoing use of the Sports Arena during the winter months would generate increased demands for natural gas as compared to the open-air venues proposed under the Project. Therefore, with respect to natural gas, this Alternative would have increased impacts as compared to the less-than-significant impacts associated with the Proposed Project.

Solid Waste

Under the No Project Alternative, the existing Sports Arena would remain on the Project Site and no new or increased demand for solid waste services would occur. Therefore, with respect to solid waste, this Alternative would have the same solid waste impacts as compared to the less-than-significant impacts associated with the Proposed Project.

Public Services

Fire Protection

The demands placed upon the Los Angeles Fire Department under the Proposed Project would be substantially similar to the current conditions, as all of the aforementioned uses would generate large public gatherings. Thus the impacts under the No Project Alternative would not represent a substantial change as compared to the Proposed Project with respect to operations. With regard to planning and fire code compliance, no administrative demands would be required because the No Project Alternative would not result in the construction of any new facilities.

Police Services

The Proposed Project would not substantially change the level of attendance or number of events that occur at the Sports Arena on an annual basis. Thus, demands upon police services would be relatively the same under this Alternative. Neither the Proposed Project nor the No Project Alternative would be expected to result in a substantial increase in the demand for police services from the LAPD such that a new police station or sub-station would need to be developed. In comparison to the Proposed Project, this Alternative would not generate any administrative demands for staff time with respect to facility planning and developing new security plans. Thus, impacts under this Alternative would be less than significant and the same as the Proposed Project.

Traffic and Transportation

Based on the Traffic Assessment provided by Fehr and Peers, the options proposed under the Proposed Project are not expected to generate significant new traffic impacts. Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. The vehicle trips associated with these attendance levels would continue to occur with no notable changes under the No Project Alternative. However, it should be noted that the anticipated opening of Phase I of the Exposition Light Rail Transit (LRT) Line (currently under construction) would likely decrease vehicle trips associated with events at the Sports Arena, because of the convenience it would provide many event spectators. Traffic impacts under this Alternative would be less than significant and the same as the Proposed Project.

Parking Impacts

The Proposed Project does not include any major changes to existing parking facilities at the Coliseum, Exposition Park, USC, or the surrounding area. No parking impacts are anticipated to occur under the Proposed Project. In comparison to the Multiple Use Space (Option 1), the continued use of the existing Sports Arena will preclude the option to provide additional surface parking for Coliseum events. In comparison to proposed Option 2, the new MLS Stadium is not anticipated to generate more parking demands than are currently generated under the existing conditions. Thus there would be no notable change in parking demands under the No Project Alternative.

Conclusion

The No Project Alternative would reduce the Proposed Project's significant and unavoidable impacts for construction air quality, construction noise, and historic resources. However, the No Project Alternative would not fulfill any of the Proposed Project's goals and objectives.

As stated in Section II, Project Description, the Sports Arena and Coliseum complex is supported solely by revenue generated from its operations and no taxpayer funds are used to support the existing facilities. Because the Sports Arena is in need of major repairs and renovation in order to extend its structural lifespan and programming opportunities to become an economically self-sufficient sports and entertainment venue, the No Project Alternative could jeopardize the ability for the Sports Arena to continue its current operations into the foreseeable future. The Los Angeles Memorial Sports Arena has had an operating loss of between $750,000 and $900,000 each of the last five fiscal years. These losses have been absorbed due to the profitability of the Los Angeles Memorial Coliseum. It is anticipated that the Sports Arena will continue to lose a significant amount of money for the foreseeable future. Due to the age of the facility, the Sports Arena will require significant capital expenditures in the next five years just to keep it operating. Improvements necessary to keep the Sports Arena operational would include new seats, a new HVAC system, new ice floor and plumbing, bathroom remodeling, and concession stand remodeling. It is estimated that these capital improvements would cost approximately an additional $8,200,000, which exceeds the Commission's current cash position. Furthermore, the above

improvements would not make the Sports Arena any more competitive with other similar venues in and around Los Angeles.

This Alternative would preclude the ability of the Sports Arena to operate as an economically viable and self-sufficient facility capable of hosting a wide variety of athletic, cultural, political, and community events. The venue would likely cease to operate and fall into a state of disrepair, which would act counter to the stated objective to enhance the prestige and visibility of Exposition Park and the City of Los Angeles through the development of a modern, world-class sports, entertainment, and cultural use complex. Ultimately, this alternative would necessitate the shuttering of the Sports Arena as it would no longer be economically viable for the Coliseum Commission to operate the venue in a self-sustaining manner.

This Alternative would consist of renovating the Los Angeles Sports Arena in accordance with the Secretary of Interior's Standards for the Rehabilitation and Renovation of Historic Structures. The existing structure would not be demolished and renovation efforts would be aimed at maintenance projects and providing modern amenities to make the facility an attractive and desirable location for sporting, entertainment and civic events. Due to the age of the facility, the continued use of the Sports Arena will require significant capital expenditures in the next five years just to keep it operating. Improvements necessary to keep the Sports Arena operational would include new seats, a new HVAC system, new ice floor and plumbing, bathroom remodeling, and concession stand remodeling. Exterior improvements would be limited to upkeep of the landscaped grounds and painting the exterior facade of the structure.

Aesthetics

Visual Character/Views

Under the Historic Retention Alternative, the existing Sports Arena building and landscaping features on the Project Site would remain and no new construction would take place. The existing use on the Project Site have remained relatively unchanged for the past 50 years and thus no adverse significant aesthetic impacts with respect to visual character, views, or value would be created by the continued presence of these features. The exterior features of the Sports Arena would be retained and rehabilitated in conformance with the Secretary of Interiors Standards to ensure that no historic impacts occur. Thus, the Historic Retention Alternative would result in no impact to the aesthetic character of the surrounding neighborhood.

Light and Glare

Under the Historic Retention Alternative, the existing Sports Arena building and surface parking uses would remain on the Project Site. These uses currently generate a moderate amount of nighttime lighting and daytime glare associated with the vehicles on passing streets and illuminated parking lots. As such, the Historic Retention Alternative would not result in any changes to the ambient lighting conditions and no impact would occur with respect to spillover lighting onto adjacent properties.

Air Quality

Under the Historic Retention, no demolition of the Sports Arena would occur and no new construction impacts would be generated. Accordingly, construction-related air quality impacts under the Proposed Project, which were determined to be significant and unavoidable, would be reduced under this

Alternative. Some construction activities would be expected to generate increased air quality emissions, however, such impacts would be greatly reduced, as no mass demolition activities would occur.

The Historic Retention Alternative would involve the continued use and operation of the Sports Arena, consistent with its current operations. The vehicle emissions associated with vehicle trips from these operations would continue at their current levels and would not be expected to increase. By comparison, the Proposed project is not expected to increase the overall attendance levels or generate a substantial increase in air quality emissions. Thus, the operational air quality impacts under the Historic Retention Alternative would be less than significant and the same as the Project.

Greenhouse Gases

The amount of GHG emissions from project construction activities would be 878 metric tons of CO_2e in 2011 and 451 metric tons of CO_2e in 2012, which would represent approximately 0.000002 percent and 0.000001 percent of the 2008 State-wide level, respectively. While this is considered to be a less-than-significant impact, these emissions would be substantially reduced under the No Project Alternative, as only minor renovation activities would take place. Thus, impacts under the Historic Retention would be less than significant and reduced as compared to the Proposed Project.

Operational GHG emissions generated by both stationary and mobile sources would continue to be generated by the Historic Retention, as the site would continue its current operations. Stationary area source GHG emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile GHG emissions would be generated by the motor vehicles traveling to and from the project site. With respect to stationary sources, the Historic Retention Alternative is expected to generate increased GHG emissions because, as an indoor facility, it would demand more energy use for heating and cooling. Thus GHG emissions from stationary sources under the Historic Retention Alternative would be increased as compared to the Proposed Project under either option.

With respect to mobile sources, the Proposed Project (under either Option) would not generate significant new traffic impacts. Events and attendance proposed under the Proposed project would continue to fall within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Accordingly, mobile source GHG emissions would be less than significant and the same under the Historic Retention Alternative.

Historic Resources

The Historic Retention Alternative would result in the continued use of the Sports Arena as is with no major alterations or improvements. Ongoing maintenance and minor renovations would be made in a manner that follows the Secretary of Interior's Standards for the Rehabilitation and Renovation of Historic Structures. As such, no demolition would occur and the loss of a significant historic resource would be avoided. Impacts under the No Project Alternative would be less than significant and

substantially reduced as compared to the significant and unavoidable impact that would result with implementation of either option proposed under the project.

Hydrology/Water Quality

Under the Historic Retention Alternative, the existing site would remain intact and no changes to the permeable surface area would occur. However, while the Historic Retention would have no impact with respect to hydrology and flooding (as no changes to surface water volumes or water quality would occur), it would preclude the benefits associated with improved water quality runoff that would occur under the Proposed Project. Compliance with stringent BMPs and regulatory code-required measures would provide and added benefit with respect to treating surface water flows prior to discharging into the off site storm drain system. Accordingly, although the Historic Retention Alternative would result in a less-than-significant impact, the Historic Retention Alternative would result in increased impacts associated with operational water quality as compared to the Proposed Project.

Noise

Under the Historic Retention Alternative, no demolition or excavation activities would take place; thus, no impacts associated with construction noise or vibration associated with these activities would occur. Minor repair and improvements would occur, though they would predominately be limited to interior spaces and would not generate a substantial amount of exterior noise. Therefore, no impacts from construction activities would occur as a result of the Historic Retention Alternative.

With respect to event operations, the Historic Retention Alternative would continue to operate based on the five-year average attendance levels. As compared to the MLS Stadium, the Historic Retention Alternative would generate less noise, as the existing venue is an indoor arena and is acoustically insulated from the surrounding neighborhood. The MLS Stadium would be an open-air outdoor soccer stadium, which would generate exterior noise from the music, soccer and civic events with crowds up to 22,000 attendees. While the noise attenuation of the indoor facility operations under the Historic Retention Alternative would generate fewer noise impacts during events (typically lasting 2-3 hours at a time), the exterior noises associated with vehicles and pedestrians entering and leaving the facility would remain the same. Accordingly, the operational noise levels associated with traffic under the Historic Retention Alternative would be reduced as compared to those of the Proposed Project.

Land Use and Planning

Under the Historic Retention Alternative, the existing Sports Arena would remain on the Project Site, which would be consistent with the underlying zoning code regulations. With respect to zoning and consistency with applicable land use plans, the Historic Retention Alternative would not require any variances or discretionary actions associated with the redevelopment of the Project Site. Impacts related to land use and planning would therefore be reduced under the No Project Alternative, as compared to the MLS Stadium Option, which may require a variance to exceed the 35-foot height limitation established by the current zoning. Land Use impacts would be the same as compared to the Multiple Use Space Option

as no new variances or discretionary actions would be required.

Public Utilities

Water

Under the Historic Retention Alternative, no changes to the existing land uses or operations at the Project Site would occur. Therefore, with respect to water demands, this Alternative would be comparable to the less-than-significant water demand impacts associated with the Proposed Project. Although no new impact would occur, this Alternative would not implement any of the water conservation efforts recommended for the Proposed Project.

Wastewater

Under the Historic Retention Alternative, no changes to the existing land uses or operations at the Project Site would occur and no new or expanded wastewater facilities would be needed. Therefore, with respect to wastewater, this Alternative would have the same impacts as compared to the less-than-significant wastewater impacts associated with the Proposed Project. No impact would occur and the mitigation measures recommended for the Proposed Project would not apply.

Energy

Electricity

Under the Historic Retention Alternative, the existing Sports Arena would remain on the Project Site and no new or increased demand for electricity would occur. The cooling required for the ongoing use of the Sports Arena would generate increased demands for electricity as compared to the open-air venues proposed under the Project. Therefore, with respect to electricity, this Alternative would have increased impacts as compared to the less-than-significant impacts associated with the Proposed Project.

Natural Gas

Under the Historic Retention Alternative, the existing Sports Arena would remain on the Project Site and no new or increased demand for natural gas would occur. However, similar to the electricity demands, the heating required for the ongoing use of the Sports Arena during the winter months would generate increased demands for natural gas as compared to the open-air venues proposed under the Project. Therefore, with respect to natural gas, this Alternative would have increased impacts as compared to the less-than-significant impacts associated with the Proposed Project.

Solid Waste

Under the Historic Retention Alternative, the existing Sports Arena would remain on the Project Site and no new or increased demand for solid waste services would occur. Therefore, with respect to solid waste, this Alternative would have the same solid waste impacts as compared to the less-than-significant impacts

associated with the Proposed Project.

Public Services

Fire Protection

Impacts under the Historic Retention Alternative would not represent a substantial change as compared to the Proposed Project with respect to operations. With regard to planning and fire code compliance, no administrative demands would be required because the Historic Retention Alternative would not result in the construction of any new facilities.

Police Services

The Proposed Project would not substantially change the level of attendance or number of events that occur at the Sports Arena on an annual basis. Thus, demands upon police services would be relatively the same under this Alternative. Neither the Proposed Project nor the Historic Retention Alternative would be expected to result in a substantial increase in the demand for police services from the LAPD such that a new police station or sub-station would need to be developed. In comparison to the Proposed Project, this Alternative would not generate any administrative demands for staff time with respect to facility planning and developing new security plans. Thus, impacts under this Alternative would be less than significant and the same as the Proposed Project.

Traffic and Transportation

Based on the Traffic Assessment provided by Fehr and Peers, the options proposed under the Proposed Project are not expected to generate significant new traffic impacts. Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. The vehicle trips associated with these attendance levels would continue to occur with no notable changes under the No Project Alternative. However, it should be noted that the anticipated opening of Phase I of the Exposition Light Rail Transit (LRT) Line (currently under construction) would likely decrease vehicle trips associated with events at the Sports Arena, because of the convenience it would provide many event spectators. Traffic impacts under this Alternative would be less than significant and the same as the Proposed Project.

Parking Impacts

The Proposed Project does not include any major changes to existing parking facilities at the Coliseum, Exposition Park, USC, or the surrounding area. No parking impacts are anticipated to occur under the Proposed Project. In comparison to the Multiple Use Space (Option 1), the continued use of the existing Sports Arena will preclude the option to provide additional surface parking for Coliseum events. In comparison to proposed Option 2, the new MLS Stadium is not anticipated to generate more parking demands than are currently generated under the existing conditions. Thus there would be no notable change in parking demands under the Historic Retention Alternative.

Conclusion

The Historic Retention Alternative would reduce the Proposed Project's significant and unavoidable impacts for construction air quality, construction noise, and historic resources. However, the Historic Retention Alternative would not fulfill any of the Proposed Project's goals and objectives.

As stated in Section II, Project Description, the Sports Arena and Coliseum complex is supported solely by revenue generated from its operations and no taxpayer funds are used to support the existing facilities. Because the Sports Arena is in need of major repairs and renovation in order to extend its structural lifespan and generate the necessary revenues to become an economically self-sufficient sports and entertainment venue, the Historic Retention Alternative would jeopardize the ability for the Sports Arena to continue its current operations into the foreseeable future. The Los Angeles Memorial Sports Arena has had an operating loss of between $750,000 and $900,000 each of the last five fiscal years. These losses have been absorbed due to the profitability of the Los Angeles Memorial Coliseum. It is anticipated that the Sports Arena will continue to lose a significant amount of money for the foreseeable future. Due to the age of the facility, the Coliseum Commission estimates that the Sports Arena will require significant capital expenditures in the next five years just to keep it operating. Improvements necessary to keep the Sports Arena operational would include new seats, a new HVAC system, new ice floor and plumbing, bathroom remodeling, and concession stand remodeling. It is estimated that these capital improvements would cost approximately an additional $8,200,000, which exceeds the Commission's current cash position.[1] A detailed account of the expenditures are provided in discussion of the baseline conditions in Section II, Project Description of this EIR. Furthermore, the above improvements would not make the Sports Arena any more competitive with other Class A facilities in and around Los Angeles, and would not generate the revenue necessary to support the operational costs and expenditures.

In conclusion, the Historic Retention Alternative would preclude the ability of the Sports Arena to operate as an economically viable and self-sufficient facility capable of hosting a wide variety of athletic, cultural, political, and community events. It is anticipated that the costs associated with the ongoing maintenance and repair of the aging facility, and the requirements to maintain the structure's eligibility for listing as a historic resource on the California or National Register would exceed the operating revenue of the limited ongoing use of the facility.

---

VI. ALTERNATIVES TO THE PROPOSED PROJECT
C. ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Section 15126.6 of the State CEQA Guidelines requires that an "environmentally superior" alternative be selected among the alternatives that are evaluated in the EIR. In general, the environmentally superior alternative is the alternative that would be expected to generate the fewest adverse impacts. As discussed in this chapter, the environmentally superior alternative would be the No Project Alternative. The No Project Alternative would eliminate all of the Project's potentially adverse effects upon the environment as it would maintain the status-quo.

However, as required by CEQA, when the No Project Alternative is shown to be environmentally superior over the Proposed Project, an Environmentally Superior Project Alternative shall be identified. Based on a review of the two alternatives identified in this EIR, both the No Project Alternative and the Historic Retention Alternative would generate identical impacts with respect to operational impacts. The No Project Alternative would not generate any construction impacts while the Historic Retention Alternative would result in some short-term construction related impacts associated with interior and exterior improvements and maintenance. Both Alternatives would successfully eliminate all of the significant unavoidable impacts that were identified for the Proposed Project. However, CEQA mandates that another Alternative be selected in the case where the No Project Alternative generates the least amount of environmental impact. For this reason, the Historic Retention Alternative is identified as the environmentally superior alternative.

NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT ON THE REDEVELOPMENT OF THE LOS ANGELES MEMORIAL SPORTS ARENA

ORIGINAL FILED
APR 19 2010
LOS ANGELES, COUNTY CLERK

TO: All Concerned Persons

FROM: The Los Angeles Memorial Coliseum Commission

PROJECT LOCATION: Los Angeles Memorial Sports Arena,
3939 S. Figueroa Street, Los Angeles, California

DATE: April 19, 2010

Project Location

The Los Angeles Memorial Sports Arena ("Sports Arena") occupies an approximate 17-acre parcel of land within the boundaries of the Exposition Park Master Plan Area. Exposition Park is located approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street on the east, Martin Luther King Jr. Boulevard on the south, and Vermont Avenue on the west. The Sports Arena is generally situated in the southeastern portion of Exposition Park. The general location of the project area is illustrated in Figure 1, Project Location Map, attached. As shown, the Project Site is generally bounded by South Coliseum Drive on the west and north, Figueroa Street on the east, and Parking Lot 6 on the south.

Project Background

The Sports Arena is owned by the Los Angeles Memorial Coliseum Commission, which leases the parcels occupied by the Sports Arena and the Coliseum from the State. In the history of its operations, the 16,740 seat indoor arena has hosted a variety of sporting events, including boxing, basketball (professional and college), and hockey. It has also hosted a number of civic events

including the 1960 Democratic National Convention as well as numerous rock concerts, track meets, rodeos, home shows, auto shows, roller derbies, rallies, fundraisers, Latin dances, etc. Over the past several decades the Sports Arena has become increasingly underutilized. The Sports Arena needs major capital improvements and repairs to continue to function. As a result, the Coliseum Commission is seeking to redevelop the Sports Arena Site with a financially viable public recreational facility for the enjoyment and benefit of the citizens and general public that demonstrates and exploits climatic, geographic, recreational, cultural and commercial resources and advantages.

Project Description

The Proposed Project would consist of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the Los Angeles Memorial Coliseum Commission is considering two different and mutually exclusive future uses for the Project Site: a civic multiple use space, or a new 20,000 seat outdoor soccer stadium. Both of these development options will be analyzed in an equal level of detail in the EIR to allow flexibility for the potential entitlement of either one of the two projects.

Option 1: Multiple Use Space

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. The multiple use space would be improved to be greenscape while also providing additional surface parking for Coliseum events. It would have the necessary infrastructure to facilitate a number of simultaneous public uses with different levels of attendance with electrical, plumbing and food service capabilities. It would serve as a public venue for civic gatherings, capable of hosting a variety of celebratory and entertainment civic events such as parades, rallies, open air meetings, festivals, and neighborhood carnivals. It would greatly increase the utility of the current outdoor paved space at the Sports Arena now used for similar events and serve as the destination for processions down the Figueroa Corridor. Combined with the Coliseum, the campus supervised by the Coliseum Commission would provide the public with event facilities appropriate for crowds from 500 to 93,000 people and all sizes in-between.

Option 2: Multiple Use Small Capacity Event and Soccer Stadium

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Multiple Use Small Capacity Event and Soccer Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with the site's history. The outdoor event/soccer stadium (including associated support facilities) would be oriented on an

east-west axis and would have a permanent seating capacity of approximately 20,000. The state-of-the art venue would host soccer games, and open-air entertainment events such as concerts and civic gatherings that are well suited for the reduced capacity facility. This smaller facility is a good compliment to the 93,000 seat Coliseum that is often too large to serve many of the above activities that are an important and growing need in this community. The stadium would also serve as a practice facility and staging area on non-event days.

Under both options, the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operations.

Probable Environmental Effects

The Los Angeles Memorial Coliseum Commission, as Lead Agency for the project, has determined that an Environmental Impact Report (EIR) will be prepared to analyze the environmental effects of the proposed project. The following areas of potential environmental impact will be considered within the scope of the Draft EIR:

- Aesthetics (Visual Impacts, Light and Glare)
- Air Quality
- Global Climate Change
- Cultural and Historical Resources
- Land Use
- Noise
- Hydrology
- Public Services (Police and Fire)
- Public Utilities (Energy Conservation, Water Conservation, Wastewater, Solid Waste)
- Traffic/Access and Parking

In addition, the EIR will analyze potential impacts from cumulative growth and construction projects in the project vicinity, and will discuss alternatives to the proposed project.

Public and Agency Comment

The Los Angeles Memorial Coliseum Commission is encouraging public and agency comment on this project. The Commission will need to be aware of the scope and content of the environmental information related to the statutory responsibilities of other public agencies in connection with the proposed project. Additionally, the Commission welcomes all comments on the possible environmental impacts of the proposed project so that the concerns of all interested individuals and/or organizations may be taken into consideration during the preparation of the

EIR. All comments should be in writing and must be received at the Commission offices no later than 4:00 P.M. on May 19, 2010.

REVISED AND RECIRCULATED NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT AND SCOPING MEETING FOR THE REDEVELOPMENT OF THE LOS ANGELES MEMORIAL SPORTS ARENA

TO: All Concerned Persons

FROM: The Los Angeles Memorial Coliseum Commission

PROJECT LOCATION: Los Angeles Memorial Sports Arena, 3939 S. Figueroa Street, Los Angeles, California

DATE: May 27, 2010

SCH #: 2010041059

Project Location

The Los Angeles Memorial Sports Arena ("Sports Arena") occupies an approximate 17-acre parcel of land within the boundaries of the Exposition Park Master Plan Area. Exposition Park is located approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street on the east, Martin Luther King Jr. Boulevard on the south, and Vermont Avenue on the west. The Sports Arena is generally situated in the southeastern portion of Exposition Park. The general location of the project area is illustrated in Figure 1, Project Location Map, attached. As shown, the Project Site is generally bounded by South Coliseum Drive on the west and north, Figueroa Street on the east, and Parking Lot 6 on the south.

Project Background

The Sports Arena is owned by the Los Angeles Memorial Coliseum Commission, which leases the parcels occupied by the Sports Arena and the Coliseum from the State. In the history of its operations, the 16,740 seat indoor arena has hosted a variety of sporting events, including boxing, basketball (professional and college), and hockey. It has also hosted a number of major civic events including the 1960 Democratic National Convention and the 1961 Freedom Rally as well as numerous rock concerts, track meets, rodeos, home shows, auto shows, roller derbies, rallies, fundraisers, Latin dances, etc. Over the past several decades the Sports Arena site has become increasingly underutilized. As a result, the Coliseum Commission is seeking to redevelop the Sports Arena Site with a financially viable public recreational facility for the enjoyment and benefit of the citizens and general public that demonstrates and exploits climatic, geographic, recreational, cultural and commercial resources and advantages.

Project Description

The Proposed Project would consist of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the Los Angeles Memorial Coliseum Commission is considering two different and mutually exclusive future uses for the Project Site: a civic multiple use space, or a new professional 20,000 seat outdoor soccer stadium. Both of these development options will be analyzed in an equal level of detail in the EIR to allow flexibility for the potential entitlement of either one of the two projects.

Option 1: Multiple Use Space

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. The multiple use space would be improved to provide additional surface parking for Coliseum events and would also serve as a public venue for civic announcements, capable of hosting a variety of celebratory and entertainment civic events such as parades, rallies, public gatherings, festivals, and neighborhood carnivals similar to the current outdoor event usage at the Sports Arena.

Option 2: Major League Soccer Stadium

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Multiple Use Small Capacity Event and Soccer Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with the site's history. The outdoor event/soccer stadium (including associated support facilities) would be oriented on a north-south axis and would have a permanent seating capacity of approximately 20,000. The state-of-the art venue would host soccer games, open-air entertainment events such as concerts and civic gatherings that are well suited for the reduced capacity facility. This smaller facility is a good compliment to the 93,000-seat

Coliseum that is often too large to serve many of the above activities that are an important and growing need in this community. The stadium would also serve as a practice facility and staging area on non-event days.

Probable Environmental Effects

The Los Angeles Memorial Coliseum Commission, as Lead Agency for the project, has determined that an Environmental Impact Report (EIR) will be prepared to analyze the environmental effects of the proposed project. The following areas of potential environmental impact will be considered within the scope of the Draft EIR:

- Aesthetics (Visual Impacts, Light and Glare)
- Air Quality
- Greenhouse Gas Emissions
- Cultural and Historical Resources
- Land Use
- Noise
- Hydrology
- Public Services (Police and Fire)
- Public Utilities (Energy Conservation, Water Conservation, Wastewater, Solid Waste)
- Traffic/Access and Parking

In addition, the EIR will analyze potential impacts from cumulative growth and construction projects in the project vicinity, and will discuss alternatives to the proposed project.

Scoping Meeting

The Los Angeles Memorial Coliseum Commission, as lead agency, will be hosting a public scoping meeting for comments from responsible governmental agencies and interested persons with respect to determining the scope and content of the EIR. The scoping meeting will be open to the public at the following time and location:

Place: Los Angeles Memorial Coliseum Board Room
(3939 S. Figueroa Street, south end of the Coliseum Peristyle)
Date: Wednesday June 16, 2010
Time: 9:30 a.m.

Public and Agency Comment

The Los Angeles Memorial Coliseum Commission is encouraging public and agency comment on this project. The Commission will need to be aware of the scope and content of the environmental information related to the statutory responsibilities of other public agencies in connection with the proposed project. Additionally, the Commission welcomes all comments on the possible environmental impacts of the proposed project so that the concerns of all interested individuals and/or organizations may be taken into consideration during the preparation of the EIR. All comments should be in writing and must be received at the Commission offices no later than 4:00 P.M. on June 30, 2010.

Please direct your responses to:

Patrick Lynch, General Manager
Los Angeles Memorial Coliseum Commission
3911 South Figueroa Street
Los Angeles, CA 90037

Agencies, organizations and individuals who have already submitted comments on the April 19, 2010 NOP do not need to submit new comment letters unless they want to add new information. Comment letters that were received on the previously circulated NOP dated April 19, 2010 will remain on file and will be a part of the administrative record.

Re: Los Angeles Memorial Sports Arena
SCH# 2010041059

Attached for your review and comment is the Notice of Preparation (NOP) for the Los Angeles Memorial Sports Arena draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Shane Parker
Los Angeles Memorial Coliseum Commission
3911 South Figueroa Street
Los Angeles, CA 90037

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Pr. Scott Morgan
Acting Director, State Clearinghouse

RECEIVED MAY - 5 2010

April 29, 2010

Mr. Patrick Lynch
General Manager
Los Angeles Memorial Coliseum Commission
3911 South Figueroa Street
Los Angeles, CA 90037

Dear Mr. Lynch:

Notice of Preparation of a Draft Environmental Impact Report (Draft EIR) for the Los Angeles Memorial Sports Arena Project

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The SCAQMD's comments are recommendations regarding the analysis of potential air quality impacts from the proposed project that should be included in the draft environmental impact report (EIR). Please send the SCAQMD a copy of the Draft EIR upon its completion. **In addition, please send with the draft EIR all appendices or technical documents related to the air quality analysis and electronic versions of all air quality modeling and health risk assessment files. Electronic files include spreadsheets, database files, input files, output files, etc., and does not mean Adobe PDF files. Without all files and supporting air quality documentation, the SCAQMD will be unable to complete its review of the air quality analysis in a timely manner. Any delays in providing all supporting air quality documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

The SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. The SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from the SCAQMD's Subscription Services Department by calling (909) 396-3720. Alternatively, the lead agency may wish to consider using the California Air Resources Board (CARB) approved URBEMIS 2007 Model. This model is available on the SCAQMD Website at: www.urbemis.com.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips should be included in the analysis.

The SCAQMD has developed a methodology for calculating PM2.5 emissions from construction and operational activities and processes. In connection with developing PM2.5 calculation methodologies, the SCAQMD has also developed both regional and localized significance thresholds. The SCAQMD requests that the lead agency quantify PM2.5 emissions and compare the results to the recommended PM2.5 significance thresholds. Guidance for calculating PM2.5 emissions and PM2.5 significance thresholds can be found at the following internet address: http://www.aqmd.gov/ceqa/handbook/PM2_5/PM2_5.html.

In addition to analyzing regional air quality impacts the SCAQMD recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LST's can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the proposed project, it is recommended that the lead agency perform a localized significance analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at http://www.aqmd.gov/ceqa/handbook/LST/LST.html.

In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis") can be found on the SCAQMD's CEQA web pages at the following internet address: http://www.aqmd.gov/ceqa/handbook/mobile_toxic/mobile_toxic.html. An analysis of all toxic air contaminant impacts due to the decommissioning or use of equipment potentially generating such air pollutants should also be included.

Mitigation Measures

In the event that the project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate significant adverse air quality impacts. To assist the Lead Agency with identifying possible mitigation measures for the project, please refer to Chapter 11 of the SCAQMD CEQA Air Quality Handbook for sample air quality mitigation measures. Additional mitigation measures can be found on the SCAQMD's CEQA web pages at the following internet address: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html Additionally, SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook contain numerous measures for controlling construction-related emissions that should be considered for use as CEQA mitigation if not otherwise required. Other measures to reduce air quality impacts from land use projects can be found in the SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. This document can be found at the following internet address: http://www.aqmd.gov/prdas/aqguide/aqguide.html. In addition, guidance on siting incompatible land uses can be found in the California Air Resources Board's Air Quality and Land Use Handbook: A Community Perspective, which can be found at the following internet address: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Pursuant to state CEQA Guidelines §15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling the SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available via the SCAQMD's World Wide Web Homepage (http://www.aqmd.gov).

The SCAQMD is willing to work with the Lead Agency to ensure that project-related emissions are accurately identified, categorized, and evaluated. If you have any questions regarding this letter, please call Ian MacMillan, Program Supervisor, CEQA Section, at (909) 396-3244.

Sincerely,

Ian V. MacMillan

Mr. Patrick Lynch
General Manager
Los Angeles Memorial Coliseum Commission
3911 South Figueroa Street
Los Angeles, CA 90037

Dear Mr. Lynch:

Revised Notice of Preparation of a Draft Environmental Impact Report (Draft EIR) for the Los Angeles Memorial Sports Arena Project

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The SCAQMD's comments are recommendations regarding the analysis of potential air quality impacts from the proposed project that should be included in the draft environmental impact report (EIR). Please send the SCAQMD a copy of the Draft EIR upon its completion. **In addition, please send with the draft EIR all appendices or technical documents related to the air quality analysis and electronic versions of all air quality modeling and health risk assessment files. Electronic files include spreadsheets, database files, input files, output files, etc., and does not mean Adobe PDF files. Without all files and supporting air quality documentation, the SCAQMD will be unable to complete its review of the air quality analysis in a timely manner. Any delays in providing all supporting air quality documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

The SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. The SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from the SCAQMD's Subscription Services Department by calling (909) 396-3720. Alternatively, the lead agency may wish to consider using the California Air Resources Board (CARB) approved URBEMIS 2007 Model. This model is available on the SCAQMD Website at: www.urbemis.com.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips should be included in the analysis.

The SCAQMD has developed a methodology for calculating PM2.5 emissions from construction and operational activities and processes. In connection with developing PM2.5 calculation methodologies, the SCAQMD has also developed both regional and localized significance thresholds. The SCAQMD requests that the lead agency quantify PM2.5 emissions and compare the results to the recommended PM2.5 significance thresholds. Guidance for calculating PM2.5 emissions and PM2.5 significance thresholds can be found at the following internet address: http://www.aqmd.gov/ceqa/handbook/PM2_5/PM2_5.html.

In addition to analyzing regional air quality impacts the SCAQMD recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LST's can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the proposed project, it is recommended that the lead agency perform a localized significance analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at http://www.aqmd.gov/ceqa/handbook/LST/LST.html.

In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis") can be found on the SCAQMD's CEQA web pages at the following internet address: http://www.aqmd.gov/ceqa/handbook/mobile_toxic/mobile_toxic.html. An analysis of all toxic air contaminant impacts due to the decommissioning or use of equipment potentially generating such air pollutants should also be included.

Mitigation Measures

In the event that the project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate significant adverse air quality impacts. To assist the Lead Agency with identifying possible mitigation measures for the project, please refer to Chapter 11 of the SCAQMD CEQA Air Quality Handbook for sample air quality mitigation measures. Additional mitigation measures can be found on the SCAQMD's CEQA web pages at the following internet address: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html Additionally, SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook contain numerous measures for controlling construction-related emissions that should be considered for use as CEQA mitigation if not otherwise required. Other measures to reduce air quality impacts from land use projects can be found in the SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. This document can be found at the following internet address: http://www.aqmd.gov/prdas/aqguide/aqguide.html. In addition, guidance on siting incompatible land uses can be found in the California Air Resources Board's Air Quality and Land Use Handbook: A Community Perspective, which can be found at the following internet address: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Pursuant to state CEQA Guidelines §15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling the SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available via the SCAQMD's World Wide Web Homepage (http://www.aqmd.gov).

The SCAQMD is willing to work with the Lead Agency to ensure that project-related emissions are accurately identified, categorized, and evaluated. If you have any questions regarding this letter, please call Ian MacMillan, Program Supervisor, CEQA Section, at (909) 396-3244.

Sincerely,

Ian V. MacMillan

FORM. GEN. 160 (Rev. 6-80)

CITY OF LOS ANGELES

INTER-DEPARTMENTAL CORRESPONDENCE

May 20, 2010

To: Patrick Lynch, General Manager
Los Angeles Memorial Coliseum Commission
3911 South Figueroa Street
Los Angeles, CA 90037

From: John Dallas, Inspector II,
Hydrants & Access Unit, Los Angeles Fire Department
221 N. Figueroa St. Los Angeles, CA 90012

Subject: REQUEST FOR COMMENTS ON PREPARATION OF A DRAFT ENVIRONMENTAL INPACT REPORT ON THE REDEVELOPMENT OF THE LOS ANGELES MEMORIAL SPORTS ARENA.

PROJECT LOCATION
Los Angeles Memorial Sports Arena, 3939 S. Figueroa St, Los Angeles, CA

PROJECT DESCRIPTION
The proposed project would consist of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the Los Angeles Memorial Coliseum Commission is considering two different and mutually exclusive future uses for the Project Site: a civic multiple use space, or a new 20,000 seat outdoor soccer stadium. Both of these development options will be analyzed in an equal level of detail in the EIR to allow flexibility for the potential entitlement of either one of the two projects.

Option 1: Multiple Use Space

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. The multiple use space would be improved to be greens cape while also providing additional surface parking for Coliseum events. It would have the necessary infrastructure to facilitate a number of simultaneous public uses with different levels of attendance with electrical, plumbing and food service capabilities. It would serve as a public venue for civic gatherings, capable of hosting a variety of celebratory and entertainment civic events such as parades, rallies, open air meetings, festivals, and neighborhood carnivals. It would greatly increase the utility of the current outdoor paved space at the Sports Arena now used for similar events and serve as the destination for processions down the Figueroa Corridor. Combined with the Coliseum, the campus supervised by the Coliseum Commission would provide the public with event facilities appropriate for crowds from 500 to 93,000 people and all sizes in-between.

Option 2: Multiple Use Small Capacity Event and Soccer Stadium

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Multiple Use Small Capacity Event and Soccer Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with the site's history. The outdoor event/soccer stadium (including support facilities) would be oriented on an east-west axis and would have a permanent seating capacity of approximately 20,000. The state-of-the-art venue would host soccer games, and open-air entertainment events such as, concerts and civic gatherings that are well suited for the reduced capacity facility. This smaller facility is a good compliment to the 93,000 seat Coliseum that is often too large to serve many of the above activities that are an important and growing need in the community. The stadium would also serve as a practice facility and staging area on non-event days.

Under both options, the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operations.

A. Fire Flow

In general, the required fire-flow is closely related to land use. The quantity of water necessary for fire protection varies with the type of development, life hazard, occupancy, and the degree of fire hazard.

The required fire-flow for this project has been set at 6,000 G.P.M. from 4 fire hydrants flowing simultaneously.

Improvements to the water system in this area may be required to provide 6,000 G.P.M. fire-flow. The cost of improving the water system may be charged to the developer. For more detailed information regarding water main improvements, the developer shall contact the Water Services Section of the Department of Water and Power at (213) 367-1120.

B. Fire Hydrant Spacing

Every first-story dwelling unit, first-story guest room, and all first-story portions of any commercial or industrial building must be within 300 feet of an approved fire hydrant. (Section 57.09.06, Subsection B-1.)

The maximum distance between fire-flow hydrants on the roads and fire lanes in a high-density residential and commercial area is 300 feet.

C. Response Distance

Based on required fire-flow of 6,000 G.P.M., the first-due Engine company should be within 1 mile, and the first—due Truck Company within 1.5 mile. (The Fire Protection and Prevention Plan – an element of the General Plan.)

The Fire Department has existing fire stations at the following locations for initial response into the area of the proposed development:

Fire Station No. 46
Engine and 2 Rescue Ambulances
4370 S. Hoover St.
Miles-0.8
Staff- 9

Fire Station No. 15
Engine, Assessment Light Force, Paramedic Ambulance
915 W. Jefferson Bl.
Miles-0.9
Staff-12

Fire Station No. 14
Task Force Station, Engine and Truck Companies, Paramedic Ambulances
3401 S. Central Ave
Miles- 1.6
Staff- 14

The above distances were computed to 3939 Figueroa St.

Based on t response distance from existing fire stations, fire protection is considered adequate.

In order to mitigate the inadequacy of fire protection in travel distance, sprinkler systems will be required throughout any structure to be built – 57.09.07 Los Angeles Municipal Code.

D. FIREFIGHTING PERSONNEL ACCESS

Any person owning or having control of any facility, structure, group of structures or premises shall provide and maintain Fire Department access in accordance with provisions of this section. (Section 57.09.03, Subsection A.)

If any portion of the first story exterior walls of any building structure is more than 150 feet from the edge of the roadway of an approved street, an approved fire lane shall be provided so that such portion is within 150 feet of the edge of the fire lane. (Section 57.09.03, Subsection B.)

EXCEPTION:

An entrance to any dwelling unit or guest room shall not be more than 150 feet in distance of horizontal travel from the edge of roadway of an improved street or approved fire lane.

The project as proposed does provide firefighting access as required by the above Code section. Additional roadways or a reconfiguration of the project to provide adequate firefighting access to all dwelling unit may be required.

E. FIREFIGHTING APPARATUS ACCESS

At least two different ingress/egress roads for each area, which will accommodate major fire apparatus and provide for major evacuation during emergency situations (The Fire Protection and Prevention Plan – an element of the General Plan.)

When required access is provided by an improved street, fire lane or combination of both which results in a dead-end in access of 700 feet in length from the nearest cross street, at least one additional ingress-egress roadway shall be provided in such a manner that an alternative means of ingress-egress is accomplished. (Section 57.09.03, Subsection C.)

All public and private streets shall be dedicated and improved in conformance with Board of Public Works, Standard Dimension Plan, Number D-22549.

Construction of public or private roadway in the proposed development shall not exceed 15 percent in grade.

Fire lanes, where required and dead ending streets shall terminate in a cul-de-sac or other approved turning area.

All access roads, including fire lanes, shall be maintained in an unobstructed manner, removal of obstructions shall be at the owner's expense. The entrance to all required fire lanes or required private driveways shall be posted with a sign no less than three square feet in area in accordance with Section 57.09.05 of the Los Angeles Municipal Code.

Fire lane width shall not be less than 20 feet. When a fire lane must accommodate the operation of Fire Department aerial ladder apparatus or where fire hydrants are installed, those portions shall not be less than 28 feet in width. The Fire Department may require additional vehicular access where buildings exceed 28 feet in height.

Where fire apparatus will be driven onto the road level surface of the subterranean parking structure, that structure shall be engineered to withstand a bearing pressure of 8,600 pounds per square foot

This project as proposed, has primary access from Martin Luther King Bl. to the south and Figueroa St, to the east. There is a fire hydrant directly north of the Sports Arena on the west side of Figueroa St. This hydrant is on a 16" water main. In addition, there is one hydrant on the southwest corner of Martin Luther King Bl., and one hydrant on the southeast corner of Martin Luther King Bl. and Figueroa St; These hydrants are situated on 8" mains and 12" mains respectively.

CONCLUSION

The proposed project shall comply with all applicable State and local codes and ordinances, and the guidelines found in the Fire Protection and Fire Prevention Plan, as well as the Safety Plan, both of which are elements of the General Plan of the City of Los Angeles C.P.C. 19708.

The proposed project would have a cumulative impact on fire protection services. Project implementation will increase the need for fire protection and emergency medical services in this area.

At present, there are no immediate plans to increase Fire Department staffing or resources in those areas, which will serve the proposed project.

The inclusion of the above recommendations, along with any additional recommendations made during later reviews of the proposed project, will reduce the impacts to an acceptable level.

Definitive plans and specifications shall be submitted to this Department and requirements for necessary permits satisfied prior to commencement of any portion of this project.

The Los Angeles Fire Department continually evaluates fire station placement and overall Department services for the entire City, as well as specific areas. The development of this proposed project, along with other approved and planned projects in the immediate area, may result in the need for the following:

1. Increased staffing for existing facilities.

2. Additional fire protection facilities.

3. Relocation of present fire protection facilities.

For additional information, please contact Inspector John Dallas of the Construction Services Unit at (213) 482-6509

Re: Notice of Preparation of a Draft Environmental Impact Report for Redevelopment of the Los Angeles Memorial Sports Arena

Dear Mr. Lynch:

On behalf of the Los Angeles Conservancy, thank you for the opportunity to comment on the Notice of Preparation for the redevelopment of the Los Angeles Memorial Sports Arena in Exposition Park. The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with over 6,000 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural heritage of Los Angeles through advocacy and education. We submit the following comments to request that the Draft EIR evaluate the Sports Arena for potential eligibility as a historical resource as defined under CEQA. If found to be significant, we ask that at least one bona fide preservation alternative be evaluated in the Draft EIR.

I. History of the Los Angeles Memorial Sports Arena

Dedicated on July 4, 1959 by then-Vice President Richard Nixon as a memorial to fallen soldiers, the Sports Arena was designed by Welton Becket & Associates with Bradow & Johnson as structural engineers. A thoroughly modern sporting venue for its time, the elliptical bowl-shaped arena was fully air conditioned and placed partially underground to allow for a sunken landscaped court in front. In order to give every seat a good view, the designers eliminated interior columns by using steel trusses extending up to 315 feet, the longest steel trusses ever used in an American building at the time. Welton Becket and his firms have been instrumental in shaping 20th century Los Angeles and are responsible for such iconic local buildings as the Pan Pacific Theater (Wurdeman and Becket, 1935, destroyed 1989), Capital Records (1956), the Santa Monica Civic Auditorium (1959), the Cinerama Dome (1963), and the Los Angeles Music Center (1964-1969). In the 1960s, Welton Becket & Associates grew into the largest architecture office in the country and would go on to design another major sports venue, Pauley Pavilion (1965) at UCLA.

Planned and constructed in the second half of the 1950s, the Sports Arena embodied the ambitions of a burgeoning city looking toward the future. Los Angeles' post-World War II population boom was being matched by equally ambitious civic initiatives to develop the

regional freeway system, a performing arts complex (eventually to become the Music Center), and a new indoor sports arena to host national events. Not only did the Sports Arena live up to expectations, hosting the 1960 Democratic National Convention where John F. Kennedy received the party's presidential nomination, it also enabled Los Angeles to lure the Minnesota Lakers at about the same time as the Brooklyn Dodgers moved west. The arrival of these two professional teams further enhanced the city's image and reflected the growing popularity of recreational sports in the postwar years.

In its 51-year history, the Sports Arena has been home to both the Lakers and Clippers as well as to UCLA and USC basketball. It has been the site of many other sporting events, including as the venue for Olympic boxing in 1984, as well as numerous concerts, exhibitions, and cultural activities. The building underwent major seismic and cosmetic renovations seven years ago. Today, the Sports Arena seats 16,740 and continues to host occasional sporting, entertainment, and cultural events.

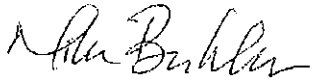
II. Potential Impacts to Historical and Cultural Resources

As the Sports Arena is over 45-years-old and designed by a notable architecture firm, the EIR should include an analysis of its potential eligibility as a historical and cultural resource. This analysis could evaluate the Sports Arena in the context of Welton Becket & Associates and the firm's vast body of work, its engineering or landscape design, the development of large civic projects in Los Angeles, and/or in comparison to other mid-twentieth century sporting venues across the country. The arena's potential cultural significance as the location of prominent sporting and cultural events should also be investigated.

A key policy under the California Environmental Quality Act (CEQA) is the lead agency's duty to "take all action necessary to provide the people of this state with historic environmental qualities and preserve for future generations examples of major periods of California history."[1] The EIR is considered "the heart" of CEQA because it provides decision makers with an in-depth review of projects with potentially significant environmental impacts and analyzes a range of alternatives that reduce those impacts.[2] Accordingly, if the Sports Arena is determined to be a historical resource as defined under CEQA, the EIR should include at least one preservation alternative that attempts to meet project goals and reduces significant adverse impacts to the Sports Arena.

Thank you for the opportunity to comment on the Notice of Preparation for the proposed redevelopment of the Los Angeles Memorial Sports Arena. Please feel free to contact me at (213) 430-4203 or mbuhler@laconservancy.org should you have any questions.

Sincerely,



Mike Buhler
Director of Advocacy

Los Angeles, CA 90037

Dear Mr. Parker:

Re: SCH# 2010041059; Los Angeles Memorial Sports Arena

The California Public Utilities Commission (Commission) has jurisdiction over the safety of highway-rail crossings (crossings) in California. The California Public Utilities Code requires Commission approval for the construction or alteration of crossings and grants the Commission exclusive power on the design, alteration, and closure of crossings.

The Commission's Rail Crossings Engineering Section (RCES) is in receipt of the *Notice of Completion & Environmental Document Transmittal-Notice of Preparation* from the State Clearinghouse for the demolition and removal of the existing Sports Arena and the redevelopment of the site as a civic multiple use space or a new professional 20,000 seat outdoor soccer stadium. RCES recommends that any traffic studies undertaken by the Los Angeles Memorial Coliseum Commission should also consider traffic impacts at nearby Los Angeles County Metropolitan Transportation Authority's (LACMTA) future Exposition line crossings.

Mitigation measures to consider include, but are not limited to, the planning for grade separations for major thoroughfares, improvements to existing at-grade highway-rail crossings due to increase in traffic volumes and continuous vandal resistant fencing or other appropriate barriers to limit the access of trespassers onto the light-rail and railroad right-of-way.

The Los Angeles Memorial Coliseum Commission should schedule a meeting with RCES, and LACMTA to discuss mitigation measures and safety improvements to the affected crossings.

If you have any questions, please contact Jose Pereyra, Utilities Engineer at 213-576-7083, jfp@cpuc.ca.gov, or me at rxm@cpuc.ca.gov, 213-576-7078.

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Redevelopment of the Los Angeles Memorial Sports Arena [I20100130]

Dear Mr. Lynch,

Thank you for submitting the **Notice of Preparation of a Draft Environmental Impact Report for the Redevelopment of the Los Angeles Memorial Sports Arena [I20100130]** to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review of Programs proposed for federal financial assistance and direct development activities, pursuant to Presidential Executive Order 12372 (replacing A-95 Review). Additionally, pursuant to Public Resources Code Section 21083(d) SCAG reviews Environmental Impact Reports of projects of regional significance for consistency with regional plans per the California Environmental Quality Act Guidelines, Sections 15125(d) and 15206(a)(1). SCAG is also the designated Regional Transportation Planning Agency and as such is responsible for both preparation of the Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP) under California Government Code Section 65080 and 65082.

SCAG staff has reviewed this project and determined that the proposed project is regionally significant per California Environmental Quality Act (CEQA) Guidelines, Sections 15125 and/or 15206. The proposed Project would consist of the demolition and removal of the existing arena and the redevelopment of the Project site with either a civic multiple use space or a new 20,000 seat outdoor soccer stadium.

Policies of SCAG's Regional Transportation Plan (RTP) and Compass Growth Visioning (CGV) that may be applicable to your project are outlined in the attachment. The RTP, CGV, and table of policies can be found on the SCAG web site at: http://scag.ca.gov/igr. For ease of review, we would encourage you to use a side-by-side comparison of all SCAG policies with a discussion of the consistency, non-consistency or non-applicability of the policy and supportive analysis in a table format (example attached).

The attached policies are meant to provide guidance for considering the proposed project within the context of our regional goals and policies. We also encourage the use of the SCAG List of Mitigation Measures extracted from the RTP to aid with demonstrating consistency with regional plans and policies. **When available, please send environmental documentation ONLY to SCAG's main office in Los Angeles and provide a minimum of 45 days for SCAG to review.** If you have any questions regarding the attached comments, please contact Bernard Lee at (213) 236-1895 or leeb@scag.ca.gov. Thank you.

Sincerely,

Jacob Lieb, Manager
Environmental and Assessment Services

DOCS# 157063

The Regional Council is comprised of 82 elected officials representing 189 cities, six counties, six County Transportation Commissions and a Tribal Government representative within Southern California.

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE REDEVELOPMENT OF THE LOS ANGELES MEMORIAL SPORTS ARENA [I20100130]

PROJECT LOCATION

The Los Angeles Memorial Sports Arena ("Sports Arena") occupies an approximate 17-acre parcel of land within the boundaries of the Exposition Park Mater Plan Area in the City of Los Angeles, California. Exposition Park is located approximately two miles southwest of the Downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street on the east, Martin Luther King Jr. Boulevard on the south, and Vermont Avenue on the west. The Sports Arena is generally situated in the southeastern portion of Exposition Park. The Project Site is generally bounded by South Coliseum Drive on the west and north, Figueroa Street on the east, and Parking Lot 6 on the south.

PROJECT DESCRIPTION

The Proposed Project would consist of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the Los Angeles Memorial Coliseum Commission is considering two different and mutually exclusive future uses for the Project Site: a civic multiple use space, or a new 20,000 seat outdoor soccer stadium. Both of these development options will be analyzed in an equal level of detail in the EIR to allow flexibility for the potential entitlement of either one of the two projects.

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. The multiple use space would be improved to be greenscape while also providing additional surface parking for Coliseum events. It would have the necessary infrastructure to facilitate a number of simultaneous public uses with different levels of attendance with electrical, plumbing and food service capabilities. It would serve as a public venue for civic gatherings, capable of hosting a variety of celebratory and entertainment civic events such as parades, rallies, open air meetings, festivals, and neighborhood carnivals. It would greatly increase the utility of the current outdoor paved space at the Sports Arena now used for similar events and serve as the destination for processions down the Figueroa Corridor. Combined with the Coliseum, the campus supervised by the Coliseum Commission would provide the public with event facilities appropriate for crowds from 500 to 93,000 people and all sizes in-between.

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Multiple Use Small Capacity Event and Soccer Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with the site's history. The outdoor event/soccer stadium (including associated support facilities) would be oriented on an east-west axis and would have a permanent seating capacity of approximately 20,000. The state-of-the-art venue would host soccer games, and open-air entertainment events such as concerts and civic gatherings that are well suited for the reduced capacity facility. This smaller facility is a good complement to the 93,000 seat Coliseum that is often too large to serve many of the above activities that are an important and growing need in this community. The stadium would also serve as a practice facility and staging area on non-event days.

CONSISTENCY WITH REGIONAL TRANSPORTATION PLAN

Regional Growth Forecasts

The DEIR should reflect the most current SCAG forecasts, which are the 2008 RTP (May 2008) Population, Household and Employment forecasts. The forecasts for your region, subregion, and city are as follows:

Adopted SCAG Regionwide Forecasts[1]

	2010	2015	2020	2025	2030	2035

1. The 2008 RTP growth forecast at the regional, subregional, and city level was adopted by the Regional Council in May 2008. City totals are the sum of small area data and should be used for advisory purposes only.

The **2008 Regional Transportation Plan (RTP)** also has goals and policies that are pertinent to this proposed project. This RTP links the goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption, promoting transportation-friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic and commercial limitations. The RTP continues to support all applicable federal and state laws in implementing the proposed project. Among the relevant goals and policies of the RTP are the following:

Regional Transportation Plan Goals:

RTP G1 *Maximize mobility and accessibility for all people and goods in the region.*
RTP G2 *Ensure travel safety and reliability for all people and goods in the region.*
RTP G3 *Preserve and ensure a sustainable regional transportation system.*
RTP G4 *Maximize the productivity of our transportation system.*
RTP G5 *Protect the environment, improve air quality and promote energy efficiency.*
RTP G6 *Encourage land use and growth patterns that complement our transportation investments.*
RTP G7 *Maximize the security of our transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.*

GROWTH VISIONING

The fundamental goal of the **Compass Growth Visioning** effort is to make the SCAG region a better place to live, work and play for all residents regardless of race, ethnicity or income class. Thus, decisions regarding growth, transportation, land use, and economic development should be made to promote and sustain for future generations the region's mobility, livability and prosperity. The following "Regional Growth Principles" are proposed to provide a framework for local and regional decision making that improves the quality of life for all SCAG residents. Each principle is followed by a specific set of strategies intended to achieve this goal.

Principle 1: Improve mobility for all residents.

GV P1.1 *Encourage transportation investments and land use decisions that are mutually supportive.*
GV P1.2 *Locate new housing near existing jobs and new jobs near existing housing.*
GV P1.3 *Encourage transit-oriented development.*
GV P1.4 *Promote a variety of travel choices*

Principle 2: Foster livability in all communities.

GV P2.1 *Promote infill development and redevelopment to revitalize existing communities.*
GV P2.2 *Promote developments, which provide a mix of uses.*
GV P2.3 *Promote "people scaled," walkable communities.*
GV P2.4 *Support the preservation of stable, single-family neighborhoods.*

Principle 3: Enable prosperity for all people.

GV P3.1 *Provide, in each community, a variety of housing types to meet the housing needs of all income levels.*
GV P3.2 *Support educational opportunities that promote balanced growth.*
GV P3.3 *Ensure environmental justice regardless of race, ethnicity or income class.*
GV P3.4 *Support local and state fiscal policies that encourage balanced growth*
GV P3.5 *Encourage civic engagement.*

Principle 4: Promote sustainability for future generations.

GV P4.1 *Preserve rural, agricultural, recreational, and environmentally sensitive areas*
GV P4.2 *Focus development in urban centers and existing cities.*
GV P4.3 *Develop strategies to accommodate growth that uses resources efficiently, eliminate pollution and significantly reduce waste.*
GV P4.4 *Utilize "green" development techniques*

CONCLUSION

As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans. This activity is based on SCAG's responsibilities as a regional planning organization pursuant to state and federal laws and regulations. Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of regional goals and policies.

All feasible measures needed to mitigate any potentially negative regional impacts associated with the proposed project should be implemented and monitored, as required by CEQA. We recommend that you review the SCAG List of Mitigation Measures for additional guidance, and encourage you to follow them, where applicable to your project. The SCAG List of Mitigation Measures may be found here: http://www.scag.ca.gov/igr/documents/SCAG_IGRMMRP_2008.pdf

SUGGESTED SIDE BY SIDE FORMAT - COMPARISON TABLE OF SCAG POLICIES

For ease of review, we would encourage the use of a side-by-side comparison of all SCAG policies with a discussion of the consistency, non-consistency or not applicable of the policy and supportive analysis in a table format. All policies and goals must be evaluated as to impacts. Suggested format is as follows:

The complete table can be found at: http://www.scag.ca.gov/igr/

- Click on ***"Demonstrating Your Project's Consistency With SCAG Policies"***
- Scroll down to ***"Table of SCAG Policies for IGR"***

SCAG Regional Transportation Plan Goals and Compass Growth Visioning Principles		
Regional Transportation Plan Goals		
Goal/ Principle Number	**Policy Text**	**Statement of Consistency, Non-Consistency, or Not Applicable**
RTP G1	Maximize mobility and accessibility for all people and goods in the region.	***Consistent:*** *Statement as to why* ***Not-Consistent:*** *Statement as to why* *or* ***Not Applicable:*** *Statement as to why*
RTP G2	Ensure travel safety and reliability for all people and goods in the region.	***Consistent:*** *Statement as to why* ***Not-Consistent:*** *Statement as to why* *or* ***Not Applicable:*** *Statement as to why*
RTP G3	Preserve and ensure a sustainable regional transportation system.	***Consistent:*** *Statement as to why* ***Not-Consistent:*** *Statement as to why* *or* ***Not Applicable:*** *Statement as to why*

Phase Assumptions

Phase: Demolition 5/2/2011 - 7/31/2011 - Demolition Subarea 1

Building Volume Total (cubic feet): 4492125

Building Volume Daily (cubic feet): 70602

On Road Truck Travel (VMT): 980.58

Off-Road Equipment:

3 Concrete/Industrial Saws (10 hp) operating at a 0.73 load factor for 6 hours per day

1 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day

2 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 6 hours per day

3 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

Phase: Demolition 8/1/2011 - 8/31/2011 - Demolition/Site Clearing Subarea 2

Building Volume Total (cubic feet): 201898

Building Volume Daily (cubic feet): 64000

On Road Truck Travel (VMT): 888.89

Off-Road Equipment:

1 Concrete/Industrial Saws (10 hp) operating at a 0.73 load factor for 6 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 6 hours per day

2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

Phase: Demolition 9/1/2011 - 9/30/2011 - Demolition/Site Clearing Subarea 3

9/9/2010 3:22:09 PM

Building Volume Total (cubic feet): 201898

Building Volume Daily (cubic feet): 64000

On Road Truck Travel (VMT): 888.89

Off-Road Equipment:

1 Concrete/Industrial Saws (10 hp) operating at a 0.73 load factor for 6 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 4 hours per day

2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

Phase: Mass Grading 10/1/2011 - 12/31/2011 - Grading/Site Preparation Subarea 1

Total Acres Disturbed: 5

Maximum Daily Acreage Disturbed: 1.25

Fugitive Dust Level of Detail: Default

20 lbs per acre-day

On Road Truck Travel (VMT): 3787.88

Off-Road Equipment:

1 Graders (174 hp) operating at a 0.61 load factor for 6 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 6 hours per day

2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

1 Water Trucks (189 hp) operating at a 0.5 load factor for 6 hours per day

Phase: Mass Grading 1/1/2012 - 1/31/2012 - Grading/Site Preparation Subarea 2

Total Acres Disturbed: 5

Maximum Daily Acreage Disturbed: 1.25

Fugitive Dust Level of Detail: Default

20 lbs per acre-day

On Road Truck Travel (VMT): 0

Off-Road Equipment:

1 Graders (174 hp) operating at a 0.61 load factor for 6 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 6 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

9/9/2010 3:22:09 PM

1 Water Trucks (189 hp) operating at a 0.5 load factor for 6 hours per day

Phase: Mass Grading 2/1/2012 - 2/29/2012 - Grading/Site Preparation Subarea 3

Total Acres Disturbed: 5

Maximum Daily Acreage Disturbed: 1.25

Fugitive Dust Level of Detail: Default

20 lbs per acre-day

On Road Truck Travel (VMT): 0

Off-Road Equipment:

1 Graders (174 hp) operating at a 0.61 load factor for 6 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 6 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

1 Water Trucks (189 hp) operating at a 0.5 load factor for 6 hours per day

Phase: Paving 12/1/2012 - 12/31/2012 - Paving for areas throughout sites

Acres to be Paved: 1.25

Off-Road Equipment:

2 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day

1 Pavers (100 hp) operating at a 0.62 load factor for 6 hours per day

1 Paving Equipment (104 hp) operating at a 0.53 load factor for 6 hours per day

1 Rollers (95 hp) operating at a 0.56 load factor for 6 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

Phase: Building Construction 3/1/2012 - 9/30/2012 - Building on Subarea 1

Off-Road Equipment:

2 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day

1 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day

2 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day

1 Generator Sets (49 hp) operating at a 0.74 load factor for 6 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

9/9/2010 3:22:09 PM

2 Welders (45 hp) operating at a 0.45 load factor for 6 hours per day

Phase: Building Construction 10/1/2012 - 10/31/2012 - Building/Landscaping on Subarea 2

Off-Road Equipment:

2 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day

1 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day

2 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day

1 Generator Sets (49 hp) operating at a 0.74 load factor for 6 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

2 Welders (45 hp) operating at a 0.45 load factor for 6 hours per day

Phase: Building Construction 11/1/2012 - 11/30/2012 - Building/Landscaping on Subarea 3

Off-Road Equipment:

2 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day

1 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day

2 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day

1 Generator Sets (49 hp) operating at a 0.74 load factor for 6 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

2 Welders (45 hp) operating at a 0.45 load factor for 6 hours per day

Phase: Architectural Coating 9/1/2012 - 9/30/2012 - Coating/finishing

Rule: Residential Interior Coatings begins 1/1/2005 ends 6/30/2008 specifies a VOC of 100

Rule: Residential Interior Coatings begins 7/1/2008 ends 12/31/2040 specifies a VOC of 50

Rule: Residential Exterior Coatings begins 1/1/2005 ends 6/30/2008 specifies a VOC of 250

Rule: Residential Exterior Coatings begins 7/1/2008 ends 12/31/2040 specifies a VOC of 100

Rule: Nonresidential Interior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Rule: Nonresidential Exterior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Construction Related Mitigation Measures

The following mitigation measures apply to Phase: Mass Grading 10/1/2011 - 12/31/2011 - Grading/Site Preparation Subarea 1

For Soil Stablizing Measures, the Water exposed surfaces 3x daily watering mitigation reduces emissions by:

PM10: 61% PM25: 61%

For Unpaved Roads Measures, the Manage haul road dust 3x daily watering mitigation reduces emissions by:

PM10: 61% PM25: 61%

The following mitigation measures apply to Phase: Mass Grading 1/1/2012 - 1/31/2012 - Grading/Site Preparation Subarea 2

For Soil Stablizing Measures, the Water exposed surfaces 3x daily watering mitigation reduces emissions by:

PM10: 61% PM25: 61%

For Unpaved Roads Measures, the Manage haul road dust 3x daily watering mitigation reduces emissions by:

PM10: 61% PM25: 61%

The following mitigation measures apply to Phase: Mass Grading 2/1/2012 - 2/29/2012 - Grading/Site Preparation Subarea 3

For Soil Stablizing Measures, the Water exposed surfaces 3x daily watering mitigation reduces emissions by:

PM10: 61% PM25: 61%

For Unpaved Roads Measures, the Manage haul road dust 3x daily watering mitigation reduces emissions by:

PM10: 61% PM25: 61%

The following mitigation measures apply to Phase: Architectural Coating 9/1/2012 - 9/30/2012 - Coating/finishing

For Nonresidential Architectural Coating Measures, the Nonresidential Exterior: Use Low VOC Coatings mitigation reduces emissions by:

ROG: 10%

For Nonresidential Architectural Coating Measures, the Nonresidential Interior: Use Low VOC Coatings mitigation reduces emissions by:

ROG: 10%

Sports Arena Project - Demolition Phase

Example		**Construction Activity**		
Five Acre Site		Demolition of Existing	164,000	Square Foot Structure[a]
Demolition Schedule -	**66**	**days[a]**		

Equipment Type[a,b]	**No. of Equipment**	**hr/day**	**Crew Size**
Concrete/Industrial Saws	3	6.0	12
Rubber Tired Dozers	2	6.0	
Cranes	1	6.0

Heavy-Duty Truck[h]	0.012822	0.041846	0.001996

Sports Arena Project - Demolition Phase

Construction Worker Number of Trips and Trip Length

Vehicle	No. of One-Way Trips/Day	Trip Length (miles)
Haul Truck	5	0.1

Incremental Increase in Onsite Combustion Emissions from Construction Equipmen

Equation: Emission Factor (lb/BHP-hr) x No. of Equipment x Work Day (hr/day) x Equipment rating (hp) x Load Factor (%/100) = Onsite Construction Emissions (lb/day)

Equipment Type	CO lb/day	NOx lb/day	PM10 lb/day
Concrete/Industrial Saws	7.58	11.23	0.94
Rubber Tired Dozers	15.94	34.01	1.45
Tractors/Loaders/Backhoes	6.97	11.30	0.87
Total	**30.5**	**56.5**	**3.3**

Incremental Increase in Onsite Fugitive Dust Emissions from Construction Equipmen

Material Handling[k]: (0.0032 x Aerodynamic Particle Size Multiplier x (wind speed (mph)/5)$^{1.3}$/(moisture content/2)$^{1.4}$ x debris handled (ton/day)) x (1 - control efficiency) = PM10 Emissions (lb/day)

Description	Control Efficiency %	PM10 Mitigated[m] lb/day
Material Handling (Demolition)[l]	61	0.12
Material Handling (Debris)	61	0.12
Total		**0.24**

Incremental Increase in Onsite Combustion Emissions from Onroad Mobile Vehicle

Equation: Emission Factor (lb/mile) x No. of One-Way Trips/Day x 2 x Trip length (mile) = Mobile Emissions (lb/day)

Vehicle	CO lb/day	NOx lb/day	PM10 lb/day
Offsite (Haul Truck)	0.01	0.04	0.002
Total	**0.01**	**0.04**	**0.002**

Sports Arena Project - Demolition Phase

Total Incremental Localized Emissions from Construction Activitie	CO	NOx	PM10
Sources	lb/day	lb/day	lb/day
On-site Emissions (Mitigated)	**30.5**	**56.6**	**3.5**
Significance Threshold[n]	***1,861***	***161***	***16***
Exceed Significance?	**NO**	**NO**	**NO**

Combustion and Fugitive Summary	PM2.5 Fraction[o]	PM10	PM2.5
		lb/day	lb/day
Combustion (Offroad)	0.92	3.3	3.0
Combustion (Onroad)	0.96	0.00	0.00
Fugitive	0.21	0.24	0.05
Total		**3.5**	**3.1**
Significance Threshold[n]			**8**
Exceed Significance?			**NO**

Notes:

Project specific data may be entered into shaded cells. Changing the values in the shaded cells will not affect the integrity of the worksheets. Verify that units of values entered match units for cell.

Adding lines or entering values with units different than those associated with the shaded cells may alter the integrity of the sheets or produce incorrect results.

a) SCAQMD, estimated from survey data, Sept 2004

b) Equipment name must match CARB Off-Road Model (see Off-Road Model EF worksheet) equipment name for sheet to look up EFs automatically.

c) SCAB values provided by the ARB, Oct 2006. Assumed equipment is diesel fueled.

d) USEPA, AP-42, Jan 1995, Section 13.2.4 Aggregate Handling and Storage Piles, p 13.2.4-3 Aerodynamic particle size multiplier for < 10 µm

e) Mean wind speed - maximum of daily average wind speeds reported in 1981 meteorological data.

f) USEPA, Fugitive Dust Background Document and Technical Information Document for Best Available Control Measures, equation 2-13, p 2-28

g) USEPA, Fugitive Dust Background Document and Technical Information Document for Best Available Control Measures, p 2-28. Debris weight to area ratio = 0.046 ton/sq ft
(164,000 sq ft x 0.046 ton/sq ft)/66 days = 114 ton/day

h) 2009 fleet year. http://www.aqmd.gov/ceqa/handbook/onroad/onroad.html.

i) Assumed 20 cubic yd truck capacity [(114 tons/day x 2,000 lb/ton x cyd/1,620 lb = 141 cyd)/20 cyd/truck = 5 one-way truck trips/day, where building debris density is assumed to be 1,620 lb/cyd]
Multiple trucks may be used.

j) Assumed trucks travel 0.1 mile through project site.

k) USEPA, Fugitive Dust Background Document and Technical Information Document for Best Available Control Measures, equation 2-13, p 2-28. EPA suggests using the material handling equation for demolition emission estimates.

l) EPA suggests using the material handling equation for demolition emission estimates.

m) Includes watering at least three times a day per Rule 403 (61% control efficiency)

n) Reflects LST for 5-acre site located in SRA 1 at 25 meters to receptor.

o) ARB's CEIDARS database PM2.5 fractions - construction dust category for fugitive and diesel vehicle exhaust category for combustion.

Historical Assessment for the

Los Angeles Memorial Sports Arena

Prepared for the Los Angeles Memorial Coliseum Commission

FINAL – July 2010

Introduction

In February 2006, Jones & Stokes (now ICF International) submitted a Draft Historic Assessment to the Los Angeles Memorial Coliseum Commission ("Commission") that evaluated the historical significance of the Los Angeles Memorial Sports Arena ("Sports Arena"), located at 3939 South Figueroa Street in Los Angeles, California. At that time, the Sports Arena, constructed in 1959, had not met the 50-year age special consideration of the California Register of Historical Resources. In June 2010, ICF Jones & Stokes was retained by Patrick Lynch, General Manager of the Los Angeles Memorial Coliseum Commission, to revise the February 2006 assessment and submit a final report in part because the Sports Arena is now 50 years old.

The original assessment evaluated the Sports Arena in light of the fact it was less than 50 years of age. A comprehensive context was presented, in order to determine historical significance. As a result, several historical contexts were found to apply. These contexts, not in order or significance, are the following: Exposition Park, in which the Sports Arena is located; the efforts to build an arena in Los Angeles; the national examples looked at before the Sports Arena was constructed; and similar facilities that existed before the Sports Arena was constructed. In this updated assessment, a review of this background is followed by a description of the resource and a discussion of the current conditions and alterations.[1] The report substantiates the determination of eligibility based on this background information, the integrity of the building, and application of the California Register of Historical Resources criteria.

Detailed evaluations are provided on California Department of Parks and Recreation Historic Resource Inventory Forms (DPR 523 forms) and are attached to this memorandum.

The report concludes that the Los Angeles Memorial Sports Arena is eligible for the California Register of Historical Resources under Criterion 1 for its association with events that have made a significant contribution to Los Angeles history.

Methodology

On January 25, 2006, Jones & Stokes employee Jessica B. Feldman, a qualified architectural historian, conducted an on-site survey of the building. She conducted a thorough walk-through, accompanied by David Bentley (Bentley Management Group, LLC), and took digital photographs of the interior and exterior elements. Katy Lain, researcher, conducted on-site research with the assistance of Commission staff.

[1] Per our discussions with Patrick Lynch in 2010, ICF Jones & Stokes' architectural historians did not conduct an additional field visit to evaluate the Sports Arena because no alterations have occurred since the 2006 photographs were taken.

The site visit was followed by research into the building's construction history, consisting of building and improvement permits gathered at the City of Los Angeles Department of Building and Safety, as well as research at the Los Angeles County Tax Assessor's archives. Further research was conducted at the Los Angeles Public Library, both on-line and on-site.

Context

The Sports Arena opened on July 4, 1959. It was the first modern indoor sports arena built in Los Angeles. Prior to the opening of the Sports Arena, the primary indoor sports arenas in Los Angeles were the Grand Olympic Auditorium, built in 1925, and the Pan Pacific Auditorium, built in 1935. The accepted definition of the word "arena" is an enclosed area, used for public entertainment, such as sporting events or spectacles. An increasing number of arenas were constructed throughout the United States from the late 1950s to the early 1960s. In a 1956 article in the *Los Angeles Times*, the Coliseum Commission chairman G.E. Kinsey noted that the "nation is currently experiencing a boom in auditorium construction, with 48 new arenas either under construction or in advanced planning stages."[2]

Seating capacity of these venues ranged from 5,000 to 15,000. In California, there was the Cow Palace in San Francisco (1941), and the Sports Arena was soon followed by the Long Beach Sports Arena (1962) and Pauley Pavilion (1965). Although there wasn't much variety in the overall design of these structures, some were unusual and unique. This included the Mellon (Civic) Arena in Pittsburgh, Pennsylvania, which was recently listed on the local landmark list and was constructed with a stainless steel, retractable roof, supported by a large steel cantilever (1960), and the Dorton Arena at the North Carolina State Fairgrounds in Raleigh, constructed in 1952 and listed on the National Register of Historic Places. The Dorton Arena is a parabolic structure, and was declared one of the 10 twentieth-century buildings expected to influence the future of American architecture by the American Institute of Architects in 1957. But the archetype was Madison Square Garden in New York City.

Madison Square Garden ("The Garden") was identified numerous times as the model for a multi-purpose facility in Los Angeles. It is the third Garden that is most often identified as setting the standard for these types of venues from the 1930s through the 1950s. The Garden has experienced four incarnations: Madison Square Garden (1871); Madison Square Garden II (1890-1925, designed by Stanford White); Madison Square Garden III (1925-1968); and "World Wide Plaza," (designed by Skidmore, Owings and Merrill, 1989). In 2006, there was discussion of moving the Garden to a new site.

[2] "Officials Plan Tour of Arenas in Other Cities," *Los Angeles Times*, March 19, 1956, page A1, ProQuest Historical Newspapers Los Angeles Times (1881-1985).

Local boosters, including Supervisor Kenneth Hahn and Bill Nicholas of the Coliseum Commission, intended to build a stadium to rival Madison Square Garden. Although the third largest city in the country in 1956, Los Angeles still lacked the facilities to host a national convention or a great indoor sporting event. The citizens of Los Angeles three times voted against propositions intended to pay for the arena. Ultimately, a State Assembly bill was passed and signed by Governor Goodwin Knight, authorizing commissioners to issue revenue bonds to finance the construction. By March 21, 1958, $7,800,000 in revenue bonds were sold. For a time, the Sports Arena enjoyed popularity and success and was touted as the most modern sports facility in California. But after a defection by Jack Kent Cooke, owner of the Los Angeles Lakers basketball team and the new hockey franchise team, to build the Forum in Inglewood in late 1967, it lost an important regular client and two major sports teams.

The Sports Arena is operated under the authority of the Los Angeles Memorial Coliseum Commission, which was formed in 1945. The Los Angeles Coliseum was constructed in 1923.[3] The Commission was created under the Joint Exercise of Power Act, and is comprised of City of Los Angeles representatives, as well as representatives of the County of Los Angeles and the State of California, who are equal decision-makers. The two multi-use buildings are self-supporting, through revenues from events at the site.

Efforts to Build a Sports Arena in Los Angeles

Getting the Sports Arena constructed was a lengthy, difficult process. As Proquest/*Historical Los Angeles Times* articles reveal, plans to build a sports arena in Los Angeles originated as early as the 1930s. Neither the Grand Olympic Auditorium (built in 1925) nor the Pan Pacific Auditorium (built 1935) had the capacity to house a large indoor team sports event. In 1938, the *Los Angeles Times* reported that a $1,500,000 sports arena was planned, to be located on the Gilmore Tract at Third Street and Fairfax Avenue. A year later, Edward Metcalf, president of Sports Gardens, Inc., announced plans to build a $2,500,000 sports arena on a 97-acre parcel, located on a site bounded by Venice and La Cienega boulevards and 18th Street. The new arena's construction would be overseen by H. O. Davis, a veteran of the 1932 Olympics and the 1915 and 1935 San Diego Expositions. Architect Stiles O. Clements proposed a suspension-style construction for the 40,000-seat auditorium, with no beams or posts, which would allow for the division of the space into three separate arenas. The facility was named "The Gardens," and it was intended for national championships, including football, wrestling and boxing. This project was not constructed.

[3] The Coliseum was declared a National Historic Landmark in 1984. It hosted the 1932 and 1984 Olympics, as well as two Super Bowls, one World Series, and decades of USC football games. In addition, it was the home of the Los Angeles Raiders for 12 years. The Coliseum also hosted religious conventions and rock concerts. For more, see the Coliseum's website, located at: http://www.lacoliseum.com/pages/history.shtml.

In 1939, Walt Disney signed a lease for the Third and Fairfax site as president of Hollywood Sports Gardens, Inc., which intended to build the "largest covered stadium in the world" with Walker and Eisen hired as architects. The Fairfax site came up again in 1944, when business leaders announced the plans to build the "Pan Pacific Sports Arena," after the war, after purchasing the 35 acres of the Gilmore Tract. Yet another sports arena was proposed in 1946 in the South Gate area, to heavy community opposition.

By 1947 newspaper articles focused on Exposition Park, adjacent to the Coliseum, as a site for the proposed "Madison Square Garden of the West." Former Coliseum Commission president and Los Angeles County Supervisor Leonard J. Roach recommended "using Coliseum profits to finance the structure." Another site under consideration included 22 undeveloped acres in Los Feliz, property owned by the estate of Aline Barnsdall, but Barnsdall's will forbade sale of the land until 10 years after her death.

Yet another plan, to build the "Los Angeles War Memorial Auditorium," was announced in 1948 by a group called "Greater Los Angeles Plans, Inc." A nonprofit organization consisting of prominent architects and planners, they were committed to building an indoor sports arena downtown, on a 23-acre tract between Third and Fifth Streets, west of Flower Street. In 1948, the Los Angeles Memorial Coliseum Commission enlisted a public relations firm to conduct a feasibility study for an indoor sports arena in Los Angeles.

When the issue of funding a new sports arena finally went before the Los Angeles voters, the site on which they voted was the downtown site, located at 3rd, 5th, Flower and Fremont streets. Propositions A and B, in the amount of $25,000,000 and $10,000,000, were placed on the April 3, 1951, municipal ballot. The propositions included the construction of a music center.

After those propositions failed, Proposition B was introduced in 1953 to finance the construction of a sports arena, convention hall, and civic auditorium, in the amount of $27,000,000, to be repaid over a 30-year period. Los Angeles Police Chief William Parker "urged construction of the center on the basis of combating juvenile delinquency." The proposed site, located again at 3rd and 5th Streets and Flower and Fremont Streets, was praised for its convenient downtown location, adjacent to freeways and public transportation. Businessman Harry Volk, who spearheaded the measure, called the proposed auditorium "something this city needs, regardless of the possibility of complete 'payout' from revenues," according to the *Los Angeles Times*.

Again, the measure failed to get the two-thirds majority required. A third measure, Proposition F, was put on the ballot in June 1954 to finance a new auditorium, led by the group "Forward Los Angeles." In support of the attempted project, the president of the Los Angeles Rams (who had arrived in Los Angeles in 1946) praised attempts to build an auditorium even greater than Cleveland's (former home of the Rams) to make Los Angeles the "sports capital of the West Coast."

After three proposition failures, in 1955 the Coliseum Commission and Supervisor Kenneth Hahn, its president, yet pursued the construction of a sports arena at Exposition Park. Architect Clements was enlisted to build a 22,000-seat arena that would be used for sports contests only, so as not to compete with the proposed downtown auditorium or the Hollywood Bowl. Another feasibility study to determine economic viability was underway. Influenced by Hahn, two State Assemblymen, Jesse M. Unruh and Augustus Hawkins, introduced a bill that would authorize the Los Angeles County Board of Supervisors to issue revenue bonds in order to finance the proposed $7,000,000 arena. The bill passed the Assembly and the Senate and was signed into law by Governor Goodwin G. Knight on April 29, 1955, after which the Sixth Agricultural District, owners of the land, extended its contract with the Coliseum Commission through 1985.

Although Coliseum General Manager Bill Nicholas predicted the new sports arena would open in 1957, contingencies like the rising cost of steel delayed its construction. Architects Stiles O. Clements and his son, Robert Clements, were fired for breach of contract, after failing to revise their architectural plans to accommodate the budget. Nine new firms were put forth as replacements; meanwhile, the Clements's sued the Commission for wrongful discharge, and the Commission countersued, charging negligence and irresponsible business practices.

In June 1957, the Coliseum Commission approved the plans submitted by Welton Becket, whose firm was chosen from the nine firms proposed in 1957. Becket (with partner William Wurdeman) was the architect of the successful Pan-Pacific Auditorium in the Fairfax area; his firm was employed as UCLA's master planner and had designed the Los Angeles Police Department's downtown Parker Center in 1955. Becket is considered one of the most prominent architects in Los Angeles, responsible for more than 150 building designs.

By the time construction was complete, the total cost was $7.4 million. Excavating for its construction resulted in a huge hole in Exposition Park for two years, referred to as the "famous hole," according to a Coliseum Commission publication. But the Sports Arena finally opened on July 5, 1959. On hand to deliver the celebratory address was Vice-President Richard M. Nixon, who exhorted the audience "never to quit." A few days later, on July 8, bantamweight Jose Becerra defeated Alphonse Halimi before a crowd of 13,675 people.

Other Local Venues

One of the reasons that civic leaders were anxious to have the Sports Arena constructed was a belief that Los Angeles was lacking the facilities that would attract professional basketball and hockey teams to the area. Semi-professional hockey, football and baseball were being played in Los Angeles are a variety of venues when the concept of the Sports Arena was beginning to be discussed; however, each was considered deficient in some regard. Seven structures in the city existed for both sports and spectacles, all of which were constructed in the 1920s and 1930s.

Grand Olympic Auditorium, located at Grand Avenue and 18th Street, was built for the 1932 Olympics and served as the "Mecca of Boxing" in Los Angeles for more than 70 years. From its opening in 1925 through 1987, when it closed (though still used for concerts and filming), it attracted Los Angeles' most famous stars, from Mae West to Barbara Stanwyck to Frank Sinatra, as well as mobster Mickey Cohen. After a brief attempt at reviving the Auditorium in 1994 with Oscar De La Hoya fighting Jimmy Bredahl of Denmark, attendance continued to decline. In 2005, the Grand Olympic Auditorium was purchased from downtown property owner Steven Needleman by a Korean-American church.

Gilmore Field was located near the intersection of Beverly and Fairfax and was the venue for the semi-professional Hollywood Stars baseball team, which played in the Pacific Coast League. The baseball field was constructed in 1939 and was demolished in 1959. Next to it was the *Gilmore Stadium*, built a few years earlier in 1934. The Los Angeles Bulldogs, a semi-professional team and the first football team in Los Angeles, played for the American Football League (AFL) at the Gilmore Stadium in 1937. The AFL folded that year.

Wrigley Field, built by William Wrigley in 1925, was located south of downtown Los Angeles. The Los Angeles Angels, a minor league team, played there from 1925. When the Brooklyn Dodgers moved to Los Angeles, Wrigley Field was proposed for their use, but until Dodger Stadium opened in 1961, they chose to play at the Coliseum. The Los Angeles Angels continued to play at the baseball field until 1961, when the team was brought into the American League and played at Dodger Stadium. Wrigley Field was torn down in 1969.

There were two open-air stadiums: the Los Angeles Memorial Coliseum at Exposition Park and the Rose Bowl in Pasadena. *The Coliseum* dates to 1923 and held a variety of sporting events, including football (Los Angeles Rams, Chargers, Raiders), baseball (the Los Angeles Dodgers played there until Dodger Stadium opened), not to mention USC and UCLA football. It seats 92,000. It is listed on the National Register and is a National Historic Landmark, as well.

The Rose Bowl Stadium was designed in 1921 as a horseshoe-shaped stadium. Architect Myron Hunt, in association with then Tournament President William Leishman, prepared the original design. Original construction conformed to the horseshoe design, but the stadium was enclosed as a full bowl in 1928, increasing spectator capacity to 76, 000. The Rose Bowl has hosted the Tournament of Roses Bowl football game since 1923. The Rose Bowl, 991 Rosemont Avenue, is listed in the National Register and also has been designated as a National Historic Landmark.

Finally, *the Pan Pacific Auditorium*, designed by Welton Becket with partner Walter Wurdeman, opened in 1935. The Los Angeles Monarchs, a hockey team in the Pacific Coast League, played there from 1938-1941. Also using the ice floor at this venue were the Ice Capades and collegiate ice hockey teams. The Harlem Globetrotters appeared at the Pan Pacific on numerous occasions. In addition to sports, the space was utilized for home shows, conventions, musical shows and

beauty contests. It only sat 6,000 within 100,000 square feet. Although the doors closed to the public in the early 1970s, it remained on site until a massive fire destroyed it in 1989.

Fate of Similar Venues across Country

In order to gather ideas for the new Los Angeles Memorial Sports Arena, Los Angeles officials traveled to 11 cities across the nation, including Chicago, Buffalo, Syracuse and Des Moines. Of the arenas that existed in those cities at that time, Union Center has replaced Chicago Stadium (1929), which was torn down in 1995; Marine Midland Arena replaced Buffalo Memorial Auditorium, which remains but is rarely used, though there are hopes of renovating it; Wells Fargo Arena replaced Veterans Memorial Auditorium (1955), which has been modernized; and in Syracuse, the Carrier Dome replaced Archbold Stadium (1907), which closed in 1978.

In 1965, the Harris County Domed Stadium, in Houston, Texas opened. At the time, the new arena, to become known as the Astrodome, was the largest enclosed stadium with 45,000 seats. It housed the Houston Astros baseball team and the Houston Oilers football team. The domed stadium, or "superstadium" is considered a watershed event in the evolution of sports facilities, made possible by new steel and concrete technologies and engineering advances. In 1966, synthetic nylon "grass" was installed on the playing field, another first. It became known as "Astro-Turf." The Astrodome has been vacant since 2003.

Exposition Park

Exposition Park is located in the City and County of Los Angeles, approximately 2 miles southwest of the city's central business district. Bordered by Exposition Boulevard to the north, Vermont Avenue to the west, Martin Luther King Boulevard to the south, and Figueroa Street on the east, Exposition Park encompasses approximately 65 hectares (160 acres). The park includes several major museum/educational institutions, recreational open space, surface parking lots, and sports facilities of regional significance, such as the Los Angeles Memorial Coliseum and the Sports Arena.[4]

Although it was not the original choice as the location for the new sports venue, finding enough land on which to build such a structure near established centers of populations was not an easy task for the boosters. The Coliseum Commission sponsored their own study to establish the viability of placing the structure at Exposition Park as early as the mid-1940s, but other sites still competed with it as the proposed sports facility was put to the local voters.

[4] Myra L. Frank & Associates, "HPSR for the Exposition Park Master Plan Parking Facility," prepared for the State of California, Department of General Services, Real Estate Services Division, December 2000.

Brief History of Exposition Park

Exposition Park, which is bounded by Exposition Boulevard on the north, Martin Luther King, Jr. Boulevard on the south, Vermont Avenue on the west and Figueroa Street on the east, is a mixture of public and privately owned structures and open space parkland. It was originally known as Agricultural Park, and it was developed in the 1870s as an agricultural fairground. In 1909, the 160-acre property developed into a park when California's Sixth District Agricultural Association (then owner of the property) and the county and city of Los Angeles agreed to a plan to transform it into a cultural center, and renamed it renamed Exposition Park a year later.

The state would build an exposition building and armory if the county would construct and operate a history and art museum and the city would maintain the grounds.[5] In 1913, the park was officially dedicated, for use as a recreational, educational and cultural gathering place. In 1922, the Exposition Club opened, followed a year later by the Los Angeles Memorial Coliseum, designed by noted Los Angeles and USC architect John Parkinson, on the grounds of Exposition Park. The park is right next to the USC campus. In addition to hosting USC sporting events, the Coliseum was enlarged for the 1932 Olympics; the Swimming Stadium was also constructed for the 1932 Olympics. The park continued to be occupied by culturally important buildings such as the County Museum of Natural History, the California African-American Museum and the Museum of Science and Industry (California Science Center). There is also the renowned Rose Garden and the Armory. In 1959, the Sports Arena was constructed. The park is still public space owned by the state of California, whose major cultural facilities mentioned above are operated by both the state and Los Angeles County.

The Exposition Park Historic District[6]:

The Exposition Park Historic District, which includes the Coliseum, Rose Garden, Natural History Museum; the Armory and Swimming Stadium; the Exposition Clubhouse; North and South Coliseum Drive; and the Exposition (Ahmanson Building), was established in the 2000 Historic Property Survey Report (HPSR), prepared for the State of California, Department of General Services, Real Estate Services Division, as part of an effects analysis of the proposed Exposition Park Master Plan Parking Facility, prepared by Myra L. Frank & Associates (now ICF).

No formal finding of National Register eligibility was made for the Exposition Park Historic District at a meeting among the review agencies on August 9, 2000. Furthermore, the Exposition

[5] "Natural History Museum Of Los Angeles County" located on the County's website at: http://www.nhm.org/expo/expopark.htm.
[6] Myra L. Frank & Associates, "HPSR for the Exposition Park Master Plan Parking Facility," December 2000.

Park Historic District has not been recorded in the California Historical Resources Inventory database.

However, based on the information presented in the HPSR, the following conclusions were made: extensive changes occurred within the 1993 District boundary that were not previously reported, indicating that the integrity of the District was less intact than reported in 1993. Major demolition (most of the Exposition Building), alterations (the Coliseum and Coliseum sidewalks), and new construction (the California Science Center) occurred within the District boundary between 1993 and 2000, further diminishing the integrity of the District. At the time of the HPSR in 2000, the Sports Arena was not yet 50 years of age and was not considered a contributing structure to the historic district.

Significant Sports and Sporting Events

Because the Sports Arena was constructed with the concept that sports teams and sporting events would be the primary tenants for the facility, this section discusses the history of sports in the Sports Arena. This includes boxing, basketball, hockey and other events.

Boxing:

Boxing was expected to be one of the major sports events held at the Sports Arena. The first event held there after it opened was a boxing match. Joe Louis promoted multiple matches at the Sports Arena before moving the bouts to smaller venues in 1962, due to the cost of holding these events at the arena. Although professional bouts continued to be held at the arena after 1962, it doesn't appear from news accounts that any major events happened there.

- The first event held at the Sports Arena was a boxing match between Jose Becerra and Alphonse Halimi on July 8, 1959.
- Cassius Clay knocked out Archie Moore on November 15, 1962.
- 1984 Olympics boxing bouts were held in the Sports Arena.

Basketball:

Basketball was one of the main reasons the Arena boosters were keen to have the structure built. They were actively trying to get a professional team to play in Los Angeles. Before an official, Los Angeles-based team was located at the Sports Arena, several professional basketball games were played at the venue. Eventually, a semi-pro team, the Jets, began playing there. Then, in 1960, the Minneapolis Lakers moved to Los Angeles, keeping the name and playing at the Sports Arena. The Lakers stayed until 1967, when they moved to the Forum. Within a few years, another team moved to the city, the Anaheim Amigos, who played in the Sports Arena as the Los Angeles Stars for two years. Finally, a second professional basketball team came to Los Angeles – the San Diego Clippers. The new Los

Angeles Clippers arrived in 1984. They played in the Sports Arena until 1999, when they moved into the Staples Center, a mile north on Figueroa Street.

At the same time, the arena provided space for high school tournaments and college games. USC has been playing basketball in the Sports Arena since it opened (until moving to Galen Center in 2006) and UCLA played there until Pauley Pavilion (also designed by Welton Becket) opened on the UCLA campus in 1966.

- USC Trojans basketball teams have been playing at the Sports Arena since 1960.
- Harlem Globetrotters played at the Sports Arena on several occasions.
- UCLA Bruins basketball was hosted by the Arena from 1959-1965 during the Golden Age of John Wooden, before Pauley Pavilion was constructed in 1965.
- Beloved and renowned UCLA Bruins men's basketball coach Forrest Twogood coached his last game for UCLA at the Sports Arena in 1966.
- The Los Angeles Jets, a semi-professional basketball team in the American Basketball League (ABL) debuted at the Sports Arena in 1961.
- Minneapolis Lakers moved to Los Angeles in 1960 to become the Los Angeles Lakers, who played in the Sports Arena until the 1967-68 season.
- Los Angeles Clippers arrived from San Diego in 1984. They moved to the Staples Center in 1999.
- The Anaheim Amigos moved to Los Angeles in 1968 and became the Los Angeles Stars. In 1970, they moved to Utah.
- LAUSD High School Championship Basketball was held in the Arean until 1995 because of high rent.
- The 1963 NBA All-Star Game was played at the arena
- Both the 1968 (won by UCLA) and 1972 Men's NCAA Final Four were played in the Arena.
- The 1992 NCAA Women's NCAA Final Four was held at the Arena.

Hockey

Getting a professional hockey team to Los Angeles was another one of the reasons behind the push for the Sports Arena. Semi-professional hockey teams had been established in Los Angeles previous to 1961, but boosters wanted a professional team associated with the National Hockey League (NHL), to be established here. According to some accounts, the Sports Arena was designed in accordance with the wishes of the NHL with the tacit understanding that when the league expanded from six teams, Los Angeles would be well positioned to receive one of those additional teams. However, in 1959, the NHL was not ready to expand; the Western Hockey League (WHL), a semi-professional league, established a team in Los Angeles for the 1961-1962 season: the Los Angeles Blades. In 1966, when the NHL was prepared to add six teams to the roster, four groups representing individual interests for a team in Los Angeles went to New York City to present their cases. The Coliseum Commission backed Dan Reeves, owner of the Blades

and his consortium. Jack Kent Cooke, another promoter who had recently obtained the Los Angeles Lakes basketball team, won the expansion rights. This was a major upset for the Commission.

- The Los Angeles Blades, a semi-pro team in the Western Hockey League, played at the Sports Arena between 1961 and 1967.
    - The Blades were owned by Dan Reeves and Jim Piggott; the former owned the Victoria team.
    - Willie O'Ree, the first African-American to play hockey for the National Hockey League, played for the Blades.
    - At one time, the Blades were a farm team for the New York Rangers.
- The Los Angeles Kings briefly played in 1967 and then moved to the Forum.

Other Sporting Events

Many other "sporting" events took place under the blue roof of the Sports Arena. Some of these included the following:

- Rodeos
- Water Follies
- Roller derbies
- Track meets
- Tennis

Significant Rock Concerts, Political Events, and Shows

The Sports Arena also hosted events such as the Ringling Brothers Circus, the Ice Follies and the Times Indoor Games. Major rock shows and concerts were held at the Sports Arena, from Pink Floyd to Bruce Springsteen, including Springsteen's 2009 shows in Los Angeles.

In 1960, the Democratic National Convention nominated John F. Kennedy as the Democratic Party's candidate for president in the Sports Arena. Kennedy gave his formal acceptance speech at the Coliseum.[7]

[7] History of the Los Angeles Memorial Coliseum and the Sports Arena on the Coliseum website located at: http://www.lacoliseum.com/pages/history.shtml.

In 1961, the Sports Arena was filled to capacity (and overflowed into the parking area) when Martin Luther King, Jr. spoke at a civil rights rally sponsored by the Western Christian Leadership Conference. The Freedom Rally was considered the largest gathering of African Americans in Southern California at the time, with an estimated 25,000 people showing up. Loudspeakers were set up to project the speech to those who did not make it inside (close to 18,000 were admitted indoors). Those who had to listen from outside, through the entire four-hour program had an opportunity afterwards to come into the Sports Arena for an abbreviated version of the program.

The Sports Arena has long had a strong presence in the Los Angeles area by providing a social gathering place for a variety of events, including:

- Home shows
- Auto shows
- Conventions
- Fundraisers
- Educational programs/classes
- Filming – the Sports Arena has been featured in numerous movies and televisions shows, and this continues to be a major source of revenue for the Coliseum Commission. Some of the movies filmed there include scenes from *Rocky* (1976), *Space Jam* (1996), *Escape from L.A.* (1996), Ali (2001), *Solvent Green* (1973) and *Almost Famous* (2000).

History of Welton Becket and Associates

Because Welton Becket and Associates are considered one of the premier post-World War II architects of modern buildings in Los Angeles, a short history of the man and the firm are presented to below.

Welton Becket was born in Seattle, Washington, on August 8, 1902, the son of a builder. As a young man, he dreamed of becoming an architect. After graduating with a degree in architecture from the University of Washington in 1927, he studied for a year at the Ecole des Beaux Arts in Fontainebleau. Becket began his career in Los Angeles in 1929 as a designer-draftsman, and then returned to Seattle to work for his brother, Evro, a builder. During this early period, his work was small-scale and undistinguished. However, in 1933, he formed an auspicious partnership with fellow Washington alumnae, Walter Wurdeman, and together the two men joined the office of a veteran Los Angeles commercial architect, Charles Plummer.

Wurdeman and Becket worked in relative obscurity as many as 80 hours a week, earning little money, in their early years with Plummer. By the late thirties, however, Wurdeman and Becket were designing period revival homes for film stars, including the Tudor Revival-style

Montgomery House in Bel Air (1938). But it was their successful 1934 bid to design the Pan Pacific Auditorium in Los Angeles that would alter their future.

Wurdeman and Becket's concept for the auditorium, which they drafted and designed together, reflected the stylistic influences of the 1933 Chicago World's Fair. In an emphatic interpretation of the Streamline Moderne—four flagpole pylons, designed to resemble fins, jutting toward the sky, atop a graceful, curved façade—Wurdeman and Becket created their first iconic Los Angeles building for the automobile age.

As architectural historians David Gebhard and Harriette Von Breton wrote in *Los Angeles in the Thirties*, the Pan Pacific Auditorium was a "popular, much-admired classic of the new style." It was partially torn down in the mid-1980s, and the surviving façade burned down in 1989.

In 1936, Wurdeman and Becket received an Honor Award from the Southern California chapter of AIA for their design of the Pan Pacific Auditorium. New commissions and publicity helped to expand the office to more than 40 employees in only a few years.

After Charles Plummer died in 1939, Wurdeman and Becket continued their collaboration under the firm's new name, Wurdeman and Becket. During World War II, the firm constructed 14,000 housing units for military families and wartime workers. In 1943, the firm was chosen to design the "House of Tomorrow," a prototype for builder Fritz Burns, in which Wurdeman and Becket presented their vision of postwar living in Los Angeles. The project gained them much needed publicity and, once again, symbolically linked the firm with the future of Los Angeles.

In 1944, Wurdeman and Becket were chosen by P. G. Winnett, the president of Bullock's, to design the new Bullock's Pasadena. For the first time, the firm would also design the interior space of a building. Bullock's Pasadena became one of the first suburban department stores, an elegant building designed in the Late Moderne style that featured a main entrance and motor court in the rear. The parking lot covered nearly six acres. Every detail of the design was overseen by Wurdeman and Becket, including the murals, fixtures, counters and furniture. This concept would be known as "total design."

Wurdeman and Becket designed many more Bullock's stores, including Bullock's Westwood in 1950, considered their finest store. In total, the firm built more than 100 department stores in Southern California and pioneered the concept of the suburban shopping mall.

Through contacts made while working on Bullock's Pasadena, Wurdeman and Becket secured a commission from Mobil Oil Corporation to build their downtown Los Angeles headquarters. It would be the firm's first office building. In the construction of the General Petroleum Building, Wurdeman and Becket pioneered the use of a lightweight concrete, which gave their buildings the appearance of white rock. The General Petroleum Building's design, with open floor plans

consisting of movable partitions and walls, is now widely used within the industry. Their innovative design of the parking structure would also be widely imitated: the garage consisted of an open space, elevators and stairs contained at the center, surrounded by floors that spiraled upward to the top.

In 1947, Wurdeman and Becket constructed another large office building, the Western headquarters of Prudential Insurance Company of America, located at 5757 Wilshire Boulevard. The entire office and retail complex sprawled for two city blocks. In contrast to the General Petroleum Building, with its Art Deco vertical banding and terra cotta exterior, the Prudential Building was built in the International Style, with a solid shaft at its center, flanked by two wings of banded glass.

For the exterior of the building, Wurdeman and Becket again used lightweight concrete. Innovative horizontal sunshield were used on each floor. The 517,000-square-foot Prudential Square, located in the Miracle Mile area, heralded a departure for the Los Angeles business community from a centralized downtown model toward smaller, mini-downtowns, as would ultimately be established in Century City. Wurdeman and Becket began construction of their own office building at 5657 Wilshire Boulevard in 1948, and it was completed in 1949. Wurdeman and Becket would help to transform Wilshire Boulevard into a modern commercial corridor.

By 1949, Wurdeman and Becket had established expertise in building types such as department stores, office buildings, and private homes. With over $100 million worth of commissions, the firm employed 80 people and completely occupied its new five-story Wilshire office building. But personal tragedy struck when Walter Wurdeman died suddenly at the age of 46.

After Wurdeman's death, Welton Becket bought out Wurdeman's heirs and created Welton Becket and Associates, with himself as sole owner. Becket undertook the role of supervising architect for UCLA, which would occupy the bulk of his time until his own untimely death in 1969. The firm was chosen as the university's master planner in 1949 and would transform the UCLA campus over 20 years, responsible for such landmark buildings as the UCLA Center for Health Sciences (1948-1970), Schoenberg Hall (1955), Ackerman Union (1959-60), and Pauley Pavilion (1965).

During the 1950s, Welton Becket and Associates completed many important commissions, including the Beverly Hilton in 1955, LAPD's downtown headquarters at Parker Center in 1955, the Los Angeles Sports Arena in 1959, and perhaps their most iconic building, the Capitol Records Building, in 1955, which was designed by Louis Naidorf in its unique cylindrical shape.

In 1958, Welton Becket and Associates was chosen to oversee the largest urban development in the nation. Private investors paid $43 million in cash for the former 260-acre back lot of

Twentieth Century Fox, located between Beverly Hills and Westwood. Developer William Zeckendorf claimed, "Century City is the first completely planned community in Los Angeles designed specifically for the Freeway Age," in the *West Los Angeles Citizen*.

As Becket and his firm were responsible for reshaping Wilshire Boulevard, transforming the UCLA campus, inventing the suburban mall, and creating numerous postwar icons such as the Capitol Records Building, so would they transform the landscape of the Westside, effectively building a $500 million "city within a city." Tombstone Street, the Fox set where numerous western scenes were once filmed, would become "Avenue of the Stars." Under their design, 181 acres of the property would be converted into landscaped streets with 88 buildings, including a shopping center, a 600-room hotel, and high-rise apartments and office buildings. Fox retained a lease on the remaining 79 acres.

Becket chose 10,000 Santa Monica Boulevard, the northeast corner of Century City, for the location of Welton Becket and Associates' worldwide corporate headquarters, the first building to be erected on the new site. Costing $2.5 million, and containing 106,000 square feet of space, the Becket Building was constructed in 1960 of concrete and steel, its façade covered with mosaic art. An entrance bridge spanned a reflecting pool and fountains.

Century City's Gateway Buildings, prominently located at Santa Monica Boulevard and Avenue of the Stars, were constructed in 1964. Becket envisioned this section of office buildings as a "spacious collection of aluminum-faced structures comprising of a self-contained business center." [citation?] The open–air Century City Shopping Center opened in 1964. David Gebhard and Robert Winter, Los Angeles' foremost architectural historians, considered the Century City development "problematic," without any of the "intimacy" and "human scale" of neighboring Beverly Hills. "In fact," they wrote in their book, *An Architectural Guidebook to Los Angeles*, "the governing idea seems to have been to inspire awe of corporate America via wide avenues and overscaled architecture" (Gehard and Winter).

As a master corporate architect, Welton Becket transformed the landscape of Southern California. By the 1960s, WB&A was internationally recognized, with 32 master plans and 150 additional buildings in progress. The firm had been awarded 66 design excellence awards, locally, nationally, and internationally. In the early 1960s, they completed several significant Los Angeles projects, including the Los Angeles International Airport Theme Building with Pereira & Luckman and Paul Williams; the Pacific Cinerama Dome, the only concrete geodesic dome in the world, according to the Los Angeles Conservancy's Modern Committee; and the Music Center, employing as many as 100 men to fulfill the "total design" concept of WB&A. By 1969 these projects generated nearly $1 billion in revenue. At the top of his profession, with more than 500 employees and operating offices in San Francisco, Chicago, Houston and New York, Becket died suddenly of a heart attack at the age of 66.

Description

The Sports Arena is an ellipse-shaped, multi-use facility, on a north-south axis. It is located in Exposition Park, at the northwest corner of Figueroa Street and Martin Luther King, Jr. Boulevard (formerly Santa Barbara Avenue). It is the sister facility of the Los Angeles Memorial Coliseum, which is located just to the northwest across an access road.

The architect was Welton Becket & Associates of Los Angeles, hired in 1957, and the contractor was L.E. Dixon Co. from San Gabriel, California. Steel for the framing was purchased from Kaiser Steel, located in Fontana, California. The excavation was begun in 1956 by Guy F. Atkinson Company of Long Beach. In "Preview," a contemporary publicity brochure featuring the Sports Arena, the entrance to the Sports Arena is described:

> At the main east entry, centered between chocolate walkways, is a magnificent memorial fountain, dedicated like the Arena, to those who died in the armed services of our nation. This main entrance is served by a spacious 65-foot wide pedestrian bridge, which spans a sunken forecourt. Three equally commodious entrances are spaced on the south, west and north to facilitate normal pedestrian approach patterns and to permit total dispersal in 15 minutes.[8]

The roof is an elliptical transverse steel truss roof, spanning 315' x 430'. The exterior material of the lower walls is comprised of concrete block construction. There are no exterior windows.

According to articles/ads published at the time of construction, the interior length was 437 feet and the interior width was 317 feet (this assumes the statistic is referring to arena floor level without seating). It is 262 feet in length between permanent seat lines and 144 feet in width between permanent seat lines. Length of floor between columns is 278 feet and width between columns is 160 feet. Floor to roof height managed a 75-foot clearance to the first steel girder. Total arena floor space topped out at 130,000 square feet, with concourse level floor space totaling over 101,000 square feet. Further quotes from "Preview" provide historic details:

> …An exquisite blending of ceramic tile, rubberized terrazzo floors and indirect fluorescent lighting lends an atmosphere of refinement and elegance to all lobbies. Each lobby is readily accessible to recessed banks of concession vending machines and expansive individual counter service provides a diversification of unexcelled refreshments. Colorama seating – commencing with the premium 'golden circle' also includes gray, blue and red upholster – based on the Arena seat prices.

[8] "Preview," Los Angeles Memorial Sports Arena publicity brochure published by the Coliseum Commission, circa 1959, courtesy of the Coliseum Commission.

> From all four lobbies on the concourse level, the arena floor level is accessible by ramps, stairways or escalators. The lower level main entrance is served by two serpentine exterior ramps leading from the walkways to the sunken forecourt. This landscaped forecourt, flanked on each side by towering Palm trees, is adaptable for trade show displays with a total of 35,850 square feet. At both the north and south entries, 48-inch reversible escalators service the arena level as crowd movement dictates. At the south lobby is a gradual ramp to enable wheelchair spectators to gain easy access. A truck ramp 40 feet wide and 20 feet high permits entry on the west of large display items to the arena level. The permanent 200 feet by 85 feet ice rink can be frozen in six hours. Seating for athletic or production events commences at the area level with 12 rows of portable seats. They connect by a graduated slope to the 28 rows of permanent seats on the concourse level.
>
> …There are no posts to impair vision whether it be sports event, a convention, or an expansive production. Every seat is foam rubber, upholstered, arm chair, designed with 'fireside' viewing in mind.
>
> The Arena's conception and design was dictated to provide unexcelled facilities for press, television, tenant and performer. Permanent press spaces for 45 are on the east side and include a lounge. A convention plan will handle 1000 press representatives. Five radio and TV booths are on the west side. Space for perfect photographic angle are five permanent TV camera platforms. Ringing the arena is a seven foot wide suspended catwalk located to give unlimited TV and still camera positions plus spotlight locations for theatrical productions… A built-in vacuum system permits rapid clean-up.

According to information received from the Commission, there are currently multiple catwalks; the lower level measures six feet wide with 360-degree access and is 62 feet above the arena floor. The upper level catwalk is separated into four catwalks that run the sixth of the facility 75 feet above the arena floor. The permanent press areas are still located on the concourse level. There are four dressing rooms, one official's dressing room and a sixth dressing room reserved for theatrical/production/event personnel.

Character-Defining Features

The Secretary of the Interior's Standards for the Rehabilitation of Historic Properties, as defined in the National Park Service's *Preservation Brief 17*, identifies "character-defining features" of a building as the following:

> *Character* refers to all those visual aspects and physical features that comprise the appearance of every historic building. Character-defining elements include the overall shape of the building, its materials, craftsmanship, decorative details, interior spaces and features, as well as the various aspects of its site and environment.[9]

The following is a preliminary list of the Sports Arena's character-defining features:

- setting and location
- elliptical transverse steel truss roof
- memorial fountain and plaque
- main entrance
- ticket offices
- signage
- terrazzo flooring
- lighting
- hallways
- restrooms
- locker rooms/dressing rooms
- plaques
- concession areas
- escalators
- seating
- catwalk
- camera platforms
- press areas
- scoreboard

[9] Lee H. Nelson, FAIA, *Preservation Brief 17: Architectural Character: Identifying the Visual Aspects of Historic Buildings as an Aid to Identifying Their Character* (Washington, D.C.: U.S. Department of the Interior, National Park Service, 1998), online version available on the National Park Service website at: http://www.nps.gov/hps/tps/briefs/brief17.htm.

Alterations to Character-Defining Features

The Sports Arena has been altered, primarily on the interior. In the early 1980s, the Clippers moved to Los Angeles and the Sports Arena and required several upgrades to the building, including the locker rooms and the creation of the Clipper Club. The building was also damaged in the 1994 Northridge earthquake and required seismic retrofitting, which was accomplished in 2002. Other changes include the replacement of original signage and the original terrazzo floor. On the outside of the building, the most significant change occurred when the main entrance was moved from the east side to the south side of the parking lot. The move also introduced the only addition to the building, the ticket office. The other physical exterior change occurred when the original tile that covered the roof and gave it a blue tint was replaced with a different material that has a green tint. These alterations and modifications are discussed further below. All photographs were taken by Jessica B. Feldman on January 25, 2006.

Exterior

Roof

The original roof material, which was a blue tile specifically chosen for this structure, was replaced during the 2002 seismic retrofitting with a green material. Currently, the roof consists of large vertical panels with standing seam between them. The new color and material were chosen to match the roof of the Swim Stadium and other structures on the Exposition Park campus. Additionally, the older material was in poor condition and the type of tile could not be replicated, in part due to cost.

Figure 1: Close up of new roof material

Main entrance

As designed, the main entrance was located on the east side, facing Figueroa Street. This entrance was situated to take advantage of pedestrians and vehicles accessing the site from the boulevard. From Figueroa, patrons passed the memorial fountain (described below) and by parallel lines of palm trees and reached the 20 doors by passing over the forecourt on a 65-foot-wide pedestrian bridge.

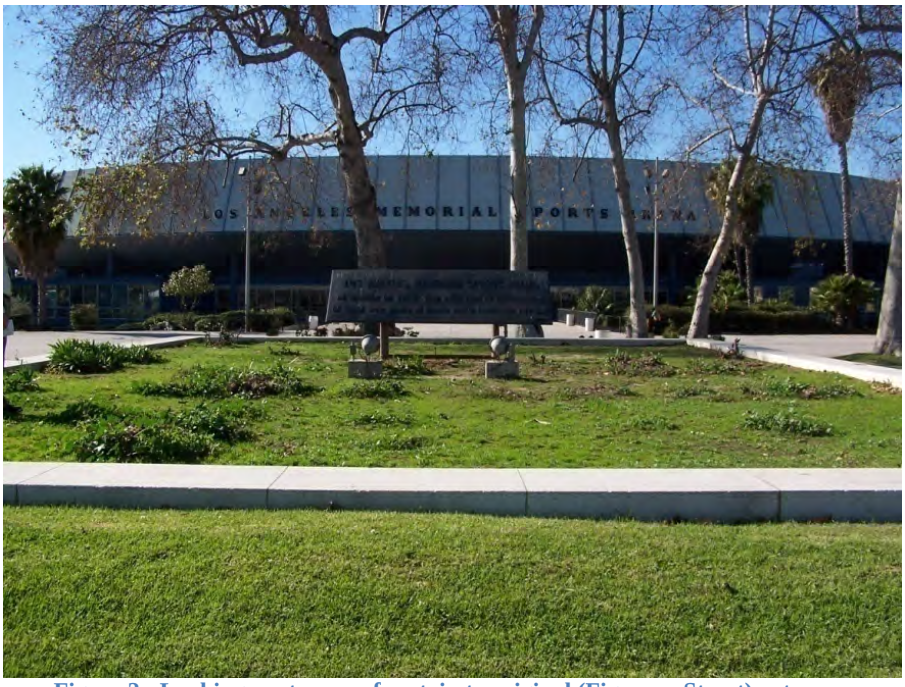

Figure 2: Looking west across fountain to original (Figueroa Street) entrance

Fountain

The fountain measures approximately 8' x 8', and is surrounded by a low, poured concrete wall. At the west side of the fountain is the original commemorative inscription, which measures 4' by 5', is constructed of bronze and is positioned on four solid concrete tubes (this last item being a more modern addition). The plaque was originally set in the grass on the front, or east side, of the fountain. The fountain appears to have been out of use since the 1970s.

The raised inscription reads:

LOS ANGELES MEMORIAL SPORTS ARENA
IN MEMORY OF THOSE WHO DIED AND IN RECOGNITION
OF THOSE WHO SERVED IN WORLD WAR II, KOREA AND VIETNAM

Ticket Office(s)

Original ticket offices were located on the east and west facades of the building. The current, main ticket office is located just to the left of the south entrance.

Figure 3: Box office

Interior

Dressing Rooms/Locker Rooms

There were originally four dressing rooms located on the northwest corner of the Arena Level. While the location of the dressing rooms/locker rooms has remained the same, two additional locker rooms were added. There were actually at least two periods of remodeling: 1) when the Clippers moved into the Sports Arena, which required significant changes and upgrades (1984) and 2) when the seismic retrofitting was required and completed in 2002.

Figure 4: Looking north at dressing rooms

Concession areas

All the concession areas have been changed over time; most recently, a few were altered when the seismic retrofitting was completed in 2002. All are in the original location.

Figure 5: Example of concession area

First Aid Office

The First Aid office is currently located on the north side of the east entrance. It was originally located in the Arena Level.

Figure 6: First Aid office (new location)

Restrooms

Arena Level: All four of the restrooms are located in the original locations. Concourse Level: All the restrooms on the Concourse Level have been altered in some manner, either with new sinks, toilets, tile or flooring.

Figure 7: Remodeled women's restroom

Seats

Portable/Floor seats are apparently not the original folding chairs. Concourse seats are believed to be original. Loge: these are believed to be original.

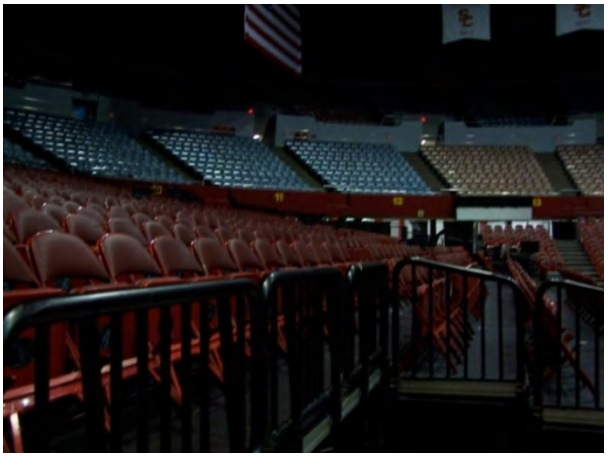

Figure 8: Floor seating, not original

Terrazzo

The original terrazzo floors have been removed and replaced with the current terrazzo in 2002, which is grey/white and red swirls with reflective pieces scattered about near the east entrance.

Figure 9: General view of hall with new tile

Plaques

These two original plaques have been moved to new locations in the venue:

John F. Kennedy - the commemorative plaque honoring President John F. Kennedy was moved from the east entrance to the south concourse across from the lobby, and a portrait of the former President was placed inside an enclosed glass cabinet above it.

Figure 10: John F. Kennedy plaque

Richard M. Nixon – the plaque honoring former President Richard M. Nixon is just the right of the Kennedy plaque. It is located inside the enclosed glass cabinet containing his portrait.

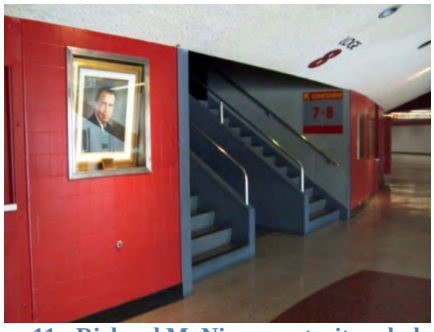

Figure 11: Richard M. Nixon portrait and plaque

Press Boxes

There were Press Boxes at the time the building opened. However, according to David Bentley, the east and west Press Boxes were added for the Clippers in 1984. The Working Press box was also added at a later date.

Camera Platforms

These have been added over time.

Lighting

The lighting for the concourses is located in the same location but elements have been changed.

Catwalk

According to the early drawings, data and conversation with David Bentley, the catwalk(s) are original.

Scoreboard

The scoreboard hanging center is original.

Figure 12: Looking north. January 25, 2006

Escalators

Parts of the escalators have been removed and/or replaced over the course of time due to regular maintenance or required replacement.

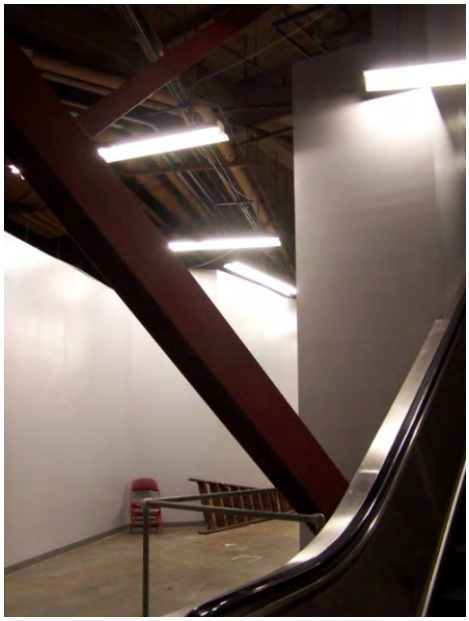

Figure 13: North escalator. Note bracing

Signage

According to David Bentley, all of the signage has been replaced with more modern panels, but these are mounted.

Figure 14: Example of signage and bracing

Determination of Eligibility

The Los Angeles Memorial Sports Arena is now more than 50 years of age and is being evaluated in this report to determine if it meets the criteria of eligibility for listing in the California Register of Historical Resources. At the outset, it was established that several historical contexts would apply. This includes Exposition Park, in which the Sports Arena is located; the efforts to build an arena in Los Angeles; national examples of sports facilities; existing venues in Los Angeles before and after the Sports Arena was constructed; and events that took place at the venue since it opened in 1959. Within this last context, the Sports Arena appears to meet California Register Criterion 1, for its association with important social and cultural events in Los Angeles.

The Sports Arena was the first such venue in Los Angeles that could accommodate up to 18,000 seated patrons under one roof. The Sports Arena was constructed in 1959, after more than two decades of planning by various agencies and individuals, to provide the City of Los Angeles with a world-class facility for a variety of events. Civic boosters hoped this type of structure and the events it would attract would boost the city's reputation, to match the city's growing population and its status as the third largest city in the country.

The idea was put to the voters more than once, but in the end, it took some creative thinking and initiative, as well as an act of the governor to get the funding. The Sports Arena was built to

accommodate basketball and hockey teams, as well as to present organizations such as the Democratic National Convention and Ringling Brothers & Barnum and Bailey Circus an indoor arena for their events which did not exist in Los Angeles at the time.

The period of significance for the Sports Arena has been established as 1959 to 1967. This eight-year span includes the opening of the structure by Vice President Nixon on July 4th of that year, and opening of the Great Western Forum in Inglewood. This end date also coincides with the beginning of the "superstadium" era, when venues such as the Sports Arena were becoming obsolete and outdated.

By the time the Sports Arena was built in 1959, there was one baseball field (Wrigley Field), one auditorium (Philharmonic), two indoor sports arenas (Grand Olympic Auditorium and Pan Pacific Auditorium) and one stadium (Coliseum) located in Los Angeles. By 1967, UCLA was ensconced in their own Pauley Pavilion sports facility to showcase their perennial national championship basketball team, Dodger Stadium was in use for major league baseball, and the Forum had opened for use by the Los Angeles Lakers and the Kings. By 1967, the Sports Arena was no longer the only "game" in town. Therefore, the building needs to retain integrity from that period of significance (1959-1967) if it is to be considered eligible for the California Register under any criterion.

Integrity. *Integrity is the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance. Historical resources eligible for listing in the California Register must meet one of the criteria of significance described in section 4852 (b) and retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. Historical resources that have been rehabilitated or restored may be evaluated for listing.*

Integrity is evaluated with regard to the retention of location, design, setting, materials, workmanship, feeling, and association. It must also be judged with reference to the particular criteria under which a resource is proposed for eligibility. Alterations over time to a resource or historic changes in its use may themselves have historical, cultural, or architectural significance.

The Sports Arena retains integrity of location, setting, feeling and association. Location is the place where the Sports Arena was constructed or the place and where the historic events occurred. The Sports Arena has not been moved, the building is in the same location as when it was originally constructed, and the interior plan is largely unchanged.

As described in National Register Bulletin #15, setting is identified as the physical environment of the Sports Arena.[10] The setting refers not only to the site on which the Sports Arena was constructed, but also its relationship to surrounding features and open space. The immediate setting would include the Coliseum, Christmas Tree Lane, and the parking lot to the south. These are unchanged from the period of significance. Moreover, although there are newer buildings in the north part of Exposition Park these are not significant to the setting discussion. Although the neighborhood surrounding Exposition Park has changed since 1959, it is still both urban and collegiate, and dominated on the east by the broad Figueroa Street and the Harbor Freeway. The one change to the setting is the fountain and memorial plaque, located on the east side of the pedestrian walkway at the east entrance. The fountain has not been functional since the 1970s, and the plaque has been lifted from the ground and placed on several posts just on the west side of the fountain. However, because the fountain is still in situ, the fact that it is no longer functioning does not diminish the integrity of setting.

Association is defined as "the direct link between an important historic event or person and a historic property." Because the Sports Arena is sufficiently intact, in the sense that the building retains its original shape and size and the interior plan is largely changed from the end of the period of significance (1967) as it did during the period of significance, association is still retained.

Excerpted below are the descriptions of "design" according to National Register Bulletin #15:

> Design includes such elements as organization of space, proportion, scale, technology, ornamentation, and materials.

Design also:

> ...Reflects historic functions and technologies as well as aesthetics. It includes such considerations as the structural system; massing; arrangement of spaces; pattern of fenestration; textures and colors of surface materials; type, amount and style of ornamental detailing…

In this case, the exterior design of the Sports Arena does appear to be intact. The most significant change was the addition of the ticket office on the south side, which moved the main entrance from the east to the south. This should be a reversible change. Similarly, the blue tint of the roof is gone, because the blue tiles were removed. This, too, is a reversible alteration. The interior design, primarily the organization of space, proportion and scale are relatively unchanged since the building was opened to the public. Materials have been changed, and much

[10] Patrick W. Andrus and Rebecca H. Shrimpton, *National Register Bulletin 15: How to Apply the National Criteria for Evluaation* (Washington, DC: U.S. Department of the Interior, National Park Service, 1990, rev. ed. 1998), 44-45.

of the original technology and ornamentation is gone. Therefore, the design of the interior is not intact.

Materials are the "physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property."

Externally, there have been several changes, such as the roof material, the moving of the main entrance from the east side to the south side and the addition of the ticket area to facilitate this change. The shape and size of the roof is intact; it is mainly the exterior material, the tiles, which have been replaced. The original blue tiles were apparently chosen specifically at the time. However, that material is no longer available and the contractors chose to replace it with a different matter. The color has changed from blue to green, which matches surrounding buildings and provides some continuity. From the outside, the integrity of design has been diminished.

Internally, there have been various changes over time, including the terrazzo floors, the concession stands, the bathrooms, the signage and the introduction of seismic braces elements. Original historic material remains, such as the original seats and the organization of space at the concourse level. Loss of historic fabric, part of the original design, affects the integrity of design.

Workmanship is defined as "the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory." This usually refers to craftsmanship, unique or artisan details, methods of construction and/or building techniques. Two construction items have been identified as important aspects of workmanship: the longest single truss ever erected at the time and the blue tile roof. The truss remains, but it is not the longest ever erected anymore, and the blue tiles have been removed and replaced with a different type and color of roof material.

Furthermore, the Sports Arena does not exhibit any of Welton Becket's innovative techniques that were used in earlier designs, such as overseeing every detail of the design ("total design"), or techniques used in the General Petroleum Building/Garage and the Prudential Building. The Sports Arena interior followed the design of most arenas of the period, although it may have been one of the earlier ones that did not have obscured seating (due to support posts). Based on this information, it does not appear that there is overriding importance in the workmanship of the Sports Arena.

Therefore, the Sports Arena appears to retain integrity of setting, location and association, but lacks integrity of design, materials and workmanship.

Criteria for evaluating the significance of historical resources.[11]

To be eligible for the California Register of Historical Resources, an historical resource must be significant at the local, state or national level under one or more of the following four criteria:

1) It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;

The Sports Arena is a multi-purpose facility, despite its official name. However, it was the idea that Los Angeles needed professional sports teams that motivated civic leaders who saw the need for an enclosed sports structure as a way to lure professional sports teams to the area. These promoters saw the lack of professional sports in Los Angeles as a significant cultural inequality with cities of equal or even lesser population. There were several sports facilities in use from the time planning began until the arena was opened to the public, but none quite like the Sports Arena.

Local boosters recognized there was a gap between the enclosed Grand Olympic Auditorium downtown and the Pan Pacific Auditorium in the Fairfax area, which sat only 6,000 people, and the open-air Coliseum and Rose Bowl, which sat up to 90,000, located near downtown Los Angeles and in Pasadena, respectively. There was a recognized need by the civic leaders for a modern, enclosed facility that sat around 15,000-20,000 and would allow the city to compete with other cities for conventions, rallies, sports teams and exhibits.

The Sports Arena was to be modern, air-conditioned, and have the most up-to-date amenities; it was a venue that would attract audiences as well as organizations and the press (especially television media). The design would take into account the need for ample space for the media and would be multi-functional. At the time, there were no other facilities that could meet those requirements. It required many years and significant efforts to find a suitable location and creative ways to obtain the funding for construction.

Numerous events occurred at the Sports Arena that would be considered important to the history of both Los Angeles and Southern California, as well as to local, state and national politics and civil rights issues. In 1960, the Democratic National Convention nominated John F. Kennedy for the Democratic Party's candidate for President at the Sports Arena. The 1961 Freedom Rally, sponsored by the Western Christian Leadership Conference, featured Dr. Martin Luther King, Jr. as their primary speaker. At the time, it was believed to be the largest gathering of African Americans in Southern California. The Sports Arena was where Wilt "The Stilt" Chamberlain

[11] California Register of Historical Resources criteria: PRC Section 5024.1(c).

played his first professional basketball game, with the Philadelphia Warriors against the Los Angeles Lakers (although Chamberlain would later join the Lakers).

It was where the first professional hockey team in Los Angeles, the Kings, played until the Great Western Forum was finished and where semi-professional hockey was played from 1959 to 1967 (the Blades); it was where semi-professional and professional basketball teams such as the Jets, the Stars, the Clippers and the Lakers played; college basketball teams from UCLA and USC played here; the NCAA held their tournament here; as well as boxing matches. Other events that were held at the Sports Arena included rodeos, home shows, auto shows, circuses, water follies and roller derbies. Also, anti-communism classes, conventions, rallies, conventions and fund-raisers were hosted at the Sports Arena.

Although the period of significance has been established as 1959 to 1967, the Sports Arena has continued to provide space and accommodation for local professional sports teams, college sports and tournaments, as well as fulfilling the function to house a variety of other exhibitions, shows and gatherings. Furthermore, although the building lacks integrity of materials and workmanship, it does retain enough integrity of exterior design to convey the original design.

Therefore, the Sports Arena appears eligible for the California Register of Historical Resources under Criterion 1 for its association with events that have made a significant contribution to Los Angeles history.

2) It is associated with the lives of persons important to local, California, or national history;

The Sports Arena has been visited or employed by or otherwise associated with many important persons in architecture, politics, sports and entertainment. In order for the Sports Arena to be eligible under this criterion, it is generally accepted that a resource illustrates a person's most important achievements, and had a close personal association. This usually reflects the time period during which the person achieves significance or during their productive life. The Sports Arena does not appear to meet this criterion because the appearances there by important persons such as John F. Kennedy and Martin Luther King, Jr. were of short duration.

3) It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values;

Welton Becket, a well-respected and well-known architect in the Los Angeles area, designed the Sports Arena. Although it was not the only indoor sports facility (Pan Pacific Auditorium and Pauley Pavilion), or structure used for musical events (the Music Center in downtown Los

Angeles) Becket and his company designed, it was the recipient of a Southern California Chapter, American Institute of Architects Grand Prix award in 1963. Along with 30 other buildings in the Los Angeles region, the Sports Arena was singled out as a "prime example of post-World War II architecture" citation?; three other Becket designs also received this honor that year.

The Sports Arena was constructed in such a manner that there were no internal poles or posts that could obstruct view of the activities on the floor. It kept the cost of the building down by limiting the amount of steel needed for construction. At the time, this included the longest single truss ever erected on an arena. The Sports Arena also embodies the characteristics of an arena, as described above. However, there is no evidence that any of the innovative techniques that epitomized Becket's designs, particularly those constructed in the 1940s and 1950s, were employed in the design of the Sports Arena. The exterior design of the Sports Arena is intact or changes are reversible, but the materials are not intact. It does not represent the work of Welton Becket and his architecture firm, and it does not possess high artistic value. Therefore, the Sports Arena does not appear to meet this criterion.

4) It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

There is no reason to believe that the Sports Arena has yielded, or will yield information important to the prehistory or history of the local area, California, or the nation.

Conclusion

In conclusion, the Los Angeles Memorial Sports Arena appears eligible for the California Register of Historical Resources under Criterion 1 for its association with events that have made a significant contribution to Los Angeles history. It does not appear to meet Criteria 2, 3, or 4.

*** P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)
The Sports Arena is an ellipse-shaped, multi-use facility, on a north-south axis. It is located in Exposition Park, at the northwest corner of South Figueroa Street and Martin Luther King, Jr. Boulevard (formerly Santa Barbara Avenue). It is the sister facility of the Los Angeles Memorial Coliseum, which is located just to the northwest across an access road. The Sports Arena's roof is an elliptical transverse steel truss roof, spanning 315' x 430'. The exterior material of the lower walls is comprised of concrete block construction. There are no exterior windows. According to articles/ads published at the time of construction, the interior length was 437 feet and the interior width was 317 feet (this assumes the statistic is referring to arena floor level without seating). It is 262 feet in length between permanent seat lines and 144 feet in width between permanent seat lines. Length of floor between columns is 278 feet and width between columns is 160 feet. Floor to roof height managed a 75 foot clearance to the first steel girder. Total arena floor space topped out at 130,000 square feet, with concourse level floor space totaling over 101,000 square feet. The main entrance, originally located on the east side of the building facing South Figueora Street, is now located on the south side of the site facing the parking lot. In conjunction with that move, a new ticket office was added to the building in the 1970s.

* Resource Name or #: Los Angeles Memorial Sports Arena

B1. Historic Name: Los Angeles Memorial Sports Arena

B2. Common Name Same

B3. Original Use: Commercial B4. Present Use: Commercial

* B5. Architectural Style: Modern

* B6. Construction History: (Construction date, alterations, and date of alterations.)

The Sports Arena has been altered, primarily on the interior. The building was also damaged in the 1994 Northridge earthquake and required seismic retrofitting, which was accomplished in 2002. On the exterior, the most significant change occurred when the main entrance was moved from the east side to the south side at the parking lot. The move also introduced the only addition to the building, the ticket office.

* B7. Moved? ☐ No ☐ Yes ☑ Unknown Date: Original Location:

* B10. Significance: Theme Sports and entertainment venues Area Los Angeles

Period of Significance 1959-1967 Property Type Arena Applicable Criteria CR1

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The Los Angeles Memorial Sports Arena appears eligible for the California Register of Historical Resources under Criterion 1 for its association with events that have made a significant contribution to Los Angeles history. Designed by architect Welton Becket and Associates in 1959, the Sports Arena became the first modern indoor sports arena in the city that could accommodate up to 18,000 seated patrons under one roof. Numerous events occurred at the Sports Arena that would be considered important to the history of Los Angeles, as well as to California and the nation. In 1960, the Democratic National Convention nominated John F. Kennedy as the Democratic Party's candidate for president at the Sports Arena. The 1961 Freedom Rally, sponsored by the Western Christian Leadership Conference, featured Dr. Martin Luther King, Jr. as their primary speaker. The Sports Arena was where the first professional hockey team in Los Angeles, the Kings, played until the Great Western Forum was finished and where semi-professional hockey was played from 1959 to 1967 (the Blades); it was where semi-professional and professional basketball teams such as the Jets, the Stars, the Clippers and Lakers played; college basketball teams UCLA and USC once played here; the NCAA held their tournament here. Other events that were held at the Sports Arena include boxing matches, rodeos, home shows, auto shows, circuses, water follies and roller derbies. Although the period of significance has been established as 1959 to 1967, the year the "superstadium" era began, rendering older venues like the Sports Arena obselete, the building continued to provide space and accommodation for local professional sports teams, college sports and tournaments, as well as fulfill its function to house a variety of other exhibitions, shows and gatherings. Furthermore, although the building lacks integrity of materials and workmanship, it does retain enough integrity of exterior design to convey the original design.

APPENDIX F:
Traffic Memorandum

FEHR & PEERS
TRANSPORTATION CONSULTANTS

DRAFT TECHNICAL MEMORANDUM

Date: October 25, 2010

To: Wes Pringle, Los Angeles Department of Transportation

From: Tom Gaul and Anjum Bawa

Subject: ***Proposed Redevelopment of the Los Angeles Memorial Sports Arena Traffic Assessment***

Ref: SM10-2413

This memorandum summarizes the results of a traffic assessment conducted by Fehr & Peers in support of the environmental processing of the proposed redevelopment of the Los Angeles Memorial Sports Arena. The traffic assessment involved a review of existing schedule and attendance level of events held at the Sports Arena and assessment of the potential traffic related impacts resulting from the proposed redevelopment of the Sports Arena.

PROJECT DESCRIPTION

The proposed project would involve the demolition and removal of the existing Sports Arena and the redevelopment of the project site. The Los Angeles Coliseum Commission is considering two different and mutually exclusive future uses for the project site:

- **Option 1: Multiple Use Space –** Under this option, all existing improvements on the project site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. The multiple use space would be improved to be greenscape while also providing additional surface parking for Coliseum events. It would have the necessary infrastructure to facilitate a number of public uses with different levels of attendance with electrical, plumbing and food service facilities. It would serve as a public venue for civic gatherings, capable of hosting a variety of celebratory and entertainment events such as parades, rallies, open-air meetings, neighborhood festivals, and the current book of events held at the Los Angeles Memorial Coliseum. Combined with the Coliseum, the campus supervised by the Coliseum Commission would provide the public with event facilities appropriate for crowds from 500 to 93,000 people and all sizes between.

- **Option 2: Multiple Use Small Capacity Event and Soccer Stadium –** Under this option, the existing Sports Arena would be removed and the site would be redeveloped with a multiple use small capacity event and soccer stadium. The outdoor event/soccer stadium (including associated support facilities) would be oriented on a north-south axis and would have a permanent seating capacity of approximately 22,000. The stadium would host soccer games and open-air entertainment events such as concerts and civic gatherings. The stadium would also serve as a practice facility and staging area on non-event days.

Under both options, the Coliseum Commission would continue to lease the project site from the state and be responsible for its operations.

FEHR & PEERS
TRANSPORTATION CONSULTANTS

GEOGRAPHIC SETTING

The existing Sports Arena is located at 3939 South Figueroa Street in Exposition Park in the City of Los Angeles, California and occupies an approximately 15-acre parcel of land within the boundaries of the Exposition Parking Master Plan Area. Exposition Park is approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street to the east, Martin Luther King, Jr. Boulevard to the south, and Vermont Avenue to the west. The Sports Arena is located generally in the southeastern portion of Exposition Park. Figure 1 shows the general location of Exposition Park with respect to downtown Los Angeles and the Sports Arena's orientation in Exposition Park. As can be seen, the project site is bounded by South Coliseum Drive to the west and north, Figueroa Street to the east, and Parking Lot 6 to the south.

EXISTING OPERATIONS

The Los Angeles Memorial Sports Arena is owned by the Los Angeles Memorial Coliseum Commission, which leases the parcels occupied by the Sports Arena and the Coliseum from the State. The existing Sports Arena is an indoor facility with 16,740 seats and has hosted a variety of sporting events including boxing, professional and college basketball, and hockey. It has also hosted a number of civic events including the 1960 Democratic Convention as well as numerous rock concerts, track meets, rodeos, home shows, auto shows, roller derbies, rallies, fundraisers, Latin dances, etc.

EXISTING SCHEDULE OF EVENTS AND ATTENDANCE

An analysis of existing schedule of events and attendance levels was conducted to develop an understanding of existing operations of the Sports Arena. Actual schedule and attendance data from the past five years (Years 2005 through 2009) for both the Sports Arena and the Coliseum were reviewed and summarized in Table 1. As shown in the table, in the past five years, the Sports Arena held, on average, 69 events a year. Of the 69 events, 60 had an attendance of less than 10,000 people, six events had an attendance between 10,000 to 20,000 people, and three events had an attendance of more than 20,000 people.

The data was analyzed to determine the number of events and their respective average attendance on a weekday vs. weekend. Table 2 shows number of events held at the Sports Arena on a weekday or weekend during the period between Years 2005 and 2009. As shown, on average, 29 events were held per year on a weekday vs. 40 events per year on a weekend. The maximum attendance size of events on a weekday ranged from 14,588 people in 2006 to 52,234 people in Year 2005. The maximum attendance size for a weekend event ranged from 17,351 people in Year 2005 to 55,132 people in Year 2009.

PROPOSED PROJECT POTENTIAL SCHEDULE OF EVENTS AND ATTENDANCE

The proposed event/soccer stadium under Option 2 would provide a maximum of 22,000 seats. The soccer stadium could become home to a Major League Soccer (MLS) team. Two MLS teams currently utilize the Home Depot Center, a multi-sport facility located on the campus of California State University, Dominguez Hills in the city of Carson, California. Thus, there is high demand for another MLS stadium in the Los Angeles region.

Based on information provided by the Coliseum Commission, in addition to hosting MLS games, the proposed event/soccer stadium would continue to host events of attendance levels similar to the ones held at the existing Sports Arena facility except that the events would be held in the open-air facility instead.

Year 2010 schedule and attendance data of local MLS teams were analyzed to determine the traffic impact of additional soccer events on neighborhood streets and roadways. Based on information obtained from www.mls-daily.com, 10 of 15 home games are typically scheduled to occur on Saturdays, three games on Sundays, and two games on Fridays. For the first seven games of the year (March through July 2010) a local MLS soccer team had an average attendance of 14,450 people per game, ranging from 12,597 to 18,653 (opening home game).

Based on this information, the proposed event/soccer stadium could host approximately two MLS games during a weekday and 13 MLS games on weekends in addition to non-soccer events similar in attendance size to historic operations of the Sports Arena. Taking a conservative approach, even if all the MLS games on both weekdays and weekends were attended by 22,000 people (proposed maximum seating capacity of the soccer stadium), the additional events would not exceed the size of events the Sports Arena has historically been hosting at its existing facility.

TRAFFIC ASSESSMENT

Based on the above assessment, the new event/soccer stadium facility replacing the Sports Arena is not expected to generate significant new traffic impacts, for the following reasons:

- With the addition of MLS soccer games, the new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility.

- Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new Multiple Use Space (Option1) or MLS stadium facility (Option 2) are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena.

- The Coliseum Commission will schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.

The anticipated opening of Phase I of the Exposition Light Rail Transit (LRT) Line (currently under construction) would provide event attendees with access to an ever-expanding regional rail and bus transit system, providing service to downtown Los Angeles and Culver City with direct connections to the Blue Line and Red Lines, which in turn have connections to Union Station, the Gold Line and the Green Line. It is anticipated that the Exposition LRT would result in reduced auto usage by the attendees and employees at Exposition Park, providing them with an alternative mode of travel to events and reducing traffic for both ongoing and new events.

The Los Angeles Memorial Coliseum Commission (LAMCC), as Lead Agency under the California Environmental Quality Act (CEQA), is providing this courtesy notice that it has completed a Final Environmental Impact Report (EIR) for the Los Angeles Memorial Sports Arena Redevelopment Project ("Proposed Project"). This information is being provided for information purposes only and no action or response is required.

As required by CEQA, the Draft EIR for the Proposed Project was prepared and circulated during a 45-day public review period that began on November 15, 2010 and ended on December 30, 2010. Pursuant to Section 15132 of the State CEQA Guidelines, a Final EIR has been prepared and includes a list of persons, organizations, and public agencies that commented on the Draft EIR; all comments and recommendations received on the Draft EIR; written responses to each comment provided on the Draft EIR; and corrections and additions, as appropriate, to the Draft EIR.

Copies of the Final EIR, as well as the Draft EIR, Draft EIR Technical Appendices are available for the public to view via the Lead Agency's official website at http://www.lacoliseumlive.com., and at the LAMCC's Administrative Offices during normal business hours at the Sports Arena ticket office at 3939 S. Figueroa Street, Los Angeles CA 90037.

The LAMCC Board of Commissioners will conduct a public hearing regarding the Proposed Project, which may result in certification of the EIR. The Board meeting will be open to the public at the following time and location:

Place: Los Angeles Memorial Coliseum Board Room
(3939 S. Figueroa Street, South End of the Coliseum Peristyle)
Date: Wednesday February 2, 2010
Time: 2:30 p.m.

I. INTRODUCTION/SUMMARY

INTRODUCTION

Sections 15089 and 15090 of the CEQA Guidelines require that prior to approving a project, a Final Environmental Impact Report (Final EIR) must be prepared for the review and consideration of the lead agency. Section 15132 of the CEQA Guidelines provides that a Final EIR shall consist of:

(a) The Draft EIR or a revision of the Draft.

(b) Comments and recommendations received on the Draft EIR either verbatim or in summary.

(c) A list of persons, organizations, and public agencies commenting on the Draft EIR.

(d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process.

(e) Any other information added by the lead agency.

The lead agency must provide each agency that commented on the Draft EIR with a copy of the lead agency's proposed response at least ten days before certifying the Final EIR.

ORGANIZATION OF THE FINAL EIR

This document, together with the Draft EIR for the Project and the Technical Appendices to the Draft EIR (dated November 15, 2010), constitute the "Final EIR" for the Project.

The Final EIR is organized in the following sections:

I. Introduction/Summary: This section is intended to provide a brief overview of the CEQA requirements and EIR history for the Project. This section also provides a summary of the Proposed Project, areas of concern, issues to be resolved, alternatives to the Proposed Project, and environmental impacts and mitigation measures.

II. Corrections and Additions: This section provides a complete overview of the corrections and additions that have been incorporated into the Draft EIR in response to the comments submitted during the public review period.

III. Responses to Comments on the Draft EIR: This section includes detailed responses to the comment letters submitted to the City in response to the Draft EIR. Copies of the comments letters are incorporated as Appendix G to the EIR.

IV. Mitigation Monitoring Program: This section includes a list of the required mitigation measures and includes detailed information with respect to the policies and procedures for implementation of the

mitigation measures. This Mitigation Monitoring Program (MMP) identifies the monitoring phase, the enforcement phase and the applicable department or agency that is responsible for ensuring each recommended mitigation measure is implemented.

CEQA PROCESS

The California Environmental Quality Act (CEQA) (Public Resources Code (P.R.C.) Division 13, § 21000 et seq.) was enacted in 1970 with the main objective of providing public disclosure to inform decision makers and the public of the significant environmental effects of proposed activities and to require agencies to avoid or reduce the environmental effects by implementing feasible alternatives or mitigation measures.

CEQA applies to all discretionary activities proposed to be carried out or approved by California public agencies, including state, regional, county, and local agencies. The proposed Sports Arena Redevelopment Project requires discretionary approval from the Los Angeles Memorial Coliseum Commission (LAMCC) and, therefore, is subject to the environmental review requirements established under CEQA. For purposes of complying with CEQA, LAMCC is identified as the Lead Agency for the Proposed Project.

A Draft Environmental Impact Report (EIR) was prepared in accordance with CEQA, the State CEQA Guidelines (California Code of Regulations (C.C.R.), Title 14, Division 6, Chapter 3, §§ 15000-15387, as amended). The State CEQA Guidelines § 15121(a) provides the following description of an EIR:

> *An EIR is an informational document which will inform public agency decision-makers and the public generally of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information which may be presented to the agency.*

Furthermore, the Draft EIR was prepared in accordance with State CEQA Guidelines § 15151 which defines the standards for EIR adequacy:

> *An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.*

This EIR is a Project-level EIR in accordance with State CEQA Guidelines §§ 15161-15168.

Notice of Preparation and EIR Scope

The Notice of Preparation was circulated to local and regional government agencies and the general public for a 30-day public review period starting on April 19, 2010 and ending on May 19, 2010. The NOP was subsequently re-circulated on May 27, 2010 to announce a public scoping meeting would be held to solicit comments from the general public and responsible agencies with regard to the scope of the EIR. The re-circulated NOP comment period began on May 27, 2010 and ended on June 30, 2010.

The public scoping meeting was held on June 16, 2001 at 9:30 a.m. at the Los Angeles Memorial Coliseum Commission's Board Room at 3939 S. Figueroa Street, in Los Angeles CA. Appendix A to the Draft EIR contains copies of both NOPs, the scoping meeting attendance sign-in sheet, and all written comments submitted to the lead agency in response to the NOPs. Based on a preliminary assessment of the Proposed Project and comments received in response to the NOP and at the public scoping meeting, the Lead Agency determined that the following environmental issue areas should be included within the scope of the EIR:

- Aesthetics (Views, Light and Glare)
- Air Quality
- Global Climate Change
- Hydrology and Water Quality
- Land Use and Planning
- Noise/Vibration
- Public Utilities (Water, Sewer, Energy Conservation, Solid Waste)
- Public Services (Police and Fire Protection)
- Transportation/Traffic/Parking
- Cumulative Impacts

Public Participation

To provide full public disclosure of potential environmental impacts that may occur as a result of a proposed project, CEQA requires the Draft EIR to be circulated during the public review period to all responsible agencies, trustee agencies, and the general public. Consistent with CEQA, the Draft EIR was circulated for a 45-day review period (P.R.C. § 21091 (a)). The Draft EIR public review period began on November 16, 2010 and ended on December 30, 2010. During this period, the Draft EIR was made available to the public via the LAMCC's official website at: http://www.lacoliseumlive.com. Copies of the Draft EIR and all documents referenced in the Draft EIR were also available for public review at the LAMMC's Administrative Offices during normal business hours.

In response to the Draft EIR, a total of eight comment letters were received by the lead agency. The comment letters and responses to the comment letters are contained in Section III, Responses to Comments to this Final EIR.

PROPOSED PROJECT SUMMARY

Project Location

The Los Angeles Memorial Sports Arena ("Sports Arena") occupies an approximate 15-acre parcel of land within the boundaries of the Exposition Park Master Plan Area. Exposition Park is located approximately two miles southwest of the downtown Los Angeles area and encompasses a total of 160 acres. Exposition Park is bounded by Exposition Boulevard to the north, Figueroa Street on the east, Martin Luther King, Jr. Boulevard on the south, and Vermont Avenue on the west. Exposition Park is the largest park in the Central Los Angeles area of the City of Los Angeles. The Sports Arena is generally situated in the southeastern portion of Exposition Park.

Project Characteristics

The Proposed Project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. In an effort to be responsive to changing community needs and market conditions, the LAMCC is considering two different and mutually exclusive future uses for the Project Site: Option 1, which consists of a Multiple Use Space for civic and special event gatherings; or Option 2: a Major League Soccer Stadium with approximately 22,000 seats. Both of these development options are analyzed in an equal level of detail in this EIR to allow flexibility for the decision–makers to select either one of the two projects.

Under Option 1, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed and the site would be redeveloped with an open-air multiple use space. This multiple use space would be improved to provide additional surface parking for Coliseum events and would serve as a public venue for civic gatherings and announcements, capable of hosting a variety of celebratory and entertainment civic events such as parades, rallies, public gatherings, festivals and neighborhood carnivals similar to the current outdoor event usage at the Sports Arena. Under this proposal, the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operation, and would partner with the City to produce civic events.

The Multiple Use Space Option would be primarily developed as an open-air amphitheater. However, as a Multiple Use Space, the intent of this Option is to provide flexibility in event programming to stimulate the local economy and promote civic activity. The Multiple Use Space could support stand-alone events confined to the 15-acre project site or, alternatively, provide flexible uses for joint events held at the Coliseum. For events held at the Coliseum, the Multiple Use Space could serve as an extension of the park-like grounds within Exposition Park, be utilized as an overflow surface parking lot, or serve as an

extension to the event activity and staging areas.

Under Option 2, the existing Sports Arena would be removed and the site would be redeveloped with a Major League Soccer (MLS) Stadium, with the goal of creating a modern, world-class sports complex on the Project Site in accord with site's history. The VIP parking lot would remain to the west of the proposed stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on a north-south axis and would have a permanent seating capacity of approximately 22,000. The state-of-the art venue would host MLS games, USC soccer games, open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. The stadium would also serve as a practice facility for local soccer teams. Under this Option the Coliseum Commission would continue to lease the Project Site from the State and be responsible for its operation, and would partner with the League, private promoters, the City, County or State to produce soccer games and civic events. It is expected to be a high-profile attraction within the City of Los Angeles, with nationally televised events and visitation from world-renowned athletes and coaches.

ALTERNATIVES

Section 15126.6(c) of the State CEQA Guidelines requires that the Draft EIR include a reasonable range of project alternatives that could feasibly accomplish most of the basics objectives of the Proposed Project and could avoid or lessen one or more of the significant effects of the Proposed Project. The following Alternatives are analyzed in the Draft EIR:

- **No Project Alternative:** The No Project Alternative would be the result of not approving the Proposed Project. Under this scenario, the Los Angeles Memorial Sports Arena would continue operating as it currently is without any physical improvements or renovation projects.

- **Historic Retention Alternative.** This Alternative would consist of renovating the Los Angeles Sports Arena in accordance with the Secretary of Interior's Standards for the Rehabilitation and Renovation of Historic Structures. The existing structure would not be demolished and renovation efforts would be aimed at maintenance projects and providing modern amenities to make the facility an attractive and desirable location for sporting, entertainment and civic events.

Section VI, Alternatives to the Proposed Project, of the Draft EIR includes a detailed description of each of the above-listed Alternatives, including the logic in choosing the Alternative and an analysis of the potential environmental impacts of each Alternative as compared to the impacts of the Proposed Project.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Table I-1, beginning on the following page, summarizes the various environmental impacts associated with the construction and operation of the Proposed Project. Mitigation measures are proposed for significant environmental impacts, and the level of impact significance after mitigation is also identified.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Aesthetics		
Views Under Option 1, Multiple Use Space, all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be demolished and the site would be redeveloped with an open-air greenspace with an amphitheater. The proposed Multiple Use Space Option would contrast sharply with the existing aesthetic and visual character of the existing Project Site, as the existing Sports Arena would be replaced with an open air landscaped area with no structures. In this regard aesthetic impacts would be less than significant. Under Option 2, MLS Stadium, the existing Sports Arena would be removed and the site would be redeveloped with a MLS Stadium. The outdoor soccer stadium (including associated support facilities) would be oriented on a north-south axis and would occupy the existing footprint of the Sports Arena building. Architecturally, the stadium would resemble other comparable venues in the nation, such as the Home Depot Center in the City of Carson, home to both the Los Angeles Galaxy and Chivas USA of Major League Soccer. It would feature dome-style geometry typical of stadium architecture, partially topped by a curved canvas tensile canopy on its west and east sides. The lighting to be used for the soccer field would consist of highly focused and directional lighting arrays. Much of the lighting (and all of the high-intensity field lighting) would be directed downward into the bowl-shaped stadium. Similar to existing conditions, low level security lighting would also be installed throughout the remainder of the site to mark walkways, parking areas, restroom facilities, and entrances. Signage A detailed signage program has not been developed for either Option at this time. However, in the absence of any specific programmatic goals for signage it is assumed that the project would be developed in a manner that is consistent with and adheres to all of the applicable codes of the LAMC,	MM A-1 Outdoor lighting shall be designed and installed with shielding, such that the light source cannot be seen from adjacent residential properties or the public right-of-way. MM A-2 The exterior of the proposed structure shall be constructed of materials such as, but not limited to, high-performance and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize glare and reflected heat.	Impacts related to aesthetics would be less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
the design guidelines of the South Los Angeles Community Plan as it pertains to signage, and the overriding rules and regulations set forth in the Coliseum Signage Overlay District. As such, aesthetic impacts related to signage would be less than significant. Light and Glare Environmental impacts to the adjacent residential properties to the south of Martin Luther King, Jr. may result due to excessive illumination on the project site. The Multiple Use Space will include permanent lighting fixtures to illuminate landscaped areas, way-finding and directional signage, and pedestrian pathways for safety and security purposes. The lighting plan would consist of low-level directional lighting fixtures to minimize light trespass to off-site properties. The Multiple Use Space Option would also employ portable event lighting that would be brought in and set up on an event-by-event basis to illuminate the amphitheater stage and surrounding areas. Due to the fact that the amphitheater stage will be set below grade, and the stage lighting will be directed downward towards the stage, event lighting it is not anticipated to result in any light trespass to off site properties. Mitigation Measure A-1 is recommended to ensure lighting impacts from both permanent and portable lighting fixtures are minimized to the maximum extent possible. Aesthetic impacts associated with light and glare would be less than significant. Under the MLS Stadium Option, exterior stadium lights are proposed which could result in light spillage onto adjacent properties and land uses. Mitigation Measure A-1 is recommended to ensure lighting impacts from exterior and field lighting fixtures are minimized to the maximum extent possible. Aesthetic impacts associated with light and glare would be less than significant. Under both Options the potential exists for excessive and disruptive glare impacts to result from architectural materials yet to be selected. As such mitigation measure A-2 is recommended to reduce this impact to an acceptable level.		

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Air Quality		
Construction Impacts Construction activities would generate pollutant emissions from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction, including the application of architectural coatings; paving and asphalting; construction workers traveling to and from the project site; delivery and hauling of construction supplies and debris to and from the project site; and, the fuel combustion generated by on-site construction equipment. On-site emissions generated by the Proposed Project during the different phases of construction would not exceed the established SCAQMD localized thresholds for NOx (in the form of NO2), CO, PM_{10}, and $PM_{2.5}$ at a receptor distance of 82 feet. Thus, the on-site construction emissions would also not exceed the SCAQMD localized thresholds at receptor distances beyond 82 feet (i.e., 164, 328, 656, and 1,640 feet). Therefore, the localized air quality impacts resulting from construction emissions associated with the Proposed Project would be less than significant. Thus, impacts on sensitive receptors resulting from construction-related emissions would also be considered less than significant. Operational Impacts Operational emissions generated by both stationary and mobile sources would result from normal day-to-day activities on the project site after occupation. Stationary area source emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile emissions would be generated by the motor vehicles traveling to and from the project site. Stationary source emissions would be reduced compared to existing conditions, impacts would be considered less than significant.	MM B-1 The Project Applicant shall comply with SCAQMD Rule 403—Fugitive Dust. Examples of the types of dust control measures currently required and recommended include, but are not limited to, the following: • Water active grading/excavation sites and unpaved surfaces at least three times daily; • Sweep daily (with water sweepers) all paved construction parking areas and staging areas; • Provide daily clean-up of mud and dirt carried onto paved streets from the site; • Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site; • Suspend excavation and grading activity when winds (instantaneous gusts) exceed 15 miles per hour over a 30-minute period or more; and • An information sign shall be posted at the entrance to each construction site that identifies the permitted construction hours and provides a telephone number to call and receive information about the construction project or to report complaints regarding excessive fugitive dust generation. Any reasonable complaints shall be rectified within 24 hours of their receipt. MM B-2 The Project Applicant shall use low VOC paints for all interior and exterior surfaces.	Therefore, regional construction-related air quality impacts would be considered significant and unavoidable. Operational impacts would be less than significant without mitigation measures.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
With respect to mobile sources, the Proposed project under either option would not increase the maximum size of the events currently held at the facility. Combined with the Coliseum, the Project Site supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new event/soccer stadium facility are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Accordingly, mobile source emissions would also not be increased as a result of the Proposed Project and operational impacts related to regional and localized emissions would be considered less than significant.	MM C-3 Pursuant to the SCAQMD recommendations, the Project shall implement the following measures to the extent feasible: • Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow; • Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site; • Reroute construction trucks away from congested streets or sensitive receptor areas; • Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM10 generation; • Use coatings and solvents with a VOC content that meet or exceed the requirements of Rule 1113; • Construct/build with materials that do not require painting; • Use pre-painted construction materials; • Use high-pressure-low-volume (HPLV) paint applicators with a minimum transfer efficiency of at least 50% or other application techniques with equivalent or higher transfer efficiency; • Use electricity from power poles rather than temporary diesel or gasoline power generators; • Use 2010 and newer diesel haul trucks (e.g., material delivery trucks, soil import/export, and demolition export); • Require all on-site construction equipment to meet EPA Tier 2 or higher emissions standards according to	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	the following: o Project start to December 31, 2011: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 2 offroad emissions standards. In addition, all construction equipment shall be outfitted with the BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 2 or Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. o January 1, 2012, to December 31, 2014: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 3 offroad emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. o Post-January 1, 2015: All offroad diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. • A copy of each unit's certified tier specification,	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.	
Global Climate Change/Greenhouse Gas Emissions		
Construction emissions represent an episodic, temporary source of GHG emissions. Emissions are generally associated with the operation of construction equipment and the disposal of construction waste. Anticipated GHG emissions were calculated for each year of construction of the proposed project. It is estimated thet 878 metric tons of CO2e would be generated in 2011 and 451 metric tons of CO2e would be generated in 2012, representing approximately 0.000002 percent and 0.000001 percent of the 2008 State-wide level, respectively. This amount is considered to be less than significant as the construction activities would be finite and not persist after construction. Operational GHG emissions generated by both stationary and mobile sources would result from future activities on the Project Site. Stationary area source GHG emissions would be generated by the consumption of natural gas for space and water heating devices, and the operation of landscape maintenance equipment; mobile GHG emissions would be generated by the motor vehicles traveling to and from the project site. With respect to stationary GHG sources, Project Option 1 would result in the development of an open-air, all-grass amphitheater. Project Option 2 would result in the development of an open-air MLS Stadium. Under either Option the Project would result in a substantial reduction of stationary source GHG emissions such as water and space heating, air conditioning, and cooking appliances. Under both options, the Proposed Project would replace an existing venue over 50 years old with a state-of-the art venue that would include numerous sustainability and design features that would result in significantly increased energy efficiencies at the Project Site.	See the water and energy conservation measures identified under Public Utilities, below.	Impacts related to the generation of GHGs would be considered less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Therefore, stationary source GHG emissions would be reduced compared to existing conditions. With respect to mobile sources, the Proposed Project is not expected to generate significant new traffic impacts. The new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility. Accordingly, mobile source GHG emissions would also not be increased as a result of the Proposed Project.		
Historic Resources		
The Los Angeles Memorial Sports Arena was constructed in 1959, after more than two decades of planning by various agencies and individuals, to provide the City of Los Angeles with a world-class facility for a variety of events. The Sports Arena is now more than 50 years of age and, based on an evaluation by ICF Jones & Stokes (July 2010), appears eligible for the California Register of Historical Resources under Criteria 1 (Pub. Res. Code Section 5024.1, Title 14 CCR, Section 44852) for its association with events that have made a significant contribution to Los Angeles history. As such, the Sports Arena has been determined to be a historically significant resource, the demolition of which would result in a significant environmental impact.	MM H-1. Prior to the issuance of a demolition permit, a report documenting the architectural and historical features of the Sports Arena shall be prepared and offered to the Southern California Information Center at California State University, Fullerton, and the City. The report shall include the following: a) A written report according to the Historic American Building Survey (HABS) narrative format, which includes historical and descriptive information; b) Duplicates of historic photographs, if available; c) Duplicates of original drawings, if available; and d) Large format (4-inch by 5-inch negative or larger) black and white 35-millimeter photographs based on HABS guidelines. The photographs shall be keyed to a floor and site plan to show the location of each photograph taken. Views shall include the setting, important site features, all exterior elevations, detailed views of significant exterior architectural features, and interior views of significant spaces and features.	The demolition of the Sports Arena, which has association with events that have made a significant contribution to Los Angeles history, would be considered significant and unavoidable.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Hydrology and Water Quality		
Surface Water Quality During construction, sediment is typically the constituent of greatest potential concern. The greatest risk of soil erosion during the construction phase occurs when site disturbance peaks due to grading activity and removal and re-compaction or replacement of fill areas. Other pollutants that could affect surface-water quality during the Project construction phase include petroleum products (gasoline, diesel, kerosene, oil, and grease), hydrocarbons from asphalt paving, paints and solvents, detergents, fertilizers, and pesticides (including insecticides, fungicides, herbicides, and rodenticides). Discharges of stormwater from construction sites with a disturbed area of one or more acres are required to either obtain individual NPDES permits for stormwater discharges or be covered by the Construction General Permit. Coverage under the Construction General Permit is accomplished by completing and filing a Notice of Intent with the SWRCB. Under the Construction General Permit, the project contractor must ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared prior to grading and implemented during construction. Mitigation Measure E-1 requires the Project Applicant to prepare a SWPPP to the satisfaction of the City of Los Angeles Department of Building and Safety prior to the issuance of building permits. Once the Project has been constructed with either Options 1 or 2, urban runoff from the Project Site would have the potential to include all of the above contaminants. The Project Applicant would be required to prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program for both Options 1 and 2. Post-construction BMPs (e.g., biofiltration swales, flow-through planters, and educational materials) would be used to reduce pollutant loadings in runoff. Preparation and implementation of the SUSMP would ensure that water quality impacts of the Project would be minimized and that the Project would not violate any water quality standards. Therefore, Project impacts related to surface water	MM E-1 The Project Applicant shall ensure that a Stormwater Pollution Prevention Plan (SWPPP) is prepared and implemented during construction. The SWPPP shall be prepared to the satisfaction of the City of Los Angeles Department of Building and Safety prior to the issuance of building permits. MM E-2 The Project Applicant must prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program. The SUSMP shall be submitted and prepared to the satisfaction of the City of Los Angeles Department of Building and Safety. MM E-3 The Project Applicant must comply with LARWQCB's General NPDES Permit and General Waste Discharge Requirements (WDRs) (Order No. R4-2003-0111, NPDES No. CAG994004) governing construction-related dewatering discharges (the "General Dewatering Permit").	With the implementation of Mitigation Measures E-1 through E-3, impacts related to hydrology and water quality would be less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
quality would be less than significant. The Project Site in its existing state is mostly impervious. Stormwater runoff from the site discharges to landscaped areas or to the local stormdrain system. Development of Option 1 would greatly increase the permeability of the site, as most of the 15-acre site would be converted to landscaped areas. Minimal paving would be required for pedestrian pathways and for the concrete stage/foundation within the amphitheater. Under Option 2, MLS Stadium, permeable areas would be only slightly increased as compared to the existing conditions, and the Stadium would be an open air and uncovered stadium. Thus, under either Option, the project design would not increase the amount of impervious areas and stormwater conditions would be improved compared to existing conditions. The potential for erosion/siltation as a result of runoff from the Project Site would be limited by the increased landscaped cover of the site. The landscaped areas would be designed and maintained to limit soil erosion. Project Therefore, impacts associated with erosion/siltation would be less than significant with mitigation.		
Land Use and Zoning		
Construction Impacts Construction of the Proposed Project under either Option (the Multiple Use Space or the MLS Stadium) would cause temporary and intermittent impacts to adjacent land uses due to temporary increases in air emissions (including fugitive dust), noise, and traffic congestion. These potential effects are discussed in detail in Sections IV.B, Air Quality; IV.G, Noise; and IV.J.1, Traffic, Transportation and Parking, of this EIR. The Proposed Project would redevelop the site with a similar serving land use and thus would be consistent with the existing composition of land uses	(See Sections IV.B, Air Quality, IV.G, Noise, and IV.J, Traffic, Transportation and Parking.) MM.F-1. The Los Angeles Memorial Coliseum Commission shall obtain all applicable permits from the Building and Safety Department (and other state and municipal agencies, as may be required) for Project construction actions associated with implementation of either Option 1 or Option 2 including, but not limited to a height variance.	Incorporation of the mitigation measures for construction-related traffic, noise, and air quality impacts identified in Sections IV.B, Air Quality, IV.G, Noise this Draft EIR would serve to reduce the Proposed Project's anticipated construction impacts, but significant and

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
within Exposition Park, and compatible with the existing community in the vicinity of the Project Site. No new significant or substantially altered land use compatibility impacts on the existing surrounding land uses are anticipated. Furthermore, the Proposed Project would be consistent with various regional land use plans, such as Southern California Association of Governments (SCAGs) Regional Transportation Plan (RTP), the South Coast Air Quality Management District's Air Quality Management Plan (AQMP), and the Regional Water Quality Control Board's National Pollution Discharge Elimination System (NPDES) statewide General Construction Activity Permit requirements, and Los Angeles County's Congestion Management Plan (CMP) and City of Los Angeles Department of Transportation (LADOT) Guidelines. On a local level, the Proposed Project would be generally consistent with the City of Los Angeles General Plan designation for the Project Site, which is OS, Open Space. This designation permits parks and community centers under the ownership and operation of a public agency. Furthermore, economic growth would be fostered along the Figueroa corridor within the City's Redevelopment Plan area, consistent with the goals identified in the CRA's Five Year Implementation Plan. As a result, the Proposed Project would be consistent with the City's General Plan and the Redevelopment Plan and no impacts are anticipated. The Proposed Project uses are consistent with the allowable uses for the OS-1XL (Open Space) zone, which permits parks and recreation facilities (including park land/lawn areas and athletic fields). With regard to the Project Site's height district of 1XL, which limits the maximum FAR to 3:1 and the height of a building or structure to two stories and 30 feet, the Proposed Project would require a discretionary action to exceed this limitation. With approval of the required discretionary actions, project impacts related to land use would be less than significant.		unavoidable impacts would result on a temporary basis during the construction period. The proposed project under Option 1 (Multiple Use Space) and Option 2 (MLS Stadium) would be consistent with the underlying General Plan and Zone Designation, the Redevelopment Plan, the Exposition Park Master Plan, and applicable regional plans and regulations. As such, impacts to operational land use compatibility and consistency with the applicable land use plans and the zoning code would be less than significant prior to mitigation and no mitigation measures are required.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Noise		
Construction Noise Construction activities with the Proposed Project would generate noise from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction; paving and asphalting; construction workers traveling to and from the project site; and delivery and hauling of construction supplies and debris to and from the project site. Outdoor noise levels at noise-sensitive receptors 50 feet from the noise source could range from 77 dBA to 86 dBA Leq with the use of noise-attenuating devices. Thus, construction activities associated with the Proposed Project would result in a temporary or periodic increase in noise levels at some of the off-site noise sensitive receptor locations. Accordingly, construction activities associated with the Proposed Project would generate a substantial temporary or periodic increase in ambient noise levels in the Proposed Project vicinity, and impacts would be considered potentially significant. Construction-Related Groundborne Vibration Construction activities that would occur within the Project Site would include demolition and excavation, which would have the potential to generate low levels of groundborne vibration. The vibration level that would be experienced by the Project's construction activities would not exceed the Federal Railway Administration's vibration impact thresholds, and this impact would be considered less than significant. Operational Noise – Special Event Noise Under both project options, the existing indoor venue would be replaced with an outdoor venue. Noise sources from special events at the open-air amphitheater or soccer stadium would include: crowd noise (particularly yells and cheers at high attendance soccer or concert events); a public address system (amplified public announcements and/or play-by-play announcements); amplified concert music; traffic-related noise from	Code Required Measures CR G-1 The Applicant shall comply with the City of Los Angeles Noise Ordinance No. 144,331 and 161,574, and any subsequent ordinances, which prohibit the emission or creation of noise beyond certain levels at adjacent uses unless technically infeasible. CR G-2 The Applicant shall ensure construction and demolition be restricted to the hours of 7:00 AM to 6:00 PM Monday through Friday, and 8:00 AM to 6:00 PM on Saturday. Project-Specific Mitigation Measures MM G-1 The Applicant shall prepare a construction-related traffic plan detailing proposed haul routes and staging areas for the transportation of materials and equipment, with consideration for sensitive uses in the neighborhood. A traffic and parking plan for the construction phase will be submitted for approval by LADOT and the Department of Building and Safety prior to the issuance of any permits. MM G-2 The Applicant shall ensure all construction equipment engines be properly tuned and muffled according to manufacturers' specifications. For example, Table IV.G-6 indicates that noise levels of 82 dBA at 50 feet could be reduced to a noise level of 76 dBA at 100 feet with the proper use of mufflers. MM G-3 Adjacent museums and residents shall be given regular notification of major construction activities and their durations. A visible and readable sign (at a distance of	Construction Noise: Significant and unavoidable. Construction Groundborne Vibration: Less Than Significant. Operational Event Noise: Significant and unavoidable. Traffic & Parking Lot Noise: Less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
motorists traveling to and from events (discussed in detail below); and helicopters and other aircrafts covering events. It is anticipated that noise levels during soccer games and related sporting events would be substantially similar to the peak noise generating events currently occurring at the Coliseum. It is typically expected that the sound level achieved for concert music, particularly popular or rock type music, would be in the 95 to 110 decibel range within the venue boundaries. Operational noise impacts from special events would be considered potentially significant.	50 feet) shall be posted on the construction site identifying a telephone number where residents can inquire about the construction process and register complaints. MM G-4 The perimeter of the Project Site shall be enclosed with a temporary barrier wall for security and noise protection purposes. This barrier wall shall consist of a solid, heavy vinyl material or ¾-inch plywood positioned to block direct line of sight from the active construction areas and other open space areas and sensitive uses.	
Public Services – Fire Protection Services		
Under Option 1 (Multiple Use Space) and Option 2 (MLS Stadium), the demands placed upon the Los Angeles Fire Department would be substantially similar to the current conditions, as all of the aforementioned uses would generate large public gatherings. Definitive plans and specifications shall be submitted to the Fire Department and requirements for necessary permits satisfied prior to commencement of any portion of the Proposed Project. In addition, compliance with the listed Code-Required Measures, as well as any additional recommendations made during later reviews of the Proposed Project by the Fire Department will reduce potential impacts to less than significant levels.	MM H.1-1 Sprinkler systems will be required throughout any structure to be built, consistent with the LAMC requirements for public venue structures (Section 57.09.07). MM H.1-2 All first-story portions of any commercial or industrial building must be within 300 feet of an approved fire hydrant (Section 57.09.06, Subsection B-1). MM H.1-3 The maximum distance between fire-flow hydrants on the roads and fire lanes in a high-density residential and commercial area is 300 feet. MM H.1-4 Any person owning or having control of any facility, structure, group of structures or premises shall provide and maintain Fire Department access (Section 57.09.03, Subsection A). MM H.1-5 If any portion of the first story exterior walls of any building structure is more than 150 feet from the	Less Than Significant

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	edge of the roadway of an approved street, an approved fire lane shall be provided so that such portion is within 150 feet of the edge of the fire lane. (Section 57.09.03, Subsection B.) MM H.1-6 When required access is provided by an improved street, fire lane or combination of both which results in a dead-end in access of 700 feet in length from the nearest cross street, at least one additional ingress-egress roadway shall be provided in such a manner that an alternative means of ingress-egress is accomplished (Section 57.09.03, Subsection C). MM H.1-7 All public and private streets shall be dedicated and improved in conformance with Board of Public Works, Standard Dimension Plan, Number D-22549. MM H.1-8 Construction of public or private roadways in the proposed development shall not exceed 15 percent in grade. MM H.1-9 Fire lanes, where required, and dead ending streets, shall terminate in a cul-de-sac or other approved turning area. MM H.1-10 All access roads, including fire lanes, shall be maintained in an unobstructed manner. Removal of obstructions shall be at the owner's expense. The entrance to all required fire lanes or required private driveways shall be posted with a sign no less than three square feet in area (Section 57.09.05). MM H.1-11 Fire lane width shall not be less than 20 feet. When a fire lane must accommodate the operation of Fire Department aerial ladder apparatus or where fire hydrants are installed, those portions shall not be less than 28 feet in width. The Fire Department may require additional vehicular access where buildings exceed 28 feet in height.	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	MM H.1-12 In the event that a subterranean parking structure is included as a part of the Proposed Project, and where fire apparatus will be driven onto the road level surface of such subterranean parking structure, that structure shall be engineered to withstand a bearing pressure of 8,600 pounds per square foot.	
Public Services – Police Protection Services		
Construction Impacts The Proposed Project has the potential to adversely affect police services during the construction period due to an increased potential for theft and vandalism. However, the Proposed Project would employ mitigation measures including erecting temporary fencing around the construction site, and installing a security camera to discourage trespassers as well as deploying security guards to monitor the construction site and deter any potential criminal activity. Implementation of the recommended mitigation measures would reduce the demands upon police services during construction of the Proposed Project and reduce the potentially significant impact to a less-than-significant level. Operational Impacts The Proposed Project has the potential to place high demands upon police protection services during operation as a result of the redevelopment of the site as a public venue. However, the Proposed Project includes security/design features that would reduce the demand for police service to less than significant levels. In addition private security staff will be employed for special events, in a manner that is consistent with the current operations. The Proposed Project would be subject to LAPD review, and would be required to comply with all applicable safety requirements of the LAPD and the City of Los Angeles in order to address police protection service demands adequately. Thus, the Proposed Project would not necessitate new or expanded police facilities, and impacts to police services	H.2-1 The Project shall erect temporary fencing around the Project Site during construction activities to secure the Project Site and discourage trespassers. H.2-2 Project Event Sponsors shall employ private security guards to monitor and secure the Project Site during events to secure the site and deter any potential criminal activity. H.2-3 The Project Applicant shall develop and implement a Security Plan in consultation with the LAPD outlining the security services and features to be provided in conjunction with the Proposed Project. The plan shall be coordinated with the LAPD and a copy of said plan shall be filed with the LAPD Central Bureau Commanding Officer. Said security plan may include some or all of the following components: i. Provisions for an on-site private security force for the mixed-use trade school. Through individual lease agreements for the proposed trade school/retail uses, private on-site security services shall provide a 24-hour presence. Security officers shall be responsible for patrolling all common areas including the back service corridors and alleys, parking garages, and stairwells. ii. The parking garage shall be fitted with emergency	Less Than Significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
and facilities would be less than significant.	features such as closed circuit television (CCTV) or emergency call boxes that would provide a direct connection with the on-site security force or the LAPD 911 emergency response system. iii. The proposed security plan shall incorporate low-level and directional security lighting features to effectively illuminate project entryways, seating areas, lobbies, elevators, service areas, and parking areas with sufficient illumination and minimum dead space to eliminate areas of concealment. Full cut-off fixtures shall be installed that minimize glare from the light source and provide light downward and inward to structures to maximize visibility.	
Public Utilities - Wastewater		
The peak and average wastewater flows from the Project Site would not be increased compared to existing conditions and it is anticipated that the existing wastewater infrastructure in the vicinity would be able to accommodate the Proposed Project. As such, impacts with respect to local sewer capacity would be less than significant. With respect to wastewater treatment facilities, as stated above, the HTP currently processes average wastewater flows of approximately 340 mgd, resulting in a remaining capacity of approximately 110 mgd. The peak and average wastewater flows from the Proposed Project would not be increased compared to existing conditions and would not substantially alter the treatment capacity presently available at the HTP. Thus, impacts are considered to be less than significant.	No mitigation measures are required.	Less Than Significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
Public Utilities – Water		
Construction The Project Area is currently served by adequate potable water infrastructure. Construction of the Proposed Project would require connection to the existing potable water infrastructure in the Project's service area to serve the Project's operational demands. The Project's water demands (i.e., quantity, size and type of infrastructure) will be determined by the Applicant's engineering consultants in consultation with the Los Angeles Department of Building and Safety based on applicable building code requirements. Although new service connections may occasionally result in temporary interruptions in water services for existing customers, new water service installations are generally "hot tapped" so as to avoid water service interruption. Therefore, temporary disruptions in local water service during the construction period are not anticipated and impacts would be less than significant. Operation The peak and average water demand for the Project Site would not be increased compared to existing conditions and it is anticipated that the existing water supply infrastructure in the vicinity would be able to accommodate the Proposed Project. Thus, as the projected water demand of the Proposed Project would be similar to existing conditions at the Project Site, it is anticipated the future water demand be within the 20-year water demand growth projected in the City of Los Angeles' Year 2005 Urban Water Management Plan. Furthermore, because the water demands of the Proposed Project are within the 20-year water demand growth projected in the UWMP and water supplies are considered to be reliable, impacts associated with regional water supplies would be less than significant. In addition, the LADWP imposes water conservation mitigation measures for all projects within its jurisdiction. Implementation of these water conservation measures would ensure impacts related to water	MM I.2-1 The Project shall comply with Ordinance No. 170,978 (Water Management Ordinance), which imposes numerous water conservation measures in landscape, installation, and maintenance (e.g., use drip irrigation and soak hoses in lieu of sprinklers to lower the amount of water lost to evaporation and overspray, set automatic sprinkler systems to irrigate during the early morning or evening hours to minimize water loss due to evaporation, and water less in the cooler months and during the rainy season). In addition, the Department of Water and Power requires the following conservation measures for all new development in the City of Los Angeles: • High efficiency toilets (1.28 gallons per flush or less, includes dual flush); • High efficiency urinals (0.5 gallons per flush or less, includes waterless); • Restroom faucet flow rate of 1.5 gallons per minute or less; • Public restroom self-closing faucets; • Showerhead flow rate of 2.0 gallons per minute or less; • Limit of one showerhead per shower stall; • High efficiency clothes washers (water factor of 6.0 or less); • High efficiency dishwashers (Energy Star rated); • Use of tankless and on-demand water heaters as feasible; • Cooling towers must be operated at a minimum of 5.5 cycles of concentration;	Less Than Significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
supply remain less than significant.	• Require onsite water recycling systems for wastewater discharge for commercial laundries, dye houses, food processing, certain manufacturing operations, etc. (subject to a payback threshold of five years or less). Mandate water recycling system for all new car wash facilities. • Strict prohibition of single-pass cooling; (Note: Single pass cooling refers to the use of potable water to extract heat from process equipment) • Irrigation system requirements: o Weather-based irrigation controller with rain shutoff; o Flow sensor and master valve shutoff (large landscapes); o Matched precipitation (flow) rates for sprinkler heads; o Drip/microspray/subsurface irrigation where appropriate; o Minimum irrigation system distribution uniformity of 75 percent; o Proper hydro-zoning, turf minimization and use of native/drought tolerant plant materials; o Use of landscape contouring to minimize precipitation runoff; • Metering: o All irrigated landscapes of 5,000 square feet or more require separate metering or submetering; • Mandated use of recycled water (where available) for appropriate end uses (irrigation, cooling towers, sanitary); Standard Urban Stormwater Mitigation Plan (SUSMP):	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	Compliance with all City of Los Angeles SUSMP requirements, and encouraging implementation of Best Management Practices that have stormwater recharge or reuse benefits.	
Public Utilities – Energy Conservation		
Construction Energy would be consumed during the demolition, excavation, and construction phases of the Proposed Project for grading and materials transfer by heavy-duty equipment, which is usually diesel powered. The energy demands during construction would be typical of construction projects for projects of this size and would not necessitate additional energy facilities or distribution infrastructure. Accordingly, energy demands during construction would be less than significant. Operation - Electricity The peak and average electricity demand for the Project Site would not be substantially increased compared to existing conditions and it is anticipated that the existing electrical infrastructure in the vicinity would be able to accommodate the Proposed Project. With modern energy-efficient construction materials and operating equipment, the Proposed Project would promote conservation in accordance with the policies identified in Title 24 and in the City of Los Angeles General Plan Framework. While impacts upon regional energy resources are expected to be less than significant, the LADWP imposes standard mitigation measures for all new projects to further reduce project impacts and promote conservation efforts. Implementation of these measures would further reduce the project's overall demand for electricity to ensure the project's impacts remain less than significant. Natural Gas The peak and average natural gas demand for the Project Site would not substantially increase as compared to existing conditions and it is	MM I.3-1 Built-in appliances, refrigerators, and space-conditioning equipment shall exceed the minimum efficiency levels mandated in the California Code of Regulations. MM I.3-2 The Project Applicant shall install high-efficiency air conditioning controlled by a computerized energy-management system in the office and retail spaces that provides the following: • A variable air-volume system that results in minimum energy consumption and avoids hot water energy consumption for terminal reheat; • A 100-percent outdoor air-economizer cycle to obtain free cooling in appropriate climate zones during dry climatic periods; • Sequentially staged operation of air-conditioning equipment in accordance with building demands; and • The isolation of air conditioning to any selected floor or floors. MM I.3-3 The project shall be designed in a manner that utilizes Cascade (i.e., passively transferred) ventilation air from high-priority areas before being exhausted, thereby decreasing the volume of ventilation air required. For example, air could be passively transferred from occupied space to corridors and then to mechanical spaces before	Project impacts on energy resources or infrastructure systems would be less than significant without mitigation. The proposed mitigation measures would further reduce energy demand.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure		Level of Significance After Mitigation
anticipated that the existing natural gas infrastructure in the vicinity would be able to accommodate the Proposed Project. Since the Proposed Project is located in an area already served by existing natural gas infrastructure, the Project would not require extensive infrastructure improvement to serve the Project Site. It is not anticipated that any new natural gas distribution pipelines or infrastructure facilities would be constructed or expanded as a result of the Project. The project would require local infrastructure improvements to connect to the existing infrastructure serving the project area. "Hooking-up" disruptions, however, cannot be determined until the actual natural gas demand is known. Impacts associated with utility upgrades or additional connections would be temporary in nature and thus result in less than significant impacts upon the environment.		being exhausted.	
	MM I.3-4	The Applicant shall incorporate a recycle lighting system heat for space heating during cool weather. Exhaust lighting-system heat from the buildings, via ceiling plenums, shall be used to reduce cooling loads in warm weather.	
	MM I.3-5	The Applicant shall install low and medium static-pressure terminal units and ductwork to reduce energy consumption by air-distribution systems.	
	MM I.3-6	The Applicant shall ensure that buildings are well sealed to prevent outside air from infiltrating and increasing interior space-conditioning loads. Where applicable, building entrances shall be designed with vestibules to restrict infiltration of unconditioned air and exhausting of conditioned air.	
	MM I.3-7	The Applicant shall conduct a performance check of the installed space-conditioning system prior to issuance of the certificate of occupancy to ensure that energy-efficiency measures incorporated into the Project operate as designed.	
	MM I.3-8	Exterior walls shall be finished with light-colored materials and high-emissivity characteristics to reduce cooling loads. Interior walls shall be finished with light-colored materials to reflect more light and, thus, increase lighting efficiency.	
	MM I.3-9	White, high albedo, and reflective material shall be used for roofing in order to meet California standards for reflectivity and emissivity to reject heat.	
	MM I.3-10	Thermal insulation that exceeds requirements established by the California Code of Regulations shall be installed in walls and ceilings.	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	MM I.3-11 Window systems shall be designed to reduce thermal gain and loss, thus reducing cooling loads during warm weather and heating loads during cool weather. MM I.3-12 The Project Applicant shall install heat-rejecting window treatments, such as films, blinds, draperies, or others on appropriate exposures. MM I.3-13 The Project Applicant shall install fluorescent and high-intensity-discharge (HID) lamps, which give the highest light output per watt of electricity consumed, wherever possible including all street and parking lot lighting to reduce electricity consumption. Reflectors shall be used to direct maximum levels of light to work surfaces. MM I.3-14 The Project Applicant shall install photosensitive controls and dimmable electronic ballasts to maximize the use of natural daylight available and reduce artificial lighting load. MM I.3-15 The Project Applicant shall install occupant-controlled light switches and thermostats to permit individual adjustment of lighting, heating, and cooling to avoid unnecessary energy consumption. MM I.3-16 The Project Applicant shall install time-controlled interior and exterior public area lighting limited to that necessary for safety and security. MM I.3-17 Mechanical systems (HVAC) and lighting buildings shall be controlled with timing systems to prevent accidental or inappropriate conditioning or lighting of unoccupied space. MM I.3-18 The Project Applicant shall incorporate windowless walls or passive solar inset of windows into the Project for appropriate exposures.	

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure		Level of Significance After Mitigation
	MM I.3-19	Design Project shall focus pedestrian activity within sheltered outdoor areas.	
Public Utilities – Solid Waste			
Construction Construction of the Proposed Project would require the demolition of the existing Sports Arena. Approximately 5.4 million cubic feet of debris would be generated from this activity. Construction debris from building activities would also be generated which includes concrete, asphalt, wood, drywall, metals, and a variety of other miscellaneous and composite materials. As such, construction of the Proposed Project would generate construction debris that would need to be disposed of at area landfills and/or recycled. Construction debris includes concrete, asphalt, wood, drywall, metals, and a variety of other miscellaneous and composite materials. The amount of solid waste generated during construction would fall within the available permitted daily intake capacity of area landfills and recycling centers. Therefore, impacts associated with demolition and construction debris would be less than significant. Operational Impacts The peak and average solid waste generated by the Project Site would not be substantially increased compared to existing conditions. It is anticipated that the solid waste demands generated by the Proposed Project could be readily accommodated by the existing regional landfill operations without the need to expand operations or divert existing waste streams to alternative locations. However, because the existing landfill capacity is finite and its overall capacity will be reduced over time, additional landfills and solutions to address the ongoing regional solid waste demands of the City beyond 2024 will need to be addressed on a regional basis. For purposes of	MM I.4-1 MM.I.4-2	The Project Applicant shall develop a construction and demolition debris recycling program to divert construction related solid waste and demolition debris from area landfills. The Project Applicant shall develop an operational project recycling plan that includes the design and allocation of recycling collection and storage space in the Project.	Less Than Significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
a Project-specific impact conclusion, the Project's impact upon solid waste disposal facilities would be considered less than significant with the implementation of the recommended mitigation measures.		
Transportation Traffic and Parking		
Traffic Impacts The Proposed uses under Option 1 (Multiple Use Space) or Option 2 (MLS Stadium) would result in a venue that operates in a manner that is consistent with existing events held at the Sports Arena and Coliseum, and thus is not anticipated to generate a substantial change to the project related traffic volumes. In addition to hosting MLS games, the proposed event/soccer stadium would continue to host events of attendance levels similar to the ones held at the existing Sports Arena facility except that the events would be held in the open-air facility instead. Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new Multiple Use Space (Option 1) or MLS Stadium facility (Option 2) are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena. Furthermore, similar to the existing operations, the Coliseum Commission will schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people. Furthermore, it is anticipated that the Exposition Light Rail project (which is expected to open before the project is constructed) would provide an alternate mode of transit for patrons and employees to the new facility, which would help to reduce traffic congestion on local roadways. Traffic impacts are thus expected to be less than significant.	MM J-1 Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. The Coliseum Commission shall schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people. MM J-2 The Coliseum Commission shall coordinate with Metro Bus Operation Control Special Events Coordinator at 213-922-4632 and LADOT Staff regarding construction activities that may affect Metro and LADOT bus line operations.	Traffic: Less Than Significant. Parking: Less Than Significant

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure		Level of Significance After Mitigation
Parking Impacts The Proposed Project does not include any major changes to existing parking facilities at the Coliseum, Exposition Park, USC, or the surrounding area. Under the Multiple Use Space (Option 1), the existing Sports Arena will be demolished and replaced with an open-air venue for civic gatherings and entertainment events. The Multiple Use Space will also be developed to provide overflow surface parking for the Coliseum events. The existing parking inventory is capable of supporting events with up to 93,000 attendees for the Coliseum. Thus, smaller events held at the Multiple Use Space (Option 1) or a MLS Stadium event (Option2), would be supported by adequate parking facilities, which include over 19,981 spaces within Exposition Park and the surrounding area. The Project's code required parking under Option 2 (MLS Stadium) is approximately 4,400 spaces. As the owner/operator of both the Coliseum and the Sports Arena, the Los Angeles Memorial Coliseum Commission will have direct control over programming events such that attendance at both uses operating concurrently would not exceed the current maximum capacity of the Coliseum (i.e., 93,000 attendees). Therefore, no parking impacts would occur.			
V. General Impact Categories			
The Project's potential to impact archaeological and paleontological resources was determined to be less than significant and scoped out during the Initial Study process for the project. As discovered during the scoping process for the project, no archaeological sites are known to exist beneath the Project Site, and potential impacts associated with the accidental discovery of unknown archaeological or paleontological resources would be considered less than significant. Nevertheless, in reviewing the comments provided by the NAHC, mitigation measures MMV-1 and MMV-2 have been added to ensure these impacts would remain less than significant.	MM V-1	If any archaeological or paleontological materials are encountered during the course of the project development, the project shall be halted in the immediate area of discovery. The services of a professional archaeologist or paleontologist shall be secured by contacting the Center for Public Archaeology - Cal State University Fullerton, or a member of the Society of Professional Archaeologist (SOPA) or a SOPA-qualified archaeologist and/or the Center for Public	Less than significant.

Table I-1
Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Mitigation Measure	Level of Significance After Mitigation
	Paleontology - USC, UCLA, Cal State Los Angeles, Cal State Long Beach, or the County Museum to assess the resources and evaluate the impact; MM V-2 Copies of the archaeological or paleontological surveys, studies or reports shall be submitted to the UCLA Archaeological Information Center. No additions or corrections to this Section of the Draft EIR were required.	

This page left intentionally blank.

II. CORRECTIONS AND ADDITIONS TO THE DRAFT EIR

DRAFT EIR

Page ii: Table of Contents: Section VI. Project Alternatives, was inadvertently omitted from the Table of Contents. The following text should be inserted between Sections V and VII:

"VI. Alternatives to the Proposed Project ..... VI-1"

I. INTRODUCTION/SUMMARY

The Introduction/Summary Section of the Draft EIR has been reprinted in its entirety in this Final EIR, as amended with the additions and corrections noted below.

II. PROJECT DESCRIPTION

Page II-17: Insert the following language to the end of the text under the Subheading "Discretionary Actions":

> "In addition to the discretionary actions listed above, the California Science Center is identified as responsible agency for any applicable approvals for any circumstances involving lease agreements, amendments to existing lease agreements and/or other discretionary approvals that may be required from the Science Center Board of Directors to carry out the Project.
>
> Although the potential for discovery of archaeological impacts during the construction process is remote, the Native American Heritage Commission is identified as a trustee agency for purposes of regulatory oversight of any archaeological resources, should any be discovered during the construction process."

III. ENVIRONMENTAL SETTING

No additions or corrections to this Section of the Draft EIR were required.

IV. ENVIRONMENTAL IMPACT ANALYSIS

A. Aesthetics

No additions or corrections to this Section of the Draft EIR were required.

B. Air Quality

Page IV.B-35 of the Draft EIR shall be revised to include the following mitigation measure as requested by the SCAQMD:

MM C-3 Pursuant to the SCAQMD recommendations, the Project shall implement the following measures to the extent feasible:

- Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow;
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site;
- Reroute construction trucks away from congested streets or sensitive receptor areas;
- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM10 generation;
- Use coatings and solvents with a VOC content that meet or exceed the requirements of Rule 1113;
- Construct/build with materials that do not require painting;
- Use pre-painted construction materials;
- Use high-pressure-low-volume (HPLV) paint applicators with a minimum transfer efficiency of at least 50% or other application techniques with equivalent or higher transfer efficiency;
- Use electricity from power poles rather than temporary diesel or gasoline power generators;
- Use 2010 and newer diesel haul trucks (e.g., material delivery trucks, soil import/export, and demolition export);
- Require all on-site construction equipment to meet EPA Tier 2 or higher emissions standards according to the following:
    - <u>Project start to December 31, 2011</u>: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 2 offroad emissions standards. In addition, all construction equipment shall be outfitted with the BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 2 or Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- o January 1, 2012, to December 31, 2014: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 3 offroad emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- o Post-January 1, 2015: All offroad diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

C. Global Climate Change/Greenhouse Gas Emissions

No additions or corrections to this Section of the Draft EIR were required.

D. Historic Resources

No additions or corrections to this Section of the Draft EIR were required.

E. Hydrology & Water Quality

No additions or corrections to this Section of the Draft EIR were required.

F. Land Use and Planning

No additions or corrections to this Section of the Draft EIR were required.

No additions or corrections to this Section of the Draft EIR were required.

H. Public Services

No additions or corrections to this Section of the Draft EIR were required.

I. Public Utilities

No additions or corrections to this Section of the Draft EIR were required.

J. Traffic/Transportation/Parking

Page IV.J-7 of the Draft EIR shall be revised to include the following:

As requested by Metro, the following mitigation measure will be added to ensure construction related impacts on Metro and LADOT bus service will remain less than significant:

MM J-2: The Coliseum Commission shall coordinate with Metro Bus Operation Control Special Events Coordinator at 213-922-4632 and LADOT Staff regarding construction activities that may affect Metro and LADOT bus line operations.

K. Cumulative Impacts

No additions or corrections to this Section of the Draft EIR were required.

V. GENERAL IMPACT CATEGORIES

Page V-3 of the Draft EIR shall be revised to include the following:

The Project's potential to impact archaeological and paleontological resources was determined to be less than significant and scoped out during the Initial Study process for the project. As discovered during the scoping process for the project, no archaeological sites are known to exist beneath the Project Site, and potential impacts associated with the accidental discovery of unknown archaeological or paleontological resources would be considered less than significant. Nevertheless, in reviewing the comments provided by the NAHC, the following mitigation measures will be added to ensure these impacts would remain less than significant:

MM V-1 If any archaeological or paleontological materials are encountered during the course of the project development, the project shall be halted in the immediate area of discovery. The services of a professional archaeologist or paleontologist shall be secured by contacting the Center for Public Archaeology - Cal State University Fullerton, or a member of the Society of Professional Archaeologist (SOPA) or a SOPA-qualified archaeologist and/or the Center for Public Paleontology - USC, UCLA, Cal State Los Angeles, Cal State Long Beach, or the County Museum to assess the resources and evaluate the impact;

MM V-2 Copies of the archaeological or paleontological surveys, studies or reports shall be submitted to the UCLA Archaeological Information Center. No additions or corrections to this Section of the Draft EIR were required.

VI. ALTERNATIVES TO THE PROPOSED PROJECT

No additions or corrections to this Section of the Draft EIR were required.

VII. BIBLIOGRAPHY

No additions or corrections to this Section of the Draft EIR were required.

COMMENT 1.1

Dear Patrick Lynch:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on December 31, 2010, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21 104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

RESPONSE 1.1

This comment acknowledges receipt and review of the Draft EIR by the State Clearinghouse. This comment also indicates that the Proposed Project has complied with the State Clearinghouse review requirements for draft environmental documents pursuant to the California Environmental Quality Act. No further response to this comment is required.

COMMENT LETTER No. 2
Native American Heritage Commission
Dave Singleton, Program Analyst
915 Capitol Mall, Room 364,
Sacramento, CA 95814
December 14, 2010 [[received December 16, 2010]]

COMMENT 2.1

Dear Mr. Parker:

The Native American Heritage Commission (NAHC) is the state 'trustee agency' pursuant to Public Resources Code §21070 for the protection and preservation of California's Native American Cultural Resources. (Also see Environmental Protection Information Center v. Johnson (1985) 170 Cal App. 3rd 604). The California Environmental Quality Act (CEQA – CA Public Resources Code §21000-21177, amendment effective 3/18/2010) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the California Code of Regulations §15064.5(b)(c)(f) CEQA Guidelines). Section 15382 of the CEQA Guidelines defines a significant impact on the environment as "a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ... objects of historic or aesthetic significance. The lead agency is required to assess whether the project will have an adverse impact on these resources within the 'area of potential effect (APE), and if so, to mitigate that effect. State law also addresses Native American Religious Expression in Public Resources Code §5097.9. The NAHC notes from a review of the Initial Study for the project that the State of California Native American Heritage Commission is not listed as a 'responsible' or 'trustee' agency with jurisdiction for this project. The State Historic Preservation Office is noted, but it has responsibility for applicable federal not state laws.

RESPONSE 2.1

The lead agency acknowledges the NAHC is a trustee agency pursuant to CEQA with respect to regulatory oversight for archaeological resources.

COMMENT 2.2

The Native American Heritage Commission did perform a Sacred Lands File (SLF) search in the NAHC SLF Inventory, established by the Legislature pursuant to Public Resources Code §5097.94(a) and Native American Cultural Resources **were NOT** identified within one-half mile of several of the Area of Potential Effect (APE). But, it is important to understand that the absence of archaeological, Native American cultural resources in an area does not indicate that they are not present, or will be present once ground-breaking activity begins. The NAHC recommends early consultation with Native American tribes

in your area as the best way to avoid unanticipated discoveries once a project is underway and to learn of any sensitive cultural areas. Enclosed are the names of the culturally affiliated tribes and interested Native American individuals that the NAHC recommends as 'consulting parties,' for this purpose, that may have knowledge of the religious and cultural significance of the historic properties in the project area (e.g. APE). A Native American Tribe or Tribal Elder may be the only source of information about a cultural resource. Also, the NAHC recommends that a Native American Monitor or Native American culturally knowledgeable person be employed whenever a professional archaeologist is employed during the 'Initial Study' and in other phases of the environmental planning processes.

Furthermore the NAHC recommends that you contact the California Historic Resources Information System (CHRIS) of the Office of Historic Preservation (OHP), for information on recorded archaeological data. This information is available at the OHP Office in Sacramento (916) 445-7000.

Consultation with tribes and interested Native American tribes and interested Native American individuals, as consulting parties, on the attached NAHC list, should be conducted in compliance with the requirements of federal NEPA (42 U.S.C. 4321-43351) and Section 106 and 4(f) of federal NHPA (16 U.S.C. 470 [f)]et seq.), 36 CFR Part 800.3, the President's Council on Environmental Quality (CSQ; 42 U.S.C. 4371 et seq.) and NAGPRA (25 U.S.C. 3001-3013), as appropriate. The *1992 Secretary of the Interior's Standards for the Treatment of Historic Properties* were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including cultural landscapes. Consultation with Native American communities is also a matter of environmental justice as defined by California Government Code §65040.12(e).

Lead agencies should consider avoidance, as defined in Section 15370 of the California Environmental Quality Act (CEQA) when significant cultural resources could be affected by a project. Also, Public Resources Code Section 5097.98 and Health & Safety Code Section 7050.5 provide for provisions for accidentally discovered archeological resources during construction and mandate the processes to be followed in the event of an accidental discovery of any human remains in a project location other than a 'dedicated cemetery'. Discussion of these should be included in your environmental documents, as appropriate.

The authority for the SLF record search of the NAHC Sacred Lands Inventory, established by the California Legislature, is California Public Resources Code §5097.94(a) and is exempt from the CA Public Records Act (c.f. California Government Cede §6254.10). The results of the SLF search are confidential. However, Native Americans on the attached contact list are not prohibited from and may wish to reveal the nature of identified cultural resources/historic properties. Confidentiality of "historic properties of religious and cultural significance" may also be protected the under Section 304 of the NHPA or at the Secretary of the Interior' discretion if not eligible for listing on the National Register of Historic Places. The Secretary may also be advised by the federal Indian Religious Freedom Act (cf. 42 U.S.C, 1996) in issuing a decision on whether or not to disclose items of religious and/or cultural significance identified in or near the APE and possibly threatened by proposed project activity.

CEQA Guidelines, Section 15064.5(d) requires the lead agency to work with the Native Americans identified by this Commission if the initial Study identifies the presence or likely presence of Native American human remains within the APE. CEQA Guidelines provide for agreements with Native American, identified by the NAHC, to assure the appropriate and dignified treatment of Native American human remains and any associated grave liens. Although tribal consultation under the California Environmental Quality Act (CEQA; CA Public Resources Code Section 21000-21177) is 'advisory' rather than mandated, the NAHC does request 'lead agencies' to work with tribes and interested Native American individuals as 'consulting parties,' on the list provided by the NAHC in order that cultural resources will be protected. However, the 2006 SB 1059 the state enabling legislation to the Federal Energy Policy Act of 2005, does mandate tribal consultation for the 'electric transmission corridors. This is codified in the California Public Resources Code, Chapter 4.3, and §25330 to Division 15, requires consultation with California Native American tribes, and identifies both federally recognized and non-federally recognized on a list maintained by the NAHC.

Health and Safety Code §7050.5, Public Resources Code §5097.98 and Sec. §15064.5 (d) of the California Code of Regulations (CEQA Guidelines) mandate procedures to be followed, including that construction or excavation be stopped in the event of an accidental discovery of any human remains in a location other than a dedicated cemetery until the county coroner or medical examiner can determine whether the remains are those of a Native American. Note that §7052 of the Health & Safety Code states that disturbance of Native American cemeteries is a felony.

Please feel free to contact me at (916) 653-6251 if you have any questions.

RESPONSE 2.2

The Project's potential to impact archaeological and paleontological resources was determined to be less than significant and scoped out during the Initial Study process for the project. During the scoping process for the project, no known archaeological sites were found to exist on the Project Site, and potential impacts associated with the accidental discovery of unknown archaeological or paleontological resources was thus dismissed from further analysis. The Sacred Lands File (SLF) search performed by the NAHC further supports the finding that no archaeological, Native American cultural resources exist on site or in the immediate project vicinity. Nevertheless the lead agency recognizes that the absence of archaeological Native American cultural resources in an area does not indicate that they are not present, or will be present once ground-breaking activity begins. Accordingly, the following standard mitigation measures, which are imposed by the Department of City Planning for all projects within the City, will be added to the Final EIR as a precautionary measure to ensure potential impacts to archaeological resources, if discovered, are mitigated to a less than significant:

MM V-1 If any archaeological or paleontological materials are encountered during the course of the project development, the project shall be halted in the immediate area of discovery. The services of a professional archaeologist or paleontologist shall be secured by contacting the Center for Public Archaeology - Cal State University Fullerton, or a

member of the Society of Professional Archaeologist (SOPA) or a SOPA-qualified archaeologist and/or the Center for Public Paleontology - USC, UCLA, Cal State Los Angeles, Cal State Long Beach, or the County Museum to assess the resources and evaluate the impact;

MM V-2 Copies of the archaeological or paleontological surveys, studies or reports shall be submitted to the UCLA Archaeological Information Center.

Therefore, based on the information above, the NAHC's comments pertaining to potential significant archaeological impacts or buried Native American remains have been adequately addressed and no further response is required.

COMMENT LETTER No. 3

State of California
Department of Transportation
District 7, Regional Planning IGR/CEQA Branch
Dianna Watson, IGR/CEQA Branch Chief
100 Main Street, MS #16
Los Angeles, CA 90012
December 28, 2010

COMMENT 3.1

Dear Mr. Lynch:

Thank you for including the California Department of Transportation (Department) in the environmental review process for the above referenced project. The proposed project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. There are two options for the future uses. Option 1 consists of a Multiple Use Space for civic and special event gatherings. Option 2 is a Major League Soccer Stadium with approximately 22,000 seats.

Appendix F: Traffic Memorandum, does not include project traffic generation and future traffic data for either option. The trip generation and traffic analysis will indicate whether the new development will generate additional traffic to local streets, including the freeways.

The existing Sports Arena is an indoor facility with 16,740 seats and has hosted a variety of sporting events including boxing, professional and college basketball, and hockey. The proposed event/soccer stadium, under Option 2, would provide a maximum of 22,000 seats. There is an increase of 5,260 seats for the soccer stadium, which results in more vehicles on the streets. This will add more vehicles to the

State highway facilities, including 1-10 and I-110 which are located in the project vicinity and are currently operating at the Level of Service (LOS) E/F.

RESPONSE 3.1

This comment restates the characteristics of the Proposed Project. With respect to the comment regarding vehicle trips generated by the Proposed Project, page IV.J-6 of the Draft EIR states that the new event/soccer stadium facility replacing the Sports Arena is not expected to generate significant new traffic impacts, for the following reasons:

- With the addition of MLS soccer games, the new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility.

- Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new Multiple Use Space (Option 1) or MLS Stadium facility (Option 2) are within the purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena.

- The Coliseum Commission will schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.

COMMENT 3.2

During Caltrans review of The USC Master Plan, from Gibson Transportation Consulting, Inc. dated September 30, 2010, it was noted that Table 2 indicated that 1-110 southbound (SB) off-ramp and Martin Luther King, Jr. Blvd. will operate at LOS E/F during the AM/PM Peak hours in 2035.

RESPONSE 3.2

This comment provides additional information regarding the impact conclusions of the USC Master Plan Project and does not challenge the adequacy of the Draft EIR for the Proposed Project. No further response is required.

COMMENT 3.3

As per your telephone conversation with Alan Lin, Project Coordinator, on December 28, 2010, the Los Angeles Memorial Coliseum Commission is aware of the potential traffic impact to the State facilities from the State's perspective and will request future applicants to mitigate future impacts, at 1-110 SB off ramp and Martin Luther King, Jr. Blvd. As a result of the traffic discussion, Los Angeles Memorial Coliseum Commission has agreed to condition the project and request the future applicant to pay $200,000 as its fair share of mitigating freeway impacts on I-110 and 1-10. These funds may be used to

prepare a Project Study Report for the extension of the I-110 high occupancy vehicle lanes into downtown Los Angeles or any State improvement project in the project vicinity.

If you have any questions, please feel-free to contact me at (213) 897-9140 or Alan Lin the project coordinator at (213) 897-8391 and refer to IGR/CEQA No. 101140AL.

RESPONSE 3.3

This comment restates correspondence between Caltrans and the Los Angeles Memorial Coliseum Commission. As agreed, the Los Angeles Memorial Coliseum Commission will impose a condition of project approval requesting that the future Applicant/Developer pay $200,000 to the California Department of Transportation. No further response is required.

COMMENT LETTER No. 4

Metropolitan Transportation Authority
CEQA Review Coordination
Scott Hartwell, CEQA Review Coordinator, Long Range Planning
One Gateway Plaza
Los Angeles, CA 90012
December 29, 2010

COMMENT 4.1

Dear Mr. Lynch:

Los Angeles County Metropolitan Transportation Authority (Metro) is in receipt of the Los Angeles Memorial Sports Arena project. The following should be addressed in the Final EIR:

> Metro bus service could be impacted by the project. Metro Bus Operation Control Special Events Coordinator should be contacted at 213-922-4632 regarding construction activities that may impact Metro bus lines. LADOT may also be impacted and therefore should be included in construction outreach efforts.

Metro looks forward to reviewing the Final EIR. If you have any questions regarding this response, contact me at 213-922-2836 or by email at hartwells@metro.net. Please send the Final EIR to the following address:

> Metro CEQA Review Coordination
> One Gateway Plaza MS 99-23-2
> Los Angeles, CA 90012-2952
> Attn: Scott Hartwell

RESPONSE 4.1

As discussed in Section I.J of the Draft EIR, impacts related to transportation, traffic and parking were determined to be less than significant. Nevertheless, as requested by Metro, the following measure will be added to ensure construction related impacts on Metro and LADOT bus service will remain less than significant:

MM J-2: The Coliseum Commission shall coordinate with Metro Bus Operation Control Special Events Coordinator at 213-922-4632 and LADOT Staff regarding construction activities that may affect Metro and LADOT bus line operations.

COMMENT LETTER No. 5

South Coast Air Quality Management District
Ian MacMillan, Program Supervisor, CEQA Inter-Governmental Review
21865 Copley Drive
Diamond Bar, CA 91765-4182
January 4, 2011

COMMENT 5.1

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are intended to provide guidance to the lead agency and should be incorporated into the final Environmental Impact Report (EIR) as appropriate.

The AQMD staff is concerned about the proposed project's significant air quality impacts resulting from construction related activities. Specifically, the proposed project will exceed the AQMD's CEQA thresholds applicable to oxides of nitrogen (NOX) and volatile organic compounds (VOC's), therefore, the AQMD staff requests that the lead agency minimize or eliminate these impacts in accordance with CEQA Guidelines §15370. Further, AQMD staff requests that the lead agency provide enforceable mitigation to ensure that the proposed project does not result in a net increase of greenhouse gas (GHG) emissions.

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the adoption of the final EIR. Further, staff is available to work with the lead agency to address these issues and any questions related to air quality that may arise. Please contact Dan Garcia, Air Quality Specialist CEQA Section, at (909) 396-3304, if you have any questions regarding the enclosed comments.

RESPONSE 5.1

The issues raised in the comment above are specifically addressed in Responses to Comments 5.2 and 5.3 below. Upon completion of the Final EIR, the Lead Agency will provide a written response to the AQMD as requested. No further response is required.

COMMENT 5.2

Mitigation for Construction Activities

1. Given that the draft EIR demonstrates that regional NOX and VOC criteria pollutant emissions during construction create significant adverse air impacts the AQMD staff recommends that the lead agency require mitigation pursuant to CEQA Guidelines §15370, which could minimize or eliminate these significant impacts. To assist the lead agency with identifying possible mitigation measures for the project, please refer to AQMD's CEQA webpage at the following internet address: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.htm. Further, a list of mitigation measures has been provided below.

- Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow,
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site,
- Reroute construction trucks away from congested streets or sensitive receptor areas,
- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM10 generation,
- Improve traffic flow by signal synchronization, and ensure that all vehicles and equipment will be properly tuned and maintained according to manufacturers' specifications,
- Use required coatings and solvents with a VOC content lower than required under Rule 1113,
- Construct/build with materials that do not require painting,
- Use pre-painted construction materials,
- Require the use of high-pressure-low-volume (HPLV) paint applicators with a minimum transfer efficiency of at least 50% or other application techniques with equivalent or higher transfer efficiency,
- Require the use of electricity from power poles rather than temporary diesel or gasoline power generators,

- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks, soil import/export, and demolition export), and

- Require all on-site construction equipment to meet EPA Tier 2 or higher emissions standards according to the following:

    - Project start to December 31, 2011: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 2 offroad emissions standards. In addition, all construction equipment shall be outfitted with the BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 2 or Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

    - January 1, 2012, to December 31, 2014: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 3 offroad emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

    - Post-January 1, 2015: All offroad diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

- Also, the lead agency should consider encouraging construction contractors to apply for SCAQMD "SOON" funds. The "SOON" program accelerates clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: http://www.aqmd.gov/tao/Implementation/SOONProgram.htm

RESPONSE 5.2

As stated in the comment above, the Proposed Project would result in significant construction-related impacts with respect NO_X and VOC emissions. As shown in Table IV.B-8 of the Draft EIR, significant impacts related to NO_X emissions would occur largely due to on-road hauling activities during the grading/site preparation phase, and significant impacts related to VOC (ROG) emissions would be limited

to the architectural coating phase. Specifically, during the grading/site preparation phase, a total estimate of 133 pounds per day (ppd) of NO_X emissions would be generated compared to the SCAQMD daily threshold of 100 ppd. Of the 133 ppd of NO_X, approximately 108.60 ppd would result from on-road hauling activities while only 24.33 ppd of NO_X would result from on-site construction equipment. As such, mitigation measures targeting the reduction of on-road diesel emissions and VOC emissions during architectural coating should be incorporated to the maximum extent feasible. It should be noted that there are currently no feasible project-level mitigation measures to reduce the NO_X emissions generated by the on-road sources (i.e., delivery trucks, haul trucks, concrete trucks, etc.) because it is not within the Lead Agency's authority to reduce on-road diesel engine NO_X emissions; such restrictions on vehicle emissions are governed by the state and the project would only utilize vehicles meeting those restrictions. Nevertheless, the Lead Agency has reviewed the recommendations provided by the SCAQMD and has agreed to incorporate the following mitigation measure to the maximum extent feasible. It should be noted that this mitigation measure is considered voluntary and in addition to Mitigation Measures C-1 and C-2 already required in the Draft EIR.

MM C-3 Pursuant to the SCAQMD recommendations, the Project shall implement the following measures to the extent feasible:

- Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow;
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site;
- Reroute construction trucks away from congested streets or sensitive receptor areas;
- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM10 generation;
- Use coatings and solvents with a VOC content that meet or exceed the requirements of Rule 1113;
- Construct/build with materials that do not require painting;
- Use pre-painted construction materials;
- Use high-pressure-low-volume (HPLV) paint applicators with a minimum transfer efficiency of at least 50% or other application techniques with equivalent or higher transfer efficiency;

- Use electricity from power poles rather than temporary diesel or gasoline power generators;
- Use 2010 and newer diesel haul trucks (e.g., material delivery trucks, soil import/export, and demolition export);
- Require all on-site construction equipment to meet EPA Tier 2 or higher emissions standards according to the following:
  - Project start to December 31, 2011: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 2 offroad emissions standards. In addition, all construction equipment shall be outfitted with the BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 2 or Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
  - January 1, 2012, to December 31, 2014: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 3 offroad emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
  - Post-January 1, 2015: All offroad diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

With respect to the "SOON" program, a construction contractor has not been secured for the Proposed Project and the exact details of the construction equipment fleet mix is unknown. These components will likely not be known until after the deadline for applying for the SOON program passes on May 6, 2011. However, as the Lead Agency is committed to reducing the Project's on-site construction emissions to the

maximum extent feasible, the Lead Agency will encourage the project contractor to explore programs such as SOON, should they be available at the time of project initiation.

Based on the above, the Proposed Project would reduce construction related air quality impacts to the maximum extent feasible and no further response is required.

COMMENT 5.3

Greenhouse Gas Emissions Analysis

2. The lead agency did not quantify GHG emissions from the operation of the proposed project. Further, the lead agency generally concluded that the project's GHG impacts are less than significant because events and attendance at the project site are "within the purview of the existing operations of the sports arena and the coliseum and would not result in an increase in the number of people that attend individual events at the sports arena." AQMD staff disagrees with the lead agency's conclusion that the proposed project will not result in an increase in the seating and vehicle capacity of the existing sports arena as there are no enforceable mechanisms to ensure that GHG emissions will remain at the baseline level. For example, if the new venue proves to be more popular than the existing arena, then annual attendance, and the subsequent VMT and emissions associated with the facility's operations, will not have been accounted for under CEQA. Therefore, the AQMD staff is concerned that the lead agency has not provided performance standards or emission targets to ensure that the proposed project will not impose an increase in the annual number of events held at the project site that could result in a potential net increase in the sports arena's annual GHG emissions. Without specific performance standards or emissions targets there is no enforceable mechanism to actually maintain existing GHG emissions from the proposed project. As the volume of traffic activity generated by the sports arena is considerable the lead agency should either quantify these emissions and compare them to a significance threshold or require enforceable measures that ensure that there is no net increase in GHG emissions.

RESPONSE 5.3

With respect to vehicle trips and baseline conditions, Page IV.J-6 of the Draft EIR states that the new event/soccer stadium facility replacing the Sports Arena is not expected to generate significant new traffic impacts, for the following reasons:

- With the addition of MLS soccer games, the new facility would increase the number of events held at the facility but would not increase the maximum size of the events currently held at the facility.

- Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to 93,000 people in attendance. Events and attendance proposed at the new Multiple Use Space (Option 1) or MLS Stadium facility (Option 2) are within the

purview of the existing operations of the Sports Arena and the Coliseum and would not result in an increase in the number of people that attend individual events at the Sports Arena.

- The Coliseum Commission will schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.

It is also recognized that the opening of Phase I of the Exposition Light Rail Transit (LRT) Line (currently under construction on Exposition Boulevard west of Figueroa Street) is expected to occur in 2011, before the Project is constructed. The Exposition Light Rail Transit Line would provide event attendees with access to an ever-expanding regional rail and bus transit system, providing service to downtown Los Angeles and Culver City with direct connections to the Blue Line and Red Lines, which in turn have connections to Union Station, the Gold Line and the Green Line. It is anticipated that the Exposition LRT would result in reduced auto usage by the attendees and employees at Exposition Park, providing them with an alternative mode of travel to events and reducing traffic for both ongoing and new events. This reduction in vehicle trips would further reduce the projects mobile source operational levels in comparison to the baseline conditions.

It should also be noted that while the Proposed Project could result in more events per year than existing conditions, the Proposed Project would not exceed the existing purview of the Sports Arena and Coliseum and would not be considered growth inducing. While the Proposed Project may result in an increased annual usage of the Project Site for events such as competitive sports, athletics, games, pageants, plays, celebrations, etc., the objective of the Proposed Project is not to generate an increased demand for these types of events held at the local, state or national level. Rather, consistent with the primary objectives of the Proposed Project, the proposed redevelopment would position the facility and Coliseum Commission to be competitive and marketable to accommodate the existing local, state, and national demand for those types of events. This is an important distinction to be made when discussing greenhouse gas emissions and impacts at the local, state, national and even global level. It is reasonable to assume that the Proposed Project would not result in an increase of these types of events at the global level, but rather could result in the redistribution of existing persons and related vehicle trips seeking entertainment at venues such as the Project Site.

As is currently the case at the Coliseum and Sports Arena complex, the annual event schedule (attendance and number of events) is largely dependent upon market demands for sporting and entertainment events and is speculative to predict. Furthermore, it should be noted that under Option 2, MLS Stadium, the Proposed Project will replace an existing 16,740 seat arena with a new facility with net increase of approximately 5,260 seats for purposes of accommodating an MLS team in the Los Angeles area. The Project, as compared to the construction of a stand alone facility in another location by another entity would greatly reduce the vehicle emissions traveled throughout the region and is a favorable alternative to the development of a stand alone arena in another location. In addition, in the event Option 2 accommodates one of the two teams that already play in the Los Angeles area, the Project would result in

a redistribution of trips that are already occurring within the basin and thus would not be generating new trips.

COMMENT LETTER No. 6
California Science Center
Jeffrey M. Rudolph, Executive Director
Eddie Kouyoumdjian, General Manager Exposition Park
December 20, 2010

COMMENT 6.1

Dear Mr. Lynch:

The Sixth District Agricultural Association, also known as the California Science Center (the "Science Center') and formerly the California Museum of Science and Industry (the "CMSI"), appreciates the opportunity to comment on the above mentioned Draft Environmental Impact Report (the "DEIR"). As an institution of the state of California, the Science Center is administered by a nine-member Board of Directors appointed by the Governor.

The proposed project would consist of the demolition of the existing Los Angeles Memorial Sports Arena (the "Sports Arena") and redevelopment of the project site with a new use that plans to reactivate the· underutilized project site. The Los Angeles Memorial Coliseum Commission (the "LAMCC"), as Lead Agency, is considering two different mutually exclusive future uses for the project site: a civic multiple use space, or a new-professional 22,000 seat outdoor soccer stadium. Both of these development options were analyzed in equal level of detail in the EIR to allow flexibility for the potential entitlement of either one of the two projects.

RESPONSE 6.1

This comment identifies the CSC and restates the information contained in the EIR characterizing the Proposed Project. No response is required.

COMMENT 6.2

The Science Center is a Responsible Agency under CEQA.

The Science Center is located Exposition Park, which is home to a variety of museums and attractions, including the Sports Arena. All land within Exposition Park is owned either by the State of California, the City of Los Angeles, or the LAMCC. State-owned properties comprise the majority of Exposition Park, and all State-owned properties within Exposition Park, not leased to other operating agencies, are under purview of the Board of Directors, administered either by the CAAM, the Executive Director of the

Science Center or the General Manager of Exposition Park. The properties containing the Los Angeles Memorial Coliseum (the "Coliseum") and the Sports Arena are leased by the LAMCC from the Science Center. Because the proposed project may require additional lease agreements, amendments to existing lease agreements and/or other discretionary approvals from the Science Center Board of Directors to carry out the proposed project, the Science Center is a Responsible Agency, as defined by CEQA (CEQA Guidelines Section 15381). The Final EIR should describe this designation.

RESPONSE 6.2

The LAMCC, as lead agency, acknowledges that the CSC would be a responsible agency should any additional lease agreements from the CSC, amendments to existing lease agreements to which the CSC is a party and/or other discretionary approvals under the CSC's jurisdiction that may be required to carry out the Project. The Additions and Corrections Section of this Final EIR has been updated to identify the CSC as a responsible agency.

COMMENT 6.3

State-owned properties, administered as described above, were not depicted in project maps in the DEIR.

The State, as administered through the General Manager of Exposition Park, owns parcels containing parking lots P and Q at the northeast corner of the proposed project site along Figueroa Street (known as the "Fig Pad"). Any plans to redevelop these parcels would have to be approved by the Science Center Board of Directors. Maps in the DEIR maps do not distinguish these parcels, nor are any potential impacts, specifically related to development of these parcels, discussed in the DEIR. The Final EIR should discuss specific impacts to these parcels.

RESPONSE 6.3

The Proposed Project does not include or propose any physical improvements to lots P and Q. The project location map depicted in the Draft EIR correctly identifies the project boundaries (See Figure II-1, Regional and Vicinity Map, and Figure II-2 Project Vicinity Map). As shown in these Figures, lots P and Q and clearly excluded from the project site boundaries.

Figures II-3 through II-5 in the Draft EIR depict artistic illustrative renderings that are conceptual and subject to change. These figures inaccurately depict landscaping improvements to lots P and Q. It should be noted that these areas are outside the project boundaries and will not be impacted by the Proposed Project.

COMMENT 6.4

The Science Center recommends additional coordination with the Lead Agency, California African American Museum (CAAM) and Natural History Museum to further reduce potential impacts related to air quality, noise, traffic and parking.

The DEIR recognizes that significant and unavoidable impacts will result from the proposed project with respect to construction air quality and construction-related and operational noise. Mitigation measures were applied to reduce these impacts to the extent feasible. The DEIR found that traffic and parking- . related impacts from the proposed project would be reduced to less-than-significant levels through coordinated event scheduling and by limiting combined attendance at Lead Agency-controlled venues (the Coliseum and the former Sports Arena site) to less-than 93,000 persons at any one time. However, the Science Center believes additional coordination is necessary to ensure that impacts on State-owned properties would be sufficiently minimized. At a minimum, such coordination should include the following:

- Advance notice to the Science Center, CAAM and Natural History Museum of construction schedules, activities and locations to minimize potential air quality and noise impacts on Science Center, CAAM and Natural History Museum attendees;

- Advance notice to the Science Center, CAAM and Natural History Museum of all events scheduled at venues under the control of the Lead Agency to allow better scheduling for events at the Science Center, CAAM and Natural History Museum. In this way, potential noise, traffic and parking-related impacts caused by multiple events can be minimized, and

- All possible good faith efforts to avoid scheduling events in conflict with previously scheduled significant events at the Science Center, CAAM and Natural History Museum.

RESPONSE 6.4

The LAMCC agrees to add the suggested coordination efforts as conditions of approval to all contractor agreements associated with the construction and operation of the proposed facility.

COMMNET 6.5

Consistency with the CMSI/Exposition Park Master Plan along Figueroa Street should be addressed in more detail.

The DEIR analyzed the proposed project for consistency with six general objectives of the CMSI/Exposition Park Master Plan, including Objective 2 related to landscaping, and concluded that the proposed project would be consistent with these objectives. The DEIR, however, does not specifically address potential impacts of the proposed project with respect to the landscaping improvements described

in the Master Plan at the corner parks and edge promenade along Figueroa Street, adjacent to the project site. Potential impacts to these specific areas should be addressed in more detail.

While this letter sets forth various areas of particular concern, is not intended, and should not be construed, as an exhaustive discussion of the DEIR's compliance with CEQA. In addition, the Science Center does not waive any rights it may possess or release any obligations owed to it by the LAMCC or by any other party under law or by contract. Such rights are reserved, including but not limited to, those rights and obligations contained in the ground leases and any amendments thereto between the Science Center and the LAMCC.

Thank you for the opportunity to comment on the DEIR for the proposed redevelopment of the Sports Arena.

RESPONSE 6.5

With respect to the CMSI/Exposition Park Master Plan's planned corner park at the northwest corner of Figueroa Street and Martin Luther King, Jr. Boulevard, this area is not located within the Project Site and will not be directly impacted by the Project. The LAMCC, however, is supportive of the plan's landscaping objectives for this area.

With respect to the planned promenade along the west side of Figueroa Boulevard, there are currently no plans to implement the objectives identified in the Master Plan. The Project Site includes approximately 500 feet of frontage along Figueroa Street, or approximately 20 percent of the entire length of the planned promenade between MLK and Exposition Boulevard. Both development Options defined in the EIR are setback sufficiently from Figueroa Street to accommodate any future improvements associated with a promenade streetscape. As such the Project will not conflict with the planned pedestrian linkages along the Figueroa corridor.

COMMENT LETTER No. 7

County of Los Angeles
Department of Public Works
Gail Farber, Director of Public Works
900 South Fremont Avenue
Alhambra, CA 91803
January 6, 2011 [received January 12, 2011]

COMMENT 7.1

Thank you for the opportunity to review the DEIR for the Los Angeles Memorial Sports Arena project. The project involves the demolition and removal of the existing Sports Arena and the redevelopment of

the project site with a new use that would reactivate the underutilized project site. The Los Angeles Memorial Coliseum Commission is considering two different options to redevelop the project site: a civic multiple use space, or a new professional 22,000-seat, outdoor, soccer stadium. The project site occupies approximately 15 acres of land within the southeastern portion of Exposition Park. The following comments are for your consideration and relate to the environmental document only.

Hazards-Flood/Water Quality

Although both project options identified in the DEIR reduce the amount of runoff entering the flood control system, the Los Angeles County Flood Control District has a preference for Option 1, which consists of developing an open air multiple use space, since it would reduce a much larger potion of impermeable pavement then would Option 2, and therefore, reduce a greater amount of runoff from entering the flood control system.

In order to further reduce the amount of runoff entering the flood control system, we recommend the use of permeable pavements for any new or redesigned parking lots.

If you have any questions regarding the flood/water quality comments, please contact Mr. Luis Perez at (626) 458-7161 or luperez@dpw.lacounty.gov.

Other-Building and Safety

Submit plans to Building and Safety Division for review and permit issuance. If you have any questions regarding the building and safety comment, please contact Mr. Clint Lee at (661) 222-2940 or cllee@dpw.lacounty.gov.

If you have any other questions or require additional information, please contact Mr. Toan Duong at (626) 458-4921 or tduong@dpw.lacounty.gov.

RESPONSE 7.1

This comment restates the Project characteristics and states that the Los Angeles County Flood Control District has a preference for Option 1. With respect to water runoff and water quality, Section IV.E, Hydrology and Water Quality of the Draft EIR, adequately summarizes the Project requirements with respect to the preparation and implementation of a SWPPP and SUSMP and further details project compliance with the LARWQCB's General NPDES Permit and General Waste Discharge Requirements. With respect to the request for the Project to submit plans to the LA County Department of Building and Safety, it is currently planned that all necessary plan review and permit issuance will be conducted through the City of Los Angeles Department of Building and Safety. In the event any County owned or operated facilities are impacted, the County will be contacted.

COMMENT LETTER No. 8

Summit Builders Construction Company
Jeffrey C. Stone, President
4010 Watson Plaza Drive, Suite 260
Lakewood, CA 584656
December 29, 2010

COMMENT 8.1

Dear Mr. Lynch:

These comments concern the above referenced draft Environmental Impact Report (dEIR) for the redevelopment of the Los Angeles Sports Arena (Project) which was released for public comment on November 16, 2010 through December 30, 2010. Initially, we strongly encourage that the public comment period be extended by at least thirty (30) days to ensure that the Commission obtain appropriate and complete public review and comment on the Project. While possibly unintentional by the Commission, the release of a significant Draft EIR for public review during the traditional end of the year holiday season is not conducive to obtaining full public review and comment on the document. In fact, holiday-timed public review has been used as a strategic advantage for controversial project to avoid meaningful comments on projects in the past. The California Supreme Court has repeatedly emphasized the importance of the public's role in the CEQA process (see *Laurel Heights Improvement Association v. Regents of University of California* (1988) 47 Cal 3rd 376). The Court has found that CEQA rests on the "belief that citizens can make important contributions to environmental protection and … notions of democratic decision making…" (*Concerned Citizens of Coats Mesa, Inc. v. 32nd District Agricultural Association* (1986) 42 Cal 3d 929). While the release of a sizeable draft environmental document for a 45 day public comment period may seek technical compliance with CEQA review requirements, doing so during the holiday season compromises the intent of public involvement in the environmental process.

RESPONSE 8.1

The Draft EIR was circulated for the required 45-day review period and the commenter's request to extend the comment period is not warranted. As noted in Comment Letter 1, the State Clearinghouse has acknowledged that the lead agency has complied with the State Clearinghouse review requirements for draft environmental documents pursuant to CEQA. In addition, it should be noted that the lead agency has accepted late comment letters that were received after the close of the official review period.

COMMENT 8.2

The dEIR identifies the Los Angeles Memorial Coliseum Commission (Commission) as the lead agency for this Project under CEQA. This identification is erroneous. CEQA does not grant a local public entity additional powers, independent of those granted by other laws, (See CEQA Guidelines 15040 (b), *Sierra Club v. California Coastal Commission* (2005) 35 Cal 4th 839, 858-860, and *Kenneth Mebane Ranches v*

Superior Court (5th Dist. 1992) 10 Cal App 4th 276, 291). The dEIR correctly states that the Commission was created as a separate legal entity pursuant to a Joint Powers Agreement between the City of los Angeles, County of Los Angeles, and the Sixth District Agricultural Association. However, the authority of the separate legal entity is limited and specific to the management and control of the Coliseum and Sports Arena facilities.

Paragraph 12 of the Joint Powers Agreement provides:

> lease, license, rent, use or permit the use of all or part of the Coliseum and Sports Arena to any person, for competitive sports, athletics, games, pageants, parades, plays, celebrations, patriotic gatherings, public recreation, motion picture production, or public gatherings, or such other events as are deemed appropriate, or for City, County, or District affairs, or viewing of any of the foregoing, and particularly to develop, and promote a wider use of the Coliseum and Sports Arena, through the presentation of festivals, pageants, games, exhibits, industrial, horticultural or agricultural shows, or international character, primarily to the end that the citizens and public generally may enjoy and receive the greatest benefit possible from the Coliseum and Sports Arena, and the City, and County and the District may more effectively exploit their climatic, geographical, recreational, cultural, and commercial resources and advance. (emphasis added)

This specific and limited authority includes the management of the facilities, but does not include the demolition and replacement of the facilities, which is the defined purpose of the redevelopment project. The dEIR takes the quantum leap that the Commission is charged with planning the long-term use and operation of the "Sports Arena Property," ignoring its mandate to focus its efforts on the Sports Arena *facility*. It is clear that the Joint Powers Agreement does not give the Commission *carte blanche* on the development of new uses of the property.

The dEIR does not address how the Commission is able to direct the demolition of the Sports Arena without legislative authority to do so. Absent such legislative authority, the Commission is unable to be identified as the lead agency which can take the discretionary action proposed by the Project other than adopting the "No-project Alternative." In addition, given the clear legislative intent provided by the JPA Agreement, the Commission must be focusing on how the Sports Arena facility can best be used. However, the dEIR does not even address an option to renovated and improve the existing facility, which is the only development option available for the Commission to approve.

RESPONSE 8.2

The LAMCC has been advised and believes that it maintains the authority to implement the proposed project as defined in the Draft EIR. The Joint Powers Agreement and the ground lease empower the LAMCC to be the designated lead agency for the Proposed Project. It should further be noted that the NOP and Draft EIR were circulated to the State Clearinghouse and distributed to all applicable state, regional and local agencies. No other state or local agency has asserted the lead agency role in implementing the project.

COMMENT 8.3

CEQA mandates that an EIR look at a "reasonable range of alternatives to the project, or the location of the project, that could feasibly attain the most basic objectives of the project." (CEQA Guidelines 15126.6(a), (f)) The dEIR defines the Project objective very broadly as planning the Sports Arena property for long-term use and operation for income generation and public uses. (footnote: As previously stated, this project objective exceed the authority of the Commission). The dEIR then limits the "reasonable range of alternatives" to two options, both of which call for the demolition of the facility and the development of either an open-air venue or a Major League soccer stadium. In order to approach the adequacy of an alternatives analysis required by CEQA, the Commission must include analysis of the renovation of the Sports Arena facility as an alternative to meet the Project objective, and recirculate this analysis for public review. If the Commission obtains a legislative extension of its powers to plan the demolition of the Sports Arena and redevelopment of the site, the Commission should develop a larger range of alternatives which support the objective of income generation and public use, and this enlarged number of alternatives should be analyzed and presented for public review. Absent such additional, meaningful alternatives analysis, the dEIR is fatally defective and fails to comply with the mandates of CEQA.

RESPONSE 8.3

An evaluation of the Project Alternatives was included in the Draft EIR (see Section VI, Alternatives, beginning on page VI-1 of the Draft EIR). Section VI, Alternatives was inadvertently omitted from the Table of Contents in the Draft EIR; however it was included in the document and was summarized on page I-6 of Section I, Introduction/Summary. This correction has been noted in Section II, Additions and Corrections, of this Final EIR.

The reader is referred to Section VI, Alternatives of the Draft EIR. In addition to evaluating two separate project options to redevelop the Project Site, the Draft EIR includes an analysis of two project alternatives: the No Project Alternative (as mandated by CEQA), and a Historic Retention Alternative.

COMMENT 8.4

Moreover, in its current state, the Commission is not authorized to render a decision on any project alternative other than the no-project alternative. As such, the presentation of a single feasible alternative fails to satisfy the CEQA mandate to present a reasonable range of alternatives in the analysis.

We look forward to reviewing a revised and improved document once circulated by the Commission.

RESPONSE 8.4

The assertion that LAMCC does not have authority to demolish the Sports Arena and carry out the Proposed Project is not a CEQA issue. In any event the demolition and carrying out of the Proposed

Project(s) would be consistent and in compliance with the Commission's mission under the JPA and ground lease to maintain and operate a first class arena, pavilion or stadium on the project site for public events.

This page left intentionally blank.

IV. MITIGATION MONITORING PROGRAM

INTRODUCTION

This section reflects the mitigation monitoring and reporting program (MMRP) requirements of Public Resources Code Section 21081.6. CEQA Guidelines Section 15097 states:

> *In order to ensure that the mitigation measures and project revisions identified in the EIR or negative declaration are implemented, the public agency shall adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects. A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity which accepts the delegation; however, until mitigation measures have been completed the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program.*

ENFORCEMENT

In accordance with CEQA, the primary responsibility for making a determination with respect to potential environmental effects rests with the lead agency rather than the Monitor or preparer of the EIR. As such, the Los Angeles Memorial Coliseum Commission (LAMCC) is identified as the enforcement agency for this Mitigation Monitoring and Reporting Program.

PROGRAM MODIFICATION

After review and approval by the lead agency, minor changes to the MMRP are permitted but can only be made by the Commission. No deviations from this program shall be permitted unless the MMRP continues to satisfy the requirements of Section 21081.6 of the California Environmental Quality Act (CEQA), as determined by the Lead Agency.

MITIGATION MONITORING AND REPORTING PROGRAM

The organization of the MMRP follows the subsection formatting style as presented within the Draft EIR. Subsections of all of the environmental chapters presented in the Draft EIR are provided below in Table IV-1. For environmental issue areas where no mitigation measures were required, the MMRP is noted accordingly.

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
Aesthetics					
MM A-1 Outdoor lighting shall be designed and installed with shielding, such that the light source cannot be seen from adjacent residential properties or the public right-of-way. MM A-2 The exterior of the proposed structure shall be constructed of materials such as, but not limited to, high-performance and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize glare and reflected heat.	Field check to confirm measures are implemented.	Pre-construction. Construction.	LAMCC		
Air Quality					
MM B-1 The Project Applicant shall comply with SCAQMD Rule 403—Fugitive Dust. Examples of the types of dust control measures currently required and recommended include, but are not limited to, the following: • Water active grading/excavation sites and unpaved surfaces at least three times daily; • Sweep daily (with water sweepers) all paved construction parking areas and staging areas; • Provide daily clean-up of mud and dirt carried onto paved streets from the site; • Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site; • Suspend excavation and grading activity when winds (instantaneous gusts) exceed 15 miles per hour over a 30-minute period or more; and • An information sign shall be posted at the entrance to each construction site that identifies the permitted construction hours and provides a telephone number to call and receive information about the construction project or to report	Field check to confirm measures are implemented.	Pre-construction. Construction.	LAMCC		

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
complaints regarding excessive fugitive dust generation. Any reasonable complaints shall be rectified within 24 hours of their receipt.					
MM B-2 The Project Applicant shall use low VOC paints for all interior and exterior surfaces.					
MM C-3 Pursuant to the SCAQMD recommendations, the Project shall implement the following measures to the extent feasible:					
• Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow;					
• Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site;					
• Reroute construction trucks away from congested streets or sensitive receptor areas;					
• Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM10 generation;					
• Use coatings and solvents with a VOC content that meet or exceed the requirements of Rule 1113;					
• Construct/build with materials that do not require painting;					
• Use pre-painted construction materials;					
• Use high-pressure-low-volume (HPLV) paint applicators with a minimum transfer efficiency of at least 50% or other application techniques with equivalent or higher transfer efficiency;					
• Use electricity from power poles rather than temporary diesel or gasoline power generators;					
• Use 2010 and newer diesel haul trucks (e.g., material delivery trucks, soil import/export, and demolition export);					

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
• Require all on-site construction equipment to meet EPA Tier 2 or higher emissions standards according to the following: o Project start to December 31, 2011: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 2 offroad emissions standards. In addition, all construction equipment shall be outfitted with the BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 2 or Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. o January 1, 2012, to December 31, 2014: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 3 offroad emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. o Post-January 1, 2015: All offroad diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.					

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification

				Initial	Date
the issuance of building permits. MM E-2 The Project Applicant must prepare and implement a SUSMP, in accordance with the LA County RWQCB MS4 Program. The SUSMP shall be submitted and prepared to the satisfaction of the City of Los Angeles Department of Building and Safety. MM E-3 The Project Applicant must comply with LARWQCB's General NPDES Permit and General Waste Discharge Requirements (WDRs) (Order No. R4-2003-0111, NPDES No. CAG994004) governing construction-related dewatering discharges (the "General Dewatering Permit").					
Land Use and Zoning					
MM.F-1. The Los Angeles Memorial Coliseum Commission shall obtain all applicable permits from the Building and Safety Department (and other state and municipal agencies, as may be required) for Project construction actions associated with implementation of either Option 1 or Option 2 including, but not limited to a height variance.	Plan Approval	Pre-Construction	LAMCC		
Noise					
Code Required Measures CR G-1 The Applicant shall comply with the City of Los Angeles Noise Ordinance No. 144,331 and 161,574, and any subsequent ordinances, which prohibit the emission or creation of noise beyond certain levels at adjacent uses unless technically infeasible. CR G-2 The Applicant shall ensure construction and demolition be restricted to the hours of 7:00 AM to 6:00 PM Monday through Friday, and 8:00 AM to	Field check to confirm measures are implemented.	Pre-construction, Construction, Operation.	LAMCC		

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
6:00 PM on Saturday.					
Project-Specific Mitigation Measures					
MM G-1 The Applicant shall prepare a construction-related traffic plan detailing proposed haul routes and staging areas for the transportation of materials and equipment, with consideration for sensitive uses in the neighborhood. A traffic and parking plan for the construction phase will be submitted for approval by LADOT and the Department of Building and Safety prior to the issuance of any permits.					
MM G-2 The Applicant shall ensure all construction equipment engines be properly tuned and muffled according to manufacturers' specifications. For example, Table IV.G-6 indicates that noise levels of 82 dBA at 50 feet could be reduced to a noise level of 76 dBA at 100 feet with the proper use of mufflers.					
MM G-3 Adjacent museums and residents shall be given regular notification of major construction activities and their durations. A visible and readable sign (at a distance of 50 feet) shall be posted on the construction site identifying a telephone number where residents can inquire about the construction process and register complaints.					
MM G-4 The perimeter of the Project Site shall be enclosed with a temporary barrier wall for security and noise protection purposes. This barrier wall shall consist of a solid, heavy vinyl material or ¾-inch plywood positioned to block direct line of sight from the active construction areas and other open space areas and sensitive uses.					

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
Public Services – Fire Protection Services					
MM H.1-1 Sprinkler systems will be required throughout any structure to be built, consistent with the LAMC requirements for public venue structures (Section 57.09.07). MM H.1-2 All first-story portions of any commercial or industrial building must be within 300 feet of an approved fire hydrant (Section 57.09.06, Subsection B-1). MM H.1-3 The maximum distance between fire-flow hydrants on the roads and fire lanes in a high-density residential and commercial area is 300 feet. MM H.1-4 Any person owning or having control of any facility, structure, group of structures or premises shall provide and maintain Fire Department access (Section 57.09.03, Subsection A). MM H.1-5 If any portion of the first story exterior walls of any building structure is more than 150 feet from the edge of the roadway of an approved street, an approved fire lane shall be provided so that such portion is within 150 feet of the edge of the fire lane. (Section 57.09.03, Subsection B.) MM H.1-6 When required access is provided by an improved street, fire lane or combination of both which results in a dead-end in access of 700 feet in length from the nearest cross street, at least one additional ingress-egress roadway shall be provided in such a manner that an alternative means of ingress-egress is accomplished (Section 57.09.03, Subsection C). MM H.1-7 All public and private streets shall be dedicated and improved in conformance with Board of Public Works, Standard Dimension Plan, Number D-22549. MM H.1-8 Construction of public or private roadways in the proposed development shall not exceed 15 percent	Field check to confirm measures are implemented.	Pre-construction, Construction.	LAMCC		

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
in grade. MM H.1-9 Fire lanes, where required, and dead ending streets, shall terminate in a cul-de-sac or other approved turning area. MM H.1-10 All access roads, including fire lanes, shall be maintained in an unobstructed manner. Removal of obstructions shall be at the owner's expense. The entrance to all required fire lanes or required private driveways shall be posted with a sign no less than three square feet in area (Section 57.09.05). MM H.1-11 Fire lane width shall not be less than 20 feet. When a fire lane must accommodate the operation of Fire Department aerial ladder apparatus or where fire hydrants are installed, those portions shall not be less than 28 feet in width. The Fire Department may require additional vehicular access where buildings exceed 28 feet in height. MM H.1-12 In the event that a subterranean parking structure is included as a part of the Proposed Project, and where fire apparatus will be driven onto the road level surface of such subterranean parking structure, that structure shall be engineered to withstand a bearing pressure of 8,600 pounds per square foot.					
Public Services – Police Protection Services					
H.2-1 The Project shall erect temporary fencing around the Project Site during construction activities to secure the Project Site and discourage trespassers. H.2-2 Project Event Sponsors shall employ private security guards to monitor and secure the Project Site during events to secure the site and deter any potential criminal activity. H.2-3 The Project Applicant shall develop and implement a Security Plan in consultation with the	Field check to confirm measures are implemented.	Pre-construction, Construction, Operation.	LAMCC		

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
LAPD outlining the security services and features to be provided in conjunction with the Proposed Project. The plan shall be coordinated with the LAPD and a copy of said plan shall be filed with the LAPD Central Bureau Commanding Officer. Said security plan may include some or all of the following components: i. Provisions for an on-site private security force for the mixed-use trade school. Through individual lease agreements for the proposed trade school/retail uses, private on-site security services shall provide a 24-hour presence. Security officers shall be responsible for patrolling all common areas including the back service corridors and alleys, parking garages, and stairwells. ii. The parking garage shall be fitted with emergency features such as closed circuit television (CCTV) or emergency call boxes that would provide a direct connection with the on-site security force or the LAPD 911 emergency response system. iii. The proposed security plan shall incorporate low-level and directional security lighting features to effectively illuminate project entryways, seating areas, lobbies, elevators, service areas, and parking areas with sufficient illumination and minimum dead space to eliminate areas of concealment. Full cut-off fixtures shall be installed that minimize glare from the light source and provide light downward and inward to structures to maximize visibility.					
Public Utilities - Wastewater					
No mitigation measures are required.	N/A	N/A	N/A	N/A	N/A
Public Utilities – Water					
MM I.2-1 The Project shall comply with Ordinance No. 170,978 (Water Management Ordinance), which imposes numerous water conservation measures in	Field check to confirm measures are implemented.	Pre-construction, Construction, Operation.	LAMCC		

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
landscape, installation, and maintenance (e.g., use drip irrigation and soak hoses in lieu of sprinklers to lower the amount of water lost to evaporation and overspray, set automatic sprinkler systems to irrigate during the early morning or evening hours to minimize water loss due to evaporation, and water less in the cooler months and during the rainy season). In addition, the Department of Water and Power requires the following conservation measures for all new development in the City of Los Angeles: • High efficiency toilets (1.28 gallons per flush or less, includes dual flush); • High efficiency urinals (0.5 gallons per flush or less, includes waterless); • Restroom faucet flow rate of 1.5 gallons per minute or less; • Public restroom self-closing faucets; • Showerhead flow rate of 2.0 gallons per minute or less; • Limit of one showerhead per shower stall; • High efficiency clothes washers (water factor of 6.0 or less); • High efficiency dishwashers (Energy Star rated); • Use of tankless and on-demand water heaters as feasible; • Cooling towers must be operated at a minimum of 5.5 cycles of concentration; • Require onsite water recycling systems for wastewater discharge for commercial laundries, dye houses, food processing, certain manufacturing operations, etc. (subject to a payback threshold of five years or less). Mandate water recycling system for all new car wash facilities. • Strict prohibition of single-pass cooling; (Note:					

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
Single pass cooling refers to the use of potable water to extract heat from process equipment) • Irrigation system requirements: o Weather-based irrigation controller with rain shutoff; o Flow sensor and master valve shutoff (large landscapes); o Matched precipitation (flow) rates for sprinkler heads; o Drip/microspray/subsurface irrigation where appropriate; o Minimum irrigation system distribution uniformity of 75 percent; o Proper hydro-zoning, turf minimization and use of native/drought tolerant plant materials; o Use of landscape contouring to minimize precipitation runoff; • Metering: o All irrigated landscapes of 5,000 square feet or more require separate metering or submetering; • Mandated use of recycled water (where available) for appropriate end uses (irrigation, cooling towers, sanitary); • Standard Urban Stormwater Mitigation Plan (SUSMP): Compliance with all City of Los Angeles SUSMP requirements, and encouraging implementation of Best Management Practices that have stormwater recharge or reuse benefits.					
Public Utilities – Energy Conservation					
MM I.3-1 Built-in appliances, refrigerators, and space-conditioning equipment shall exceed the minimum efficiency levels mandated in the California Code of Regulations.	Field check to confirm measures are implemented.	Pre-construction, Construction, Operation.	LAMCC		

Mitigation Measure/Condition of Approval	Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
				Initial	Date
MM I.3-2 The Project Applicant shall install high-efficiency air conditioning controlled by a computerized energy-management system in the office and retail spaces that provides the following: • A variable air-volume system that results in minimum energy consumption and avoids hot water energy consumption for terminal reheat; • A 100-percent outdoor air-economizer cycle to obtain free cooling in appropriate climate zones during dry climatic periods; • Sequentially staged operation of air-conditioning equipment in accordance with building demands; and • The isolation of air conditioning to any selected floor or floors. MM I.3-3 The project shall be designed in a manner that utilizes Cascade (i.e., passively transferred) ventilation air from high-priority areas before being exhausted, thereby decreasing the volume of ventilation air required. For example, air could be passively transferred from occupied space to corridors and then to mechanical spaces before being exhausted. MM I.3-4 The Applicant shall incorporate a recycle lighting system heat for space heating during cool weather. Exhaust lighting-system heat from the buildings, via ceiling plenums, shall be used to reduce cooling loads in warm weather. MM I.3-5 The Applicant shall install low and medium static-pressure terminal units and ductwork to reduce energy consumption by air-distribution systems. MM I.3-6 The Applicant shall ensure that buildings are well sealed to prevent outside air from infiltrating and increasing interior space-conditioning loads. Where applicable, building					

Mitigation Measure/Condition of Approval		Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
					Initial	Date
	entrances shall be designed with vestibules to restrict infiltration of unconditioned air and exhausting of conditioned air.					
MM I.3-7	The Applicant shall conduct a performance check of the installed space-conditioning system prior to issuance of the certificate of occupancy to ensure that energy-efficiency measures incorporated into the Project operate as designed.					
MM I.3-8	Exterior walls shall be finished with light-colored materials and high-emissivity characteristics to reduce cooling loads. Interior walls shall be finished with light-colored materials to reflect more light and, thus, increase lighting efficiency.					
MM I.3-9	White, high albedo, and reflective material shall be used for roofing in order to meet California standards for reflectivity and emissivity to reject heat.					
MM I.3-10	Thermal insulation that exceeds requirements established by the California Code of Regulations shall be installed in walls and ceilings.					
MM I.3-11	Window systems shall be designed to reduce thermal gain and loss, thus reducing cooling loads during warm weather and heating loads during cool weather.					
MM I.3-12	The Project Applicant shall install heat-rejecting window treatments, such as films, blinds, draperies, or others on appropriate exposures.					
MM I.3-13	The Project Applicant shall install fluorescent and high-intensity-discharge (HID) lamps, which give the highest light output per watt of electricity consumed, wherever possible including all street and parking lot lighting to reduce electricity consumption. Reflectors shall be used to direct maximum levels of light to					

Mitigation Measure/Condition of Approval		Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
					Initial	Date
	work surfaces.					
MM I.3-14	The Project Applicant shall install photosensitive controls and dimmable electronic ballasts to maximize the use of natural daylight available and reduce artificial lighting load.					
MM I.3-15	The Project Applicant shall install occupant-controlled light switches and thermostats to permit individual adjustment of lighting, heating, and cooling to avoid unnecessary energy consumption.					
MM I.3-16	The Project Applicant shall install time-controlled interior and exterior public area lighting limited to that necessary for safety and security.					
MM I.3-17	Mechanical systems (HVAC) and lighting buildings shall be controlled with timing systems to prevent accidental or inappropriate conditioning or lighting of unoccupied space.					
MM I.3-18	The Project Applicant shall incorporate windowless walls or passive solar inset of windows into the Project for appropriate exposures.					
MM I.3-19	Design Project shall focus pedestrian activity within sheltered outdoor areas.					
Public Utilities – Solid Waste						
MM I.4-1	The Project Applicant shall develop a construction and demolition debris recycling program to divert construction related solid waste and demolition debris from area landfills.	Field check to confirm measures are implemented.	Pre-construction, Construction, Operation.	LAMCC		
MM.I.4-2	The Project Applicant shall develop an operational project recycling plan that includes the design and allocation of recycling collection and storage space in the Project.					
Transportation, Traffic and Parking						
MM J-1	Combined with the Coliseum, the campus supervised by the Coliseum Commission currently holds events ranging from 500 to	Field check to confirm measures are implemented.	Pre-construction, Construction, Operation.	LAMCC		

Mitigation Measure/Condition of Approval		Action Required	Monitoring Phase	Responsible Agency	Compliance Verification	
					Initial	Date
	93,000 people in attendance. The Coliseum Commission shall schedule events at the two facilities in such a manner that the event attendance size at the two venues combined does not exceed 93,000 people.					
MM J-2	The Coliseum Commission shall coordinate with Metro Bus Operation Control Special Events Coordinator at 213-922-4632 and LADOT Staff regarding construction activities that may affect Metro and LADOT bus line operations.					
V. General Impact Categories						
MM V-1	If any archaeological or paleontological materials are encountered during the course of the project development, the project shall be halted in the immediate area of discovery. The services of a professional archaeologist or paleontologist shall be secured by contacting the Center for Public Archaeology - Cal State University Fullerton, or a member of the Society of Professional Archaeologist (SOPA) or a SOPA-qualified archaeologist and/or the Center for Public Paleontology - USC, UCLA, Cal State Los Angeles, Cal State Long Beach, or the County Museum to assess the resources and evaluate the impact;	Field check to confirm measures are implemented.	Construction.	LAMCC, NAHC		
MM V-2	Copies of the archaeological or paleontological surveys, studies or reports shall be submitted to the UCLA Archaeological Information Center. No additions or corrections to this Section of the Draft EIR were required.

Dear Patrick Lynch:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on December 31, 2010, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Scott Morgan

Document Details Report
State Clearinghouse Data Base

SCH# 2010041059
Project Title Los Angeles Memorial Sports Arena
Lead Agency Los Angeles Memorial Coliseum Commission

Type EIR Draft EIR

Description The Proposed Project would consist of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the under-utilized Project Site. In an effort to be responsive to changing community needs and market conditions, the Los Angeles Memorial Coliseum Commission is considering two different and mutually exclusive future uses for the Project Site: a civic multiple use space, or a new professional 22,000 seat outdoor soccer stadium. Both of these development options will be analyzed in an equal level of detail in the EIR to allow flexibility for the potential entitlement of either one of the two projects.

STATE CLEARING HOUSE

December 14, 2010

Mr. Shane Parker, CAJA

The Los Angeles Memorial Coliseum Commission
3911 South Figeroa Street
Los Angeles, CA 90037

Re: SCH#2010041059; CEQA Notice of Completion; draft Environmental Impact Report (DEIR) for the **Los Angeles Memorial Sports Arena;** located south of downtown Los Angeles near S. Figeroa Street & Martin Luther King Jr. Boulevard; Los Angeles County, California

Dear Mr. Parker:

The Native American Heritage Commission (NAHC) is the state 'trustee agency' pursuant to Public Resources Code §21070 for the protection and preservation of California's Native American Cultural Resources. (Also see *Environmental Protection Information Center v. Johnson (1985) 170 Cal App. 3rd 604).* The California Environmental Quality Act (CEQA - CA Public Resources Code §21000-21177, amendment effective 3/18/2010) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the California Code of Regulations §15064.5(b)(c)(f) CEQA guidelines). Section 15382 of the CEQA Guidelines defines a significant impact on the environment as "a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ...objects of historic or aesthetic significance. The lead agency is required to assess whether the project will have an adverse impact on these resources within the 'area of potential effect (APE), and if so, to mitigate that effect. State law also addresses Native American Religious Expression in Public Resources Code §5097.9. The NAHC notes from a review of the Initial Study for the project that the State of California Native American Heritage Commission is not listed as a 'responsible' or trustee' agency with jurisdiction for this project. The State Historic Preservation Office is noted, but it has responsibility for applicable federal not state laws.

The Native American Heritage Commission did perform a Sacred Lands File (SLF) search in the NAHC SLF Inventory, established by the Legislature pursuant to Public Resources Code §5097.94(a) and Native American Cultural Resources **were NOT identified** within one-half mile of several of the Area of Potential Effect (APE). But, it is important to understand that the absence of archaeological, Native American cultural resources in an area does not indicate that they are not present, or will be present once ground-breaking activity begins. The NAHC recommends early consultation with Native American tribes in your area as the best way to avoid unanticipated discoveries once a project is underway and to learn of any sensitive cultural areas. Enclosed are the names of the culturally affiliated tribes and interested Native American individuals that the NAHC recommends as 'consulting parties,' for this purpose, that may have knowledge of the religious and cultural significance of the historic properties in the project area (e.g. APE). A Native American Tribe or Tribal Elder may be the only source of information about a cultural resource.. Also, the NAHC recommends that a Native American Monitor or Native American culturally knowledgeable person be employed whenever a professional

archaeologist is employed during the 'Initial Study' and in other phases of the environmental planning processes.

Furthermore the NAHC recommends that you contact the California Historic Resources Information System (CHRIS) of the Office of Historic Preservation (OHP), for information on recorded archaeological data. This information is available at the OHP Office in Sacramento (916) 445-7000.

Consultation with tribes and interested Native American tribes and interested Native American individuals, as consulting parties, on the attached NAHC list, should be conducted in compliance with the requirements of federal NEPA (42 U.S.C. 4321-43351) and Section 106 and 4(f) of federal NHPA (16 U.S.C. 470 [f]*et seq.),* 36 CFR Part 800.3, .4 & .5, the President's Council on Environmental Quality (CSQ; 42 U.S.C. 4371 *et seq.*) and NAGPRA (25 U.S.C. 3001-3013), as appropriate. The 1992 *Secretary of the Interior's Standards for the Treatment of Historic Properties* were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including *cultural landscapes.* Consultation with Native American communities is also a matter of environmental justice as defined by California Government Code §65040.12(e).

Lead agencies should consider avoidance, as defined in Section 15370 of the California Environmental Quality Act (CEQA) when significant cultural resources could be affected by a project. Also, Public Resources Code Section 5097.98 and Health & Safety Code Section 7050.5 provide for provisions for accidentally discovered archeological resources during construction and mandate the processes to be followed in the event of an accidental discovery of any human remains in a project location other than a 'dedicated cemetery'. Discussion of these should be included in your environmental documents, as appropriate.

The authority for the SLF record search of the NAHC Sacred Lands Inventory, established by the California Legislature, is California Public Resources Code §5097.94(a) and is exempt from the CA Public Records Act (c.f. California Government Code §6254.10). The results of the SLF search are confidential. However, Native Americans on the attached contact list are not prohibited from and may wish to reveal the nature of identified cultural resources/historic properties. Confidentiality of "historic properties of religious and cultural significance' may also be protected the under Section 304 of the NHPA or at the Secretary of the Interior' discretion if not eligible for listing on the National Register of Historic Places. The Secretary may also be advised by the federal Indian Religious Freedom Act (cf. 42 U.S.C, 1996) in issuing a decision on whether or not to disclose items of religious and/or cultural significance identified in or near the APE and possibly threatened by proposed project activity.

CEQA Guidelines, Section 15064.5(d) requires the lead agency to work with the Native Americans identified by this Commission if the initial Study identifies the presence or likely presence of Native American human remains within the APE. CEQA Guidelines provide for agreements with Native American, identified by the NAHC, to assure the appropriate and dignified treatment of Native American human remains and any associated grave liens. Although tribal consultation under the California Environmental Quality Act (CEQA; CA Public Resources Code Section 21000 – 21177) is 'advisory' rather than mandated, the NAHC does request 'lead agencies' to work with tribes and interested Native American individuals as 'consulting parties,' on the list provided by the NAHC in order that cultural resources will be protected. However, the 2006 SB 1059 the state enabling legislation to the Federal Energy Policy Act of 2005, does mandate tribal consultation for the 'electric transmission corridors. This

is codified in the California Public Resources Code, Chapter 4.3, and §25330 to Division 15, requires consultation with California Native American tribes, and identifies both federally recognized and non-federally recognized on a list maintained by the NAHC

Health and Safety Code §7050.5, Public Resources Code §5097.98 and Sec. §15064.5 (d) of the California Code of Regulations (CEQA Guidelines) mandate procedures to be followed, including that construction or excavation be stopped in the event of an accidental discovery of any human remains in a location other than a dedicated cemetery until the county coroner or medical examiner can determine whether the remains are those of a Native American. . Note that §7052 of the Health & Safety Code states that disturbance of Native American cemeteries is a felony.

Please feel free to contact me at (916) 653-6251 if you have any questions.

Sincerely,

Dave Singleton
Program Analyst

Re: IGR/CEQA No. 101140AL-DEIR
Los Angeles Memorial Sports arena
Vic. LA-110 / PM 19.50

Mr. Patrick Lynch, General Manager
Los Angeles Memorial Coliseum Commission
3939 S. Figueroa St.
Los Angeles, CA 90037

Dear Mr. Lynch:

Thank you for including the California Department of Transportation (Department) in the environmental review process for the above referenced project. The proposed project consists of the demolition and removal of the existing Sports Arena and the redevelopment of the Project Site with a new use that would reactivate the underutilized Project Site. There are two options for the future uses. Option 1 consists of a Multiple Use Space for civic and special event gatherings. Option 2 is a Major League Soccer Stadium with approximately 22,000 seats.

Appendix F: Traffic Memorandum, does not include project traffic generation and future traffic data for either option. The trip generation and traffic analysis will indicate whether the new development will generate additional traffic to local streets, including the freeways.

The existing Sports Arena is an indoor facility with 16,740 seats and has hosted a variety of sporting events including boxing, professional and college basketball, and hockey. The proposed event/soccer stadium, under Option 2, would provide a maximum of 22,000 seats. There is an increase of 5,260 seats for the soccer stadium, which results in more vehicles on the streets. This will add more vehicles to the State highway facilities, including I-10 and I-110 which are located in the project vicinity and are currently operating at the Level of Service (LOS) E/F.

During Caltrans review of The USC Master Plan, from Gibson Transportation Consulting, Inc. dated September 30, 2010, it was noted that Table 2 indicated that I-110 southbound (SB) off-ramp and Martin Luther King, Jr. Blvd. will operate at LOS E/F during the AM/PM Peak hours in 2035.

As per your telephone conversation with Alan Lin, Project Coordinator, on December 28, 2010, the Los Angeles Memorial Coliseum Commission is aware of the potential traffic impact to the State facilities from the State's perspective and will request future applicants to mitigate future impacts, at I-110 SB off-ramp and Martin Luther King, Jr. Blvd. As a result of the traffic discussion, Los Angeles Memorial Coliseum Commission has agreed to condition the project and request the future applicant to pay $200,000 as its fair share of mitigating freeway impacts on I-110 and I-10. These funds may be used to prepare a Project Study Report for the extension of the

I-110 high occupancy vehicle lanes into downtown Los Angeles or any State improvement project in the project vicinity.

If you have any questions, please feel free to contact me at (213) 897-9140 or Alan Lin the project coordinator at (213) 897-8391 and refer to IGR/CEQA No. 101140AL.

Sincerely,

DIANNA WATSON
IGR/CEQA Branch Chief

Los Angeles, CA 90037

Dear Mr. Lynch:

Los Angeles County Metropolitan Transportation Authority (Metro) is in receipt of the Los Angeles Memorial Sports Arena project. The following should be addressed in the Final EIR:

Metro bus service could be impacted by the project. Metro Bus Operations Control Special Events Coordinator should be contacted at 213-922-4632 regarding construction activities that may impact Metro bus lines. LADOT may also be impacted and therefore should be included in construction outreach efforts.

Metro looks forward to reviewing the Final EIR. If you have any questions regarding this response, contact me at 213-922-2836 or by email at hartwells@metro.net. Please send the Final EIR to the following address:

Metro CEQA Review Coordination

Review of the Draft Environmental Impact Report (Draft EIR)
for the Los Angeles Memorial Sports Arena Redevelopment Project

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are intended to provide guidance to the lead agency and should be incorporated into the final Environmental Impact Report (EIR) as appropriate.

The AQMD staff is concerned about the proposed project's significant air quality impacts resulting from construction related activities. Specifically, the proposed project will exceed the AQMD's CEQA thresholds applicable to oxides of nitrogen (NOX) and volatile organic compounds (VOC's), therefore, the AQMD staff requests that the lead agency minimize or eliminate these impacts in accordance with CEQA Guidelines §15370. Further, AQMD staff requests that the lead agency provide enforceable mitigation to ensure that the proposed project does not result in a net increase of greenhouse gas (GHG) emissions.

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the adoption of the final EIR. Further, staff is available to work with the lead agency to address these issues and any

questions related to air quality that may arise. Please contact Dan Garcia, Air Quality Specialist CEQA Section, at (909) 396-3304, if you have any questions regarding the enclosed comments.

Sincerely,

Ian MacMillan
Program Supervisor, CEQA Inter-Governmental Review
Planning, Rule Development & Area Sources

Control Number

Mitigation for Construction Activities

1. Given that the draft EIR demonstrates that regional NOX and VOC criteria pollutant emissions during construction create significant adverse air impacts the AQMD staff recommends that the lead agency require mitigation pursuant to CEQA Guidelines §15370, which could minimize or eliminate these significant impacts. To assist the lead agency with identifying possible mitigation measures for the project, please refer to AQMD's CEQA webpage at the following internet address: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.htm. Further, a list of mitigation measures has been provided below.

- Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow,
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site,
- Reroute construction trucks away from congested streets or sensitive receptor areas,
- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM10 generation,
- Improve traffic flow by signal synchronization, and ensure that all vehicles and equipment will be properly tuned and maintained according to manufacturers' specifications,
- Use required coatings and solvents with a VOC content lower than required under Rule 1113,
- Construct/build with materials that do not require painting,
- Use pre-painted construction materials,
- Require the use of high-pressure-low-volume (HPLV) paint applicators with a minimum transfer efficiency of at least 50% or other application techniques with equivalent or higher transfer efficiency,
- Require the use of electricity from power poles rather than temporary diesel or gasoline power generators,
- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks, soil import/export, and demolition export), and
- Require all on-site construction equipment to meet EPA Tier 2 or higher emissions standards according to the following:

  - ✓ Project start to December 31, 2011: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 2 offroad emissions standards. In addition, all construction equipment shall be outfitted with the BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 2 or Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

  - ✓ January 1, 2012, to December 31, 2014: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 3 offroad emissions standards. In addition, all construction equipment shall be outfitted with

BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- ✓ Post-January 1, 2015: All offroad diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

- Also, the lead agency should consider encouraging construction contractors to apply for SCAQMD "SOON" funds. The "SOON" program accelerates clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: http://www.aqmd.gov/tao/Implementation/SOONProgram.htm

Greenhouse Gas Emissions Analysis

2. The lead agency did not quantify GHG emissions from the operation of the proposed project. Further, the lead agency generally concluded that the project's GHG impacts are less than significant because events and attendance at the project site are "within the purview of the existing operations of the sports arena and the coliseum and would not result in an increase in the number of people that attend individual events at the sports arena." AQMD staff disagrees with the lead agency's conclusion that the proposed project will not result in an increase in the seating and vehicle capacity of the existing sports arena as there are no enforceable mechanisms to ensure that GHG emissions will remain at the baseline level. For example, if the new venue proves to be more popular than the existing arena, then annual attendance, and the subsequent VMT and emissions associated with the facility's operations, will not have been accounted for under CEQA. Therefore, the AQMD staff is concerned that the lead agency has not provided performance standards or emission targets to ensure that the proposed project will not impose an increase in the annual number of events held at the project site that could result in a potential net increase in the sports arena's annual GHG emissions. Without specific performance standards or emissions targets there is no enforceable mechanism to actually maintain existing GHG emissions from the proposed project. As the volume of traffic activity generated by the sports arena is considerable the lead agency should either quantify these emissions and compare them to a significance threshold or require enforceable measures that ensure that there is no net increase in GHG emissions.

Re: Notice of Completion and Availability of a Draft Environmental Impact Report for the Redevelopment of the Los Angeles Memorial Sports Arena

Dear Mr. Lynch:

The Sixth District Agricultural Association, also known as the California Science Center (the "Science Center") and formerly the California Museum of Science and Industry (the "CMSI"), appreciates the opportunity to comment on the above mentioned Draft Environmental Impact Report (the "DEIR"). As an institution of the State of California, the Science Center is administered by a nine-member Board of Directors appointed by the Governor.

The proposed project would consist of the demolition of the existing Los Angeles Memorial Sports Arena (the "Sports Arena") and redevelopment of the project site with a new use that plans to reactivate the underutilized project site. The Los Angeles Memorial Coliseum Commission (the "LAMCC"), as Lead Agency, is considering two different mutually exclusive future uses for the project site: a civic multiple use space, or a new professional 22,000 seat outdoor soccer stadium. Both of these development options were analyzed in equal level of detail in the EIR to allow flexibility for the potential entitlement of either one of the two projects.

The Science Center is a Responsible Agency under CEQA.

The Science Center is located in Exposition Park, which is home to a variety of museums and attractions, including the Sports Arena. All land within Exposition Park is owned either by the State of California, the City of Los Angeles, or the LAMCC. State-owned properties comprise the majority of Exposition Park, and all State-owned properties within Exposition Park, not leased to other operating agencies, are under purview of the Board of Directors, administered either by the CAAM, the Executive Director of the Science Center or the General Manager of Exposition Park. The properties containing the Los Angeles Memorial Coliseum (the "Coliseum") and the Sports Arena are leased by the LAMCC from the Science Center. Because the proposed project may require additional lease agreements, amendments to existing lease agreements and/or other discretionary approvals from the Science Center Board of Directors to carry out the proposed project, the Science Center is a Responsible Agency, as defined by CEQA (CEQA Guidelines Section 15381). The Final EIR should describe this designation.

State-owned properties, administered as described above, were not depicted in project maps in the DEIR.

The State, as administered through the General Manager of Exposition Park, owns parcels containing parking lots P and Q, at the northeast corner of the proposed project site along Figueroa Street (known

as the "Fig Pad"). Any plans to redevelop these parcels would have to be approved by the Science Center Board of Directors. Maps in the DEIR maps do not distinguish these parcels, nor are any potential impacts, specifically related to development of these parcels, discussed in the DEIR. The Final EIR should discuss specific impacts to these parcels.

The Science Center recommends additional coordination with the Lead Agency, California African American Museum (CAAM) and Natural History Museum to further reduce potential impacts related to air quality, noise, traffic and parking.

The DEIR recognizes that significant and unavoidable impacts will result from the proposed project with respect to construction air quality and construction-related and operational noise. Mitigation measures were applied to reduce these impacts to the extent feasible. The DEIR found that traffic and parking-related impacts from the proposed project would be reduced to less-than-significant levels through coordinated event scheduling and by limiting combined attendance at Lead Agency-controlled venues (the Coliseum and the former Sports Arena site) to less-than 93,000 persons at any one time. However, the Science Center believes additional coordination is necessary to ensure that impacts on State-owned properties would be sufficiently minimized. At a minimum, such coordination should include the following:

- Advance notice to the Science Center , CAAM and Natural History Museum of construction schedules, activities and locations to minimize potential air quality and noise impacts on Science Center, CAAM and Natural History Museum attendees;
- Advance notice to the Science Center, CAAM and Natural History Museum of all events scheduled at venues under the control of the Lead agency to allow better scheduling for events at the Science Center, CAAM and Natural History Museum. In this way, potential noise, traffic and parking-related impacts caused by multiple events can be minimized, and
- All possible good faith efforts to avoid scheduling events in conflict with previously scheduled significant events at the Science Center, CAAM and Natural History Museum.

Consistency with the CMSI/Exposition Park Master Plan along Figueroa Street should be addressed in more detail.

The DEIR analyzed the proposed project for consistency with six general objectives of the CMSI/Exposition Park Master Plan, including Objective 2 related to landscaping, and concluded that the proposed project would be consistent with these objectives. The DEIR, however, does not specifically address potential impacts of the proposed project with respect to the landscaping improvements described in the Master Plan at the corner parks and edge promenade along Figueroa Street, adjacent to the project site. Potential impacts to these specific areas should be addressed in more detail.

While this letter sets forth various areas of particular concern, it is not intended, and should not be construed, as an exhaustive discussion of the DEIR's compliance with CEQA. In addition, the Science Center does not waive any rights it may possess or release any obligations owed to it by the LAMCC or by any other party under law or by contract. Such rights are reserved, including but not limited to, those rights and obligations contained in the ground leases and any amendments thereto between the Science Center and the LAMCC.

Thank you for the opportunity to comment on the DEIR for the proposed redevelopment of the Sports Arena.

Sincerely,

Jeffrey N. Rudolph

Los Angeles, CA 90037

Dear Mr. Lynch:

DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR)
LOS ANGELES MEMORIAL SPORTS ARENA
3939 SOUTH FIGUEROA STREET
CITY OF LOS ANGELES

Thank you for the opportunity to review the DEIR for the Los Angeles Memorial Sports Arena project. The project involves the demolition and removal of the existing Sports Arena and the redevelopment of the project site with a new use that would reactivate the underutilized project site. The Los Angeles Memorial Coliseum Commission is considering two different options to redevelop the project site: a civic multiple use space, or a new professional 22,000-seat, outdoor, soccer stadium. The project site occupies approximately 15 acres of land within the southeastern portion of Exposition Park.

The following comments are for your consideration and relate to the environmental document only.

Hazards–Flood/Water Quality

Although both project options identified in the DEIR reduce the amount of runoff entering the flood control system, the Los Angeles County Flood Control District has a preference for Option 1, which consists of developing an open air multiple use space, since it would reduce a much larger portion of impermeable pavement then would Option 2 and, therefore, reduce a greater amount of runoff from entering the flood control system.

In order to further reduce the amount of runoff entering the flood control system, we recommend the use of permeable pavements for any new or redesigned parking lots.

If you have any questions regarding the flood/water quality comments, please contact Mr. Luis Perez at (626) 458-7161 or luperez@dpw.lacounty.gov.

Other–Building and Safety

Submit plans to Building and Safety Division for review and permit issuance.

If you have any questions regarding the building and safety comment, please contact Mr. Clint Lee at (661) 222-2940 or cllee@dpw.lacounty.gov.

If you have any other questions or require additional information, please contact Mr. Toan Duong at (626) 458-4921 or tduong@dpw.lacounty.gov.

Very truly yours,

GAIL FARBER
Director of Public Works

Re: Draft Environmental Impact Report for Los Angeles Memorial Sports Arena Redevelopment Project; SCH# 2010041059

Dear Mr. Lynch:

These comments concern the above referenced draft Environmental Impact Report (dEIR) for the redevelopment of the Los Angeles Sports Arena (Project) which was released for public comment on November 16, 2010 through December 30, 2010. Initially, we strongly encourage that the public comment period be extended by at least thirty (30) days to ensure that the Commission obtain appropriate and complete public review and comment on the Project. While possibly unintentional by the Commission, the release of a significant Draft EIR for public review during the traditional end of the year holiday season is not conducive to obtaining full public review and comment on the document. In fact, holiday-timed public review has been used as a strategic advantage for controversial project to avoid meaningful comments on projects in the past. The California Supreme Court has repeatedly emphasized the importance of the public's role in the CEQA process (see *Laurel Heights Improvement Association v. Regents of University of California* (1988) 47 Cal 3d 376). The Court has found that CEQA rests on the "belief that citizens can make important contributions to environmental protection and. . . notions of democratic decision making. . ." (*Concerned Citizens of Coats Mesa, Inc. v. 32nd District Agricultural Association* (1986) 42 Cal 3d 929). While the release of a sizable draft environmental document for a 45 day public comment period may seek technical compliance with CEQA review requirements, doing so during the holiday season compromises the intent of public involvement in the environmental process.

The dEIR identifies the Los Angeles Memorial Coliseum Commission (Commission) as the lead agency for this Project under CEQA. This identification is erroneous. CEQA does not grant a local public entity additional powers, independent of those granted by other laws. (See CEQA Guidelines 15040(b), *Sierra Club v. California Coastal Commission* (2005) 35 Cal 4th 839, 858-860, and *Kenneth Mebane Ranches v. Superior Court* (5th Dist. 1992) 10 Cal App 4th 276, 291). The dEIR correctly states that the Commission was created as a separate legal entity pursuant to a Joint Powers Agreement between the City of Los Angeles, County of Los Angeles and the Sixth District Agricultural Association. However, the authority of that separate legal entity is limited and specific to the management and control of the Coliseum and Sports Arena facilities.

Paragraph 12 of the Joint Powers Agreement provides:

> *lease, license, rent, use or permit the use of all or part of the Coliseum and Sports Arena, to any person, for competitive sports, athletics, games, pageants, parades, plays, celebrations, patriotic gatherings, public recreation, motion picture production, or public gatherings, or such other events as are deemed appropriate, or for City, County, or District affairs, or for viewing of any of the foregoing, and particularly to develop, and promote a wider use of the Coliseum and Sports Arena, through the presentation of festivals, pageants, games exhibits, industrial, horticultural or agricultural shows, conventions, exhibitions, and productions of a local, regional, national, or international character, primarily to the end that the citizens and public generally may enjoy and receive the greatest benefit possible from the Coliseum, and Sports Arena, and the City, and County and the District may more effectively exploit their climatic, geographical, recreational, cultural, and commercial resources and advances.* (emphasis added)

This specific and limited authority includes the management of the facilities, but does not include the demolition and replacement of the facilities, which is the defined purpose of the redevelopment project. The dEIR takes the quantum leap that the Commission is charged with planning the long-term use and operation of the "Sports Arena property," ignoring its mandate to focus its efforts on the Sports Arena *facility*. It is clear that the Joint Powers Agreement does not give the Commission *carte blanche* on the development of new uses of the property.

The dEIR does not address how the Commission is able to direct the demolition of the Sports Arena without legislative authority to do so. Absent such legislative authority, the Commission is unable to be identified as the lead agency which can take the discretionary action proposed by the Project other than adopting the "No-project Alternative." In addition, given the clear legislative intent provided by the JPA Agreement, the Commission must be focusing first on how the Sports Arena facility can best be used. However, the dEIR does not even address an option to renovate and improve the existing facility, which is the only development option available for the Commission to approve.

CEQA mandates that an EIR look at a "reasonable range of alternatives to the project, or the location of the project, that could feasibly attain the most basic objectives of the project." (CEQA Guidelines 15126.6(a), (f)) The dEIR defines the Project objective very broadly as planning the Sports Arena property for long-term use and operation for income generation and public uses.[1] The dEIR then limits the "reasonable range of alternatives" to two options, both of which call for the demolition of the facility and the development of either an open-air venue or an Major Soccer League soccer stadium. In order to approach the adequacy of alternatives analysis required by CEQA, the Commission must include analysis of the renovation of the Sports Arena facility as an alternative to meet the Project objective, and recirculate this analysis for public review. If the Commission obtains a legislative extension

of its powers to plan the demolition of the Sports Arena and redevelopment of the site, the Commission should develop a larger range of alternatives which support the objective of income generation and public use, and this enlarged number of alternatives should be analyzed and presented for public review. Absent such additional, meaningful alternatives analysis, the dEIR is fatally defective and fails to comply with the mandates of CEQA.

Moreover, in its current state, the Commission is not authorized to render a decision on any project alternative other than the no-project alternative. As such, the presentation of a single feasible alternative fails to satisfy the CEQA mandate to present a reasonable range of alternatives in the analysis.

We look forward to reviewing a revised and improved document once circulated by the Commission.

Best regards,

Jeffrey C. Stone
President

[1] As previously stated, this project objective exceeds the authority of the Commission.

ADDENDUM TO THE ENVIRONMENTAL IMPACT REPORT FOR THE LOS ANGELES MEMORIAL SPORTS ARENA REDEVELOPMENT PROJECT

I. Introduction

This document is an Addendum to the Environmental Impact Report (EIR) prepared for the Los Angeles Memorial Sports Arena Redevelopment Project (State Clearinghouse No. 2010041059), which was certified by the Los Angeles Memorial Coliseum Commission (Coliseum Commission) on February 2, 2011 (Certified EIR). The Certified EIR analyzed the demolition of the existing Los Angeles Sports Arena (Sports Arena) on an approximately 15-acre site in the southeastern portion of Exposition Park in the City of Los Angeles (Project Site), and the development of two potential options on the Project Site: (1) a multiple-use space that would serve as a public venue for civic gatherings, celebratory and entertainment events (e.g., festivals, carnivals, rallies, and concerts), and other similar uses (Multi-Use Project); or (2) a Major League Soccer (MLS) Stadium with a permanent seating capacity of approximately 22,000 seats and associated amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities (Original Stadium Project). After the Certified EIR was certified by the Coliseum Commission, the Coliseum Commission leased both the Los Angeles Memorial Coliseum (Coliseum) and Sports Arena sites to the University of Southern California (USC), allowing development of those uses approved under the Certified EIR. USC has now agreed with the Los Angeles Football Club (LAFC), which has acquired an MLS expansion franchise, to cooperate with LAFC's efforts to seek approval of certain modifications to the Original Stadium Project in order to develop the LAFC Stadium on the Project Site (Modified Project). The Modified Project would consist of the Original Stadium Project (reconfigured on the Project Site) together with the addition of up to approximately 105,900 square feet of ancillary facility floor area (up to approximately 119,000 gross square feet), including the following uses and floor areas: up to approximately 30,250 square feet of office and conference facility space, including no more than 21,250 square feet of office space; an approximately 36,000-square-foot "World Football" museum; up to approximately 27,750 square feet of team store or other retail space; and up to approximately 11,900 square feet of restaurant uses. The Modified Project also includes signage and lighting programs to support stadium operations.

In accordance with the California Environmental Quality Act (CEQA), the purpose of this Addendum is to analyze the Modified Project's proposed modifications to the Original

Stadium Project and to determine whether implementation of the Modified Project would result in any new significant environmental impacts that were not identified in the Certified EIR, or whether the previously identified significant impacts would be substantially more severe under the Modified Project.

This Addendum demonstrates that all of the potential environmental impacts associated with the Modified Project would be within the envelope of impacts already evaluated in the Certified EIR for the Original Stadium Project. Therefore, the Modified Project would not result in new significant impacts or increase the severity of significant impacts that were previously evaluated and disclosed in the Certified EIR.

II. CEQA Authority for Addendum

CEQA establishes the type of environmental documentation required when changes to a project occur after an EIR is certified. Specifically, Section 15164(a) of the CEQA Guidelines states that:

> *The lead agency or responsible agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred.*

Section 15162 of the CEQA Guidelines requires the preparation of a Subsequent EIR when an EIR has been certified or a negative declaration has been adopted for a project and one or more of the following circumstances exist:

1. Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

2. Substantial changes occur with respect to the circumstances under which the project is undertaken, which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

3. New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:

a. The project will have one or more significant effects not discussed in the previous EIR or negative declaration;

b. Significant effects previously examined will be substantially more severe than shown in the previous EIR;

c. Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

d. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

Likewise, California Public Resources Code (PRC) Section 21166 states that unless one or more of the following events occur, no subsequent or supplemental EIR shall be required by the lead agency or by any responsible agency:

- Substantial changes are proposed in the project which will require major revisions of the environmental impact report;
- Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report; or
- New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, becomes available.

As demonstrated by the analysis herein (refer to Section IV, Comparative Analysis of Modified Project Impacts, on page 31), the Modified Project would not result in any new significant impacts, nor would it substantially increase the severity of previously identified significant impacts. In addition, there are no substantial changes to the circumstances under which the Original Stadium Project analyzed in the Certified EIR would have been undertaken, and no new information of substantial importance which was not known and could not have been known when the Certified EIR was certified has been identified. Therefore the minor changes resulting from the Modified Project do not meet the standards for a Subsequent or Supplemental EIR pursuant to CEQA Guidelines Section 15162.

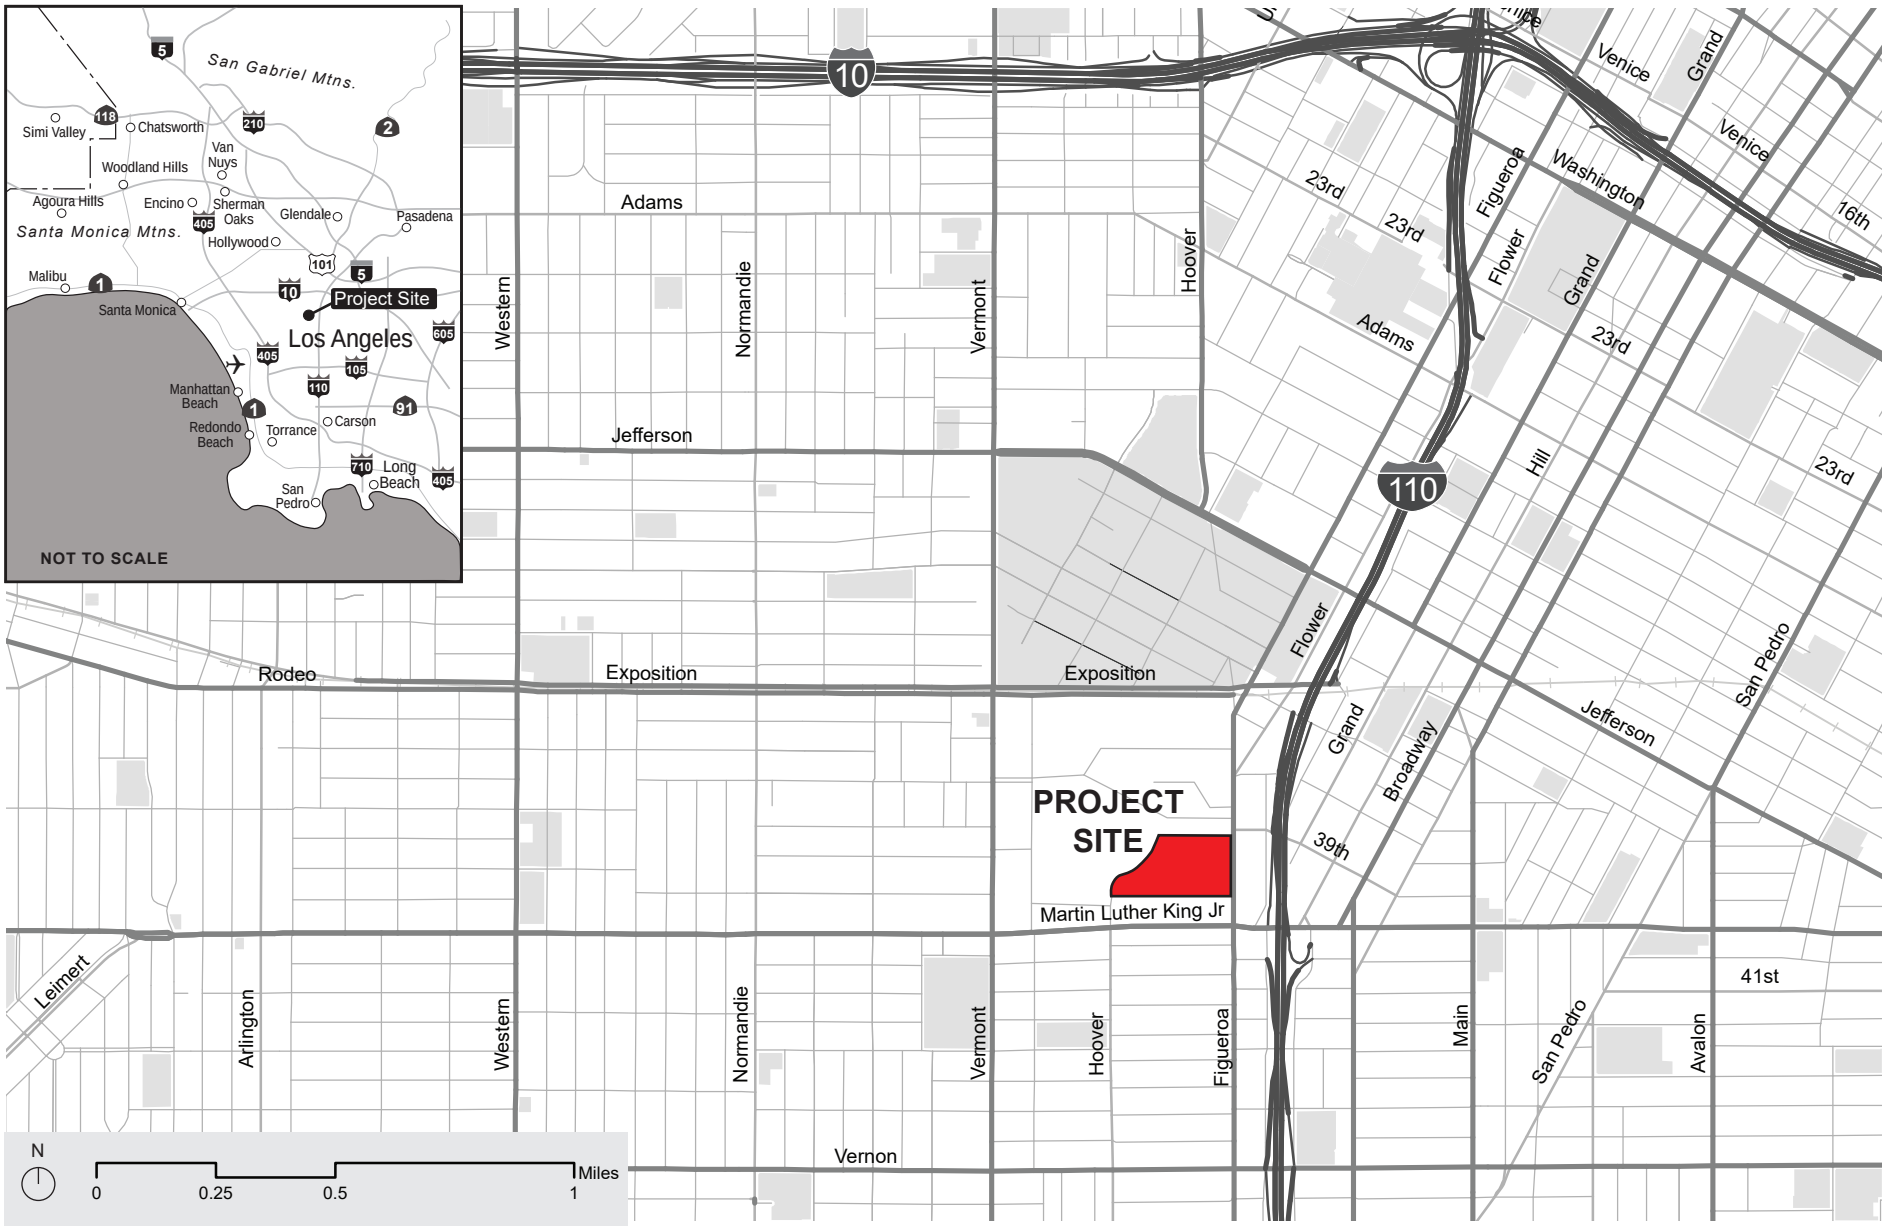
III. Project Description

A. Project Location and Existing Conditions

As shown in Figure 1 on page 5, the approximately 15-acre Project Site is located in the City of Los Angeles approximately 2 miles southwest of downtown, within Exposition Park. The Project Site includes the site of the existing Los Angeles Memorial Sports Arena (Sports Arena), located at 3939 South Figueroa Street, as well as immediately surrounding surface parking and landscape areas. The specific boundary of the irregularly shaped Project Site is shown in Figure 2 on page 6. As shown therein, the Project Site is bounded by Exposition Park Drive (Christmas Tree Lane) to the north, Figueroa Street to the east, Exposition Park Parking Lot 6 to the south, and South Coliseum Drive (Hoover Street) to the west. Regional access to the Project Site is provided by the Harbor Freeway (Interstate 110), located approximately 0.1 mile east of the Project Site. Major arterials serving the Project Site include Vernon Avenue, Martin Luther King, Jr. Boulevard, and Exposition Boulevard in the east-west direction; and Vermont Avenue, Figueroa Street, Hoover Street, and Flower Street in the north-south direction.

At approximately 160 acres, Exposition Park is the largest park in the Central Los Angeles area. It is bounded by Exposition Boulevard to the north, Figueroa Street to the east, Martin Luther King, Jr. Boulevard to the south, and Vermont Avenue to the west. Owned by the State of California and leased by various entities, Exposition Park houses the Coliseum; the Los Angeles Sports Arena (located on the Project Site); the California Science Center; the Dr. Theodore T. Alexander Jr. Science Center School; the California African American Museum; the Los Angeles County Natural History Museum; the Exposition Park Rose Garden; the Wallis Annenberg Building; and the Expo Center, which includes a swim stadium, recreation center, senior citizen center, amphitheater, and pre-school. The Project Site is generally situated in the southeastern portion of Exposition Park. All of Exposition Park, including the Project Site, is located within the City's South Los Angeles Community Plan Area, the eastern boundary of which is Figueroa Street. The Project Site is also within the boundaries of the Coliseum District Specific Plan (Specific Plan). All land uses east of Figueroa Street are located in the Southeast Los Angeles Community Plan Area.

Land uses immediately adjacent to the Project Site include Christmas Tree Lane and adjacent landscaped areas to the north; the Coliseum and adjacent surface parking lots across South Coliseum Drive to the west and northwest; Parking Lot 6 to the south; and commercial/retail uses and surface parking lots fronting the east side of Figueroa Street to the east. Residential uses are also located in the vicinity of the Project Site, including multi-family residential uses fronting Flower Drive to the east, and multi-family



eyestone ENVIRONMENTAL

eyestone ENVIRONMENTAL

Figure 2
Aerial Photograph

Source: Google Earth, 2015; Eyestone Environmental, 2015.

residential uses on the south side of Martin Luther King, Jr. Boulevard to the south. In addition, the USC main campus is located north of Exposition Boulevard.

The predominant land use on the Project Site is the 16,740-seat Sports Arena. Since it commenced operations in 1959, the Sports Arena has hosted indoor sporting events as well as other major events including political conventions, concerts, trade shows, and rallies. The Sports Arena hosts weekday and weekend events, with attendance levels ranging from approximately 500 to approximately 55,000 attendees. The Sports Arena is an oval-shaped structure oriented along a north-south axis. It was constructed within a large excavated depression that extends approximately 25 feet below grade level; as such, the seven-story arena extends only approximately 45 feet above grade level. In addition to the Sports Arena, a surface parking lot for VIPs occupies the western portion of the Project Site. The VIP parking lot contains approximately 238 vehicle parking spaces and is accessed from South Coliseum Drive via Martin Luther King, Jr. Boulevard. The Project Site is generally flat, with the exception of the sunken court and seating within the Sports Arena structure, and a sunken landscaped courtyard extending off of the east side of the Sports Arena structure. The Project Site also includes several at-grade plazas and ornamental landscaping.

USC currently leases the Sports Arena, as well as the adjacent Coliseum, from the Coliseum Commission. USC's lease, including extension options, provides USC with the right to possess and use the Sports Arena site through 2054. The USC lease also contemplates the redevelopment of the Sports Arena site with a soccer stadium and associated ancillary facilities, provided that the seating capacity in any stadium does not exceed 24,950 seats. In addition, USC has entered into a Lease Option Agreement with the California Science Center (Sixth District Agricultural Association) that would provide USC with an option to enter into a new lease for the Sports Arena site that could be extended through 2111. USC and LAFC have proposed entering into a sublease for the Sports Arena site that would give LAFC the right to develop the Modified Project and possess and use the Sports Arena site consistent with the rights in these existing USC lease agreements.

As further discussed below, a distinct project site has been identified for the Modified Project's signage program (Signage Project Site), which encompasses an area within the Specific Plan that is slightly larger than the Project Site. Specifically, the Signage Project Site consists of the Project Site in addition to a small area at the southwest corner of Christmas Tree Lane and Figueroa Street, and Parking Lot 6 to the south of the Project Site, which is controlled by the State of California (California Science Center). The only proposed development involved within areas of the Signage Project Site that are outside the Project Site involves signage.

B. Projects Analyzed under the Certified EIR

As previously discussed, the Certified EIR analyzed the demolition of the existing Sports Arena and the redevelopment of the Project Site with two potential options: (1) the Multi-Use Project, which would include a multiple-use space that would serve as a public venue for civic gatherings, celebratory and entertainment events (e.g., festivals, carnivals, rallies, and concerts), and other similar uses, referred to as Option 1 in the Certified EIR; or (2) the Original Stadium Project, which would include an MLS Stadium with a permanent seating capacity of approximately 22,000 seats and associated amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities, referred to as Option 2 in the Certified EIR. Both of these development options were analyzed with an equal level of detail in the Certified EIR, and the Coliseum Commission has kept both options available for future consideration.

The Certified EIR assumed that under the Multi-Use Project (Option 1), all existing improvements on the Project Site, including the Sports Arena and the VIP parking lot, would be removed, and the Project Site would be redeveloped with a multiple-use space anchored by an open-air amphitheater. The multiple-use space would be improved to provide additional surface parking for Coliseum events and would serve as a public venue for civic events such as parades, rallies, public gatherings, festivals, and neighborhood carnivals, similar to the types of outdoor events currently held at the Sports Arena. The bowl-shaped amphitheater would be built into the depression currently occupied by the Sports Arena and would be surrounding by grass-covered seating levels (no fixed seating was proposed). To provide for flexible programming, it was assumed that the multiple-use space could support stand-alone events confined to the Project Site or, alternatively, serve as an extension space and/or overflow parking space for joint events held within Exposition Park, including the Coliseum. A variety of different types of events could be held at the multiple-use space, from outdoor concerts and cultural gatherings with anticipated attendance levels ranging from 500 to 4,000 attendees, to annual events such as charity walks, music festivals, and citywide celebrations with anticipated attendance levels ranging from 1,000 to 90,000 attendees. The Certified EIR assumed that under any possible joint use of the Coliseum and the multiple-use space, the total planned attendance would not exceed the current capacity of the Coliseum (i.e., 93,000 attendees).

The Certified EIR assumed that under the Original Stadium Project (Option 2), the existing Sports Arena would be removed and the Project Site would be redeveloped with an MLS Stadium with a permanent seating capacity of approximately 22,000 seats. The analysis in the Certified EIR assumed that the state-of-the art venue would host 15 MLS games in addition to non-soccer events similar in attendance size to historic operations of the Sports Arena, such as USC soccer games, open-air entertainment events such as

concerts and civic gatherings, and exhibition soccer games, and would serve as a practice facility for local soccer teams. The stadium would also include associated amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities. The VIP parking lot to the west of the proposed stadium was assumed to remain as surface parking. Similar to Option 1, the Certified EIR assumed that total attendance during simultaneous events at the Coliseum and the MLS Stadium would not exceed 93,000 attendees (refer to Mitigation Measure MM J-1 in the Certified EIR).

The Original Stadium Project was assumed to be an outdoor facility oriented on a north-south axis featuring dome-style architecture topped by a curved roof on its east and west sides. The stadium would be constructed within the existing depression currently occupied by the Sports Arena so that the field and much of the seating would be located below grade-level elevation. As a result, the stadium analyzed in the Certified EIR would occupy the same general field of view as the current Sports Arena building. The existing depression would be graded and reconfigured to accommodate the footprint of the stadium, requiring the import of approximately 125,000 cubic yards (cy) of soil.

The lighting for the soccer field would consist of highly focused and directional lighting arrays. Much of the lighting (and all of the high-intensity field lighting) would be directed downward into the bowl-shaped stadium. Low-level security lighting would also be installed throughout the remainder of the Project Site to mark walkways, parking areas, restroom facilities, and entrances. The proposed soccer stadium would also include landscaped plazas and roadways and perimeter landscaping.

The Certified EIR assumed that the Original Stadium Project would include advertising signage and naming rights consistent with similar sporting venues in the Los Angeles area. The Certified EIR explained that while a detailed signage program had not been developed for the Original Stadium Project, the signage program would be in conformance with all applicable requirements of the Los Angeles Municipal Code (LAMC), the design guidelines of the South Los Angeles Community Plan, and the overriding rules and regulations set forth for signage in the Coliseum District Specific Plan.

The construction analysis in the Certified EIR for the Original Stadium Project is based on an approximately 20-month construction schedule that involves the following phases: (1) demolition of the existing Sports Arena, resulting in 5.4 million cubic feet of demolition debris; (2) import of approximately 125,000 cy of soil; (3) grading and reconfiguration of the Project Site to accommodate the stadium footprint; (4) pouring of concrete to create the stadium foundation; (5) construction of the stadium and related support facilities; and (6) installation of grass and landscaping. Construction of the

Approved Multi-Use Project was assumed to entail a similar order of phasing, but with a shorter construction phase and an import of approximately 250,000 cubic yards of soil.

The Coliseum Commission certified the Certified EIR in February 2011. However, the Coliseum Commission did not select between the Original Stadium Project and the Multi-Use Project at that time. Both options remain open.

C. Modified Project

LAFC and USC have proposed entering into a lease agreement for the Sports Arena site that would enable LAFC to develop the Modified Project and possess and use the Sports Arena site consistent with USC's existing agreements with the Coliseum Commission and the California Science Center (Sixth District Agricultural Association). Those existing agreements recognize that the Sports Arena site may be redeveloped with the Original Stadium Project, analyzed as Option 2 in the Certified EIR. As described in detail below, in addition to the Original Stadium Project's approximately 22,000-seat soccer stadium and associated uses, LAFC is proposing certain modifications to the Original Stadium Project that include the addition of up to approximately 105,900 square feet of ancillary amenity floor area (up to approximately 119,000 gross square feet) that would be open during stadium events as well as on non-event days, refinements to the design of the stadium, the redevelopment of the VIP parking lot west of the stadium as a new parking area, and adjustments to construction phasing.[1] These modifications are hereafter referred to as the Modified Project.

A table summarizing the primary differences between the Original Project and the Modified Project is provided in Table 1 on page 11. A Conceptual Site Plan for the Modified Project is provided in Figure 3 page 13.

(1) Ancillary Uses and Northwest Plaza

Under the Modified Project, additional amenities supporting the primary stadium use and further activating the Project Site on non-event days (Ancillary Uses) would be incorporated into the project design to provide for a cohesive development that is comparable to other recently-constructed MLS venues. Specifically, the Ancillary Uses

[1] *The total amount of development would not exceed approximately 641,000 gross square feet.*

Table 1
Comparison Between the Original Stadium Project and the Modified Project

	Original Stadium Project	Modified Project
Demolition	Demolition of the Sports Arena	No Change
MLS Stadium	22,000 seating capacity; Would host MLS games, USC soccer games, open-air entertainment events (e.g., concerts and civic gatherings), and exhibition soccer games. Would include amenities such as restrooms, concessions, press facilities, spectator viewing areas, luxury suites and club seating, and locker and dressing facilities.	No Change
Ancillary Uses		
Conference Facility and Office Space	0	≈ 30,250 sf (max. 21,250 sf office)
Museum	0	≈ 36,000 sf
Team Store and Other Retail	0	≈ 27,750 sf
Restaurant	0	≈ 11,900 sf (max. 4,250 sf high-turnover sit-down) (max. 2,550 sf fast food)
Total Ancillary Uses		≈ 105,900 sf (max)
Open Space and Pedestrian Plazas	Perimeter landscaping and pedestrian plaza areas. Open space square footage not specified.	≈ 143,000 square feet of improved public open space that would consist of pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas, potentially including water features, public art, and seating areas. Pedestrian plazas would include a main plaza at the northwest corner of Project Site and a large pedestrian gathering area along Figueroa Street.
Signage and Lighting	Signage consistent with the LAMC, South Los Angeles Community Plan, and Specific Plan. High-intensity field lighting (focused downward) and low-level security lighting throughout.	New Supplemental Use District (SUD) for signage to permit proposed signage program including up to ≈ 44,500 sf of signage for Modified Project including 19,200 sf digital signage, identification signs, temporary event signs, electronic digital displays, changeable message light-emitting diode (LED) boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed.

Table 1 (Continued)
Comparison Between the Original Stadium Project and the Modified Project

	Original Stadium Project	Modified Project
		Lighting would include illuminated signage in addition to field and security/wayfinding lighting.
Existing VIP Parking Lot	Retained and used for surface parking	Reconfigured and used for surface parking

sf = square feet

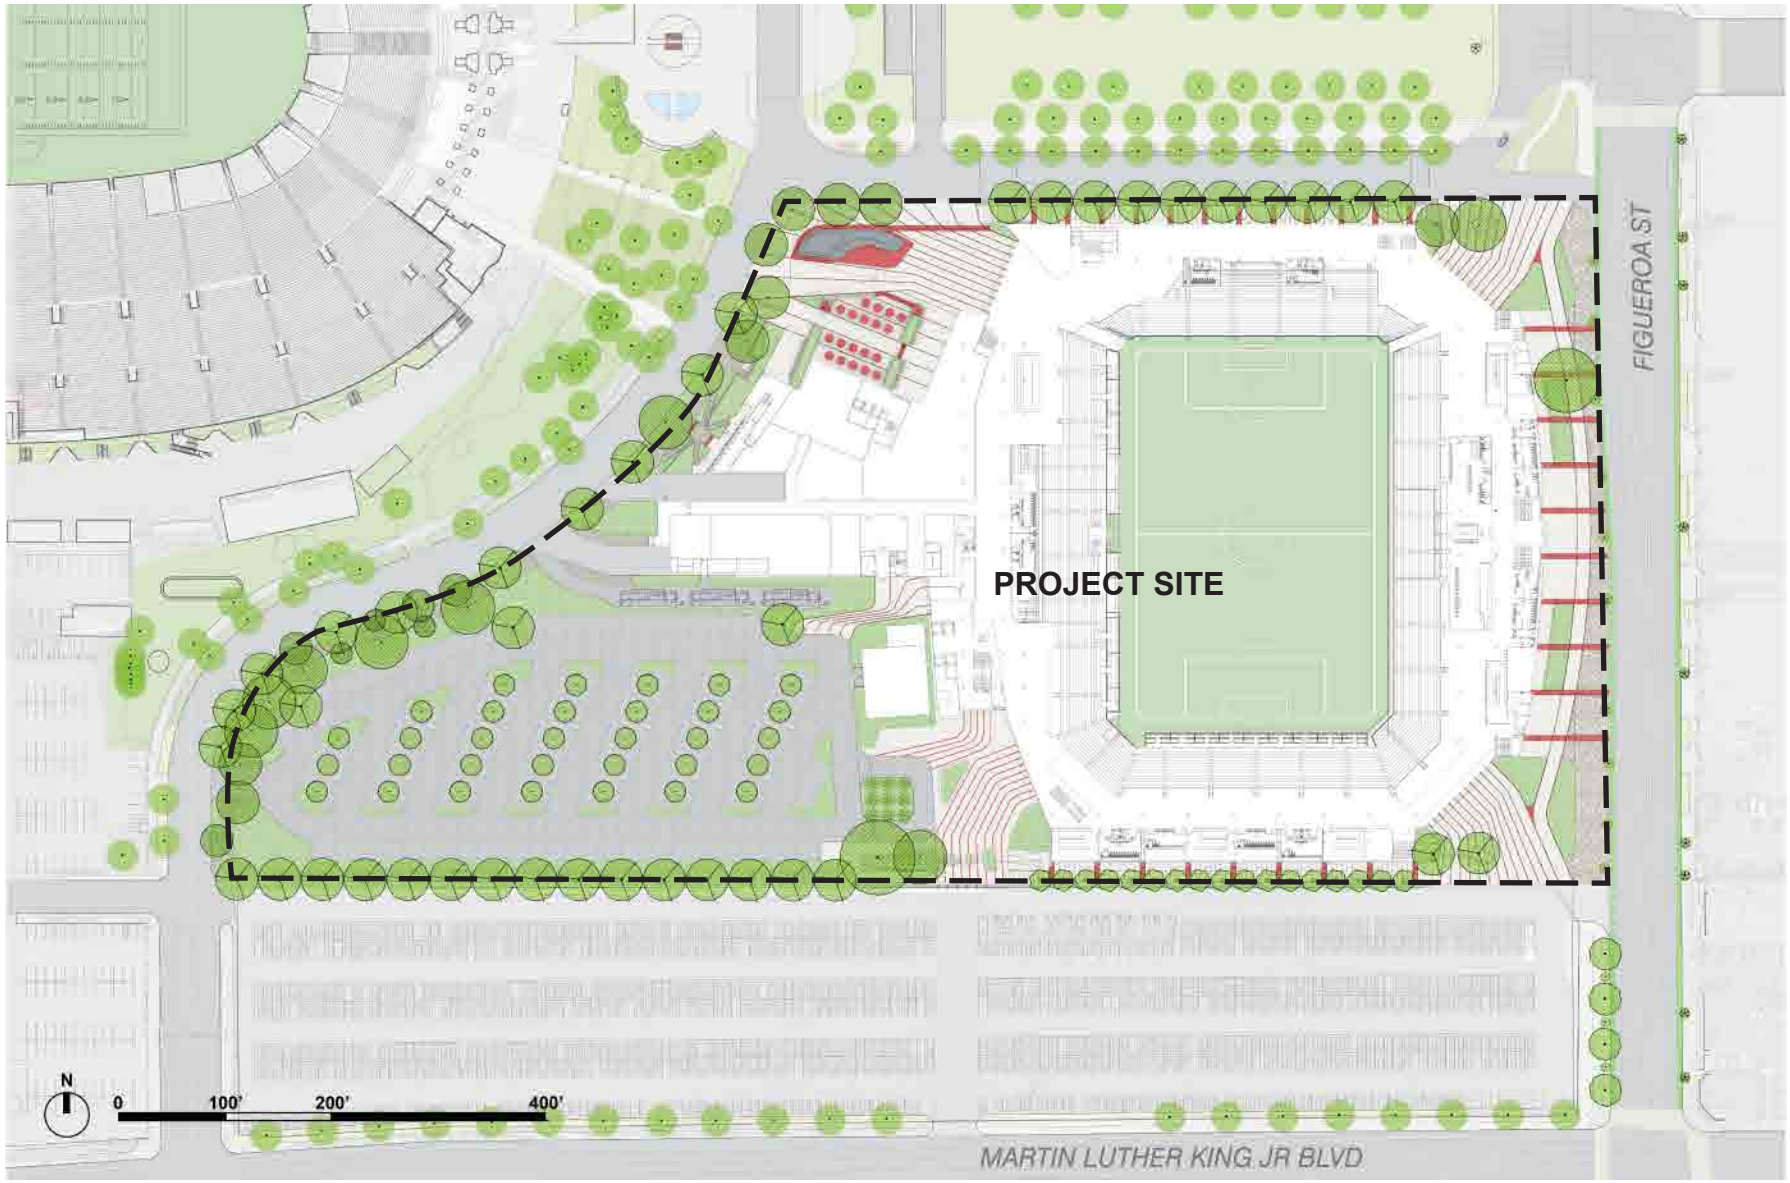
Square footage is calculated pursuant to the LAMC definition of floor area for the purpose of calculating floor area ratio (FAR). In accordance with LAMC Section 12.03, floor area is defined as: "[t]he area in square feet confined within the exterior walls of a building, but not including the area of the following: exterior walls, stairways, shafts, rooms housing building-operating equipment or machinery, parking areas with associated driveways and ramps, space for the landing and storage of helicopters, and basement storage areas."

Source: Eyestone Environmental, 2015.

would include a total of up to approximately 105,900 square feet of new floor area[2] (up to approximately 119,000 gross square feet) and would include the following:

- up to approximately 30,250 square feet (sf) of office and conference facility space, including no more than 21,250 sf of office space (with morning conference facility functions on non-event days limited to 261 attendees and evening conference facility functions on non-event days limited to 430 attendees if the maximum amount of office space is developed);
- an approximately 36,000-sf museum;
- up to approximately 27,750 sf of team store or other retail space (of which no more than 2,700 sf could be located along the Figueroa Street frontage of the Project Site); and up to approximately 11,900 sf of restaurant uses, including no more than 4,250 sf of high-turnover sit-down restaurants and 2,550 sf of fast food restaurants (with no more than 1,275 sf of the fast food space located along the Figueroa Street frontage of the Project Site).

[2] *Except where otherwise noted, square footage is calculated pursuant to the LAMC definition of floor area for the purpose of calculating floor area ratio (FAR). In accordance with LAMC Section 12.03, floor area is defined as: "[t]he area in square feet confined within the exterior walls of a building, but not including the area of the following: exterior walls, stairways, shafts, rooms housing building-operating equipment or machinery, parking areas with associated driveways and ramps, space for the landing and storage of helicopters, and basement storage areas."*



eyestone ENVIRONMENTAL

Figure 3
Conceptual Site Plan

Source: Gensler, 2015.

The primary function of the proposed conference facilities would be to provide programming for event day patrons (e.g., VIP gatherings and other programming during events at the stadium or the adjacent Coliseum). On non-event days, the conference facilities would serve as meeting spaces for conferences for outside organizations (such as USC, chambers of commerce, trade groups, and other types of businesses and organizations), with attendance limited based on the amount of office space that is developed, as described above. Additional conference facility attendees beyond the limits described above could be allowed by reducing the maximum office floor area from the proposed maximum of 21,250 sf. Specifically, for every reduction of 850 sf in office space floor area, the number of persons attending functions in the conference facility could be increased by 5.6 persons for morning conference facility functions on non-event days, and by 3.0 persons for evening conference facility functions on non-event days.

In addition to supporting stadium events (i.e., games and concerts), the Ancillary Uses would be open to the public on non-event days to serve as a catalyst for the revitalization of Exposition Park and to complement and enhance the existing venues and destinations within the park. For periods before, during, and after games/events at the proposed stadium, the Ancillary Uses would be open only to ticket-holding game/event patrons. Further, for events at the adjacent Coliseum reasonably anticipated to equal or exceed 25,000 patrons in attendance, including USC home football games, the Ancillary Uses would be open only to ticket-holding patrons of those events for periods before, during, and after the events. Refer to Project Design Feature O-4 in Section IV.O, Traffic/Transportation/Parking, on page 169 of this Addendum.

Most of the Ancillary Uses would be centered around a main entry plaza at the northwest corner of the Project Site (Northwest Plaza) that would connect to the stadium's main concourse and serve as a primary public entry to the stadium, although up to 3,975 sf of retail and restaurant uses could be located along the stadium's Figueroa Street frontage, as noted above. The Ancillary Uses would reach a maximum height of 75 feet above grade. The Northwest Plaza would provide a gathering space for pre-game events and other game-day activities and would serve as an active public space on non-event days (e.g., for small concerts, red carpet events, and community events such as food festivals or art fairs). Ground floor restaurants would open up to the plaza to provide outdoor dining and seating areas. The Northwest Plaza would be designed to provide a welcoming pedestrian environment with a mix of hardscape and landscaped areas, and could include water features, public art, and seating areas. Sound, lighting, and video components would also be incorporated into the design of the plaza. The Northwest Plaza would link to a system of enhanced pedestrian improvements and open space areas that would encircle the stadium. Specifically, the Modified Project would include approximately 143,000 square feet of improved public open space that would consist of pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas. The Ancillary Uses and the

Northwest Plaza would have the potential to operate from mid-morning (i.e., 10:00 A.M.) until 2:00 A.M., seven days a week, with some ancillary uses (e.g., the museum and retail uses) closing sooner. The conference facilities and office space would have the potential to operate earlier in the morning, as described above, and also would have the potential to operate seven days a week until 2:00 A.M.

(2) Stadium Design

As is the case under the Original Stadium Project, the proposed stadium under the Modified Project would have a maximum seating capacity of approximately 22,000 attendees and would host MLS games, USC field events (such as soccer games), open-air entertainment events such as concerts and civic gatherings, and exhibition soccer games. However, with the evolution of the project design, refinements and modifications have been made to the physical characteristics of the stadium. The following discussion provides a detailed description of the proposed stadium design under the Modified Project. Conceptual renderings of the proposed stadium are provided in Figure 4 through Figure 6 on pages 16 through 18. Stadium elevations are provided in Figure 7 and Figure 8 on pages 19 and 20.

Under the Modified Project, the proposed stadium would be oriented along a north-south axis and, like the Original Stadium Project, would be located within the eastern portion of the Project Site (within a portion of the footprint area currently occupied by the Sports Arena). The footprint of the stadium under the Modified Project would be somewhat larger than under the Original Stadium Project in order to provide for a more modern stadium that includes the amenities expected of a world-class professional sports stadium.

Most of the seating areas within the open-air stadium would be covered by a cantilevered roof canopy extended inward from the stadium's perimeter, with the field level placed approximately 20 feet below street level (as measured from the grade along Figueroa Street), roughly at the same elevation as the floor of the existing Sports Arena. The roof canopy would consist of a steel frame with a lightweight, ethylene tetrafluoroethylene (ETFE) canopy skin that would provide shade for most of the stadium's seating areas while also being translucent. The canopy skin would moderate the perceived height of the stadium because it would be permeable to light and would not be perceived as solid. The top of the roof canopy of the stadium would reach a maximum height of approximately 105 feet above street level, with rooftop structures extending to approximately 115 feet.

Based on the conceptual site plan, the stadium structure would be approximately 470 feet from the Coliseum peristyle when measured on the diagonal from the northwestern corner of the stadium. The westernmost façade of the Ancillary Uses building

NORTH ELEVATION

SOUTH ELEVATION

eyestone ENVIRONMENTAL

Figure 8
Proposed Stadium Elevations—North and South

Source: Gensler, 2015.

would be setback approximately 60 feet from South Coliseum Drive and approximately 270 feet from the Coliseum wall. The eastern façade of the stadium would be setback approximately 58 feet from Figueroa Street. The northern façade of the stadium structure would be setback 27 feet from the southern curb of South Coliseum Drive. Through the final design process, the stadium footprint could be moved or extended up to 40 feet to the west from the location depicted on the conceptual site plan shown in Figure 3 on page 13. Under this scenario, no building heights would increase, and the Ancillary Uses building would remain in the same location, though would be reconfigured in the area where it connects to the stadium. If adjusted in this manner, the stadium structure would be approximately 430 feet from the Coliseum peristyle. Under any buildout scenario, the Modified Project would retain the geometry of the existing sidewalk and curb line of South Coliseum Drive.

The stadium's seating bowl would be comprised of multiple levels that would provide a series of different seating types and amenities including a supporter's section, standing room terraces, premium clubs and suites, and general seating areas. The main concourse of the stadium would be located at street level and would provide an open-air, 360-degree circulation path around the stadium, connecting to several general and premium entry points distributed along the stadium perimeter. Premium spaces such as club lounges and suites would be interior spaces. A rooftop terrace at the top of the west seating bowl, along with two standing room terraces along the northern side of the stadium, would be featured spaces both during games and for other hospitality events, with potential hours of operation from mid-morning until 2:00 A.M., seven days a week. The rooftop terraces could include features such as seating areas, gathering spaces, water features (such as a reflection pool or pool), and art.

The stadium's northeast and southeast corners would be open to provide views into and out of the stadium seating bowl. Specifically, these openings would allow for clear views into the stadium from the street and sidewalk along Figueroa Street at the primary entry to Exposition Park, and would frame focal views of the downtown skyline from within the seating bowl, particularly from the southwest corner. The base of the stadium at street level would draw on material influences from the Coliseum and Swim Complex, incorporating similar materials and color palates, such as the Travertine and the concrete used extensively on those venues. Entry gates would be clearly identifiable and would prominently feature signage integrated into their design. As such, the design of the street level façades would relate to a human scale.

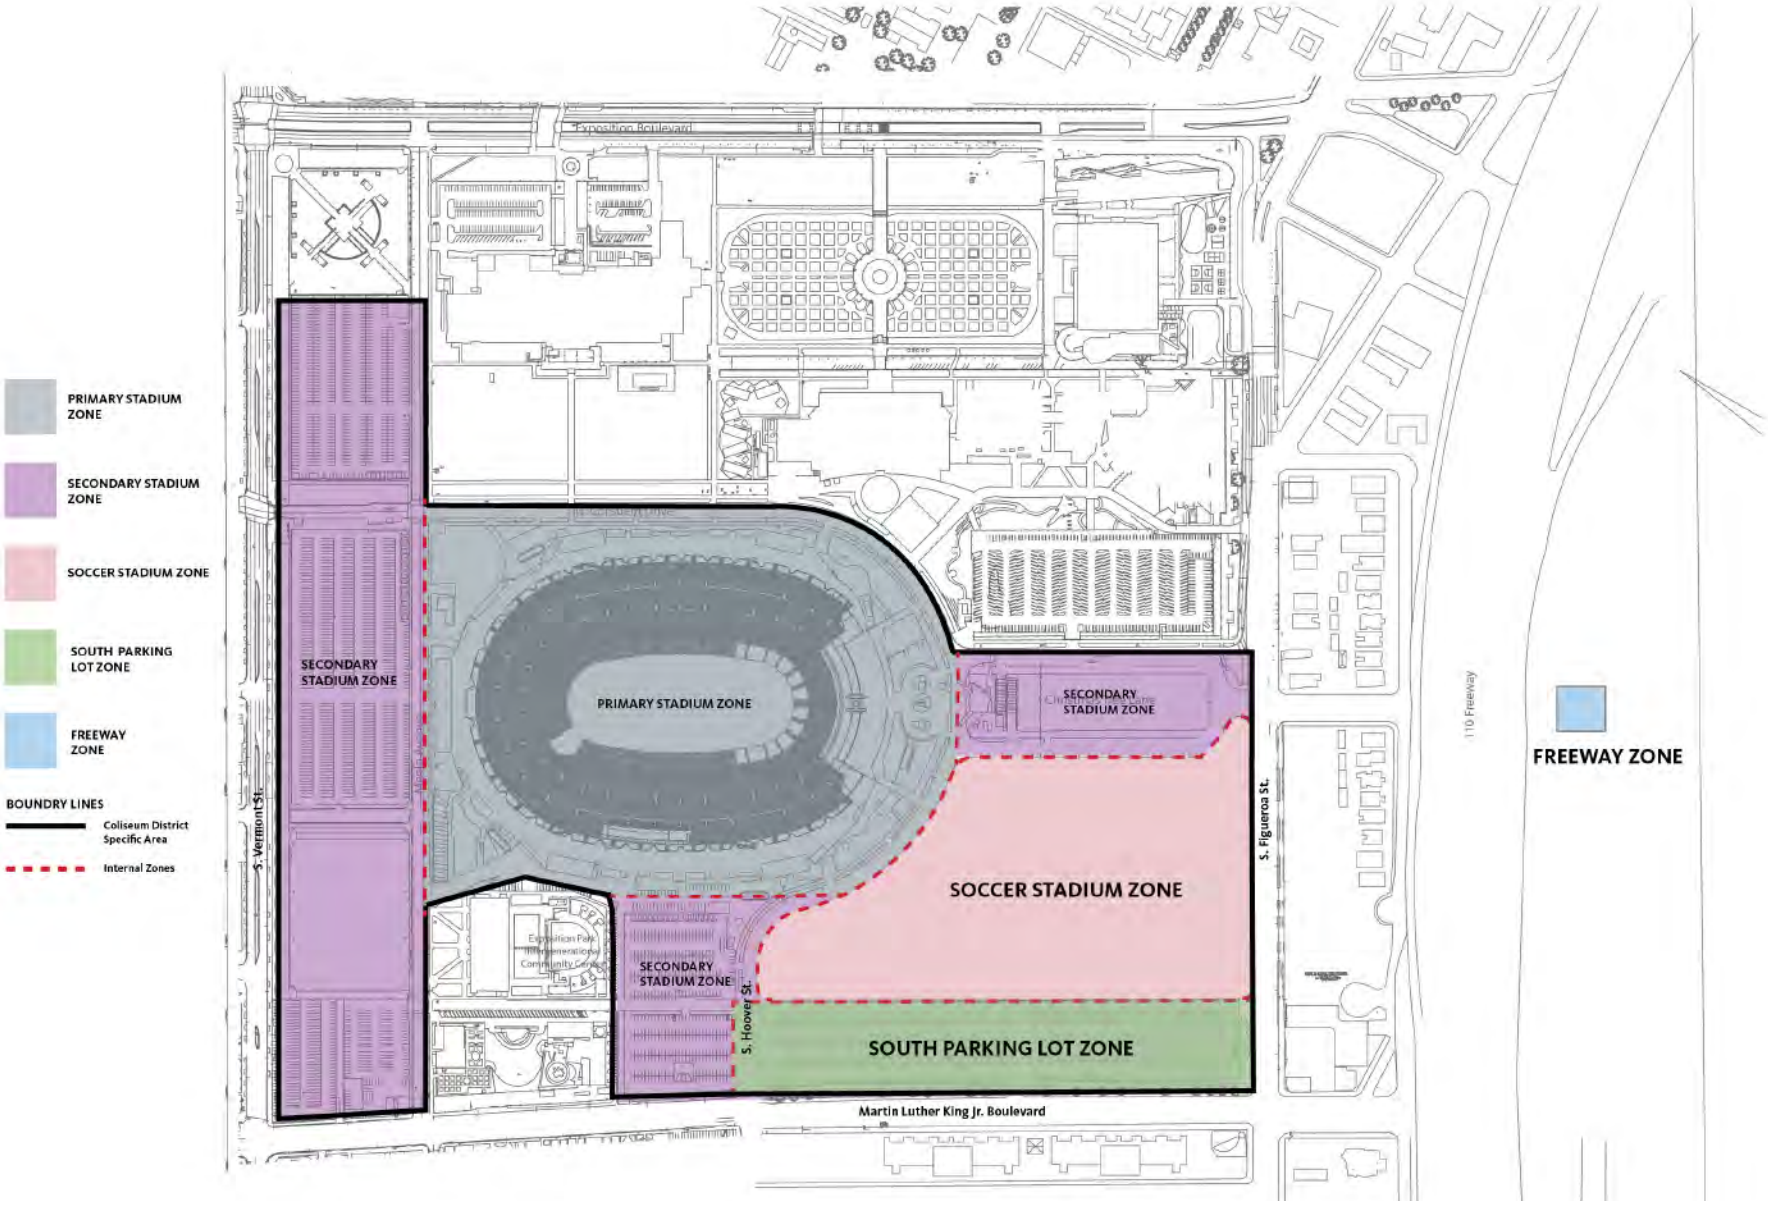
(3) Signage and Lighting

A signage program has been developed for the Modified Project that is an important element of a major league sports stadium. The proposed signage program would support

advertising and the naming and sponsorship rights to the Modified Project, generating revenue streams necessary for Modified Project funding. Signage rules and regulations pertaining to the Project Site are currently set forth in the Specific Plan. The Modified Project's signage program would be implemented through a new Supplemental Use Sign District (SUD), consistent with current City policies regarding the regulation of signage. Consistent with the Specific Plan, the proposed SUD would encompass the Project Site as well as all of the Specific Plan area. As part of the Modified Project's proposed Specific Plan amendment (refer to Section III.9, Discretionary Actions, on page 30 of this Addendum), the existing signage authorized in the Specific Plan, which includes some signage for the Project Site, the Coliseum, and surrounding areas, would be removed from the Specific Plan and relocated into the proposed SUD, along with modifications to permit the Modified Project's signage program. Signage rights previously allowed by the Specific Plan for the Coliseum and other areas in the Specific Plan area that are unrelated to the Modified Project's signage program would not change under the proposed SUD.

As shown on Figure 9 on page 23, the proposed SUD would encompass the entire Specific Plan area and would create five sign zones, the Primary Stadium Zone, Secondary Stadium Zone, Soccer Stadium Zone, South Parking Lot Zone, and Freeway Zone. The Project Site is located within the Soccer Stadium Zone. The proposed SUD would allow the same amount and variety of signage currently authorized by the Specific Plan in the Primary Stadium Zone, Secondary Stadium Zone, and Freeway Zone. A new signage program associated with the Modified Project would be allowed in the Soccer Stadium Zone. In addition, some limited new signage associated with the Modified Project would be allowed in the South Parking Lot Zone (i.e., Parking Lot 6 south of the Project Site). The areas where Modified Project-related signage would be permitted are collectively referred to as the Signage Project Site, as shown in Figure 10 on page 24. The Signage Project Site consists of the Project Site in addition to a small area at the southwest corner of Christmas Tree Lane and Figueroa Street (located in the SUD's proposed Soccer Stadium Zone), and Parking Lot 6 to the south of the Project Site (located in the SUD's proposed South Parking Lot Zone). The proposed signage program for the Signage Project Site, including permitted sign types, sizes, and locations, is provided in Appendix C of this Addendum.

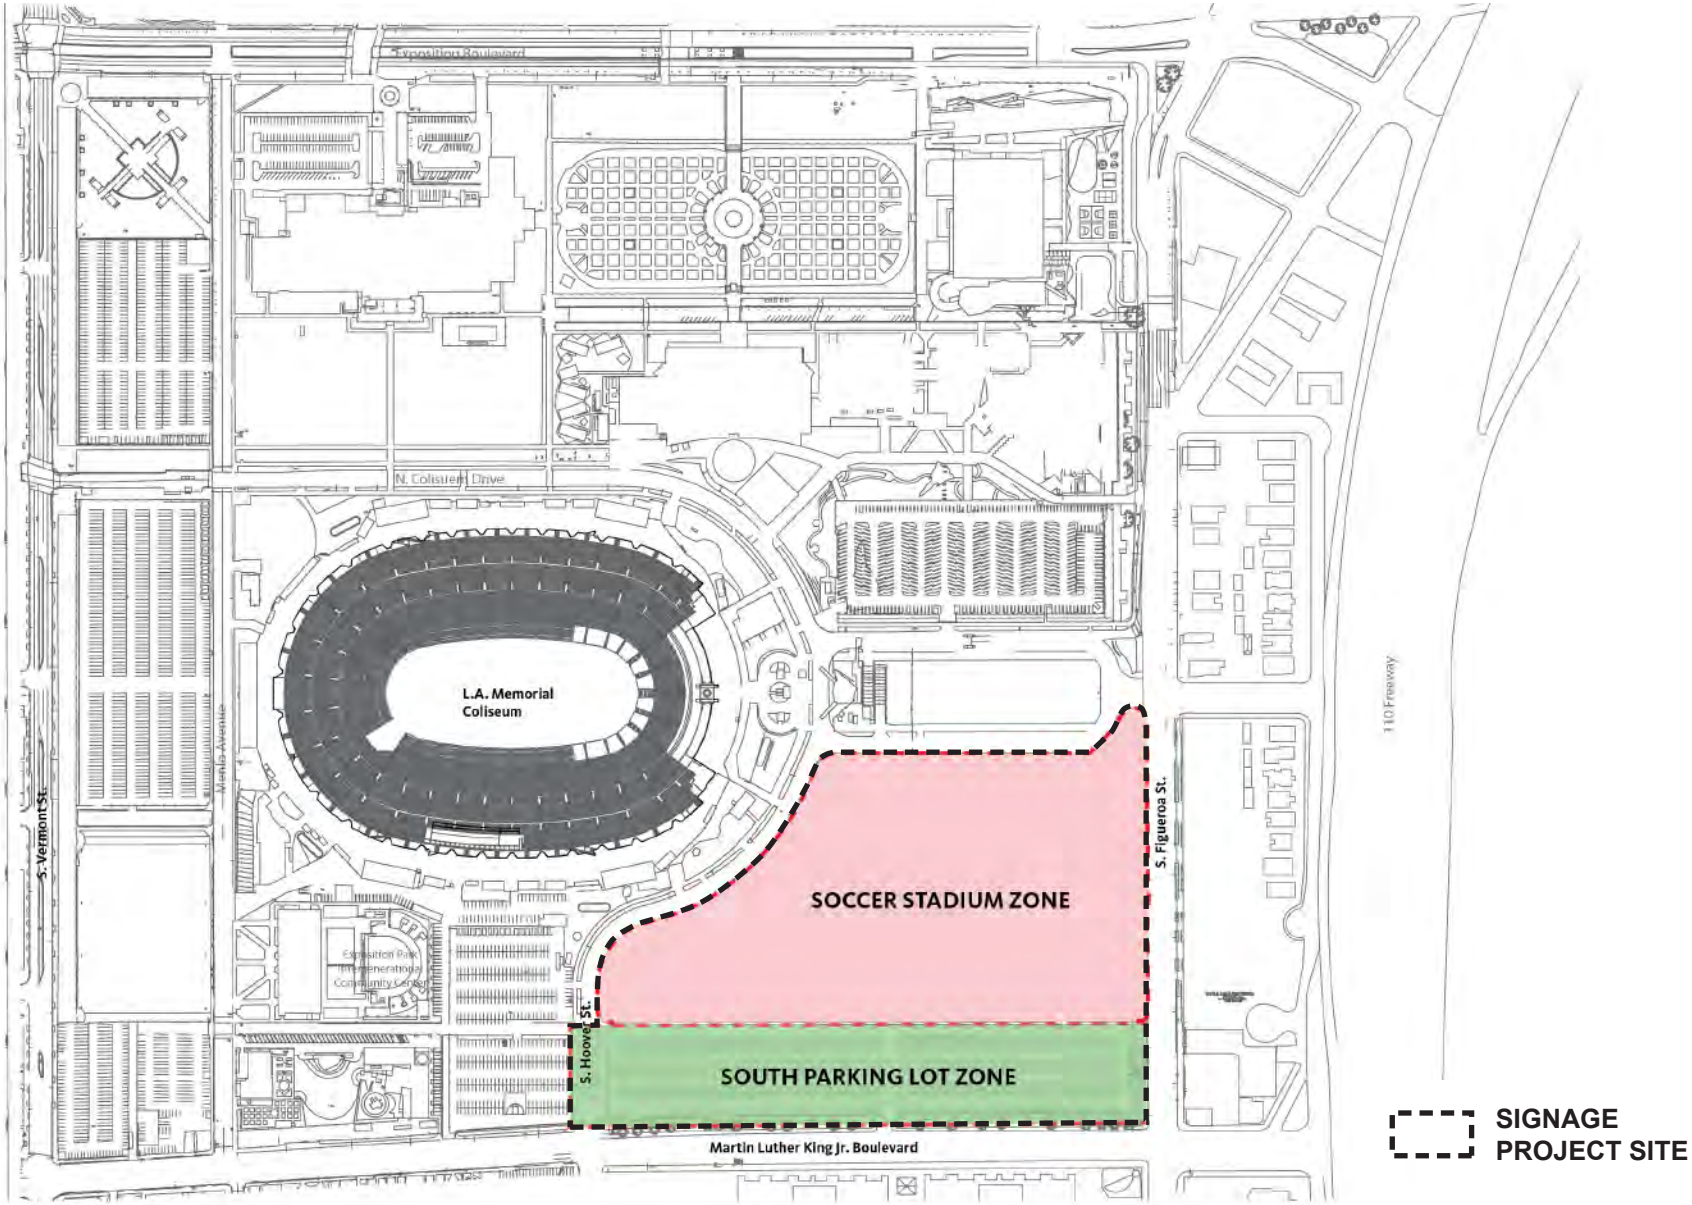
As shown in Appendix C of this Addendum, total signage allowed in the Signage Project Site as part of the SUD for the Modified Project, excluding aerial view signs, information signs, temporary signs, and interior signs, would be approximately 44,500 square feet, including up to approximately 19,200 square feet of digital signage. Individual signs could vary from approximately 40 to 3,800 square feet in size, depending on the sign zone, sign type, and location. Permitted signage would include a freestanding digital sponsorship sign along Figueroa Street in the South Parking Lot Zone, a free-standing digital sign near the southeast corner of the Soccer Stadium Zone along Figueroa Street, a



eyestone ENVIRONMENTAL

Figure 9
Proposed Supplemental Use Sign District

Source: Gensler, 2015.



eyestone ENVIRONMENTAL

Figure 10
Signage Project Site

Source: Gensler, 2015.

free-standing digital sign near the entry to Exposition Park at Christmas Tree Lane at the northeastern corner of the Soccer Stadium Zone adjacent to Figueroa Street, and digital signs integrated with the architecture of the stadium. In addition, smaller-scale, directional pedestrian and vehicular signage would be placed throughout the Signage Project Site as necessary to facilitate access and safety. The types and extent of permitted signage would emphasize the event and entertainment-oriented aspect of the Project Site. Specifically, signage types could include identification signs, temporary event signs, electronic digital displays, changeable message light-emitting diode (LED) boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed. In addition, the SUD would place limitations on the operating hours and illumination of permitted signs.

Lighting for the Modified Project would include lighting of the stadium, including the field and associated amenities and ancillary uses (e.g., outdoor dining and seating areas, plazas, and walkways). Lighting emissions resulting from the illuminated signage are expected to be emitted from three types of signs: front-lit signs, electronic digital displays, and changeable message LED boards.

(4) VIP Parking Lot

Under the Modified Project, the VIP parking lot west of the stadium, which contains approximately 238 vehicle parking spaces, would be reconfigured and re-landscaped to provide a secure, VIP parking lot with up to approximately 250 parking spaces. The parking lot would be surrounded by a perimeter fence and gates and accessed from South Coliseum Drive, similar to existing conditions.

(5) Figueroa Street Pedestrian Improvements and Project Site Boundary Modification

The Modified Project would provide a 40- to 70-foot setback along Figueroa Street to activate the pedestrian realm. This area would be developed as a broad, landscaped sidewalk to provide sufficient space for patrons to circulate and queue on event days, and to provide an inviting and safe pedestrian environment on non-event days. The portion of the sidewalk that would be redeveloped would include the on-site portion along the eastern boundary of the Project Site as well as two off-site portions north and south of the Project Site such that the improved sidewalk would extend from Christmas Tree Lane to Martin Luther King, Jr. Boulevard. Additionally, up to 3,975 sf of retail and restaurant use floor area could be located along the stadium's Figueroa Street frontage, as noted above. The Modified Project also includes a slight modification to the Project Site boundary at the northeast corner of the Project Site so that the Project Site boundary generally corresponds with the southern and western edges of the South Coliseum Drive and Figueroa Street

rights-of-way, respectively, as shown in Figure 1, Figure 2, and Figure 3 on pages 5. 6, and 13, respectively. With this change, the size of the Project Site remains approximately 15 acres, which is substantially consistent with the Project Site analyzed in the Certified EIR.

(6) Sustainability Features

The Modified Project would incorporate sustainability as part of its key design and operation criteria. In so doing, the Modified Project would comply with Title 24 of the California Code of Regulations, including Part 6 (Energy Efficiency Standards for Residential and Nonresidential Buildings) and Part 11 (California Green Building Standards Code, commonly referred to as the CALGreen Code), as well as the City of Los Angeles Green Building Code (2013), which incorporates the CALGreen Code into Chapter IX of the LAMC, in effect at the time of the Modified Project's permit application. The Modified Project would also be designed to be capable of achieving at least Silver certification under the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED)-BD+C or LEED-ND Rating System (v.3), or equivalent green building standards. Specific sustainability features that have been incorporated into the Modified Project are summarized below. It should be noted that while this Addendum evaluates the potential environmental impacts that would occur from the proposed modifications to the Original Stadium Project, i.e., the Ancillary Uses that would be developed under the Modified Project, in order to present a comprehensive and informative description of the degree of sustainability for the development as a whole, the proposed sustainability features would apply to all development located within the Project Site, including the stadium component of the Modified Project.

<u>Site Location and Community Access</u>

- The Project Site is located approximately two miles southwest of downtown, within Exposition Park, on a previously developed urban site where substantial existing infrastructure is in place (refer to Figure 1 on page 5). This location provides convenient pedestrian access to several stops on the Expo Light Rail Line, including the Expo Park/USC Station (0.35 mile from the Project Site) and the Expo/Vermont Station (0.7 mile from the Project Site), as well as the 37th Street/USC Silver Line Bus Rapid Transit (BRT) Station on the Harbor Transitway (located approximately 0.37 mile from the Project Site). All of these transit facilities are operated by the Los Angeles County Metropolitan Transportation Authority (Metro). The Project Site is also served by seven bus lines operated by Metro and the Los Angeles Department of Transportation (LADOT) within 0.25 mile of the Project Site.

Water Efficiency

- The Modified Project would reduce indoor potable water demand by at least 20 percent below 2013 CALGreen requirements.
- The Modified Project would comply with City Ordinance No. 170,978 (Water Management Ordinance), which imposes numerous water conservation measures in landscape, installation, and maintenance (e.g., use drip irrigation and soak hoses in lieu of sprinklers to lower the amount of water lost to evaporation and overspray, set automatic sprinkler systems to irrigate during the early morning or evening hours to minimize water loss due to evaporation, and water less in the cooler months and during the rainy season).
- The Modified Project would include conservation measures in accordance with Los Angeles Department of Water and Power (LADWP) requirements for new development in the City of Los Angeles (e.g., high-efficiency fixtures and appliances, weather-based irrigation systems, drought-tolerant landscaping).
- The Modified Project would use native, drought-tolerant plantings and xeriscape designs for non-playing field areas.

Water Quality

- The Applicant would prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) and Standard Urban Stormwater Mitigation Plan (SUSMP), both of which would include Best Management Practices (BMPs), subject to City of Los Angeles Department of Building and Safety approval. The Modified Project would comply with applicable Los Angeles County Regional Water Quality Control Board (LARWQCB) requirements including National Pollutant Discharge Elimination System (NPDES) and Municipal Separate Storm Sewer System (MS4) requirements.

Energy and Atmosphere

- The Modified Project would comply with the required measures of the 2013 Los Angeles Green Building Code and would implement additional efficiency measures to achieve a reduction in energy consumption that is greater than 25 percent relative to the ASHRAE 90.1-2007 standard, but no less than minimum compliance with the 2013 California energy efficiency standards (Title 24, Part 6). Energy efficiency would be achieved through building design and through the incorporation of energy-efficient heating, ventilation, and air conditioning (HVAC) systems, lighting, and appliances.

- Ten percent of the parking spaces provided in the Modified Project's VIP parking lot on the Project Site shall be constructed to accommodate the future placement of facilities for the recharging of electric vehicles.

Materials and Resources

- A minimum of 20 percent of all building materials would consist of pre-consumer and post-consumer recycled content and would be manufactured within a 500-mile radius of the Project Site.

- The Applicant would develop a construction and demolition debris recycling program to divert construction related solid waste and demolition debris from area landfills. Specifically, a minimum of 75 percent of all demolition and construction waste would be diverted for recycling.

- During operation, the Modified Project would divert solid waste from landfills through robust recycling, the donation of durable goods, and implementing a front-of-house composting program that includes sourcing biodegradable concessions packaging.

Indoor and Outdoor Air Quality

- An indoor air quality management plan would be prepared prior to construction. The design would specify interior finish materials such as adhesives, sealants, paints, flooring, and composite wood products with low emission rates of volatile organic compounds (VOCs) to reduce the generation of indoor air contaminants that are odorous, irritating and/or harmful to the comfort and well-being of the construction work force and building occupants.

- The Applicant would implement South Coast Air Quality Management District (SCAQMD)-recommended BMPs during construction and would comply with SCAQMD Rule 403—Fugitive Dust.

- The Applicant would use low-VOC paints for all interior and exterior surfaces.

(7) Site Access and Parking

Parking for the Modified Project would be provided by the supply available at Exposition Park. Exposition Park provides approximately 5,961 parking spaces in multiple parking lots and on streets within Exposition Park (not including the on-site VIP parking lot, as discussed below). These spaces are used by the Coliseum, the Sports Arena, the California Science Center, the Los Angeles County Natural History Museum, the California African American Museum, and other park visitors. Per the terms of a Non-Disturbance Agreement between the California Science Center and USC, during special events at the

Coliseum or Sports Arena (i.e., events with a reasonably anticipated or actual attendance of 3,000 people or more), 600 parking spaces may be reserved by the California Science Center in the Science Center parking structure and 375 spaces may be reserved by the Natural History Museum in Lot 3. If these reservations occur, an estimated 4,986 spaces would be available for events in the Exposition Park parking supply. The Modified Project would not alter these parking space allocations in the Non-Disturbance Agreement between the California Science Center and USC.

It should also be noted that the existing VIP parking lot located on the Project Site, which contains approximately 238 vehicle parking spaces, is not included in the approximately 5,961-space parking supply in Exposition Park. Under the Modified Project, this parking lot would be retained and reconfigured to provide up to approximately 250 spaces. This would increase the vehicle parking supply in Exposition Park to up to approximately 6,211 spaces (5,236 on special event days if the Science Center and Natural History Museum reservations occur).

Vehicle access to the Project Site would be provided off of Figueroa Street via Exposition Park Drive (Christmas Tree Lane) and Martin Luther King, Jr. Boulevard. Primary vehicle access on non-event days would occur at the existing signalized intersections of Hoover Street/Martin Luther King, Jr. Boulevard and Figueroa Street/ Exposition Park Drive/39th Street. Truck access to the Project loading docks would be provided from South Coliseum Drive (Hoover Street). Additionally, the south drive of Christmas Tree Lane could be closed to traffic and open to pedestrians prior to and during events at the stadium, and would be re-opened to allow for exiting traffic prior to completion of the event.

The Modified Project would provide a minimum of 440 bicycle parking spaces (two percent of the proposed stadium seating capacity) to encourage bicycling to events at the stadium, of which 107 (58 short-term and 49 long-term) would be provided in LAMC-compliant bike racks and would satisfy LAMC bicycle parking requirements for the Modified Project's Ancillary Uses on non-event days. The remaining 333 bicycle parking spaces would be managed via a bicycle valet service on event days.

(8) Construction

Construction of the Modified Project is anticipated to take approximately 20.5 months to complete, which is slightly longer than the construction duration assumed for the Original Stadium Project in the Certified EIR. Construction is anticipated to involve five key phases: abatement and soft demolition (approximately 10 weeks); structure demolition (approximately 14 weeks); grading (approximately 4 weeks); building construction (approximately 14 months); and site finishing (approximately 2 months,

overlapping with the last several weeks of building construction). It is estimated that demolition of the existing Sports Arena would create approximately 5.4 million cubic feet of debris, a large percentage of which would be reused on-site as base material. Up to 200,000 cubic yards (cy) of soil would be moved and re-compacted on-site. Whereas the Original Stadium Project analyzed in the Certified EIR estimated an import of approximately 125,000 cy of soil, the Modified Project could result in a total import/export of up to 30,000 cy of soil. Construction trucks and workers would access the Project Site via Martin Luther King, Jr. Boulevard, and construction worker parking would be coordinated through the Exposition Park General Manager.

(9) Discretionary Actions

The Lead Agency with discretionary authority to approve the Modified Project is the Coliseum Commission. In addition, the Modified Project would require various discretionary and ministerial approvals from the City of Los Angeles. In addition to approval of the Modified Project by the Coliseum Commission, approvals required for development of the Modified Project by the City of Los Angeles would include, but may not be limited to, the following:

- Amendment of the Coliseum District Specific Plan to expressly allow development standards for Modified Project (e.g., seating capacity, floor area ratio (FAR), height, signage, parking and uses);
- Director's Review (pursuant to Coliseum District Specific Plan);
- Alcohol Use Approval to expressly allow all establishments that would sell and serve alcohol (pursuant to Coliseum District Specific Plan);
- Sign District/Supplemental Use District (Zone Change) for Signage; and
- Possible Board of Police Commissioners permit for extended interior construction hours.

Other discretionary approvals for the Modified Project may include:

- Haul Route approval (as applicable);
- Possible approval of a property and/or project agreement by the Coliseum Commission authorizing the development of the Modified Project on the Project Site; and
- Possible approval of a Non-Disturbance Agreement or other agreements for LAFC's operation of the Modified Project by the State of California (California

Science Center—Sixth District Agricultural Association), including use of State-owned properties in Exposition Park for signage, parking, and construction staging.

IV. Comparative Analysis of Modified Project Impacts

The analyses provided below address each of the environmental issues analyzed in the Certified EIR and focus on the potential changes in environmental impacts that could result from implementation of the Modified Project. Specifically, potential impacts attributable to the Modified Project are compared with the analysis and findings within the Certified EIR to determine if such impacts are within the envelope of impacts documented in the Certified EIR, including whether new significant impacts would result from the Modified Project or whether previously identified significant impacts would be substantially more severe. As set forth by the analyses below, and as summarized in Table 2 on page 32, the Modified Project would not result in any new significant environmental impacts or a substantial increase in the severity of a significant impact already identified in the Certified EIR. In addition, a revised Mitigation Monitoring Program (MMP) containing all Project Design Features and Mitigation Measures applicable to the Modified Project, including applicable mitigation measures from the Certified EIR analysis, is included as Appendix A to this Addendum.

A. Aesthetics

The following analysis of the Modified Project's potential impacts associated with aesthetics (visual character and views, light and glare and shading) is based on the analysis provided in Section IV.A, Aesthetics, of the Certified EIR, and on the Environmental Impact Lighting Study (Lighting Study) prepared for the Modified Project by Francis Krahe & Associates, dated August, 2015, which is included in Appendix B of this Addendum. The Lighting Study evaluates the proposed lighting program associated with the Modified Project and determines whether the Modified Project would result in new significant light and glare impacts not previously identified in the Certified EIR.

(a) Visual Character and Views

(i) Construction

Construction-related visual character and views impacts were not assessed in detail in the Certified EIR. As set forth in the L.A. CEQA Thresholds Guide and within the Certified EIR, visual character and views impacts are based on a number of factors that are used to determine whether a Project would substantially alter, degrade, or eliminate the existing visual character of an area. As set forth on pages IV.A-21–IV.A-22 of the Certified EIR, these factors include the existing valued aesthetic features that would be removed; open space to be developed; integration of new structures with open spaces; contrast of project features with the area's aesthetic image; the potential for new structures to detract from the existing image of the area; the Project's contribution to the area's aesthetic value; and consistency of the Project with applicable design guidelines and/or regulations.

Similar to the Original Stadium Project, during construction activities for the Modified Project, the visual appearance of portions of the Project Site would be altered due to the removal of the existing Sports Arena building and redevelopment of the Project Site with a new stadium building, and the Modified Project's proposed Ancillary Uses and outdoor open space areas. Related construction activities including site preparation and grading and the staging of construction equipment and materials (i.e., bulldozers, portable toilets, and offices) would also alter the visual character of the Project Site. However, in accordance with Project Design Feature A-1, the perimeter of the Project Site would be screened, which would limit views of construction activities from off-site areas. Given the temporary nature of construction activities and the use of screening to limit views of construction activities, short-term construction activities would not substantially and adversely alter or degrade the existing visual character of the Project Site. As such, construction of the Modified Project would not result in any new significant impacts with respect to construction-related visual character and view impacts. Construction-related impacts to views and visual character would be less than significant, and no mitigation measures are required.

(ii) Operation

The Certified EIR for the Original Stadium Project concluded that impacts with respect to visual character and views during operation of the Original Stadium Project would be less than significant (refer to Section IV.A, Aesthetics, of the Certified EIR). As set forth above, the thresholds on which this analysis was based are stated on pages IV.A-21–IV.A-22 of the Certified EIR. As discussed in the Certified EIR, the Original Stadium Project would result in a notable change to the existing character of the Project Site, as the Sports Arena building would be demolished and replaced with a modern, open-roof stadium complex. The new soccer stadium proposed under the Original Stadium Project, while architecturally different than the existing Sports Arena, would have occupied approximately the same general height, mass, and orientation as the Sports Arena. In addition, architecturally, the Certified EIR stated that the Original Stadium Project would be designed to complement the existing public use structures within Exposition Park and would generally improve the visual character in the project area. Perimeter landscaping and pedestrian plaza areas of the Original Stadium Project would be improved around the stadium fronting Figueroa Street. In addition, the Certified EIR determined that views from residential and commercial uses in the outlying vicinity would not be adversely affected since the Original Stadium Project would occupy the same general field of view as the existing Sports Arena building. With regard to signage, the Certified EIR concluded that while a detailed signage program was not developed at the time of preparation of the EIR, signage would be implemented in accordance with all of the applicable codes of the LAMC, the design guidelines of the South Los Angeles Community Plan, as it pertains to signage, and the rules and regulations set forth in the Specific Plan. Accordingly, the Certified EIR determined that under the Original Stadium Project, visual character and view impacts, including impacts related to the addition of signage to the Project Site, would be less than significant.

As described in detail in Section III, Project Description of this Addendum, the physical development envelope under the Modified Project would not vary substantially from the Original Stadium Project. Specifically, as with the Original Stadium Project, the Modified Project includes an approximately 22,000-seat soccer stadium and associated uses, which would replace the existing Sports Arena within Exposition Park. Proposed modifications to the Original Stadium Project include the addition of up to approximately 105,900 square feet of ancillary amenity floor area (Ancillary Uses), and refinements to the design of the stadium and open space areas. Most of the Ancillary Uses would be centered around a main entry plaza at the northwest corner of the Project Site (Northwest Plaza) that would connect to the stadium's main concourse and serve as a primary public entry to the stadium. The Northwest Plaza is designed to serve as an active public space that would be integrated with ground-floor restaurants with outdoor dining areas. The Ancillary Uses would be a maximum of 75 feet above grade. The Modified Project would also include a 40- to 70-foot setback along Figueroa Street to activate the pedestrian

realm. Overall, as compared the Original Stadium Project, the Modified Project would provide enhanced pedestrian improvements and open space areas, including approximately 143,000 square feet of improved public open space around the Project Site that would include pedestrian walkways and plazas featuring a mix of hardscape and landscaped areas and could potentially include water features, public art, and seating areas.

Under the Modified Project, the proposed stadium would be oriented along a north-south axis and, like the Original Stadium Project, would be located within the eastern portion of the Project Site (within a portion of the footprint area currently occupied by the Sports Arena). The footprint of the stadium under the Modified Project would be somewhat larger than under the Original Stadium Project in order to provide for a more modern stadium that includes the amenities expected of a world-class professional sports stadium. Most of the seating areas within the open-air stadium would be covered by a cantilevered roof canopy extended inward from the stadium's perimeter, with the field level placed approximately 20 feet below street level (as measured from the grade along Figueroa Street), roughly at the same elevation as the floor of the existing Sports Arena, consistent with the Original Stadium Project. The top of the roof canopy of the stadium would reach a maximum height of approximately 105 feet above street level, with rooftop structures extending to approximately 115 feet. The roof canopy skin would consist of a translucent, ETFE material, which would moderate the perceived height of the stadium because it would be permeable to light and would not be perceived as solid. The main concourse of the stadium would be located at street level and would provide an open-air, 360-degree circulation path around the stadium, connecting to several general and premium entry points distributed along the stadium perimeter. In addition, the stadium's northeast and southeast corners would be open to provide views into and out of the stadium seating bowl. Specifically, these openings would allow for clear views into the stadium from the street and sidewalk along Figueroa Street at the primary entrance to Exposition Park, and would frame focal views of the downtown skyline from within the seating bowl, particularly from the southwest corner. The base of the stadium at street level would draw on material influences from the Coliseum and Swim Complex, incorporating similar materials and color palates such as the Travertine and the concrete used extensively on those venues. Entry gates would be clearly identifiable and would prominently feature signage integrated into their design. As such, the design of the street level façades would relate to a human scale.

As discussed in detail in Section III, Project Description, on page 4 of this Addendum, the proposed Supplemental Use Sign District (SUD) for the Modified Project would authorize a new signage program in the proposed Signage Project Site, which consists of the Project Site in addition to a small area at the southwest corner of Christmas Tree Lane and Figueroa Street (located in the SUD's proposed Soccer Stadium Zone), and Parking Lot 6 to the south of the Project Site (located in the SUD's proposed South Parking

Lot Zone). Total signage allowed in the Signage Project Site as part of the SUD for the Modified Project, excluding aerial view signs, information signs, temporary signs, and interior signs, would be approximately 44,500 square feet, including up to approximately 19,200 square feet of digital signage. Individual signs could vary from approximately 40 to 3,800 square feet in size, depending on the sign zone, sign type, and location. Permitted signage would include a freestanding digital sponsorship sign along Figueroa Street in the South Parking Lot Zone, a free-standing digital sign near the southeast corner of the Soccer Stadium Zone along Figueroa Street, a free-standing digital sign near the entry to Exposition Park at Christmas Tree Lane at the northeastern corner of the Soccer Stadium Zone adjacent to Figueroa Street, and digital signs integrated with the architecture of the stadium. In addition, smaller-scale, directional pedestrian and vehicular signage would be placed throughout the Signage Project Site as necessary to facilitate access and safety. The types and extent of permitted signage would emphasize the event and entertainment-oriented aspect of the Project Site. Specifically, signage types could include identification signs, temporary event signs, electronic digital displays, changeable message LED boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed.

Based on the physical description of the Modified Project summarized above and the more detailed description provided in Section III, Project Description, of this Addendum, potential visual character and views impacts, including impacts related to signage, would continue to be less than significant under the Modified Project. The Project Site is located within an urbanized area and specifically within the 145-acre Exposition Park, a major community resource and destination within the City that includes the Coliseum, several museums, educational facilities, recreational amenities and open space areas, including existing signage and approved additional signage pursuant to the Coliseum District Specific Plan. Exposition Park, including the Sports Arena and the Coliseum, has been a renowned destination for major sporting and entertainment activities for decades. The Modified Project would therefore continue the primary existing use on the Project Site by providing an iconic sports and entertainment destination. Further, the Modified Project would replace an aging, underutilized indoor stadium with a new, open-air stadium characterized by contemporary, streamlined architecture. As shown in the visual renderings provided in Figure 4 through Figure 6 on pages 16 through 18 of this Addendum, the stadium would be designed to create an iconic venue for LAFC and the City of Los Angeles, and would consist of materials and color palates that draw influence from adjacent structures within Exposition Park, including the Coliseum. While the height and massing of the new structures would be taller than the existing Sports Arena, the proposed height of the new structures would be modulated with building heights that would range from approximately 75 feet above grade (for the Ancillary Uses in the Northwest Plaza, closest to the Coliseum) to approximately 105 feet above grade (for the proposed stadium roof structure located within the southeast portion of the site furthest from the Coliseum). The proposed building heights would be visually compatible with and within the context of the adjacent

Coliseum, which reaches a height of approximately 75 feet above grade at the Coliseum Bowl and a height of 124 at the top of the peristyle.[3] The Modified Project was specifically designed to respect the height of the Coliseum, so that its maximum height occurs at the edge furthest from the Coliseum (southeast corner), transitioning down to its lowest height of approximately 75 feet at the edge closest to the Coliseum. As discussed in detail in Section IV.E, Cultural Resources, on page 61 of this Addendum, the Coliseum's historic significance would not be materially impaired by the physical design of the Modified Project, and the change in setting under the Modified Project would result in a less than significant impact to the historic significance of the Coliseum.

In addition, the openings within the façade of the Modified Project's stadium and its translucent roof canopy would create additional architectural articulation and view opportunities (as discussed below), thereby contributing to the area's aesthetic value. Furthermore, as summarized above, the new structures would be integrated with approximately 143,000 square feet of improved public open space around the Project Site, which would include a new Northwest Plaza that would also be integrated with the Coliseum and adjacent areas within Exposition Park, as well as an expansive setback along Figueroa Street that would include enhanced landscape and streetscape to activate the western portion of the Project Site and create an inviting pedestrian space. Further, under the Modified Project, the street pattern, sidewalks, rows of trees, and central green space of North and South Coliseum Drives and Christmas Tree Lane would remain intact. In addition, trees and landscaping along the Modified Project's north and northwestern edges would provide screening when viewed from the Coliseum that would reduce the perception of the Modified Project's height and mass. In addition, the proposed reconfiguration and re-landscaping of the VIP parking lot would enhance the aesthetic character of the southern portion of the Project Site as compared to existing conditions. Thus, the visual appearance of the Modified Project would be appropriate in the context of existing development on and immediately surrounding the Project Site and the Modified Project would not degrade the general visual character of the Project Site.

The proposed signage program would represent an important component of the Modified Project and a strong visual element that would influence the aesthetics of the Project Site. As previously described, the Modified Project's signage program would allow a variety of sign types with requirements based on specific locations. The types and extent of permitted signage would emphasize the event- and entertainment-oriented aspect of the Project Site and complement the existing and approved signage environment in Exposition Park. The signage program is intended to support stadium operations and revitalize the

---

[3] *The Olympic Torch spire atop the central arch of the Coliseum peristyle reaches a height of approximately 124 feet above grade.*

Project Site as a major sports and entertainment venue, consistent with its historic use. Central to this concept is the goal of establishing a unique visual identity for the Project Site, which would be achieved in part through dynamic signage. As discussed in Section III, Project Description, on page 4 of this Addendum, the proposed SUD would place limitations on the types, amounts, locations, sizes, operating hours, and illumination of permitted signs. By design, Modified Project signage would be consistent with the character of a sports and entertainment venue (i.e., a well-lit and active environment with substantial pedestrian activity including nighttime activity), such as that which already exists on-site and within the surrounding area, including at the adjacent Coliseum. In addition, as discussed below, proposed signage would not result in significant light and glare impacts. Thus, proposed signage would not result in significant impacts associated with visual character when compared with the existing and contemplated visual character of the area as set forth in existing planning policies such as the Coliseum District Specific Plan. Overall, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.A, Aesthetics, of the Certified EIR), the Modified Project would result in less-than-significant impacts associated with visual character, and no mitigation measures are required.

With regard to views, as stated in the Certified EIR, due to the developed nature of the Project Site vicinity, existing views from the ground level are limited by existing structures and ornamental landscaping. Views of aesthetic resources in the Project Site vicinity include views of the Coliseum and landscaped open space areas within Exposition Park, as well as intermittent distant views of the downtown skyline. As discussed above, the stadium under the Modified Project would be located in the same general location of the existing Sports Arena. While the building height and massing would increase as compared to the existing Sports Arena and the Original Stadium Project, the building height would be modulated to locate shorter building heights closer to the Coliseum. However, there are very limited views of the Coliseum across the Project Site from the public right-of-way along Figueroa Street due to the presence of the Sports Arena and existing trees and landscaping. Accordingly, while the Modified Project would be taller than the Original Stadium Project, it would not result in the blockage of existing unobstructed views of the Coliseum. Further, the Modified Project has been sited so as to not block views of the Coliseum when entering Exposition Park from Figueroa Street (i.e., along Christmas Tree Lane), which is the most important public view corridor in the vicinity in terms of conveying the aesthetic and historic importance of the Coliseum (refer to Section IV.E, Cultural Resources, on page 61 of this Addendum). With regard to views of the downtown skyline, as is the case under existing conditions, and as would have been the case under the Original Stadium Project, such views would continue to be available on an intermittent basis. As compared to the Original Stadium Project, the openings in the Modified Project stadium's northeast and northwest corners would provide enhanced viewing opportunities of the downtown skyline, that are by design intended to provide dramatic and prominent views of this visual resource. With regard to landscaped open space areas within

Exposition Park, as was the case under the Original Stadium Project, the accessibility of such views would vary depending on the vantage point of the viewer. However, in general, the Modified Project would provide enhanced connections to adjacent open space areas through the Northwest Plaza and associated pedestrian walkways, providing more opportunities to access and view open space areas within Exposition Park. Thus, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.A, Aesthetics, of the Certified EIR), potential impacts associated with views under the Modified Project would be less than significant. No mitigation measures are required.

Based on the analysis above, the Modified Project would not result in any new significant impacts with respect visual character and views, including impacts related to signage, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

(b) Light and Glare

(i) Construction

Potential impacts associated with construction-related lighting and glare were not assessed in detail in the Certified EIR. As set forth on page IV.A-22 of the Certified EIR, impacts with respect to light and glare would be significant if the Project would result in a new substantial source of light or glare, which would adversely affect day or nighttime views in the area.

The Modified Project would implement Mitigation Measure CR G-2 of the Certified EIR, which restricts exterior construction and demolition activities to the hours of 7:00 A.M. to 6:00 P.M. Monday through Friday, and 8:00 A.M. to 6:00 P.M. on Saturday. Thus, construction lighting would be limited to very short durations during the winter season and would be temporary. Further, construction-related illumination would be used for safety and security purposes only, in compliance with LAMC light intensity requirements. Additionally, in accordance with Project Design Feature A-1, the perimeter of the Project Site would be screened and would limit views of construction activities. Therefore, uses which are not adjacent to the Project Site would not be anticipated to be substantially affected by construction light or daytime glare. Thus, through implementation of the identified mitigation measure and Project Design Feature, and with adherence to existing LAMC regulations, light and glare impacts associated with proposed construction under the Modified Project would be less than significant. As such, construction of the Modified Project would not result in any new significant impacts with respect to construction-related lighting. No additional mitigation measures are required.

(ii) Operation

The Certified EIR for the Original Stadium Project concluded that impacts with respect to lighting during operation would be less than significant through compliance with mitigation measures (refer to Section IV.A, Aesthetics, of the Certified EIR). As set forth on page IV.A-22 the Certified EIR, impacts with respect to light and glare would be significant if a project would result in a new substantial source of light or glare, which would adversely affect day or nighttime views in the area. In the context of the applicable thresholds identified in the Certified EIR and applicable LAMC requirements related to lighting, the previously referenced Lighting Study was prepared for the Modified Project to determine whether potential lighting and glare from Modified Project operations would result in any new significant impacts that were not identified in the Certified EIR, or whether the previously identified significant impacts would be substantially more severe (see Appendix B of this Addendum). The Lighting Study specifically considers light and glare impacts to be significant if the Modified Project: (1) generates light intensity levels of 2.0 foot-candles or more at the property boundary from exterior on-site light sources[4]; (2) generates light emissions associated with an illuminated sign that produces a light intensity exceeding 3.0 foot-candles at the property line of a residence or other sensitive receptor; (3) creates new high contrast conditions visible from a field of view from sensitive receptor; or (4) incorporates substantial amounts of highly reflective building materials or signage (i.e., daytime glare) in areas that are highly visible to off-site glare-sensitive uses.

As discussed in the Certified EIR, the Original Stadium Project would include stadium lights and other sources of lighting such as pole-mounted lighting for parking lot areas, pedestrian walkways, and security lighting for pedestrian plaza areas that could result in light spillage onto adjacent properties and land uses. In particular, when compared with the existing indoor Sports Arena facility, nighttime events and games held at the Original Stadium Project would generate a high degree of artificial lighting in the night sky. However, under the Original Stadium Project, proposed lighting would be designed in a manner that limits spillover and light pollution to the maximum extent feasible. For example, the Certified EIR explained that the lighting system would employ directional lighting fixtures to illuminate the field level. In addition, Mitigation Measure A-1 required that outdoor lighting shall be designed and installed with shielding such that the light source cannot be seen from adjacent residential properties or the public right-of-way. With regard to daytime glare, Mitigation Measure A-2 limited the types of building materials to be employed in order to address potential daytime glare impacts. Thus, with the

---

[4] *The LAMC addresses lighting intensity levels at the property line of the nearest off-site residence of other light-sensitive use. To provide a conservative analysis, potential lighting impacts are based on the Specific Plan boundary or in the case of the eastern site boundary of the Project Site, the centerline of Figueroa Street.*

implementation of these measures, the Certified EIR concluded that Original Stadium Project's potential aesthetic impacts associated with light and daytime glare would be less than significant.

As with the Original Stadium Project, the Modified Project includes lighting and signage to support stadium operations. Lighting would include lighting of the stadium, including the field and associated amenities and ancillary uses (e.g., outdoor dining and seating areas, plazas, and walkways). As discussed above, new signage would be provided as part of a signage program for the Modified Project to emphasize the event and entertainment-oriented aspect of the Project that would be implemented via the proposed SUD. As described in detail in Section III, Project Description, on page 4, and within Appendix C of this Addendum, signage types for the Modified Project could include identification signs, temporary event signs, electronic digital displays, changeable message LED boards, static signs, identification signs and retail/tenant identification signs, with both on-site and off-site signage allowed. Lighting emissions resulting from the illuminated signage are expected to be emitted from three types of signs: front-lit signs, electronic digital displays, and changeable message LED boards.

A detailed analysis of the potential light and glare impacts associated with proposed lighting and signage under the Modified Project is provided in the Lighting Study included as Appendix B of this Addendum. As discussed in detail in the Lighting Study, a computer model was used to evaluate the Modified Project's potential lighting impacts. To analyze potential lighting impacts, both illuminance and glare from the Modified Project were evaluated. As discussed in the Lighting Study, illuminance is defined as the measured amount of illumination that falls on a given area from a light source, and glare (also referred to as contrast) is defined as the magnitude of the sensation that results when an individual views a surface from which light comes to the eye. A summary of these analyses is provided below. Also included in the evaluation of potential glare impacts below is an analysis of daytime glare.

Illuminance

As described in detail in the Lighting Study, the illuminance analysis for the Modified Project was conducted using a detailed computer model and in accordance with recommended practices established by the Illuminating Engineering Society of North America (IESNA). For the field and on-site lighting, the model evaluated potential lighting impacts at the centerline of Figueroa Street, at the southern Specific Plan boundary at the north edge of Martin Luther King, Jr. Boulevard, at the northern Specific Plan boundary at the north edge of Christmas Tree Lane and at the Specific Plan boundary west of Hoover Street. The analysis conservatively assumed simultaneous lighting of the field and associated amenities and Ancillary Uses within the Project Site. For signage, consistent with applicable LAMC requirements, the model evaluated potential lighting impacts at the

Figueroa Street east boundary, at the southern edge of Martin Luther King, Jr. Boulevard, at the north edge of Christmas Tree Lane and at the Specific Plan boundary west of Hoover Street. The analysis conservatively assumed simultaneous lighting of all proposed illuminated signage (including digital signage).

In addition, the analysis assumed incorporation of specific Project Design Features relative to lighting that would be implemented as part of the Modified Project and would reduce impacts associated with lighting. Specifically, as set forth in Project Design Feature A-2, stadium field lighting would be designed based on Major League Soccer (MLS) standards that stipulate the use of high performance lights with good color and good glare control. In accordance with Project Design Feature A-3, the Project's field lighting would include high-intensity LED fixtures in specified areas and a no lighting fixture zone would be specified as shown in Figure 34 of the Lighting Study. Furthermore, in accordance with Project Design Feature A-4, design elements would be incorporated to limit the direct view of the light source surface of all stadium light fixtures and to ensure that the light source cannot be seen from adjacent residential properties or the public right-of-way. In accordance with Project Design Feature A-5, all light sources, including illuminated signage, would comply with CALGreen (Part 11 of Title 24, California Code of Regulations). Finally, in accordance with Project Design Feature A-6, signage brightness would not exceed 800 candelas per square meter at night.

As summarized in Table 3 on page 44, potential illuminance impacts resulting from field and other on-site lighting proposed under Modified Project would be well below the 2.0-foot-candle significance threshold. In addition, the maximum calculated illuminance would be less than the IESNA recommendations of 8 lux (0.76 foot-candle) for Lighting Zone 3 in which the Project Site is located. As discussed in detail in the Lighting Study, the highest illumination levels would be along Figueroa Street. However, this area is already well illuminated with existing horizontal illuminance levels above 3.0 foot-candles directly across Figueroa Street from the Project Site. Furthermore, Mitigation Measures A-1 and A-2 set forth in the Certified EIR would continue to be incorporated to ensure that impacts associated with illumination from on-site lighting would be less than significant. Thus, no additional mitigation measures are required.

As discussed above, lighting emissions resulting from the illuminated signage proposed by the Modified Project are expected to be emitted from three types of signs: front-lit signs, electronic digital displays, and changeable message LED boards. In accordance with Project Design Feature A-5, illuminated signage would comply with the requirements outlined in CALGreen, and as such, would require 65 percent dimming of signage at night. In addition, in accordance with Project Design Feature A-6, signage brightness would not exceed 800 candelas per square meter at night. As described in detail in the Lighting Study and summarized in Table 4 on page 45, lighting impacts

Table 3
Field and Site lighting Illuminance Calculation Results

Location	Description	Illuminance (foot-candles)			Impact[a]
		Average	Maximum	Minimum	
1-1	Vertical Plane 80 feet high at Centerline of Figueroa St.	0.066	0.735	0.000	Below Threshold
1-2	Vertical Plane 80 feet high at north edge of Martin Luther King, Jr. Blvd.	0.010	0.259	0.000	Below Threshold
1-3	Vertical Plane 80 feet high at north edge of Christmas Tree Ln.	0.014	0.034	0.000	Below Threshold
1-4	Vertical Plane 80 feet high at Specific Plan Boundary west of Hoover St.	0.000	0.000	0.000	Below Threshold

[a] *Threshold is 2.0 foot-candles or more.*

Source: Francis Krahe & Associates, 2015.

resulting from the proposed illuminated signage on neighboring residential properties would be below the 3.0-foot-candle threshold. Thus, potential illumination impacts associated with signage would be less than significant and no mitigation measures are required.

Glare

With regard to glare/contrast from Modified Project lighting, the most sensitive locations for potential glare impacts are those sites closest to the Project Site. Thus, the most sensitive locations are to the east of the Project Site followed by the locations to the south of the Project Site. These locations were evaluated in detail in the Lighting Study.

As discussed above, the Modified Project would include a variety of lighting types, including high-intensity LED field lighting and LED pole lighting. However, as discussed in detail in the Lighting Study, the design of the Modified Project, together with the proposed Project Design Features, would limit direct view of any light sources from areas outside of the Specific Plan boundary. Specifically, as demonstrated by the detailed analysis in the Lighting Study, the receptors to the east of Figueroa Street would not experience high glare conditions due to design features of the Modified Project that screen the field surface and direct view of the field light fixtures, the use of opaque façades and walls that eliminate direct light, and the use of directed and shielded lighting per CALGreen. As such, the resulting contrast from lighting under the Modified Project would be low to medium, resulting in no glare impacts from new lighting sources. With respect to potential glare from

Table 4
Illuminated Signage Calculation Results

Location	Description	Illuminance (foot-candles)			Impact[a]
		Average	Maximum	Minimum	
2-1	Vertical plane 80 feet high at the east edge of Figueroa St.	1.150	2.900	0.100	Below threshold
2-2	Vertical plane 80 feet high at the south edge of Martin Luther King, Jr. Blvd.	0.120	0.600	0	Below threshold
2-3	Vertical plane 80 feet high at the north edge of Christmas Tree Ln.	0.220	0.300	0.100	Below threshold
2-4	Vertical plane 80 feet high at the Specific Plan Boundary west of Hoover St.	0	0	0	Below threshold

[a] *Threshold is 3.0 foot-candles or more.*

Source: Francis Krahe & Associates, 2015.

signage, as stated above, in accordance with Project Design Feature A-6, signage brightness would not exceed 800 candelas per square meter at night, which would ensure that adjacent sensitive receptors do not experience substantial glare effects from Modified Project signage. In addition, as required by the Outdoor Advertising Act, Modified Project signage would not contain flashing images that are visible from freeways. Electronic digital display signage with changing messages, including those visible from the freeway, would consist of static images that remain at a constant brightness for no less than 8 seconds, and then complete an instant refresh to the next image which would then be static for no less than 8 seconds.[5] Accordingly, potential nighttime glare impacts from the Modified Project, including the proposed signage program, would be less than significant and no mitigation measures are required.

With regard to potential impacts from daytime glare, Mitigation Measure A-2 in the Certified EIR requires that the exterior of the proposed structure shall be constructed of materials including, but not limited to high-performance and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize

[5] *The Outdoor Advertising Act defines "flashing" as a light or message that changes more than once every 4 seconds.*

glare and reflected heat. With continued implementation of this Mitigation Measure, potential daytime glare impacts under the Modified Project would be less than significant.

(c) Shading

Potential impacts associated with shading were not assessed in detail in the Certified EIR. As set forth in the L.A. CEQA Thresholds Guide, a project would have a significant shading impact if off-site shadow-sensitive uses would be shaded by project-related development for more than three hours between the hours of 9:00 A.M. and 3:00 P.M. Pacific Standard Time (between early November and early March), or more than four hours between the hours of 9:00 A.M. and 5:00 P.M. Pacific Daylight Time (between early March and early November).[6]

As discussed above, the proposed structures under the Modified Project would range in height from approximately 75 feet within the northwestern portion of the Project Site to a maximum of approximately 105 feet above street level, with rooftop structures extending to approximately 115 feet. The closest off-site shadow-sensitive uses to the Specific Plan area are residential uses located across Figueroa Street to the east followed by residential uses to the of south of Martin Luther King, Jr. Boulevard. Based on the proposed building heights, the maximum shadows that would be generated by the proposed structures would extend approximately 345 feet in a northern orientation during the winter. Given the location of the shadow-sensitive uses to the east and south of the site, as well as the presence of intervening roadways (i.e., Figueroa Street and Martin Luther King Jr., Boulevard) and surface parking areas, the Modified Project would not shade off-site shadow-sensitive uses for more than three hours during any time of the year. As such, the Modified Project's potential shading impacts would be less than significant and no mitigation measures are required.

Based on the analysis above, through the implementation of mitigation measures identified in the Certified EIR and the proposed Project Design Features, implementation of the Modified Project would not result in any new significant impacts with respect aesthetics, and would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

---

[6] *Shade-sensitive uses under the Los Angeles CEQA Thresholds Guide include routinely useable outdoor spaces associated with residential, recreational, or institutional (e.g., schools, convalescent homes) land uses; commercial uses such as pedestrian-oriented outdoor spaces or restaurants with outdoor dining areas; nurseries; and existing solar collectors.*

(d) Project Design Features and Mitigation Measures

The Modified Project would implement the following Project Design Features related to aesthetics:

PDF A-1: The perimeter of the Project Site shall be screened during primary construction activities to limit views of construction activities

PDF A-2: Stadium field lighting shall be designed based on Major League Soccer (MLS) standards that stipulate the use of high performance lights with good color and good glare control.

PDF A-3: The Project's field lighting shall be implemented in accordance with the zones established in Figure 34 of the Lighting Study.

PDF A-4: Design elements shall be incorporated to limit the direct view of the light source surface for all stadium light fixtures and to ensure that the light source cannot be seen from adjacent residential properties or the public right-of-way. Such design elements could include one or more of the following: use of light fixtures that comply with the ratings specified in CALGreen Table 5.106B; use of light fixtures with a focused output where the output angles greater than 20 degrees from beam centerline do not exceed 500 candelas; glare shields and louvers attached to the front face of the light fixture; and/or architectural screens to conceal the direct view of the LED light fixtures from the center of Figueroa Street to the east and the Coliseum District Specific Plan boundary to the north, south, and west.

PDF A-5: All light sources, including illuminated signage, shall comply with CALGreen (Part 11 of Title 24, California Code of Regulations).

PDF A-6: Signage luminance shall not exceed 800 candelas per square meter after sunset or before sunrise.

The following mitigation measures were included in the Certified EIR to reduce potential aesthetics impacts to less than significant levels. These Mitigation Measures would continue to be implemented as part of the Modified Project and have been incorporated into the MMP included with this Addendum (see Appendix A of this Addendum):

EIR Mitigation Measure MM A-1: Outdoor lighting shall be designed and installed with shielding such that the light source cannot be seen from adjacent residential properties or the public right-of-way.

EIR Mitigation Measure MM A-2: The exterior of the proposed structure shall be constructed of materials such as, but not limited to, high-performance

and/or non-reflective tinted glass (no mirror-like tints or films) and pre-cast concrete or fabricated wall surfaces to minimize glare and reflected heat.

B. Agriculture and Forestry Resources

The Certified EIR for the Original Stadium Project concluded that no impacts to agricultural resources would occur under the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR). Significant impacts to agricultural resources could occur if a project were to convert designated farmland to non-agricultural use, conflict with existing zoning for agricultural use or a Williamson Act contract, or otherwise result in the conversation of farmland. The Project Site is currently developed with the Sports Arena and is not located on designated Prime Farmland, Unique Farmland, or Farmland of Statewide Importance as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program. There are no existing or mapped agricultural resources within the Project Site and such uses are not proposed as part of the Modified Project. No agricultural zoning is present in the surrounding area, and no nearby lands are enrolled under the Williamson Act. Thus, the Modified Project would not result in the conversion of designated farmland. In addition, the Modified Project would not conflict with agricultural zoning or a Williamson Act contract. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section V, General Impact Categories, of the Certified EIR), no impacts to agricultural resources would occur under the Modified Project. No mitigation measures are required. Therefore, the Modified Project would not result in any new significant impacts with respect to agricultural resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

Potential impacts to forestry resources were not assessed in detail in the Certified EIR for the Original Stadium Project (Appendix G of the CEQA Guidelines was amended to include forestry resources effective March 2010). Significant impacts to forestry resources could occur if a project were to result in the loss or conversion of forest land, or conflict with existing zoning for forest land or timberland. The Project Site is located in an urbanized area and does not include any forest land or timberland. Additionally, the Project Site is not zoned for forest land, and is not used as forest land. Therefore, development of either the Original Stadium Project or the Modified Project would not conflict with existing zoning for, or cause rezoning of, forest land or timberland as defined by the Public Resources Code. Accordingly, no impacts to forestry resources would occur and no mitigation measures are required. Therefore, the Modified Project would not result in any new significant impacts with respect to forestry resources, and it would not substantially increase the severity of any significant impacts previously identified in the Certified EIR.

C. Air Quality

(a) Construction

The Certified EIR for the Original Stadium Project concluded that air quality impacts from construction of the Original Stadium Project would be significant and unavoidable for regional emissions and less than significant for localized emissions (refer to Section IV.B, Air Quality, of the Certified EIR). The thresholds on which this analysis was based are stated on pages IV.B-21–IV.B-24 of the Certified EIR. As stated in the Certified EIR, the Original Stadium Project would generate pollutant emissions from the following construction-related activities and sources: demolition and site clearing, grading and site preparation; building construction, including the application of architectural coatings; paving and asphalting; construction workers traveling to and from the Project Site; delivery and hauling of construction supplies and debris to and from the Project Site; and, the fuel combustion generated by on-site construction equipment.

The Modified Project would consist of the Original Stadium Project (reconfigured on the Project Site) together with the addition of up to approximately 105,900 square feet of ancillary facility floor area (up to approximately 119,000 gross square feet). In addition, as described in Section III, Project Description, on page 4 of this Addendum, the Modified Project would have a slightly longer construction period (by 0.5 month) and a total import/export of up to 30,000 cubic yards (cy) of soil compared to the Original Stadium Project's estimated import of approximately 125,000 cy of soil. Therefore, construction haul trips are anticipated to be less under the Modified Project. However, as a result of the modifications proposed under the Modified Project, potential construction-related emissions associated with the Modified Project were quantified to determine whether the changes in the proposed development program would have the potential to increase the severity of previously identified significant impacts or result in new, previously unidentified significant impacts related to construction air emissions.

With regard to regional emissions, the Certified EIR determined that the peak daily emissions generated during construction of the Original Stadium Project would exceed the regional emissions threshold recommended by the South Coast Air Quality Management District (SCAQMD) for nitrogen oxides (NO_X) during the grading/site preparation phase, as well as the threshold for reactive organic compounds (ROG) during the building and coating phase. The Certified EIR included Mitigation Measures MM B-1 and MM B-2, requiring compliance with SCAQMD Rule 403 and the use of low-volatile organic compound (VOC) paints, respectively, to reduce these impacts to the extent feasible. However, even with implementation of these mitigation measures, the Certified EIR determined that levels of NO_X and ROG would exceed applicable thresholds. Therefore, the Certified EIR concluded that regional air quality impacts associated with construction emissions would be significant and unavoidable under the Original Stadium Project.

Construction of the Modified Project would generate regional pollutant emissions from the same general sources as the Modified Project, as described above (e.g., heavy-duty construction equipment, haul truck trips, and construction worker trips). Construction-related emissions associated with these sources were calculated using CalEEMod. Model results are provided in Appendix D of this Addendum. The calculations reflect the estimated types and quantities of construction equipment that would be used to remove existing structures and pavement; grade and excavate the Project Site; construct the proposed structures and related improvements; pave new parking; and plant new landscaping within the Project Site under the Modified Project. The analysis assumes that all construction activities would comply with SCAQMD Rule 403 regarding the control of fugitive dust (as reflected in Mitigation Measure MM B-1 in the Certified EIR) and that construction activities would utilize low-VOC paints (as reflected in Mitigation Measure MM B-2 in the Certified EIR). In addition, the Modified Project would incorporate Project Design Feature C-1 related to the control of exhaust emissions from on-site heavy-duty construction equipment, which is reflected in the emission calculations presented in Table 5 on page 51. The Modified Project would also implement Project Design Feature C-2 to encourage Project contractors to apply for SCAQMD Surplus Off-Road Opt-In for NO_X (SOON) funds, if applicable and available at the time of construction. The SOON program provides funding assistance to applicable fleets for the purchase of commercially-available low-emission heavy-duty engines to achieve near-term reduction of NO_X emissions from in-use off-road diesel vehicles. Implementation of Project Design Feature C-2 is not reflected in the Modified Project's emission calculations.

As shown in Table 5, peak daily construction emissions under the Modified Project would be less than those under the Original Stadium Project for all pollutants. However, as with the Original Stadium Project, peak daily emissions of NO_X and VOC would exceed the SCAQMD regional thresholds even with implementation of Mitigation Measures MM B-1 and MM B-2 set forth in the Certified EIR, which have been incorporated into the Modified Project's MMP included as Appendix A to this Addendum. Therefore, consistent with the conclusions in the Certified EIR for the Original Stadium Project (refer to Section IV.B, Air Quality, of the Certified EIR), impacts with respect to regional air emissions during construction would be significant and unavoidable under the Modified Project. However, emissions would be less than levels analyzed in the Certified EIR. No other feasible mitigation measures have been identified to reduce impacts to a less-than-significant level.

With respect to localized emissions, the Certified EIR determined that on-site emissions generated by the Original Stadium Project during the different phases of construction would not exceed the established SCAQMD localized thresholds for NO_X (in the form of nitrogen dioxide (NO_2)), carbon monoxide (CO), particulate matter less than 10 microns in size (PM_{10}), and particulate matter less than 2.5 microns in size ($PM_{2.5}$).

Table 5
Modified Project Regional Construction Emissions[a]
(pounds per day)

Emission Source	VOC	NO_X	CO	$SO_{2.5}$	PM_{10}[b]	$PM_{2.5}$[b]
Modified Project						
2016	10	128	133	<1	18	9

[b] *PM_{10} and $PM_{2.5}$ emissions estimates are based on compliance with SCAQMD Rule 403 requirements for fugitive dust suppression/*

[c] *See Table IV.B-8 on page IV.B-29, Section IV.B, Air Quality, of the Certified EIR. Emissions shown are peak daily emissions during maximum impact phase.*

Source: Eyestone Environmental, 2015.

Therefore, the Certified EIR concluded that impacts related to localized air emissions during construction would be less than significant under the Original Stadium Project.

With respect to quantifying mass emissions for localized analysis, only emissions that occur on-site are considered. Consistent with the SCAQMD Localized Significance Threshold (LST) methodology guidelines, emissions related to off-site delivery/haul truck activity and employee trips are not considered in the evaluation of localized impacts. As shown in Table 6 on page 52, localized construction emissions from the Modified Project would increase in comparison to levels analyzed in the Certified EIR for the Original Stadium Project. However, as with the Original Stadium Project, localized emissions of all criteria pollutants (CO, NO_X, PM_{10}, and $PM_{2.5}$) would remain below their respective SCAQMD LST significance thresholds. As such, consistent with the conclusions in the

Table 6
Modified Project Localized Construction Emissions
(Pounds per Day)

Emission Source	NO_X	CO	PM_{10}	$PM_{2.5}$
