

Cornfield Arroyo Seco Specific Plan (CASP) Update

Environmental Case: ENV-2021-2643-EIR
State Clearinghouse No.: 2021040206

Project Location: The Project Area comprises the entire area within the boundaries of the existing Cornfield Arroyo Seco Specific Plan (CASP), which is generally bordered by Chinatown to the west, Lincoln Heights to the east, and Cypress Park to the north. The Project Area is located entirely within Los Angeles City Council District One and within both the Downtown and the Northeast Los Angeles Community Plan Areas. Interstate 5 (I-5) and State Route-110 (SR-110) bisect the northern portion of the Project Area. Entrances and exits to and from SR-110 are located on the northern perimeter of the Project Area. Entrances and exits to I-5 are located at North Broadway/Pasadena Avenue and at Avenue 26 across from Lacy Street. Other major arterials located in the Project Area include Figueroa Street in the northern portion of the Project Area, San Fernando Road in the central portion of the Project Area, and Spring Street, Broadway Avenue, and Main Street in the southern portion of the Project Area. The Project Area is approximately 600 acres (0.93 square miles).

Council District: 1 (Hernandez)

Project Description: The Proposed Project is an update of the existing CASP. The update includes new land use and zoning regulations, incentives, and boundaries, for the purpose of encouraging affordable, mixed-income, and permanent supportive housing production. The Proposed Project would strengthen the existing CASP's affordable housing requirements, including the recalibration of the CASP's existing incentive zoning system; establish a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities; include provisions that facilitate the production of new 100% affordable housing and permanent supportive housing projects on public land; increase the zoning capacity for housing in targeted areas; and adopt a modernized zoning system based on the City's new modular Zoning Code. The Proposed Project would supersede the text, maps, and tables of the existing CASP, and will include the adoption of necessary revisions and any other amendments necessary to implement this update, including amendments to General Plan elements (such as the Framework Element), community plans, the Los Angeles Municipal Code (LAMC) Chapter 1 and Chapter 1A, specific plans, and other City ordinances.

TABLE OF CONTENTS

1.0 INTRODUCTION

- 1.1 Proposed Project 1-1
- 1.2 Purpose of this Environmental Impact Report..... 1-1
- 1.3 Lead, Responsible, and Trustee Agency 1-2
- 1.4 Authorization and Focus 1-3
- 1.5 Type of Environmental Review 1-3
- 1.6 Environmental Review Process 1-4
- 1.7 Areas of Controversy/Issues to Be Resolved..... 1-9
- 1.8 Organization of the Draft Environmental Impact Report 1-9
- 1.9 Public Participation..... 1-11
- 1.10 Final EIR and EIR Circulation..... 1-11
- 1.11 CEQA Findings for Project Approval..... 1-12
- 1.12 Mitigation Monitoring Program..... 1-12

2.0 EXECUTIVE SUMMARY

- 2.1 Summary of the Proposed Project..... ES-1
- 2.2 Areas of Controversy/Issues to Be Resolved..... ES-4
- 2.3 Classification of Environmental Impacts ES-4
- 2.4 Summary of Alternatives ES-5
- 2.5 Summary of Project Impacts and Mitigation Measures..... ES-7

3.0 PROJECT DESCRIPTION

- 3.1 Project Overview 3-1
- 3.2 Regulatory Setting 3-3
- 3.3 Project Objectives 3-21
- 3.4 Project Components 3-22
- 3.5 Project Timeline and Phases 3-34
- 3.6 Required Approvals 3-34

4.0 ENVIRONMENTAL IMPACT ANALYSIS

- 4.0.1 Introduction to the Analysis..... 4-1
- 4.0.2 Scope of Impacts..... 4-1
- 4.0.3 Format of Sections 4-2

4.1 AESTHETICS

1.0 INTRODUCTION

This chapter provides a brief introduction to the project, an overview of the purpose and focus of the Draft Environmental Impact Report (EIR), a discussion of the intended use of this Draft EIR, a description of the organization of the Draft EIR, and a discussion of the public review process and potential areas of controversy.

1.1 PROPOSED PROJECT

This Draft EIR analyzes the potential environmental effects of the “Proposed Project” or “Project.” The Proposed Project is composed of a long-term land use planning effort which is summarily described below:

The Proposed Project is an update of the existing Cornfield Arroyo Seco Specific Plan (CASP). The update includes new land use and zoning regulations, incentives, and boundaries, for the purpose of encouraging affordable, mixed-income, and permanent supportive housing production. The Proposed Project would amend the text, maps, and tables of the existing CASP, and will include the adoption of necessary revisions and any other amendments necessary to implement this update, including amendments to General Plan elements (such as the Framework Element), community plans, the Los Angeles Municipal Code (LAMC) Chapter 1 and Chapter 1A, specific plans, and other City ordinances.

1.2 PURPOSE OF THIS ENVIRONMENTAL IMPACT REPORT

This EIR has been prepared to comply with the requirements of the California Environmental Quality Act (CEQA), which requires the preparation and certification of an environmental impact report on any project proposed by the City to carry out or approve that may have a significant effect on the environment. (PRC Section 21100(a).) The EIR is ultimately intended as an informational document and by itself does not determine whether the Project, or any component of the Proposed Project, will be approved. The EIR aids in the decision-making process by disclosing the potential significant and adverse impacts. In conformance with CEQA, California Public Resources Code, Section 21000, this EIR provides objective information addressing the environmental consequences of the Proposed Project and identifies the means of reducing or avoiding its significant impacts where feasible.

The CEQA Guidelines help define the role and expectations of this EIR as follows:

- **Information Document.** An EIR is an informational document that will inform decision-makers as well as members of the public of the significant environmental effects of a project, identify feasible ways to minimize or avoid these effects, and describe a set of reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information contained in the administrative record (Section 15121(a)).
- **Degree of Specificity.** An EIR on an individual development project will be more detailed in the specific effects of the project than will an EIR on the adoption of a community plan, specific plan, or zoning ordinance because the effects of the individual development can be predicted with greater accuracy. An EIR on a project such as the adoption of a community plan, specific plan, and/or zoning ordinance should focus on the secondary effects that can be expected to follow from the

adoption but need not be as detailed as the analysis on the specific construction project that might follow (Section 15146).

- **Standards of Adequacy.** An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information that enables them to make a decision that intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure (Section 15151).

The CEQA Guidelines, Section 15382, defines a significant effect on the environment as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.”

1.3 LEAD, RESPONSIBLE, AND TRUSTEE AGENCY

The lead agency for the Proposed Project is the City of Los Angeles (City). The Department of City Planning is responsible for preparing the EIR for the review and consideration of the City Council, as the final decision-maker for the Proposed Project. The address for the Department of City Planning is the following:

City of Los Angeles
Department of City Planning
200 North Spring Street, Room 667
Los Angeles, CA 90012

The determination that the City of Los Angeles is the “lead agency” is made in accordance with CEQA Guidelines sections 15051 and 15367, which define the lead agency as the public agency that has the principal responsibility for carrying out or approving a project. This Draft EIR reflects the independent judgment of the City regarding the potential environmental impacts, the level of significance of the impacts both before and after the mitigation measures proposed to reduce the impacts.

Responsible agencies are other agencies responsible for carrying out/implementing a specific component of the Proposed Project or for approving a project (such as an annexation) that implements the goals and policies of a general plan. Section 15381 of the CEQA Guidelines defines a “responsible agency” as: “A public agency which proposes to carry out or approve a project, for which a lead agency is preparing or has prepared an EIR or Negative Declaration. For purposes of CEQA, responsible agencies include all public agencies other than the lead agency that have discretionary approval authority over the project.”

There are no responsible agencies for the Proposed Project. However, several other agencies have approval authority over individual developments that could be facilitated by the Proposed Project. These agencies include, but are not limited to, California Department of Transportation, California Department of Fish and Wildlife (CDFW), the South Coast Air Quality Management District, and the Los Angeles Regional Water Quality Control Board.

Trustee agencies have jurisdiction over certain resources held in trust for the people of California, but do not have legal authority to approve or carry out the project. CEQA Guidelines Section 15386 designates four agencies as trustee agencies: CDFW with regards to fish and wildlife, native plants designated as rare or endangered, game refuges, and ecological reserves; the State Lands Commission with regard to state-owned “sovereign” lands, such as the beds of navigable waters and state school lands; the California Department of Parks and Recreation with regard to units of the state park system; and, the University of California with regard to sites within the Natural Land and Water Reserves System. There are no trustee agencies for the Proposed Project.

1.4 AUTHORIZATION AND FOCUS

The City determined that an EIR is needed to evaluate potentially significant effects that could result from the implementation of the Proposed Project. An Initial Study was not prepared for the Proposed Project since it was determined from the outset that an EIR would be required (CEQA Guidelines Section 15060(d)).

The City is required to consider the information in the Draft EIR, along with any other relevant information, in making its decision on the Proposed Project. Although the Draft EIR does not determine the ultimate decision that will be made regarding implementation of the project, CEQA requires the City to consider the information in the Draft EIR and make findings regarding each significant effect in the Draft EIR.

Once certified, the Final EIR will serve as the environmental document for the Proposed Project and will be used as a basis for decisions related to future development in the Project Area. Other agencies may also use this Draft EIR in their review and approval process.

1.5 TYPE OF ENVIRONMENTAL REVIEW

The Proposed Project will guide development for the Cornfield Arroyo Seco Specific Plan (CASP) Area (“Project Area”) through 2040. This EIR considers broad specific plan level issues and evaluates the effects of the Project to the Project Area. This EIR also addresses environmental impacts from the Proposed Project to a level that can be assessed without undue speculation, in light of the scope of the Proposed Project components.

Consistent with the requirements of CEQA, the EIR compares the reasonably anticipated development from the Proposed Project against the existing environment and not to the existing plans and regulations. The No Project alternative considers the effects of the existing specific plan and zoning ordinances relative to the impacts of the Proposed Project.

Future Use of the EIR and Subsequent Projects

Approval of the Proposed Project does not constitute a commitment to any specific development project. It is contemplated that future site-specific approvals in the Project Area may be evaluated with consideration of the EIR under CEQA rules for subsequent approvals, where applicable, including but not limited to the following:

- **Addendums (CEQA Guidelines Sections 15162 and 15164).** Addendums may be used when a subsequent approval is consistent with the Proposed Project and no major revisions to the EIR are required based on a change to the Proposed Project, a change in circumstances, or new information, as a result of a new significant impact or an identified significant impact being more severe.

- **Tiering (Public Resources Code Section 21094 and CEQA Guidelines Section 15152).** Tiering refers to using the analysis of general matters contained in a broader EIR with later EIRs and negative declarations on narrower projects; incorporating by reference the general discussion from the broader EIR; and concentrating the later EIR or negative declaration solely on the issues specific to the later project.
- **Program EIR/Subsequent Approvals (CEQA Guidelines Section 15168.)** Projects within the scope of a Program EIR are eligible for streamlined review.
- **Projects Consistent with a Community Plan, General Plan, or Zoning (CEQA Guidelines Section 15183).** Streamlined environmental review is available for a project consistent with community plan, general plan, or zoning adopted with an EIR (Public Resources Code Section 21083).
- **Streamlining for Infill Projects (SB 226; PRC Section 21094.5; CEQA Guidelines Section 15183.3).** Eligible infill projects may qualify for streamlined environmental review at the project level where the effects of infill development have been addressed in a planning level decision or by uniformly applicable development policies.
- **Transit Priority Projects (SB 375; PRC Section 21155-21155.2).** Transit Priority Projects consistent with the SCAG RTP/SCS near transit that have imposed all or all applicable mitigation measures from a prior EIR may be exempt from CEQA or be subject to streamlined review.
- **Statutory Exemption for Projects Consistent with Specific Plan (SB 743; PRC Section 21155.4; CEQA Guidelines Section 15182).** Eligible projects consistent with a specific plan adopted/updated with an EIR may be eligible for these statutory exemptions if all requirements are met.

1.6 ENVIRONMENTAL REVIEW PROCESS

In compliance with CEQA, the City of Los Angeles completed a multi-step process to determine the appropriate scope of issues to be examined in this Draft EIR.

Pursuant to CEQA Guidelines Section 15082, the City filed a Notice of Preparation (NOP) with the State Clearinghouse in the Office of Planning and Research (State Clearinghouse No. 2021040206) as an indication that an EIR would be prepared. The Department of City Planning published the NOP for this Draft EIR for a 30-day public review period on April 8, 2021. The NOP was distributed to trustee agencies, responsible agencies, and other interested parties to request information and concerns relative to the potential environmental impacts of the Proposed Project.

Information, data and observations addressing comments from these letters are included throughout this Draft EIR where relevant. The NOP and NOP comment letters received are included in Appendix A of this Draft EIR. A public Scoping Meeting was held on April 22, 2021 to provide early consultation for the public to express their concerns about the Proposed Project and to acquire information and make recommendations on issues to be addressed in the Draft EIR, including the scope of impacts, alternatives, and potential mitigation.

The City received a total of 92 written and verbal comments and letter responses to the NOP. Information, data and observations addressing comments from these letters are included throughout this Draft EIR where relevant. Comments received are summarized in **TABLE 1-1**.

TABLE 1-1 NOP COMMENTS AND EIR RESPONSE	
Topic	Where Topic is Addressed in EIR
<p>Proposed Project Scope and Description</p> <ul style="list-style-type: none"> • Clear indication of which Area Plans will be revised to be consistent with the Proposed Project • Provide clear goals and objectives so the public can propose alternatives to those goals • Request that the financial and economic setting for existing and proposed population is assessed • Proposed Project should avoid development that may have adverse direct and indirect impacts on CA Protected Areas Database (CPAD) sites. If development adjacent to CPAD is unavoidable, the Proposed Project should include effective setbacks • Include language in the Proposed Project that informs future development activity of Los Angeles County Metropolitan Transportation Authority (Metro) notification procedures, including policy language or guidance that denotes development occurring within 100 feet of a Metro facility will require Metro review and approval, including Metro’s Development Guidelines and a recorded Noise Easement Deed • Policies should encourage transit-supportive public realm improvements, way finding signage, and enhanced ADA-compliant street crossing elements adjacent to transit stops and stations • Proposed Project should include the Connect US Action Plan, which is a community-driven active transportation plan that prioritizes pedestrian and bicyclist connections to and from adjacent neighborhoods • Refer to Metro’s 2020 Long Range Transportation and Measure M Expenditure Plan • Los Angeles Department of Water and Power (LADWP) suggests the Proposed Project include plans illustrating the LADWP Facilities boundaries and show impacts to facilities and access roads • Southern California Association of Governments (SCAG) recommends review of the Final Program Environmental Impact Report (Final PEIR) for Connect SoCal guidance • Proposed Project should incorporate the plans for a clean water campus for LA Sanitation employees • Include an outcome-focused Racial Equity Analysis 	<p>Section 3, Project Description Economic impacts and a GIS mapping tool are not within CEQA’s scope.</p>
<p>Aesthetics</p> <ul style="list-style-type: none"> • Consistency with historic buildings and new proposed uses, especially height differences between existing historic buildings and proposed residential high rises • Metro encourages thoughtful integration of art and culture into public spaces and will review proposals for public art or placemaking facing a Metro right-of-way • Use innovative architecture, with more interesting and innovative design 	<p>Section 4.1, Aesthetics</p>
<p>Air Quality</p> <ul style="list-style-type: none"> • Use of the South Coast Air Quality Management District (SCAQMD) Air Quality Handbook, the California Emissions Estimator Model (CalEEMod), and the 2016 Air Quality Management Plan in the analysis • Take into account all costs related to replacing building filtration including emissions from transportation to disposal sites and the waste generated • Provide SR-110 tunnel emissions and modeling of cold NOx • Delineate TOCs for CASP area and within 1,000 ft of boundary 	<p>Section 4.2, Air Quality</p>

TABLE 1-1 NOP COMMENTS AND EIR RESPONSE	
Topic	Where Topic is Addressed in EIR
<ul style="list-style-type: none"> • Provide numerical/quantified levels of findings, cumulative impacts, infrastructure improvements, and air quality modeling • Request that appendices and technical documents related to air quality, health risk and greenhouse gas analyses as input/output files (not PDFs) 	
Biological Resources <ul style="list-style-type: none"> • Wildlife impacts and nesting bird impacts • Concerns of potential impacts to nesting birds and avoiding disturbance by scheduling ground-disturbing activities outside of aviation breeding season • Avoid and minimize native trees, large and dense-canopied native and non-native trees to reduce habitat loss. Trees should be replaced if loss of habitat occurs. • Algal mats may affect wading bird habitat in the LA River for wading birds • No net loss of wetlands • Provide River flyways, closest wildfire risk area and vegetated hills 	Section 4.8, Biological Resources
Cultural Resources/Tribal Cultural Resources <ul style="list-style-type: none"> • Protection through Historical Zones • Provide review for endemic peoples, especially for the river confluence and summer water sources for villages • Review historic documents, ground and aerial photos and assess potential for subsurface remains as found in Union Station during Red Line construction • Evaluate the impacts of zone change and preserve William Mead Homes and Lincoln Heights Jail as historic buildings • Can an EIR Alternative include doubling of William Mead Homes (as done in the Rose Hill Courts project underway)? • Include SurveyLA findings and analysis 	Section 4.4, Cultural Resources Section 4.16, Tribal Cultural Resources
Energy	Section 4.5, Energy
Geology and Soils <ul style="list-style-type: none"> • Provide locations of recorded seismic events and blind/buried faults • ZIMAS identifies the Fault Zone as the Upper Elysian Park Fault; will the EIR/Plan consider earthquakes? 	Section 4.6, Geology and Soils
Greenhouse Gas Emissions	Section 4.7, Greenhouse Gas Emissions
Hazards and Hazardous Materials <ul style="list-style-type: none"> • Provide historic locations of railroads, cornfields, and industrial land uses • Hazardous material contamination from historic railroads, industrial development, and LA oil field 	Section 4.8, Hazards and Hazardous Materials
Hydrology and Water Quality <ul style="list-style-type: none"> • Maps of groundwater recharge/forced infiltration, storage, and outflow in relation to Los Angeles River • Provide a map of ancestral river floodplain and recharging zones and related land uses • Provide stormwater runoff and ground water reports • Low impact development for stormwater management 	Section 4.9, Hydrology and Water Quality

TABLE 1-1 NOP COMMENTS AND EIR RESPONSE	
Topic	Where Topic is Addressed in EIR
<ul style="list-style-type: none"> • Use of native plants in landscaping • Identify impacts for issuance of LSA Agreement and provide setbacks to maintain buffer areas adjoining ephemeral drainages • A new Water Supply Assessment (WSA) be required if changes occurred after the assessment on 4/6/2010 • Water distribution systems must be reviewed and approved by LADWP • Concern for groundwater contamination from industrial use and costs of remediation 	
<p>Land Use and Planning</p> <ul style="list-style-type: none"> • Lack of and expense for housing infrastructure - drains, sewers, cabling/transformers • Provide transition zones between public facilities and different zones/uses along with a planning development model for parcellation of current plots • Concern for scale of plan in relation to many single-story historic homes that are adjacent to industrial and mixed-use areas within the plan. • Metro supports the creation of General Plan Land Use Designations that prioritize growth around transit infrastructure, such as the Transit Core with the highest allowed FAR of all designations, and Transit Edge designations • Metro supports the inclusion of a core principle that calls for “Promoting a transit, bicycle, and pedestrian-friendly environment” and the creation of linkages between districts • Remove minimum parking requirements and consider shared parking opportunities • Allow for above grade parking and increase building heights for the parking • Increase FAR, building height, and density based on the existing Option B density bonus • Of the current Affordable Housing Bonus, Options A and B, do you anticipate the incentives being the same or expanding on the FAR options to allow for more housing? • Will update plan allow additional incentives via FAR and height? What is the new incentive structure? • TOC and/or state density bonus in addition to those incentives in the CASP • Maximize Extremely Low Income and Deeply Low Income units • Suggestion to accommodate additional housing in CASP by expanding the residential Urban Village (UV) zone. 	<p>Section 4.10, Land Use and Planning</p> <p>Economic impacts are not within CEQA’s scope.</p>
<p>Noise</p> <ul style="list-style-type: none"> • Provide traffic noise assessment with model, including railroad uses 	<p>Section 4.11, Noise</p>
<p>Population and Housing</p> <ul style="list-style-type: none"> • Provide current home ownership, rentals, and R2-R5 rental levels and costs for 2010-2020 and 2020-current • Provide household financial summaries for CASP, including TAZ • Provide definitions/enumerations for economic status and affordability • Needs of affordable housing, especially in Chinatown for lower income and seniors • Incorporate anti-gentrification and anti-displacement strategies to stabilize low-income residents and small businesses 	<p>Section 4.12, Population and Housing</p>

TABLE 1-1 NOP COMMENTS AND EIR RESPONSE	
Topic	Where Topic is Addressed in EIR
<ul style="list-style-type: none"> • How new 100% affordable housing proposal will incentivize private investment and encourage socioeconomic diversity • Able to prioritize distressed residents in surrounding communities to those affordable units? If so, what are the strategies? • Ensure new incentives and affordable housing units benefit current residents • How will this plan avoid large-scale low-income housing that usually amplifies economic segregation • Regarding low-income housing, are there paths to ownership? • How will update accommodate all income levels including medium income? • Provide SCAG 2045 projections for population, employment and housing 	
<p>Recreation</p> <ul style="list-style-type: none"> • Provide program and schedule for major services and support improvements/upgrades • Provide services available for R3-R5 averaged for the city and apply same service levels to all TAZs in SP • Include a community benefits program that incentivizes the creation of public parks and public spaces • Creation of community/public spaces and parks 	Section 4.14, Recreation
<p>Transportation and Traffic</p> <ul style="list-style-type: none"> • Creation of safest streetscape for pedestrians and bicyclists through physical design and geometrics to reduce exposure to vehicles • Eliminate car parking requirements to encourage public transit and provide at least one long-term bicycle parking space per residential unit • Metro recommends that the City review the Transit Supportive Planning Toolkit which identifies 10 elements of transit-supportive places • The City should address first-last mile connections to transit and is encouraged to support these connections with wayfinding signage inclusive of all modes of transportation • Request of a VMT analysis • Provide additional density for developments surrounding major transit stops and include stations for all rail lines that are existing and under construction • Emphasis of coordination of planning efforts between local agencies and the California Department of Transportation (Caltrans) districts 	Section 4.15, Transportation and Traffic
<p>Utilities and Service Systems</p> <ul style="list-style-type: none"> • Lack of and expense for housing infrastructure - drains, sewers, cabling/transformers 	Section 4.17, Utilities and Service Systems
<p>Alternatives</p> <ul style="list-style-type: none"> • Goodwill suggests accommodating additional housing in CASP by expanding the residential Urban Village (UV) zone 	Section 5, Alternatives
<p>Non-CEQA</p> <ul style="list-style-type: none"> • Why does the preservation of industrial land remain a goal of the CASP? • Concern for community members with language and technology barriers to participate and engage • Transcription of Zoom notes and meeting comments 	Non-CEQA

TABLE 1-1 NOP COMMENTS AND EIR RESPONSE	
Topic	Where Topic is Addressed in EIR
<ul style="list-style-type: none"> • Will planning and permit fees be reduced in CASP to offset current high development costs? • Market study findings • Concern with language and technology barriers among seniors and residents of CASP • Scoping meetings during business hours will exclude many stakeholders from participating 	

In accordance with CEQA Guidelines sections 15087 and 15105, this Draft EIR is being circulated for a 60-day review period. The Draft EIR was also submitted to the State Clearinghouse for distribution to state agencies.

Interested parties may provide written comments on the Draft EIR during the comment period. Comment letters may be sent via U.S. mail or email addressed to the following:

City of Los Angeles, Department of City Planning

ATTN:

Michael Sin, City Planner
 Case Number: CPC-2021-2642-SP; ENV-2021-2643-EIR
 200 N. Spring Street, Room 667
 Los Angeles, CA 90012

1.7 AREAS OF CONTROVERSY/ISSUES TO BE RESOLVED

Potential areas of controversy and issues to be resolved by the City’s decision-makers may include those environmental issue areas where the potential for an unavoidable and significant impact has been identified.

Based on the Scoping Meeting and NOP comment letters (summarized in **Table 1-1**, above, and provided in Appendix A of this Draft EIR), issues known to be of concern in the community and therefore, potential areas of controversy, include impacts to wildlife and nesting birds, hazardous material contamination, groundwater contamination, lack of housing infrastructure, consistency with historic buildings and adjacent industrial and mixed use areas, and lack of anti-gentrification and anti-displacement strategies,

1.8 ORGANIZATION OF THE DRAFT ENVIRONMENTAL IMPACT REPORT

This Draft EIR is organized into ten chapters, as follows:

1.0 INTRODUCTION. This chapter contains an overview of the purpose and focus of the Draft EIR, a discussion of the intended use of this Draft EIR, a description of the organization of the Draft EIR, and a discussion of the public review process and potential areas of controversy.

2.0 EXECUTIVE SUMMARY. This chapter provides a summary of the Proposed Project's potential environmental impacts that would result from implementation of the Proposed Project, proposed mitigation measures where applicable, and the level of significance of the impact before and after mitigation.

3.0 PROJECT DESCRIPTION. This chapter describes the Proposed Project, including project location, existing conditions, project objectives, and a description of the proposed changes to existing plans and zoning under the project.

4.0 ENVIRONMENTAL IMPACT ANALYSIS. This chapter is the primary focus of this Draft EIR. Each environmental issue is considered in a separate section, which contains a discussion of the environmental settings, the regulatory setting, the methodology and the thresholds of significance. Each section also includes the analyses of environmental impacts of the project, mitigation measures, conclusions regarding the level of significance after mitigation, and cumulative impacts for each of the following environmental topics and environmental issues:

- 4.1 **Aesthetics** - Changes to views, scenic resources, and visual quality
- 4.2 **Air Quality** - Changes in pollutants affecting air quality
- 4.3 **Biological Resources** - Impacts on any sensitive wildlife habitats or special species
- 4.4 **Cultural Resources** - Changes to historic resources and impacts to archaeological or paleontological resource and human remains
- 4.6 **Energy** - Wasteful or inefficient use of energy resources
- 4.7 **Geology and Soils** - Risk from geologic and seismic hazards
- 4.8 **Greenhouse Gas Emissions** - Changes to greenhouse gas emissions and conformance to applicable greenhouse gas plans, policy, and regulations
- 4.9 **Hazards and Hazardous Materials** - Changes in the risk of exposure to hazardous materials, or proximity to wildland fire hazards
- 4.0 **Hydrology and Water Quality** - Changes in water quality, drainage patterns and the amount of stormwater runoff
- 4.10 **Land Use and Planning** - Changes to land use and zoning
- 4.11 **Noise and Vibration** - Changes in noise and vibration levels due to construction, traffic, and proposed uses
- 4.12 **Population, Housing, and Employment** - Changes in population, jobs/housing balance, and the displacement of a substantial number of housing units or persons
- 4.13 **Public Services** - Impacts related to the construction of new or expanded public facilities (i.e. fire protection and schools)
- 4.14 **Recreation** – Impacts related to the construction of new or expanded recreational facilities and impacts to existing recreational facilities with implementation of the Proposed Project
- 4.15 **Transportation and Traffic** - Changes in transportation conditions and vehicles miles travelled, review of emergency access, potential hazardous design features, and potential conflict with alternative transportation (e.g., bicycles and public transportation)
- 4.16 **Tribal and Cultural Resources** – Impacts to cultural resources potentially related to one of more Native American tribes
- 4.17 **Utilities and Service Systems** - Impacts related to the increased need for utilities and infrastructure improvements and the construction of new or expanded facilities
- 4.18 **Effects Found Not to Be Significant** – Issues for which the Proposed Project was found to have no potential for significant environmental impacts

The proposed land use and zoning designation for all the properties in the Project Areas is known and can be analyzed for the Proposed Project.

5.0 ALTERNATIVES. This chapter provides analysis of a range of reasonable alternatives to the Proposed Project in accordance with CEQA Guidelines Section 15126(f). The range of alternatives considered is based on their ability to feasibly attain most of the project objectives and avoid or substantially lessen any of the significant effects of the Proposed Project.

- Alternative 1: No Project Alternative
- Alternative 2: No Urban Village Alternative
- Alternative 3: Reduced Urban Village Alternative

6.0 OTHER CEQA CONSIDERATIONS. This chapter provides analysis of a discussion of the (1) significant environmental effects that cannot be avoided if the Proposed Project is implemented, (2) significant irreversible environmental changes that would result from implementation of the Proposed Project, and (3) growth-inducing impacts of the Proposed Project.

7.0 PREPARERS OF THE DRAFT EIR. The chapter lists the persons and lead agency that were consulted or contributed in the preparation of this Draft EIR.

1.9 PUBLIC PARTICIPATION

CEQA encourages public participation in the planning and environmental review processes. The City will provide opportunities for the public to present comments and concerns regarding the CEQA processes. The public is invited to provide comments and concerns regarding the accuracy of the Draft EIR and the CEQA process. Written comments may be submitted to the City of Los Angeles City Planning Department to the attention of Michael Sin, City Planner, at 200 N. Spring Street, Room 667, Los Angeles, CA, 90012 or email to michael.sin@lacity.org, during the specified public review and comment period. The comment period and public hearing dates are indicated on the cover of this EIR. Pursuant to CEQA Guidelines Section 15088, the City will prepare written responses to any comments that raise significant environmental issues received during the noticed comment period and include those responses in the Final EIR. The public will also be provided opportunities to present oral and written comments at future hearings and meetings on the Proposed Project to City Planning Commission and the City Council. The City may but is not required to provide written responses to comments submitted after the circulation period for the Draft EIR.

1.10 FINAL EIR AND EIR CERTIFICATION

Following the close of the public review period on the Draft EIR, the City will prepare and publish a Final EIR, which will contain a summary of all written and recorded oral comments on this EIR received during the public review period for the Draft EIR and written responses to those comments that raise environmental concerns, along with copies of the letters received, and any necessary revisions to the EIR. The Draft EIR, comments on the EIR and a list of persons, organizations and public agencies that commented on the Draft EIR, response to comments, and any revisions to the Draft EIR will constitute the Final EIR. The City Council, in an advertised public meeting(s), will consider the documents and then, if found adequate, certify the Final EIR as completed in compliance with CEQA and the CEQA Guidelines.

1.11 CEQA FINDINGS FOR PROJECT APPROVAL

Where a certified EIR identifies significant environmental effects, CEQA Guidelines Sections 15091 and 15092 require the adoption of findings prior to approval of a project. Prior to approval of a project, one of three findings must be made, as required by PRC Section 21081 and CEQA Guidelines Section 15091:

- Changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect as identified in the Final EIR.
- Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
- Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR.

If the City approves the Proposed Project, despite significant impacts identified in the Final EIR that cannot be feasibly mitigated, the City must state in writing the reasons for its actions, under CEQA Guidelines Section 15093. Those findings, called a Statement of Overriding Considerations, must be prepared to substantiate the City's decision to accept the unavoidable significant environmental effects of the Proposed Project balanced against the benefits afforded by the Proposed Project.

1.12 MITIGATION MONITORING PROGRAM

At the time of project approval, CEQA and the CEQA Guidelines require lead agencies to adopt a mitigation monitoring program for monitoring the revisions it has required in the project and the measures it has imposed to mitigate or avoid significant effects on the environment (CEQA Section 21081.6; CEQA Guidelines Section 15097). This Draft EIR contains mitigation measures that if found feasible will be included in the Mitigation Monitoring Program for the Proposed Project.

2.0 EXECUTIVE SUMMARY

This document is an Environmental Impact Report (EIR) analyzing the environmental effects of the proposed updates to the City of Los Angeles' Cornfield Arroyo Seco Specific Plan (CASP) Update (herein referred to as "Proposed Project" or "Project"). The Proposed Project is an update of the existing CASP, which includes new land use and zoning regulations, incentives, and boundaries, for the purpose of encouraging affordable, mixed-income, and permanent supportive housing production. The Proposed Project would supersede the text, maps, and tables of the existing CASP, and will include the adoption of necessary revisions and any other amendments necessary to implement this update, including amendments to General Plan elements (such as the Framework Element), community plans, the Los Angeles Municipal Code (LAMC) Chapter 1 and Chapter 1A, specific plans, and other ordinances to implement those updates.

This section summarizes the characteristics of the Proposed Project, alternatives to the Proposed Project, and the environmental impacts and mitigation measures associated with the Proposed Project.

PROJECT DESCRIPTION

This EIR has been prepared to examine the potential environmental effects of the updates to the City's Cornfield Arroyo Seco Specific Plan Update. The following is a summary of the full project description, which can be found in Section 3.0, *Project Description*.

CASP

The Proposed Project would strengthen the existing CASP's affordable housing requirements, including the recalibration of the CASP's existing incentive zoning system; establish a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities; include provisions that facilitate the production of new 100% affordable housing and permanent supportive housing projects on public land; increase the zoning capacity for housing in targeted areas; and adopt a modernized zoning system based on the City's new modular Zoning Code. The Proposed Project would also update the building form, urban design, open space, parking, conservation, performance, and sign standards of the existing CASP, including adopting standards in the New Zoning Code in lieu of those in the existing CASP, as necessary to support housing production and implement technical revisions that ensure consistency, clarity,

and ease of implementation and reflect current and future demographic, regulatory, environmental, and economic conditions. The Project Area boundaries would be revised to exclude parcels that currently do not contain zoning within the Project Area, such as RD zones, or to exclude peripheral open space areas adjacent to Elysian Park in the Silver Lake-Echo Park-Elysian Valley Community Plan Area. The Proposed Project would retain the existing ministerial review process for subsequent qualifying development projects.

The intent of the existing CASP was to guide the transition of a vehicular-oriented industrial and public facility area into a cluster of mixed-use, pedestrian-oriented neighborhoods. Policies in the existing CASP support a range of housing options, new public spaces, opportunities for walking and bicycling, and the retention of land for existing industrial businesses and new clean technology businesses. Among its numerous goals, a key priority of the existing CASP is to facilitate the production and continued provision of affordable housing for Extremely Low Income and Very Low Income households.

However, since the CASP's adoption, housing production of any kind within the Project Area boundaries has been limited. Among the projects constructed, at the time of EIR preparation, all involved discretionary actions from the City Planning Commission or Area Planning Commission to deviate from the CASP, or were entitled prior to the adoption of the CASP, with less than one percent of total units reserved for low-income households. The limited supply of available housing units (0.9 percent residential vacancy rate), together with the low average household income and strong demand for housing in the greater area, creates growing displacement pressure for existing residents and disproportionately in communities of color.

In light of the present housing situation, and in response to a City Council Motion (Council File No. 13-0078- S2) calling for the evaluation and amendment of the Specific Plan, the City of Los Angeles is updating the CASP with the goal of further bolstering the production of affordable, mixed-income, and permanent supportive housing in the Project Area. The Proposed Project will entail updates to the CASP's zoning regulations, land use incentives, boundaries, and other key provisions to facilitate the production of housing, consistent with the underlying vision and purpose of the adopted CASP.

PROJECT OBJECTIVES

The underlying purpose of the Proposed Project is to encourage the production of affordable, mixed-income, and permanent supportive housing in the Project Area.

Objectives of the Proposed Project are as follows:

- Increase the production of affordable, mixed-income, and permanent supportive housing within the Project Area.
- Protect residents, especially low-income households, from indirect and direct displacement, and ensure stability of existing vulnerable communities.
- Design and regulate housing to promote health and well-being, increase access to amenities such as parks and public transit, contribute to a sense of place, foster community and belonging, and plan for a sustainable future.
- Build, operate, and maintain welcoming and accessible housing for Angelenos with unique needs, including those with disabilities, large families, older adults, and other people facing housing barriers and economic insecurity.
- Refine Plan standards, processes, and procedures to be more intuitive and transparent, with the goal of enhancing development certainty for both market-rate and affordable housing developers; and
- While reducing overall employment capacity, preserve employment areas that show a concentration of jobs, while supporting small and/or legacy businesses, local employment, and new productive uses and employment spaces, such as light industrial and general commercial uses.

CASP REASONABLY ANTICIPATED DEVELOPMENT

The Proposed Project would continue to accommodate future growth in the Project Area, including the employment, housing, and population growth projections through the planning horizon year 2040. With implementation of the Proposed Project, the zoning designations of the Project Area would be updated to continue accommodating the population growth, housing, and employment demand projected by the Southern California Association of Governments (SCAG) through the year 2040. The Proposed Project would also accommodate growth in the City consistent with the City's Framework Element policies, SCAG's Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), and SB 375.

To assess potential environmental impacts of the Proposed Project, the reasonably anticipated development that is anticipated to occur in 2040 as a result of the Proposed Project was determined. The reasonably anticipated development of the Project Area was determined based on assumptions about the level of development that can be anticipated to occur during the life of the updated Specific Plan (through the year 2040, or approximately 20 years into the future, coincident with the adopted 2016-2040 RTP/SCS).¹ A key factor in determining reasonably anticipated development is the allocation of land and the distribution of uses to reflect the development patterns most likely to be built, or that are reasonably expected to occur. This approach is consistent with the approach used by SCAG to comply with federal laws that require RTPs to reflect development patterns most likely to be built in the region. As SCAG is a guiding precept, it is the City's responsibility while planning for the entire City in light of its Framework Element, the Sustainable Communities Strategy, and SB 375 policies, to determine whether any given specific plan or community plan should meet, exceed, or be under SCAG's expected projections for that specific plan or community plan area, and prepare a specific plan or community plan update in light of that responsibility.

The development growth assumptions for the Proposed Project, shown in **TABLE ES-1**, are based on the acreage of land designated for each type of function (by zone); allowable development capacity in each designation; anticipated levels of development in the life of the Proposed Project; discussion with existing public agencies, such as HACLA; and potential development constraints. Additionally, the development growth assumptions estimate that roughly 3,255 cumulative acres of grading would occur up to Project buildout in year 2040. This grading would not occur simultaneously throughout the Project Area but is projected to occur in order to accommodate total population growth. The rough grading estimates equate to no more than 200,000 cubic yards of grading at any given time and for a wide range of probable construction activities which are expected to occur, such as site preparation and remediation, if necessary. Projected daily worker and truck trips with associated haul routes are also expected to increase as a result of the Proposed Project.

TABLE ES-1 REASONABLY ANTICIPATED DEVELOPMENT OF THE PROPOSED PROJECT COMPARED TO SCAG FORECAST				
	2021 Baseline /a/	Existing Plan Reasonably anticipated development /b/	Proposed Project Reasonably anticipated development /b/	SCAG 2040 Growth Forecast /c/
Housing	2,012	12,773	20,036	5,039
Population	6,027	36,021	56,501	14,444
Employment	5,411	10,005	8,263	8,797
/a/ SCAG 2016-2040 RTP/SCS interpolated to 2021, adjusted				
/b/ LADCP 2021				
/c/ SCAG 2016-2040 RTP/SCS (includes portions of whole Transportation Assessment Zones outside of Project Area)				

¹ For a discussion on how the 2016-2040 RTP/SCS and 2020-2045 RTP/SCS projections are consistent with each other within the Project Area, and how 2016-2040 RTP/SCS projections are used in this EIR, see Section 3.0, *Project Description*, in this EIR.

2.2 AREAS OF CONTROVERSY/ISSUES TO BE RESOLVED

Potential areas of controversy and issues to be resolved by the City's decision-makers may include those environmental issue areas where the potential for an unavoidable and significant impact has been identified.

Based on the NOP comment letters (summarized in Table 1-1, of this Draft EIR, and provided in Appendix A of this Draft EIR), issues known to be of concern in the community and therefore, potential areas of controversy, include but are not limited to loss of affordable housing, lack of parks, lack of jobs, overconcentration of certain uses, protection of small businesses, displacement of residents, and environmental contamination.

The primary issue to be resolved through the planning and environmental review process for the Proposed Project is whether the City should adopt the updated CASP to replace the existing CASP. Options include adopting the Proposed Project or some variation of it (such as one of the alternatives considered in this EIR) or continuing to have the existing CASP guide development in the Project Area and throughout the City.

2.3 CLASSIFICATION OF ENVIRONMENTAL IMPACTS

The following environmental impact categories are analyzed in this EIR:

- **Aesthetics.** Consistency with applicable scenic quality regulations and changes to scenic vistas, scenic highways, and light/glare.
- **Air Quality.** Consistency with applicable air quality plan and changes in cumulative pollutant emissions, sensitive receptor exposure, and odors.
- **Biological Resources.** Consistency with applicable habitat conservation plan and policy and impacts to special status species and special species habitat, riparian habitat, wetlands, and migratory wildlife.
- **Cultural Resources.** Impacts to historical resources, archaeological resources, and human remains.
- **Energy.** Consistency with applicable renewable energy plans and changes in energy consumption.
- **Geology and Soils.** Risk from geologic and seismic hazards and impacts to paleontological resources.
- **Greenhouse Gas Emissions.** Generation of greenhouse gases and consistency with applicable plans, policy, and regulations related to climate change and greenhouse gas emissions.
- **Hazards and Hazardous Materials.** Changes in risk or exposure to hazardous materials, and consistency with applicable airport and emergency response plans.
- **Hydrology and Water Quality.** Consistency with applicable water quality plans and policy, and changes in water quality, groundwater supplies, drainage, and release in pollutants.
- **Land Use Planning.** Consistency with applicable land use plans and policies and impacts to community connectivity.
- **Noise.** Changes in noise and vibration levels due to construction, traffic, and operation of future development, and consistency with applicable airport plans.

- **Population and Housing.** Changes in population, and the displacement of housing units or persons.
- **Public Services.** Impacts related to the construction or expansion of public facilities (i.e. police protection, fire protection, schools, and libraries).
- **Recreation.** Impacts related to the construction, expansion, or deterioration of recreational facilities.
- **Transportation.** Consistency with applicable plans and policy related to circulation, impacts related to vehicle miles travelled metric, hazards, and emergency access.
- **Tribal Cultural Resources.** Impacts to tribal cultural resources.
- **Utilities and Services Systems.** Consistency with applicable regulations and goals, and impacts related to the construction of new or expanded facilities (i.e., wastewater treatment, drainage, water, solid waste, electric power, natural gas, telecommunications, police, fire, libraries and schools).

2.4 SUMMARY OF ALTERNATIVES

As required by Section 15126.6 of the CEQA Guidelines, a range of reasonable alternatives to the Proposed Project that would attain most of the basic project objectives but would avoid or substantially lessen any of its significant environmental effects must be examined. Project alternatives aim to identify and disclose ways to mitigate or avoid significant environmental effects that may result from the Proposed Project. Impacts found to be significant and unavoidable in Section 4.0, *Environmental Analysis*, include the exceedance of criteria air pollutant emission standards including construction-related NO_x, PM_{2.5}, PM₁₀ emissions and operation-related VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions, the possible loss of historical resources, temporary construction-related noise and construction-related vibration impacts, and traffic safety impacts related to highway off-ramps. Impacts found to be potentially significant but able to be reduced to less than significant with the imposition of proposed mitigation include impacts to sensitive receptors from construction-related activities, impacts to birds from construction activities, impacts from ground-disturbing activities to tribal and paleontological resources, or impacts resulting from contaminated soils.

The alternatives considered are summarized below. Project alternatives are further discussed in Section 5.0, *Alternatives*.

- **Alternative 1: No Project Alternative.** The “No Project” alternative involves continued implementation of the existing CASP. This alternative assumes that the City’s existing plans and policies would continue to accommodate development in accordance with existing zoning designations. The Project Area is projected to accommodate a population of 36,021 residents, 12,773 housing units, and 10,005 jobs by 2040. SCAG projects growth of the Project Area to reach 14,444 residents, 5,039 housing units, and 8,797 jobs by 2040. Therefore, population and housing growth in the Project Area would exceed SCAG’s forecasts under current plans, as would forecasted employment growth. Overall, current land use patterns limit population and housing growth in the Project Area, as compared to the Proposed Project, and would likely cause development to occur elsewhere in the region to meet the SCAG’s 2040 Citywide projections. This may increase regional emissions of air pollutants and greenhouse gases as well as increased regional energy consumption, and VMT.
- **Alternative 2: No Urban Village Alternative.** The “No Urban Village” alternative does not include the expansion of the residential Urban Village zone to any new parcels, but it includes other changes to the existing CASP that are likely to increase housing production, such as the

establishment of the new Public Use (P2) zone and allowing 100% affordable housing in the Urban Center, Urban Innovation, and Public Use (P2) zones. Under Alternative 2 the Project Area is projected to accommodate a population of 43,523 residents, 15,434 housing units, and 9,551 jobs by 2040. SCAG projects growth of the Project Area to reach 14,444 residents, 5,039 housing units, and 8,797 jobs by 2040. Therefore, population, housing and employment growth in the Project Area would exceed SCAG's forecasts under current plans, though the City has discretion in how it allocates growth across the City to meet other objectives and has historically allocated more growth to the Project Area than SCAG, consistent with the City's General Plan Framework. Overall, the lack of the residential Urban Village zone expansion would limit population and housing growth in the Project Area, as compared to the Proposed Project but would result in increased job opportunities in the Project Area as commercial and light industrial uses would take the place of residential development.

- **Alternative 3: Reduced Urban Village Alternative.** The "Reduced Urban Village" does include the expansion of the residential Urban Village zone to new parcels, but not to the same extent as the Proposed Project. Compared to the Proposed Project, Alternative 3 does not include any new Urban Village zoning east of the Los Angeles River, or in an area along Main Street west of the Los Angeles River. Under Alternative 3, the Project Area is projected to accommodate a population of 48,527 residents, 17,208 housing units, and 9,055 jobs by 2040. SCAG projects growth of the Project Area to reach 14,444 residents, 5,039 housing units, and 8,797 jobs by 2040. Therefore, population, housing and employment growth in the Project Area would exceed SCAG's forecasts under current plans. Overall, the reduced expansion of the residential Urban Village zone would limit population and housing growth in the Project Area, as compared to the Proposed Project but would result in increased job opportunities in the Project Area as commercial and light industrial uses would take the place of residential development.

ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA requires identification of the environmentally superior alternative among the options studied. In general, the environmentally superior alternative is the alternative that would be expected to generate the fewest adverse impacts. If the No Project Alternative (Alternative 1) is identified as environmentally superior, then another environmentally superior alternative shall be identified among the other alternatives.

Alternatives 1, 2, and 3 would all incrementally reduce impacts for multiple issue areas compared to the Proposed Project. This is because these alternatives would all reduce overall development levels in the Project Area. However, none of these alternatives would avoid any of the significant and unavoidable impacts of the Proposed Project. Alternative 1 would involve the lowest overall level of population growth and development in the Project Area. However, because Alternative 1 would not be subject to all of the same mitigation measures as proposed in the Proposed Project, it may result in higher greater overall impacts than the Proposed Project for certain issues, such as noise and tribal cultural resources. In addition, by limiting growth in the Project Area, Alternative 1 could cause more forecast growth and associated development to occur in other areas of the City or region that have less access to transit and longer distances between housing, jobs, and services. In this way, Alternative 1 may also result in greater overall regional VMT and associated GHG emissions.

Between the two other alternatives, Alternative 2 has the potential to reduce impacts more so than Alternative 3, although both are very similar with respect to environmental impacts. Alternative 2 would accommodate less growth in the Project Area, as compared to Alternative 3, potentially resulting in slightly reduced impacts to air quality (operational emissions), cultural resources, hazards/hazardous materials, public services, and utilities/service systems, although Alternative 2 would still result in the same impact conclusions as Alternative 3 and the Proposed Project in all impact categories. Similar to Alternative 1, limiting development potential in the Project Area may induce higher levels of growth in other areas of the

City and region that have fewer transit options and longer distances between housing, jobs, and services, potentially increasing regional traffic and related GHG emissions. Additionally, while significant impacts would potentially be less under Alternative 2, impacts related to historical resources, air quality, construction noise and vibration, and transportation safety impacts related to freeway off-ramp queuing would remain *significant and unavoidable*. Nonetheless, Alternative 2 is identified as the Environmentally Superior Alternative as it would be expected to generate the fewest adverse impacts.

TABLE ES-2 IMPACT COMPARISON OF ALTERNATIVES			
Issue	Alternative 1: No Project	Alternative 2: No Urban Village	Alternative 3: Reduced Urban Village
Aesthetics	=	=	=
Air Quality	+	+	+
Biology	+	+	+
Cultural Resources	+	+	+
Energy	-	-	-
Geology and Soils	+	+	+
Greenhouse Gas Emissions	-	-	-
Hazards/Hazardous Materials	+	+	+
Hydrology/Water Quality	=	=	=
Land Use and Planning	-	-	-
Noise	-	+	+
Population and Housing	-	-	-
Public Services	+	+	+
Recreation	+	+	+
Transportation/Traffic	-	-	-
Tribal Cultural Resources	-	+	+
Utilities/Service Systems	+	+	+
+ Superior to the Proposed Project (reduced level of impact) - Inferior to the Proposed Project (increased level of impact) = Similar level of impact to the Proposed Project Significant and unavoidable impacts are bolded and red. Note that for Alternative 1, impacts would not technically be “significant” under CEQA since that alternative involves continued implementation of the existing CASP; impacts are identified as “significant and unavoidable” if the physical effect associated with the alternative would be equivalent to a “significant impact” if the alternative involved a new discretionary action.			

2.5 SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

A summary of the environmental impacts associated with the Proposed Project is included in **Table ES-3**. If necessary, mitigation measures are included to avoid or decrease the severity of significant impacts. The level of significance before and after mitigation measures is also identified.

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
AESTHETICS				
Scenic Vista	Impact 4.1-1: Would implementation of the Proposed Project have a substantial adverse effect on a scenic vista?	Less than significant	No mitigation required.	Less than significant
Scenic Resources Within a State Scenic Highway	Impact 4.1-2: Would implementation of the Proposed Project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	No impact	No mitigation required.	No impact
Scenic Quality Zoning and Regulations	Impact 4.1-3: Would the Proposed Project conflict with applicable zoning and other regulations governing scenic quality in an urbanized area? Would the Proposed Project substantially degrade the existing visual character quality of public views of the site and its surroundings in a non-urbanized area?	Less than significant	No mitigation required.	Less than significant
Light and Glare	Impact 4.1-4: Would implementation of the Proposed Project create a new source of substantial light or glare that would adversely affect day or nighttime views in the area?	Less than significant	No mitigation required.	Less than significant
AIR QUALITY				
Air Quality Plan	Impact 4.2-1: Would implementation of the Proposed Project conflict with or obstruct implementation of the applicable air quality plan?	Less than significant	No mitigation required.	Less than significant
Cumulative Increase	Impact 4.2-2: Would implementation of the Proposed Project result in a cumulatively considerable net increase of any criteria pollutant for	<i>Construction</i> – Significant and unavoidable <i>Operation</i> –	4.2-2 Construction Emissions Reduction The City shall require all discretionary projects that involve construction-related activity to comply with the following and require the developers to notify any contractors, and include in	<i>Construction</i> – Significant and unavoidable

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>AQ1-3: Vehicle Idling Limit and Notification Signs</p> <p>a. Applicability Threshold Any Project whose construction activities involve the use of construction vehicles and require a permit from LADBS.</p> <p>b. Standard Vehicle idling during construction activities shall be limited to five minutes as set forth in the California Code of Regulations, Title 13, Section 2449. Signs shall be posted in areas where they will be seen by vehicle operators stating idling time limits.</p> <p>AQ1-4: Non-Diesel Fueled Electrical Power</p> <p>a. Applicability Threshold Any Project whose construction activities involve the use of construction equipment and require a permit from LADBS.</p> <p>b. Standard Electricity from power poles rather than temporary gasoline or diesel-powered generators shall be used To the Extent Available and Feasible.</p> <p>AQ1-5: Emissions Standards for Off-Road Construction Equipment Greater than 50 Horsepower</p> <p>a. Applicability Threshold Any Project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day.</p> <p>b. Standard All off-road diesel-powered construction equipment equal to or greater than 50 horsepower shall meet the U.S. Environmental Protection Agency's (USEPA) Tier 4 emission standards during construction, or use alternative fuels (such as compressed natural gas, liquid petroleum gas, unleaded gasoline, or electricity.). Operators shall</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>maintain records of all off-road equipment associated with Project construction to document that each piece of equipment used meets these emission standards per the proof of compliance requirement in Subsection I.D.6.</p> <p>In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.</p> <p>AQ1-6: Use of Low Polluting Fuels</p> <p>a. Applicability Threshold</p> <p>Any Project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day.</p> <p>b. Standard</p> <p>Construction equipment less than 50 horsepower shall use low polluting fuels (i.e., compressed natural gas, liquid petroleum gas, unleaded gasoline, or electricity).</p> <p>In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.</p> <p>AQ1-7: Emission Standards for On-Road Haul Trucks</p> <p>a. Applicability Threshold</p> <p>Any Project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve more than 90 round-trip haul truck trips on any given day for demolition debris and import/export of soil.</p> <p>b. Standard</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>Construction haul truck operators for demolition debris and import/export of soil shall use trucks that meet the California Air Resources Board's (CARB) 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of nitrogen oxides (NO_x) emissions. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards per the proof of compliance requirements in Subsection I.D.6 of the Environmental Protection Measures Handbook.</p> <p>In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.</p> <p>AQ1-8: Routes for On-Road Haul Trucks</p> <p>a. Applicability Threshold</p> <p>Any Project whose construction activities involve the use of construction vehicles and require a permit from LADBS.</p> <p>b. Standard</p> <p>Construction contractors shall reroute construction trucks away from congested streets or Sensitive Uses, as feasible. The burden of proving that compliance is infeasible shall be upon the Applicant or Owner. Where avoiding Sensitive Uses and congested streets altogether is infeasible, routing away from Sensitive Uses shall be prioritized over routing away from congested streets.</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Sensitive Receptors	Impact 4.2-3: Would implementation of the Proposed Project expose sensitive receptors to substantial pollutant concentrations?	<i>Construction</i> – Potentially significant <i>Operation</i> – Less than significant	Refer to Mitigation Measure 4.2-2.	<i>Construction</i> – Less than Significant with mitigation <i>Operation</i> – Less than significant
Odors	Impact 4.2-4: Would implementation of the Proposed Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	<i>Construction</i> – Less than significant <i>Operation</i> – Less than significant	No mitigation required.	<i>Construction</i> – Less than significant <i>Operation</i> – Less than significant
BIOLOGICAL RESOURCES				
Special Status Species Habitat	Impact 4.3-1: Would implementation of the Proposed Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially significant	<p>4.3-1 Biological Resources Assessment For individual projects that will include disturbance of vegetation, trees, structures, or other areas where biological resources could be present, a qualified biologist shall be retained by the applicant to conduct an initial site assessment. The assessment will include a review of the California Natural Diversity Database (CNDDDB) and iNaturalist maps to determine where sightings have occurred or habitats for nesting birds, or bat species have previously been identified. A site assessment survey may be required for sites that are in proximity to areas where habitats for nesting birds or bat species occur. Species-specific surveys may be required for sites that contain suitable habitats for nesting birds or bat species.</p> <p>4.3-2(a) Pre-Construction Bird Nest Surveys and Avoidance For projects in the Project Area, a pre-construction survey for nesting bird, including ground nest birds, survey shall be conducted no more than ten days prior to initiation of ground disturbance and vegetation removal activities for any grading or</p>	Less than significant with mitigation

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>construction activity initiated during the bird nesting season (February 1 – August 31). The nesting bird pre-construction survey shall be conducted on foot by a qualified biologist and shall include a 100-foot buffer around the construction site. If nests are found, an avoidance buffer (dependent upon the species, the proposed work activity, and existing disturbances associated with land uses outside of the site) shall be determined and demarcated by the biologist with bright orange construction fencing, flagging, construction lathe, or other means to mark the boundary. All construction personnel shall be notified as to the existence of the buffer zone and to avoid entering the buffer zone during the nesting season. No ground disturbing activities or vegetation removal shall occur within this buffer until the biologist has confirmed that breeding/ nesting is completed and the young have fledged the nest. Encroachment into the buffer shall occur only at the discretion of the qualified biologist on the basis that the encroachment will not be detrimental to an active nest. A Statement of Compliance signed by the Applicant and Owner is required to be submitted to LADBS at plan check and prior to the issuance of any permit. Any survey, report, construction monitoring, and implementation of protective measures conducted shall be documented by a qualified biologist, and shall be provided to the City upon request. Best management practices (BMPs) to avoid disturbing nesting birds, including burrowing owls, during construction include visually check all sections of pipe or other construction materials for the presence of wildlife before moving and capping or elevating the ends of all pipes or similar construction materials while storing to prevent wildlife from entering them.</p> <p>4.3-2(b) Notification All project applicants will be notified of and shall include on their plans an acknowledgement of the requirement to comply with the federal MBTA and CFGC to not destroy active bird nests and of best practices recommended by qualified biologist to avoid impacts to active nests, including checking for nests prior to construction activities during February 1-August 31 and what</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			to do if an active nest is found, including inadvertently during grading or construction activities. Such best practices shall include giving an adequate construction and grading buffer to avoid the active nest during construction.	
Riparian Habitat	Impact 4.3-2: Would implementation of the Proposed Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	Less than significant	No mitigation required.	Less than significant
Wetlands	Impact 4.3-3: Would implementation of the Proposed Project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	Potentially significant	Mitigation Measure AQ1-1 in Section 4.2 <i>Air Quality</i> would address impacts related to fugitive dust.	Less than significant
Migratory Wildlife, Biological Resources Plan	Impact 4.3-4: Would implementation of the Proposed Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Less than significant	No mitigation required.	Less than significant
Local Policies and Ordinances	Impact 4.3-5: Would implementation of the Proposed Project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	Less than significant	No mitigation required.	Less than significant

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Habitat Conservation Plan	Impact 4.3-6: Would implementation of the Proposed Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	No impact	No mitigation required.	No impact
CULTURAL RESOURCES				
Historical Resources	Impact 4.4-1: Would implementation of the Proposed Project cause a substantial adverse change in the significance of a historical resource as pursuant to § 15064.5?	Significant and unavoidable	No feasible mitigation measures have been identified.	Significant and unavoidable
Archaeological Resources	Impact 4.4-2: Would implementation of the Proposed Project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	Potentially significant	<p>4.4-2(a) Archaeological Resources Evaluation and Avoidance/Recovery</p> <p>For any project that requires a permit for grading or excavation; if a possible archaeological resource is uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a qualified archaeologist has been retained to evaluate the find in accordance with National Register of Historic Places and California Register of Historical Resources criteria. The qualified archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground disturbance activities may continue unimpeded on other portions of the site outside the specified radius.</p> <p>Any potential archaeological resource or associated materials that are uncovered shall not be moved or collected by anyone other than an archaeological monitor or qualified archaeologist unless the materials have been determined to be non-unique archaeological resources, as defined in Public Resources Code</p>	Less than significant with mitigation

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>Section 21083.1(h), by the qualified archaeologist. The qualified archaeologist shall determine if the resources are unique archaeological resources as defined in Public Resources Code Section 21083.2(g).</p> <p>Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows:</p> <ul style="list-style-type: none"> • The find should be preserved in place or left in an undisturbed state unless the project would damage the resource. • When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a qualified archaeologist. <p>Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a qualified archaeologist. A report that describes the resource(s) and its disposition, as well as the assessment methodology, shall be prepared by the qualified archaeologist according to current professional standards and maintained for a minimum of five years after the Certificate of Occupancy is used. If appropriate, the report should also contain the qualified archaeologist's recommendations for the preservation, conservation, and curation of the resource at a suitable repository, such as the Natural History Museum of Los Angeles County, with which the Applicant or Owner must comply.</p> <p>4.4-2(b) Archaeological Assessment</p> <p>Prior to issuance of a permit for grading or excavation all project applicants will receive notice and acknowledge receipt of the following notice:</p>

Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>Several laws regulate the treatment of archaeological, paleontological, and tribal cultural resources and make it a criminal violation to destroy those resources. These regulations include, but are not limited to:</p> <ul style="list-style-type: none"> • California Penal Code Section 622.5 provides the following: “Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor.” • Public Resources Code Section 5097.5(a) states: “A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.” • California Code of Regulations, Title 14, Section 4307 states: “No person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value.” Section 1427 “recognizes that California’s archaeological resources are endangered by urban development and population growth and by natural forces...Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave.” <p>The following best practices are recognized by archaeologists and environmental consultants to ensure archaeological resources are not damaged during grading, excavation, or other Ground Disturbance Activities:</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<ul style="list-style-type: none"> Records Search. A cultural resources records search should be requested from and conducted by the California Historical Resources Information System's (CHRIS) South Central Coastal Information Center (SCCIC) located at California State University, Fullerton to determine whether any cultural resources have been previously identified on or within a 0.5-mile radius of the Project site. The results of this records search shall be used as an indicator of the archaeological sensitivity of the Project site. A qualified archaeologist shall be retained and use all reasonable methods, consistent with professional standards and best practices, to determine the potential for archaeological resources to be present on the Project site. If the qualified archaeologist determines there is a medium to high potential that archaeological resources may be located on the Project site and it is possible that such resources will be impacted by the Project, the qualified archaeologist shall advise the Applicant and Owner to retain an Archaeological monitor to observe all Ground Disturbance Activities within those areas identified as having a medium to high potential in order to identify any resources and avoid potential impacts to such resources. Monitoring. An archaeological monitor should monitor excavation and grading activities in soils that have not been previously disturbed in order to identify and record any potential archaeological finds and avoid potential impacts to such resources. In the event of a possible archaeological discovery, the archaeological monitor shall notify a qualified archaeologist. The Archaeological monitor has the authority to temporarily halt earthwork activities. Handling, Evaluation, and Preservation. Any archaeological resource materials or associated materials that are uncovered shall not be moved or collected by anyone other than an archaeological monitor or qualified archaeologist unless they have been determined to be nonunique archaeological resources, as defined in Public Resources Code Section 21083.1(h) by a qualified archaeologist. A 	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>qualified archaeologist shall determine if the resources are unique archeological resources as defined in Public Resources Code Section 21083.2(g).</p> <ul style="list-style-type: none"> • Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows: <ul style="list-style-type: none"> ○ The find should be preserved in place or left in an undisturbed state unless the Project would damage the resource. ○ When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a qualified archaeologist. • If recommended by the qualified archaeologist, the resource(s) shall be curated by a public, non-profit institution with a research interest in the material, such as the Natural History Museum of Los Angeles County or another appropriate curatorial facility for educational purposes. • Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a qualified archaeologist. <p>4.4-2(c) Zanja Madre HAER Documentation Projects within 500 feet of the currently mapped known segments of the Zanja system (see Appendix E) have increased likelihood of encountering segments of the Zanja system during construction. The Zanja system includes the Zanja Madre and its outbranching secondary Zanja segments. If possible, segments of the Zanja system are uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a qualified archaeologist has been retained to inspect and evaluate the</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>find. The qualified archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground Disturbance Activities may continue unimpeded on other portions of the site outside the specified radius.</p> <p>At a minimum, and even if avoided, should the find be determined to be related to the Zanja system, the qualified archaeologist shall prepare a memo and complete all relevant State of California Department of Parks and Recreation (DPR) DPR 523 forms documenting the find.</p> <p>If the qualified archaeologist, having evaluated the find, determines that the find retains integrity, documentation consistent with the standards and guidelines established the Historic American Engineering Record (HAER) shall be undertaken and transmitted to the Library of Congress before any alteration, demolition, construction, or removal activity may occur within the determined avoidance area. Documentation shall include narrative records, measured drawings, and photographs in conformance with HAER Guidelines. The found segments shall also be mapped using Geographic Information Systems (GIS) or 3D mapping technology in order to contribute to the existing record of the location and extent of the Zanja system as a whole. At minimum, GIS data shall include the geographic coordinates and depth of all portions of the find. All records, including geographic data, georeferenced photographs, and information about the depth of the find shall be submitted to City Planning. Report documentation and GIS files shall additionally be provided to the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton.</p> <p>In addition to HAER documentation, if determined appropriate by the qualified archaeologist, one or more of the following</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>specific treatments shall be developed and implemented based on potential California Register eligibility criteria or the significance of the find as a unique archaeological resource:</p> <ul style="list-style-type: none"> • Treatment Under Criterion 1: Treatment shall include interpretation of the Zanja Madre System for the public. The interpretive materials may include, but not be limited to, interpretive displays of photographs and drawings produced during the HAER documentation, signage at the Zanja Madre alignment, relocating preserved segments in a publicly accessible display, or other visual representations of Zanja alignments through appropriate means such as a dedicated internet website other online-based materials. At a minimum, the interpretive materials shall include photographs and drawings produced during the HAER documentation, and signage. These interpretive materials shall be employed as part of Project public outreach efforts that may include various forms of public exhibition and historic image reproduction. Additionally, the results of the historical and archaeological studies conducted for the Project shall be made available to the public through repositories such as the local main library branch or with identified non-profit historic groups interested in the subject matter. The interpretive materials shall be prepared at the expense of the Project applicant, by professionals meeting the Secretary of the Interior standards in history or historical archaeology. The development of the interpretive materials shall consider any such materials already available to the public so that the development of new materials would add to the existing body of work on the historical Los Angeles water system, and to this end, shall be coordinated, to the extent feasible and to the satisfaction of the Department of City Planning. The interpretive materials shall include a consideration of the Zanja Madre segment located on the Project Site in relation to the entire Zanja system. The details of the interpretive materials, including the content and format, and the timing of their preparation, shall be 	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			completed to the satisfaction and subject to the approval of the Department of City Planning. <ul style="list-style-type: none"> • Treatment Under Criterion 2: No additional work; archival research about important persons directly associated with the construction and use of Zanja Madre would be addressed as part of HAER documentation. • Treatment Under Criterion 3: No additional work; HAER documentation is sufficient. • Treatment Under Criterion 4: No additional work; archaeological data recovery and HAER documentation are sufficient. • Treatment as a unique archaeological resource: Same as Criterion 1 treatment. 	
Human Remains	Impact 4.4-3: Would implementation of the Proposed Project disturb any human remains, including those interred outside of dedicated cemeteries?	Less than significant	No mitigation required.	Less than significant
ENERGY				
Inefficient Energy Consumption	Impact 4.5-1: Would implementation of the Proposed Project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	Less than significant	No mitigation required.	Less than significant
Renewable Energy/Energy Efficiency Plans	Impact 4.5-2: Would implementation of the Proposed Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	Less than significant	No mitigation required.	Less than significant

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
GEOLOGY AND SOILS				
Earthquake Fault, Seismicity, and Seismic-Related Ground Failure	Impact 4.6-1: Would implementation of the Proposed Project directly or indirectly cause potential adverse effects, including the risk of loss, injury, or death involving: i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42 ii) Strong seismic ground shaking? iii) Seismic-related ground failure, including liquefaction? iv) Landslides?	No impact	No mitigation required.	No impact
Soil Erosion	Impact 4.6-2: Would implementation of the Proposed Project result in substantial soil erosion or the loss of topsoil?	Less than significant	No mitigation required.	Less than significant
Geologic Hazards / Unstable Soils	Impact 4.6-3: Would development of the Proposed Project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	Less than significant	No mitigation required.	Less than significant

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
Expansive Soil	Impact 4.6-4: Would development of the Proposed Project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	Less than significant	No mitigation required.	Less than significant
Septic Tanks	Impact 4.6-5: Would the Proposed Project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	No impact	No mitigation required.	No impact
Paleontological Resources	Impact 4.6-6: Would implementation of the Proposed Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Potentially significant	<p>4.6-6(a) Paleontological Resources</p> <ul style="list-style-type: none"> Retention of Qualified Paleontologist. The project applicant shall retain a Qualified Paleontologist prior to excavations. The Qualified Paleontologist shall direct all mitigation measures related to paleontological resources. A qualified professional paleontologist is defined by the Society of Vertebrate Paleontology (SVP) standards (SVP 2010) as an individual preferably with an M.S. or Ph.D. in paleontology or geology who is experienced with paleontological procedures and techniques, who is knowledgeable in the geology of California, and who has worked as a paleontological mitigation project supervisor for a least two years (SVP 2010). Paleontological Worker Environmental Awareness Program. Prior to the start of construction, the Qualified Paleontologist or their designee shall conduct a paleontological Worker Environmental Awareness Program (WEAP) training for construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered by construction staff. Paleontological Monitoring. Full-time paleontological monitoring shall be conducted during the initial phases of ground disturbing construction activities (i.e., grading, 	Less than significant with mitigation

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>trenching, foundation work) within sediments with a high paleontological sensitivity. Paleontological monitoring shall be conducted by a qualified paleontological monitor, who is defined as an individual who has experience with collection and salvage of paleontological resources and meets the minimum standards of the SVP (2010) for a Paleontological Resources Monitor. The duration and timing of the monitoring shall be determined by the Qualified Paleontologist based on the observation of the geologic setting from initial ground disturbance, and subject to the review and approval by the City of Los Angeles. If the Qualified Paleontologist determines that full-time monitoring is no longer warranted, based on the specific geologic conditions once the full depth of excavations has been reached, they may recommend that monitoring be reduced to periodic spot-checking or ceased entirely. Monitoring shall be reinstated if any new ground disturbances are required, and reduction or suspension shall be reconsidered by the Qualified Paleontologist at that time. In the event of a fossil discovery by the paleontological monitor or construction personnel, all work in the immediate vicinity of the find shall cease. A Qualified Paleontologist shall evaluate the find before restarting construction activity in the area. If it is determined that the fossil(s) is (are) scientifically significant, the Qualified Paleontologist shall complete the following conditions to mitigate impacts to significant fossil resources:</p> <ul style="list-style-type: none"> • Salvage of Fossils. If fossils are discovered, the paleontological monitor shall have the authority to halt or temporarily divert construction equipment within 50 feet of the find until the monitor and/or lead paleontologist evaluate the discovery and determine if the fossil may be considered significant. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. Bulk matrix 	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<p>sampling may be necessary to recover small invertebrates or microvertebrates from within paleontologically sensitive deposits.</p> <ul style="list-style-type: none"> • Treatment of Paleontological Resources. Once salvaged, significant fossils shall be identified to the lowest possible taxonomic level, prepared to a curation-ready condition, and curated in a scientific institution with a permanent paleontological collection (such as the Natural History Museum of Los Angeles County), along with all pertinent field notes, photos, data, and maps. Fossils of undetermined significance at the time of collection may also warrant curation at the discretion of the Qualified Paleontologist. • Final Paleontological Mitigation Report. Upon completion of ground disturbing activity (and curation of fossils if necessary) the Qualified Paleontologist shall prepare a final report describing the results of the paleontological monitoring efforts associated with the project. The report shall include a summary of the field and laboratory methods, an overview of the project geology and paleontology, a list of taxa recovered (if any), an analysis of fossils recovered (if any) including their scientific significance, and recommendations. The report shall be submitted to the City of Los Angeles. If the monitoring efforts produced fossils, a copy of the report shall also be submitted to the designated museum repository. <p>4.6-6(b) Treatment of Paleontological Resources For discretionary projects, the City shall require that all paleontological resources identified on a project site be assessed and treated. A report shall be prepared according to current professional standards that describes the resource, how it was assessed, and disposition.</p> <p>4.6-6(c) Notification of Intent to Excavate Language For all projects not subject to 4.6-6(a) that are seeking excavation or grading permits, the Department of Building and Safety shall issue the following notice and obtain an acknowledgement of receipt of the notice from applicants:</p>	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<ul style="list-style-type: none"> • California Penal Code Section 622.5 provides the following: “Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor.” • PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that: “No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.” • California Code of Regulations, Title 14, Section 4307 states that “no person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value.” Section 1427 “recognizes that California’s archaeological resources are endangered by urban development and population growth and by natural forces....Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave.” • Best practices to ensure unique geological and paleontological resources are not damaged include but are not limited to the following steps: <ul style="list-style-type: none"> ○ Prior to excavation and grading activities, a qualified paleontologist prepares a resource assessment using records from the Natural History Museum of Los Angeles County. 	

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
			<ul style="list-style-type: none"> ○ If in the assessment, the soil is identified as potentially containing paleontological resources, a qualified paleontologist monitors excavation and grading activities in soils that have not been previously disturbed, to identify, record, and evaluate the significance of any paleontological finds during construction. ○ If paleontological resources are uncovered (in either a previously disturbed or undisturbed area), all work ceases in the area of the find until a qualified paleontologist has evaluated the find in accordance with federal, state, and local guidelines. ○ If fossils are discovered, a qualified paleontologist shall recover them. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. In this case the paleontologist would have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner. Handline and disposition of fossils is done at the direction and guidance of a qualified paleontologist. ○ Personnel of the project would not collect or move any paleontological materials or associated materials. ○ If cleared by the qualified paleontologist, construction activity would continue unimpeded on other portions of the project site. ○ Construction activities in the area where resources were found would commence once the identified resources are properly assessed and processed by a qualified paleontologist and if construction activities were cleared by the qualified paleontologist.

			pile driver are alternatives that shall be utilized where geological conditions permit their use. <ul style="list-style-type: none"> • Construction activities shall involve rubber-tired equipment rather than metal-tracked equipment. • The construction contractor shall manage construction phasing (scheduling demolition, earthmoving, and ground-impacting operations so as not to occur in the same time period), use low-impact construction technologies, and shall avoid the use of vibrating equipment when allowed by best engineering practices. 	
Private Airstrip / Airport Plan	Impact 4.11-3: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Proposed Project expose people residing or working in the project area to excessive noise levels?	No impact	No mitigation required.	No impact
POPULATION, HOUSING AND EMPLOYMENT				
Induce Substantial Population Growth	Impact 4.12-1: Would implementation of the Proposed Project induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?	Less than significant	No mitigation required.	Less than significant
Displacement of Existing People or Housing	Impact 4.12-2: Would implementation of the Proposed Project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	Less than significant	No mitigation required.	Less than significant

TABLE ES-3 SUMMARY OF ENVIRONMENTAL IMPACTS, MITIGATION MEASURES, AND RESIDUAL IMPACTS				
Impact Category	Checklist Threshold	Level of Impact Before Mitigation	Mitigation Measure	Level of Impact After Mitigation
PUBLIC SERVICES				
Fire Protection	Impact 4.13-1: Would the Proposed Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection?	Less than significant	No mitigation required.	Less than significant
Police Protection	Impact 4.13-2: Would the Proposed Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection?	Less than significant	No mitigation required.	Less than significant
Public Schools	Impact 4.13-3: Would the Proposed Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service or other	Less than significant	No mitigation required.	Less than significant

Solid Waste Management and Reduction Regulations	Impact 4.17-7: Would the Proposed Project not comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	Less than significant	No mitigation required.	Less than significant
Electric Power, Natural Gas, or Telecommunication Facilities	Impact 4.17-8: Would implementation of the Proposed Project require or result in the relocation or construction of new or expanded electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	Less than significant	No mitigation required.	Less than significant

3.0 PROJECT DESCRIPTION

Consistent with the provisions of the California Environmental Quality Act (CEQA) Guidelines Section 15124, this chapter provides information regarding the Cornfield Arroyo Seco Specific Plan (CASP) Update (herein referred to as “Proposed Project” or “Project”).

This chapter is required to contain the following information: the location of the Proposed Project; a statement of project objectives; a general description of the Proposed Project’s technical, economic, and environmental characteristics; and a statement briefly describing the intended uses of the EIR. The *CEQA Guidelines* state a project description need not be exhaustive but should provide the level of detail needed for the evaluation and review of potential environmental impacts.

The Project Description is the starting point for all environmental analysis required by the State CEQA Guidelines. Section 15146 of the CEQA Guidelines states that the degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity, which is described in the EIR.

3.1 PROJECT OVERVIEW

The Proposed Project is an update of the existing CASP. The update includes new land use and zoning regulations, incentives, and boundaries, for the purpose of encouraging affordable, mixed-income, and permanent supportive housing production. The Proposed Project would supersede the text, maps, and tables of the existing CASP, and will include the adoption of necessary revisions and any other amendments necessary to implement this update, including amendments to General Plan elements (such as the Framework Element), community plans, the Los Angeles Municipal Code (LAMC) Chapter 1 and Chapter 1A, specific plans, and other City ordinances.

The Proposed Project would strengthen the existing CASP’s affordable housing requirements, including the recalibration of the CASP’s existing incentive zoning system; establish a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities; include provisions that facilitate the production of new 100% affordable housing and permanent supportive housing projects on public land; increase the zoning capacity for housing in targeted areas; and adopt a modernized zoning system based on the City’s new modular Zoning Code. The Proposed Project would also update the building form, urban design, open space, parking, conservation, performance, and sign standards of the existing CASP, including adopting standards in the new Zoning Code in lieu of those in the existing CASP, as necessary to support housing production and implement technical revisions that ensure consistency, clarity, and ease of implementation and reflect current and future demographic, regulatory, environmental, and economic conditions. The Project Area boundaries would be revised to exclude parcels that currently do not contain zoning such as RD zones within the Project Area, or to exclude peripheral open space areas adjacent to Elysian Park in the Silver Lake-Echo Park-Elysian Valley Community Plan Area. The Proposed Project would retain the existing ministerial review process for subsequent qualifying development projects.

PROJECT BACKGROUND

On June 28, 2013, the City adopted the CASP and certified its Environmental Impact Report (ENV-2009-599-EIR, SCH No. 2009031002). The CASP involved substantial revisions to portions of the Central City North, Northeast Los Angeles, and Silver Lake-Echo Park-Elysian Valley Community Plans and the establishment of a Specific Plan to guide the future development of the predominantly industrial, approximately 600-acre area. Broadly, the existing CASP includes the following:

- The designation of new mixed-use zoning districts that replace former industrial zoning, and the identification of the types and intensities of uses permitted within these districts, as well as building height, massing, and façade standards,
- The establishment of new affordable housing land use incentives,
- The designation of new open spaces and parks and the establishment of open space requirements for new developments,
- Circulation and parking standards,
- Revised street designations and standards,
- Resource conservation standards, and
- Mitigation measures for subsequent development projects.

The intent of the existing CASP is to guide the transition of a vehicular-oriented industrial and public facility area into a cluster of mixed-use, pedestrian-oriented neighborhoods. The existing CASP supports a range of housing options, new public spaces, opportunities for walking and bicycling, and the retention of land for existing industrial businesses and new clean technology businesses. Among its numerous goals, a key priority of the existing CASP is to facilitate the production and continued provision of affordable housing for Extremely Low Income and Very Low Income households.

However, since the CASP's adoption, housing production of any kind within the Project Area boundaries has been limited. Among the projects constructed, at the time of EIR preparation, all involved discretionary actions from the City Planning Commission or Area Planning Commission to deviate from the CASP, or were entitled prior to the adoption of the CASP, with less than one percent of total units reserved for low-income households. The limited supply of available housing units (0.9 percent residential vacancy rate), together with the low average household income and strong demand for housing in the greater Northeast Los Angeles area, creates growing displacement pressure for existing residents and disproportionately in communities of color.

In light of the present housing situation, and in response to a City Council Motion (Council File No. 13-0078-S2) calling for the evaluation and amendment of the Specific Plan, the City of Los Angeles is updating the CASP with the goal of further bolstering the production of affordable, mixed-income, and permanent supportive housing in the Project Area. The Proposed Project will entail updates to the CASP's zoning regulations, land use incentives, boundaries, and other key provisions to facilitate the production of housing, consistent with the underlying vision and purpose of the adopted CASP.

Project Setting and Location

The Project Area comprises the entire area within the boundaries of the existing CASP. Specifically, the Project Area is located entirely within Los Angeles City Council District One, and is generally bordered by Chinatown to the west, Lincoln Heights to the east, and Cypress Park to the north. The Project Area is approximately 600 acres (0.93 square miles) and is located within the original floodplains of the Los Angeles River and Arroyo Seco water bodies, which are part of the lower Los Angeles River Watershed.

The Project Area is predominantly developed, with transportation infrastructure being a central feature of the Project Area. Interstate 5 (I-5) and State Route-110 (SR-110) bisect the northern portion of the Project Area. Entrances and exits to and from SR-110 are located on the northern perimeter of the Project Area. Entrances and exits to I-5 are located at North Broadway/Pasadena Avenue and at Avenue 26 across from Lacy Street. Other major arterials located in the Project Area include Figueroa Street in the northern portion of the Project Area, San Fernando Road in the central portion of the Project Area, and Spring Street, Broadway Avenue, and Main Street in the southern portion of the Project Area. The Los Angeles County Metropolitan Authority (LA Metro) L Line (Gold) cuts across the northern portion of the Project Area and provides frequent access to downtown Los Angeles, northeastern sections of Los Angeles, and the cities of South Pasadena and Pasadena.

Figure 3-1 shows the regional location of the Project Area. While the Proposed Project does modify the boundaries of the CASP by excluding some parcels from the Project Area, the term “Project Area” as used in this EIR refers to that area within the current CASP boundaries as shown in **Figure 3-2**, below.

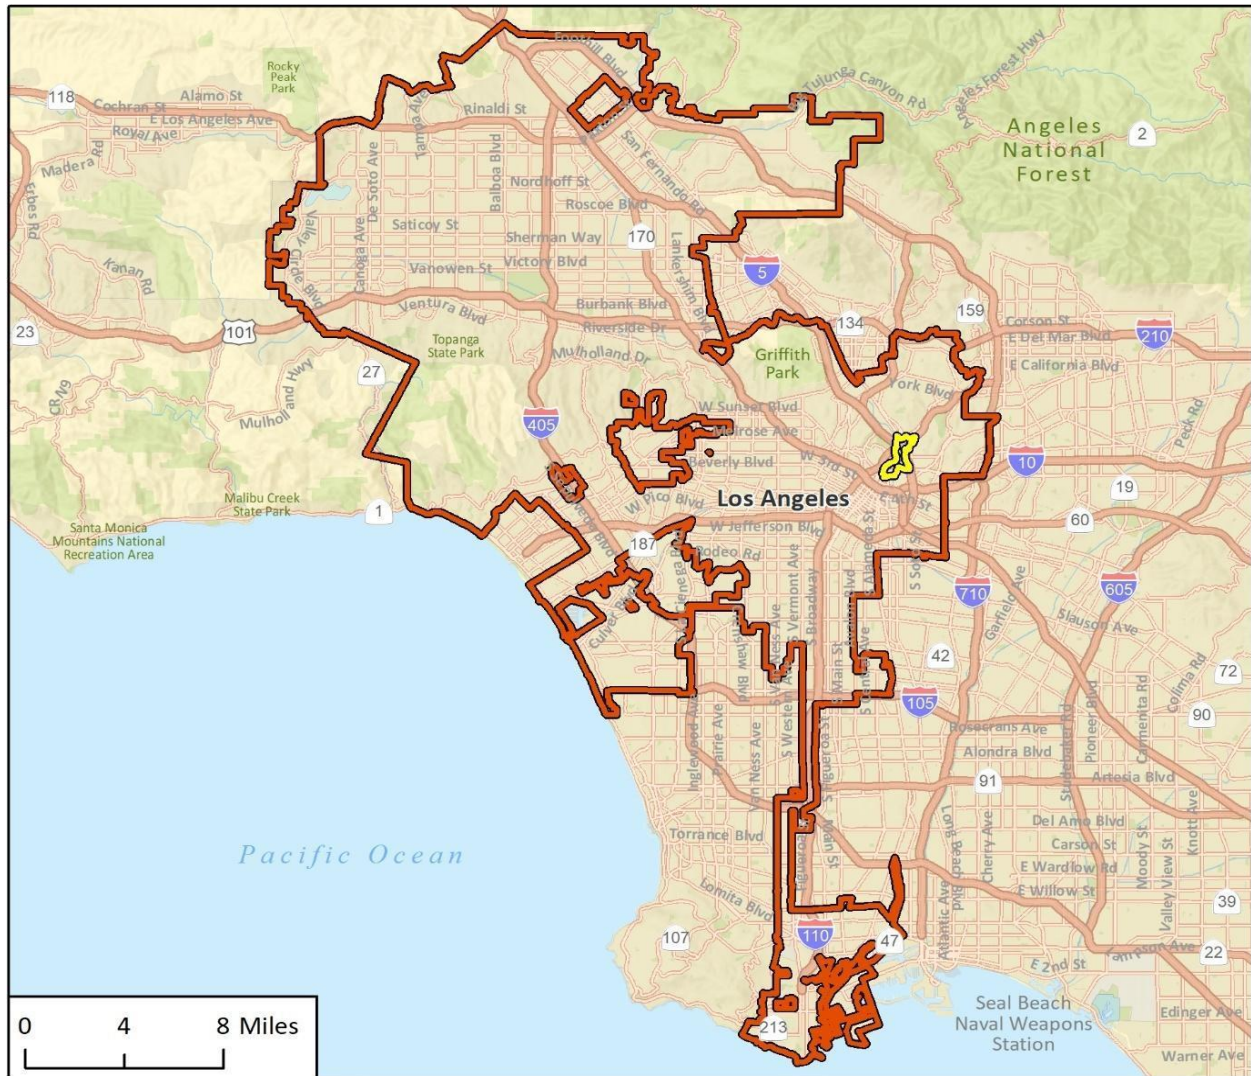

3.2 REGULATORY SETTING

SPECIFIC PLANS AND PLANNING OVERLAYS

California State law (Government Code Section 65300) requires that each city and county, including charter cities and counties, adopt a comprehensive, integrated, long-term General Plan to direct future growth and development and accommodate projected increases in population and employment. The General Plan is a fundamental policy document. It defines how a city should use and manage its physical and economic resources over time. State law requires eight General Plan Elements: land use, circulation, housing, conservation, open space, noise, safety, and environmental justice. Government Code Section 65302(a) requires the General Plan to include a land use element described as follows:

(a) A land use element that designates the proposed general distribution and general location and extent of the uses of the land for housing, business, industry, open space, including agriculture, natural resources, recreation, and enjoyment of scenic beauty, education, public buildings and grounds, solid and liquid waste disposal facilities, and other categories of public and private uses of land. The location and designation of the extent of the uses of the land for public and private uses shall consider the identification of land and natural resources pursuant to paragraph (3) of subdivision (d). The land use element shall include a statement of the standards of population density and building intensity

Figure 3-1 Regional Location

Imagery provided by Esri and its licensors © 2021.

-  Plan Boundary
-  Los Angeles City Boundary

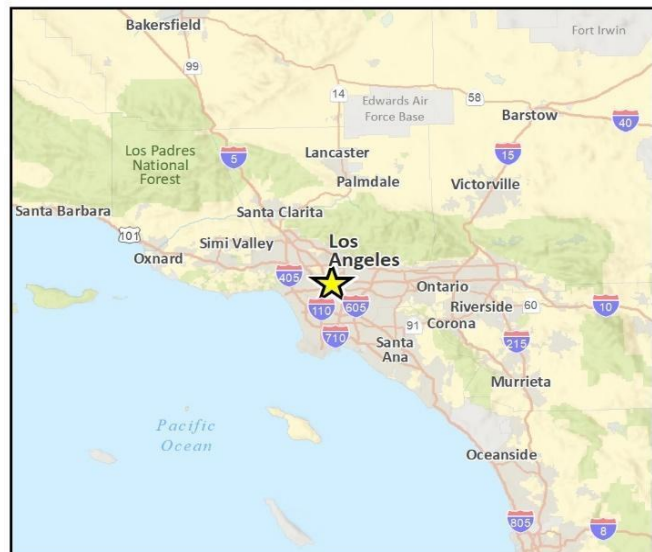

Fig. 3 Regional Location-2

Figure 3-2 Project Site Location

The State requires that the General Plan be periodically revised to reflect new conditions, community input, and technological advances.

The Los Angeles Charter also requires that the City adopt a General Plan:

Sec. 554. General Plan – Purpose and Contents.

The General Plan shall be a comprehensive declaration of goals, objectives, policies and programs for the development of the City and shall include, where applicable, diagrams, maps and text setting forth those and other features.

(a) Purposes. The General Plan shall serve as a guide for:

- (1) the physical development of the City.*
- (2) the development, correlation and coordination of official regulations, controls, programs and services; and*
- (3) the coordination of planning and administration by all agencies of the City government, other governmental bodies and private organizations and individuals involved in the development of the City.*

(b) Content. The General Plan shall include those elements required by state law and any other elements determined to be appropriate by the Council, by resolution, after considering the recommendation of the City Planning Commission.

The General Plan’s guiding document for the City of Los Angeles is the **Framework Element**, which provides *a strategy for long-range growth and development* focused around the following guiding principles:

- grow strategically.
- conserve existing residential neighborhoods.
- balance the distribution of land uses.
- enhance neighborhood character through better development standards.
- create more small parks, pedestrian districts, and public plazas.
- focus growth around transit stations.
- improve mobility and access; and
- identify a hierarchy of commercial districts and centers.

The Framework Element, adopted in 1996, establishes a long-range land use strategy to support the City’s viability and to accommodate projected growth. Framework Element policies reflect that where growth occurs, it is accommodated in a sustainable manner that protects residential neighborhoods and commercial districts, while guiding growth to higher-intensity commercial and mixed use centers that are served by transportation infrastructure. The Long-Range Land Use Diagram depicts this growth strategy with land use categories, including Neighborhood District, Community Center, Regional Center, Downtown Center, and Mixed-Use Boulevard, which reflect a conceptual relationship between land use patterns and transportation.

The Framework Element characterizes the majority of the Project Area as being adjacent to or within the Regional Center, “A focal point of regional commerce, identity and activity and containing a diversity of uses,” or the Community Center, “A focal point for surrounding residential neighborhoods and containing a diversity of uses.”

The big-picture goals established in the Framework Element are then further refined in other planning documents such as the Community Plans, the Zoning Code, and the Specific Plans. In the City of Los Angeles, the Land Use Element is composed of 35 Community Plans. The 35 Community Plans guide the physical development of neighborhoods by establishing goals and policies for land use within each Community Plan Area (CPA). The Community Plans implement, at a community level, the citywide goals and policies established in the overarching Framework Element and all other elements of the General Plan. The Project Area is within the Central City North, Northeast Los Angeles, and Silver Lake-Echo Park-Elysian Valley Community Plan Areas.

A Specific Plan, such as the CASP, is a regulatory land use ordinance that further implements the Community Plan(s), the Framework Element, and other elements of the General Plan. A Specific Plan provides by ordinance regulatory controls or incentives for the systematic execution of the General Plan and provides for public needs, convenience, and general welfare. Specific Plans allow zoning regulations to be further tailored to local areas and include various types of regulatory limitations, such as land use restrictions, maximum heights, building form and massing requirements, intensity limits, etc. Procedures for the establishment, amendment, or repeal of Specific Plans are set forth in LAMC Sections 11.5.7 and 12.32. The stated purpose of the current CASP is to “implement the Central City North, Northeast Los Angeles, and Silver Lake-Echo Park-Elysian Valley Community Plans” (CASP Chapter 1, 2013).

Built Environment of the Project Area

The Project Area comprises approximately 600 acres and roughly 1,600 assessor’s parcels in an area northeast of downtown just east of Chinatown and comprising portions of Lincoln Heights. The existing built environment within the Project Area varies as a result of different phases of development that have occurred throughout the Project Area over time. The Project Area can generally be split into four sections including a northern section, western section, central section, and eastern section. Information on historical resources in the Project Area can be found in Section 4.4, *Cultural Resources*.

Northern Section

The section north of the Arroyo Seco comprises mainly of the properties facing Figueroa Street and Avenue 26, which are largely commercial in character. Properties along Figueroa Street have seen extensive redevelopment and remodeling over the last half of the 20th century, leading to a mix of older one-story commercial buildings, a neighborhood movie theater (eventually converted to a store), gas stations, and a Googie-style diner. The former Los Angeles Railway Huron Substation is located in this section, as is the former Lawry’s California Center (now the Los Angeles River Center and Gardens).

Western Section

The section west of the Los Angeles River is characterized by blocks of industrial buildings constructed throughout the 20th century. The section along Spring Street, historically surrounded the Southern Pacific River Station, is now Los Angeles State Historic Park (the State Park). In 2005, the State Park was the site of an art project by Lauren Bon called “Not a Cornfield,” which is where the Cornfield Arroyo Seco Specific Plan gets part of its name. One of the more notable industrial buildings in the section is the Raphael Junction Block/NY Suspenders Factory, a flatiron-shaped building adjacent to the State Park. The western section also includes Los Angeles Department of Water and Power (LADWP) generating and maintenance facilities and William Mead Homes Public Housing. A rare extant section of the Zanja Madre, the main irrigation ditch that fed the early Pueblo de Los Angeles, is located just north of the State Park along the Metro L Line (Gold) alignment.

Central Section

The section between the Los Angeles River and I-5, south of Arroyo Seco is mixed in character, containing residential, commercial, and industrial uses, often adjacent to each other. Approximately five blocks on the south side of Broadway contain a concentration of late 19th and early 20th century residences, as well as the Albion Elementary School. Albion Cottages and Milagro Market are located in this small residential area. Broadway Avenue and Pasadena Avenue act as commercial corridors through the area. Industrial properties are interspersed throughout the section, but the north half of the section is particularly industrial in character.

Eastern Section

Located east of I-5 and south of Arroyo Seco, this section is largely industrial, with the exception of a few older homes left over from the original residential tract that existed before industry expanded into it. The Lincoln/Cypress L Line (Gold) stop is located in this section, which has spurred apartment and condominium development in the mid-2000s. Lacy Street is defined by a mix of historic and new buildings, including the old Columbia Mills (now Lacy Street Studios), Lacy Street Neighborhood Park, the North Central Animal Care Center, and former offices of the Cannon Electric Development Company. Other industries in the area were historically involved in metal work, from the manufacturing of brass to general fabrication of metal objects and building materials.

Growth Trends

The Proposed Project, as an update to the Specific Plan for the Project Area that is within the Central City North, Northeast Los Angeles, and Silverlake-Echo Park-Elysian Valley Community Plan Areas, plans for and guides growth and development. This section discusses how the City identifies forecasted growth in population, housing, and employment and why the Southern California Association of Governments (SCAG) is the City's primary source for current and forecasted population, housing, and employment numbers. It also describes the growth trends for the City of Los Angeles and the Project Area.

2040 Regional Transportation Plan (RTP)

Southern California Association of Governments (SCAG)

SCAG is designated as a Metropolitan Planning Organization (MPO) responsible for carrying out federal and state statutory duties within its region which encompasses six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) and 191 cities in an area covering more than 38,000 square miles with over 18 million residents.

Federal and state laws require SCAG to develop regional plans for transportation, growth management, hazardous waste management and air quality¹. SCAG is responsible for producing socio-economic estimates and projections at multiple geographic levels. The socio-economic estimates and projections are used for federal and state mandated long-range planning efforts, such as the Regional Transportation Plan (RTP). The RTP is a 20-year transportation plan for the region that addresses regional growth, air quality and other issues, based on an analysis of past and future regional trends.

Federal laws require that land use allocation in an RTP reflect development patterns most likely to be built in the region. While federal and state laws do not mandate consistency with the RTP, state law does require SCAG to identify and quantify housing needs for the region, prepare the Regional Housing Needs Assessment (RHNA) for all cities in its jurisdiction, and for local agencies to update their Housing Elements to plan and zone to accommodate the agency's assigned RHNA. SB 375 coordinates land use and

¹Government Code Section 65080(b)(2)(B); Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations.

transportation planning to reduce greenhouse gas (GHG) emissions and, to that end, requires SCAG to prepare a Sustainable Communities Strategy (SCS) as an integral part of the RTP. SB 375 also requires the RHNA process to be consistent with an SCS, and that RHNA must be coordinated every eight years (RTP is updated every four years).¹

A function of SCAG, in preparing the RTP/SCS, is to forecast or prepare population, housing and employment projections in consultation with cities in the region. These projections are derived from a combination of sources and consider factors such as birth rates; migration rates; historical trends; household size; market and economic projections; existing and planned land uses; and consistency with relevant adopted local, regional and state land use policies and growth strategies. The development of the growth forecast is driven by collaboration between SCAG and local jurisdictions. The integration of the regional and local forecasts is achieved through joint efforts and collaboration among the various contributors.

SCAG’s 2016-2040 RTP/SCS and 2020-2045 RTP/SCS were adopted in April 2016 and September 2020, respectively. As described in further detail below, the population, housing, and employment projections of these two regional plans are consistent with each other in the Project Area. Accordingly, the City has elected to use the socio-economic estimates and projections of the 2016-2040 RTP/SCS in this EIR in order to be consistent with the City of Los Angeles Travel Demand Forecasting (TDF) Model. The current TDF Model, which was developed in the last few years as part of the City’s effort to move to vehicle miles traveled (VMT) thresholds of significance, relies on the 2016-2040 RTP/SCS. The outputs of the TDF Model are used to inform transportation, air quality, and greenhouse gas emissions analysis in this EIR.

The City has begun the process of updating the TDF Model to use 2020-2045 RTP/SCS data. However, the update is not expected to be complete by the time this EIR is published. It would not be reasonable to complete an update to the TDF Model every time the City prepares a new EIR, as the update is a significant, multi-year work product costing approximately \$400,000. The current TDF Model is the best tool the City has available to estimate VMT and conduct the required analysis. As such, the socio-economic data for the Proposed Project is derived from 2016-2040 RTP/SCS population, housing, and employment estimates, which as shown below in **Table 3-1**, and is consistent with the data from the 2020-2045 RTP/SCS.

TABLE 3-1 BASELINE YEAR (2021) SOCIO-ECONOMIC DATA ESTIMATES WITHIN THE PROJECT AREA		
	2016-2040 RTP/SCS (2021)	2020-2045 RTP/SCS (2021)
Population	6,027	6,202
Households	2,012	1,936
Employment	5,411	6,189
Source: SCAG 2016-2040 RTP/SCS and 2020-2045 RTP/SCS interpolated.		

Between the 2016-2040 RTP/SCS and 2020-2045 RTP/SCS, the population and households estimates for the baseline year (2021) differ by less than 3 percent and 4 percent, respectively. The 2016-2040 RTP/SCS estimates that baseline year employment within the Project Area is 5,411 jobs, compared to the 2020-2045 RTP/SCS’s estimate of 6,189 jobs, a difference of 14 percent. The use of the 2016-2040 RTP/SCS’s lower employment figure represents a more conservative analysis, as the EIR would be analyzing a greater

¹ Government Code Section 65080(b)(2)(B).

employment delta over the course of the Proposed Project compared to the 2020-2045 RTP/SCS's higher baseline year employment figure.

Many municipalities and government agencies (including public service providers and other City departments) rely on the same source, i.e., 2016-2040 SCAG RTP/SCS data, for purposes of planning, both for estimates of current population, housing and employment, as well as for projections of future population, housing, and employment. Use of such data is a consistent and best practice for local governments. It is also the Department of City Planning's practice to use SCAG RTP/SCS data as a benchmark or as a reference point for estimates and projections locally.

Citywide Population Growth Projections

The City of Los Angeles is approximately 478 square miles and has a population of approximately 4.1 million. The population is anticipated to increase by 12 percent from the 2021 estimate to approximately 4.6 million persons by the year 2040, according to the SCAG 2016-2040 RTP/SCS (**Table 3-2**). Every four years, SCAG prepares socioeconomic projections that are used by various City departments and agencies for their long-range planning efforts. The growth projection for the City of Los Angeles is based on several factors, including historical development trends, land values, as well as smart growth strategies to direct development to areas in proximity to rail and major bus stations, community centers and regional centers.

Geographic Planning Area	2021 Estimated Population /a/	2040 Projected Population /a/	Projected Population Growth (2021 – 2040) /a/
City of Los Angeles	4,091,000	4,609,000	518,308
South Valley	780,493	875,559	95,066
South Los Angeles	779,803	874,467	94,664
North Valley	734,546	795,498	60,952
Central	738,605	903,743	165,138
West Los Angeles	441,950	497,159	55,209
East Los Angeles	412,614	448,846	36,232
Harbor	202,680	213,603	10,923

/a/ The 2021 estimated population and the 2040 projected population are based on SCAG's 2016-2040 RTP/SCS. Due to rounding, the percentages may not add up to 100 percent.

The City's 35 CPAs are divided into seven larger geographic areas for planning administration. Each of these geographic planning areas has an Area Planning Commission that reviews certain cases located within their planning area. The Project Area is located within the Central and East Los Angeles geographies. According to the 2016-2040 RTP/SCS, the population in the Central Los Angeles geography, which includes the CPAs of Hollywood, Wilshire, Westlake, Central City, and Central City North, is anticipated to increase by approximately 165,000 by 2040. The Central Los Angeles geography represents approximately 20 percent of the anticipated population growth for the entire City by 2040 (**Table 3-3**). The following tables summarize projected population growth for the City of Los Angeles.

The population in the East Los Angeles geography, which includes the CPAs of Silver Lake-Echo Park-Elysian Valley, Northeast Los Angeles, and Boyle Heights, is anticipated to increase by approximately

36,000 by 2040. The East Los Angeles geography represents approximately 10 percent of the anticipated population for the entire City by 2040 (**Table 3-3**). The following tables summarize projected population growth for the City of Los Angeles.

TABLE 3-3 PERCENTAGE OF CITYWIDE POPULATION AND PROJECTED GROWTH			
Geographic Planning Area	% of Citywide 2021 Population /a/	% of Citywide 2040 Projected Population /a/	% Change of Citywide Projected Population Growth (2021 – 2040) /a/
City of Los Angeles	100%	100%	
South Valley	19%	19%	-
South Los Angeles	19%	19%	-
North Valley	18%	17%	-1%
Central	18%	20%	2%
West Los Angeles	11%	11%	-
East Los Angeles	10%	10%	-
Harbor	5%	5%	-

/a/ The 2021 estimated population and the 2040 projected population are based on SCAG's 2016-2040 RTP/SCS. Due to rounding, percentages may not add up to 100 percent.

The purpose of forecasting future population is to describe the likely future population based on current trends and be able to plan for and accommodate change. In general, projections help City departments to understand where current policies might lead to and determine whether those policies are leading the City towards its stated objectives consistent with federal, state, and local policies. They are also used by each City department in preparing long-range plans, such as community plan updates and infrastructure plans. DCP uses anticipated population growth, or population projections as a benchmark, to determine the level of development that is needed to accommodate this future growth. Population growth is a fundamental consideration in making long-range land use planning decisions. However, it is important to note that these projections are calculations based in part on a number of assumptions and, as with any data reliant on assumptions, projections have limitations. For example, projections are often based on recent trends that may or may not continue as conditions change and populations can fluctuate over time for various circumstances, such as the recent global pandemic or the Great Recession.

Project Area Growth Projections

The State of California requires that cities plan for changes in demographics, including housing demand, population, and employment. If growth is anticipated, each city must accommodate a share of the region’s projected growth. The Project Area represents approximately 0.20 percent of the City of Los Angeles’ total land area (one square mile out of 478 square miles) and 0.15 percent of the City’s population. Over the next few decades, population within the Project Area is anticipated to increase by approximately 27 percent by year 2040, as identified by SCAG projections in 2016-2040 RTP/SCS (see **Table 3-4**). The Proposed Project would more than accommodate SCAG’s 2040 population, housing, and employment projections based on the amount of development that is reasonably expected to occur during the life of the Specific Plan, given the Proposed Project’s zoning capacity and land use regulations.

TABLE 3-4 PROJECTED POPULATION GROWTH FOR THE PROJECT AREA						
Area	Existing Population (2021)	% of Citywide Existing Population	SCAG's 2040 Projected Population	Projected Population Growth (2021-2040)	% of Citywide 2040 Project Population	% Change in Project Population Growth (2021-2040)
City of Los Angeles	4,091,000	100%	4,609,000	518,000	100%	13%

CEQA requires an EIR to compare existing physical conditions (“baseline”) to the physical conditions after implementation of a project. For purposes of the CASP, which is an update to a Specific Plan, there is no expected direct effect from the Proposed Project (such as for a construction project), but there are expected indirect impacts from the reasonable anticipated development that will occur. To assess the impacts of the Proposed Project requires determining reasonable anticipated development and identifying current conditions. Both of these determinations rely in part on estimates of the current population, housing and employment, and the forecasted growth in population, housing and employment.

CEQA Guidelines Section 15125(a) requires that an EIR include a description of the physical environmental conditions in the vicinity of a project, as they exist at the time the NOP is published. This environmental setting normally constitutes the baseline physical conditions to which the lead agency compares the impacts from the project and determines the significance of impacts. The NOP for this EIR was published on April 8, 2021 (see **Appendix A**). Thus, the Draft EIR uses 2021 as the baseline for existing conditions.

CEQA generally requires an analysis of the foreseeable impacts from a project against the existing environment or baseline conditions. However, there are some exceptions to this rule where that analysis would be misleading or not provide useful information for purposes of CEQA impacts from the project, and the lead agency provides a justification for using future baselines (*Neighbors for Smart Rail v. Exposition Metro Line Const. Auth.*). In the event this EIR does not analyze the impacts of the Proposed Project against the existing environment, the alternative baseline is identified and a justification is provided for the use of the alternative baselines. A description of the methodology for analysis of impacts, including the use of alternative baselines, is included in Chapter 4 Environmental Analysis. The subject of baselines is not always established by population and housing information. The subject of the baseline is related to the particular impact area under consideration. For example, a baseline for purposes of agricultural and aesthetic impacts is related to current legal status and/or the physical condition of land in the project area (e.g., land that is designated prime farmland, a designated state scenic highway, or the presence of a valued scenic vista).

Existing Land Use Designations and Zoning

The Project Area is predominantly developed with a mix of industrial, commercial, residential, institutional, educational, and recreational uses. Industrial development is the largest sector within the Project Area, totaling approximately 3.7 million square feet of industrial space across 153 buildings. The total residential inventory in the Project Area comprised approximately 1,814 housing units. Approximately 75 percent of the Project Area’s existing housing stock (1,343 units) is multifamily development, totaling 1.3 million square feet of area, with the remaining 471 units as single-family homes.

There are five Generalized Land Use Designations within the current Project Area: Hybrid Industrial, Public Facilities, Open Space, Residential Multi-Family, and Commercial Manufacturing. Hybrid Industrial is the most common land use designation, comprising 276 acres, followed by Open Space (108 acres), Public Facilities (57 acres), Residential Multi-Family (29 acres), and Commercial Manufacturing (5 acres).

The Project Area has four zones that are unique to the Specific Plan: the Urban Innovation zone (144 acres), Urban Village zone (90 acres), and Urban Center zone (40 acres), which all correspond with the Hybrid Industrial land use designation, and the Greenway zone (74 acres), which corresponds with the Open Space designation. Other zones in the Project Area include the OS zone (34 acres), RD1.5 and RD2 zones (29 acres), PF zone (57 acres), and CM zone (5 acres).

Figure 3-3 and **Figure 3-4** show the zoning and land uses in the Plan Area under the existing CASP as originally adopted in 2013. The maximum permitted development intensity for each parcel is regulated by Floor Area Ratio (FAR) and is shown in **Figure 3-5**. Permitted uses in each zone are identified below in **Table 3-5** while use limitations for each zone are identified below in **Table 3-6**. The Proposed Project would revise the existing Specific Plan's zoning regulations to further encourage affordable housing and mixed-income housing production in the Project Area. Further discussion on the proposed amendments to the zoning and land use regulations of the Specific Plan can be found in Section 3.6, *Proposed Land Use and Zoning Changes*.

Footnotes for Use Classification Table

1. See Limits Table for area, FAR, and square footage limits.
2. Truck repair uses are not permitted in the Urban Village Zone
3. Free Standing Fast Food establishments are permitted with a Conditional Use Permit Pursuant to Section 12.24.W.17., except that the finding set forth in Section 12.24.W.17 (a) shall not apply.
4. Self-storage uses are limited to 50% of the Base FAR.
5. Schools, Colleges, Tutoring, and Technical Training Programs in the Urban Innovation zone are limited to Vocational Technical Training Schools or Programs.
6. Parking uses must be combined with the development of other uses, and such other uses must equal no less than a 1:1 FAR for the project site.
7. Conservations, Environmental, and Social Services uses are limited to Block 70 in the Block Numbers Map on page 3-23.
8. These uses are limited to Block 52 in the Block Numbers Map on page 3-23.
9. If the parcel is 30,000 square feet in area or less, then the Ancillary Use is permitted up to a 1:1 FAR.

TABLE 3-6 EXISTING USE LIMITATIONS				
Use Classification	Greenway	Urban Village	Urban Innovation	Urban Center
Commercial Office	N/A	65% ^a	Ancillary-(10%) ^a	65% ^a
Retail square footage limit	1,200 sf ^b	15,000 sf ^b	5,000 sf ^b	50,000 sf ^b
Retail and/or Personal Services	Only Retail uses are permitted, and they are subject to a 10% FAR limitation	20% ^a	20% ^a	20% ^a
Residential Multi-Family	N/A	90% ^{c,d}	15% ^{c,d}	15% ^{c,d}
Commercial Hotels	N/A	150 rooms	100 rooms	200 rooms
Footnote for Limits Table				
<p>a. The floor area for the use shall not exceed the allowable percentage of the site's Base FAR set forth in the Limits Table. For example, a 100,000 square foot site with a permitted 3:1 Base FAR may not be developed with a Commercial Office project that exceeds 195,000 square feet (i.e., 65% of 300,000 sf) of commercial use. The same project could include other permitted uses to maximize the permitted total floor area if desired. If a Project applicant obtains a FAR in excess of their Base FAR as a result of a Bonus Option or TFAR, then the floor area for the use shall not exceed the allowable percentage of the site's total FAR.</p> <p>b. The square footage provided is the maximum square footage permitted for each Retail establishment on the lot.</p> <p>c. The maximum floor area of Residential Multi-Family uses shall not exceed the stated percentage of the total gross floor area of all principal and Ancillary Uses combined.</p> <p>d. Only the "living" portion of a joint living and work quarter that is designed for residential purposes shall count towards the residential square footage limitation.</p>				

Existing Affordable Housing Incentives

The existing CASP has an incentive-based zoning system that grants developers additional floor area rights in exchange for reserving a portion of units for low-income households. The system seeks to capture the land value increases that result from rezoning and public investment to create public benefits such as affordable housing.

Presently, project applicants may obtain additional floor area rights by complying with the Affordable Housing Bonus Option, Strategy A or B, and/or the Community Benefit Bonus Options, as set forth below:

- **Affordable Housing Bonus Option, Strategy A:** If an applicant agrees to set aside a portion of the residential units in a project for affordable housing, then the project shall be granted a Floor Area Bonus as set forth in the following table (Table 3-7).

TABLE 3-7 FLOOR AREA BONUS TABLE - STRATEGY A*				
Affordable Level/Location	Greenway	Urban Village	Urban Innovation	Urban Center
11% of units set aside for households earning 50% of AMI or less, or 20% of units set aside for households earning 80% of AMI or less	NA	3:1	3.15:1 (The Residential portion of the Project is subject to a .6:1 FAR)	3.15:1 (The Residential portion of the Project is subject to a .6:1 FAR)
100% of units set aside for households earning 80% of AMI or less	NA	4:1	3.45:1 (The Residential portion of the Project is subject to a .9:1 FAR)	3.45:1 (The Residential portion of the Project is subject to a .9:1 FAR)
11% of units located in the River Buffer set aside for households earning 50% of AMI or less, or 20% of units located in the River Buffer set aside for households earning 80% of AMI or less	NA	2:1	1.6:1 (The Residential portion of the Project is subject to a .3:1 FAR)	1.6:1 (The Residential portion of the Project is subject to a .3:1 FAR)

TABLE 3-7 FLOOR AREA BONUS TABLE - STRATEGY A*				
Affordable Level/Location	Greenway	Urban Village	Urban Innovation	Urban Center
100% of units located in the River Buffer set aside for households earning 80% of AMI or less	NA	2:1	1.8:1 (The Residential portion of the Project is subject to a .525:1 FAR)	1.8:1 (The Residential portion of the Project is subject to a .525:1 FAR)
*Projects located in an area with a Maximum FAR of 3:1, as shown on the FAR Map, shall be limited to a 3.375:1 FAR.				

- Affordable Housing Bonus Option, Strategy B:** If an applicant agrees to set aside a portion of the residential units in a project for affordable housing, then for each square foot of affordable housing constructed, the applicant shall be granted the right to construct additional floor area above the Base FAR for the Project, as set forth in the Bonus Square Footage Table below (**Table 3-8**). One additional square foot shall be added to the bonus numbers set forth below for square footage that is used to construct affordable units containing three or more bedrooms.

TABLE 3-8 BONUS SQUARE FOOTAGE TABLE UNTIL FIVE YEARS FOLLOWING PLAN ADOPTION*			
Affordability	Affordable SF	Market SF	Total Bonus SF
Extremely-Low – Units set aside for households earning 30% of AMI or less	1	18	19
Very Low – Units set aside for households earning 50% of AMI or less	1	13	14
Low – Units set aside for households earning 80% of AMI or less	1	5	6
Five years after Plan adoption, the market square value footage is reduced by half unless the City Council legislatively acts to modify the current market square footage. The revised numbers shall not apply to Projects for which the application is deemed complete by the Department of City Planning prior to the termination of the five-year period following Plan adoption.			

Community Benefit Bonus Options: Project applicants may obtain additional Floor Area Rights by providing the following Community Benefits:

- Open Space:** A project applicant may add 3 square feet of floor area for each square foot of publicly accessible open space provided.
 - Community Facility:** A project applicant may add 6 square feet of floor area for each square foot of area provided for a Community Facility.
 - Passageway:** A project applicant may add 3 square feet of floor area for each square foot of a public passageway that extends from an adjacent street to another public right-of-way

Additionally, the existing Specific Plan sets forth a Transfer of FAR (TFAR) Program available to non-residential projects to transfer unused floor area from a Donor site to a Receiver site, up to the allowable Maximum FAR limit on a site. More details on the existing Specific Plan's zoning incentives can be found in **Appendix C, Cornfield Arroyo Seco Specific Plan (2013)**.

Existing Building Form and Urban Design Standards

The existing Specific Plan document sets forth building form and design standards to shape development in the Project Area. Several goals of the Specific Plan’s guidelines include providing spatial and proportional standards that reinforce the street as a large public outdoor room, emphasizing the public realm more than individual buildings, ensuring that development is designed with a pedestrian orientation, reinforcing the street wall with well scaled elements or structures that are sensitive to the neighborhood context, and respecting the smaller scale of adjacent low-density buildings.

Specific building form regulations for the Project Area are identified in the existing CASP and include standards such as: yard and setback regulations, street wall and massing, maximum lot coverage, building heights, and buffers. Urban design standards include requirements such as forward facing street-oriented entrances, retail oriented ground floors, transparent wall openings such as storefront windows and doors, aesthetic lighting for public spaces, and screening mechanical units and trash enclosures from public view.

Existing Open Space Standards

Enhancing and preserving Open Space in the Project Area is identified as a main goal of the existing CASP and is promoted through a variety of measures and design standards. There are currently 108 acres of open space in the Plan Area. Major open space within or adjacent to the Project Area include the Los Angeles Historic Park, Albion Riverside Park, Rio de Los Angeles State Park, Elysian Park, and Downey Park.

Open space regulations contained within the Project Area designed to achieve various goals such as: providing inviting safe and accessible public space; increasing recreational opportunities for residents, employees, and visitors; providing pedestrian linkages throughout the Project Area; encouraging community based and local food production; supporting an easy transition between indoors and outdoors; and establishing focal points and meeting places to create general visual interest and enhance the Area's image. Open space is regulated in the Plan Area through design requirements such as area requirements (minimum percent of open space per project), open space accessibility requirements, seating, landscape, trees, irrigation, fencing, and specialty design requirements such as community gardens.

Existing Parking and Access Standards

Mobility, parking, and access standards are a focal area of the existing CASP. There are several goals set forth in the existing CASP for parking and access standards including: managing and controlling parking supply and demand; increasing pedestrian, bicycle, and transit use and reducing vehicular trips to and through the Project Area; and screening parking to provide a safe, aesthetically pleasing and secure environment for pedestrians. Regulations pertaining to parking and access in the existing CASP include but are not limited to: no minimum vehicle parking requirements, electric vehicle charging stations, bicycle parking requirements, parking lot and structure design standards, vehicular access standards to public buildings, and drop-off zones.

Existing Conservation, Performance, and Sign Standards

The existing CASP sets forth conservation standards that are intended to reduce energy demand, recycle water and decrease demand for potable water, reduce waste and use of new materials, and reduce demand on natural resources. These standards apply to plumbing and plumbing fixtures, interior lighting design and operations, energy generation, heat island reduction, and pools and jacuzzies.

Additionally, the existing CASP sets forth performance standards that are intended to provide for a safe, clean, and healthy environment; minimize the effects of noise and vibration on the surrounding environment; and reduce the visual impact of utility facilities. These standards apply to building maintenance, deliveries, recycling, storage, utilities, and equipment. The existing CASP regulates signs, including a prohibition on specific sign types (animated, blinking and scrolling signs, inflatable devices, and off-site supergraphics, pole signs, roof, and window signs).

Existing Street Standards

The existing CASP establishes modified highway and street improvement standards that are intended to facilitate a multi-modal street network and build linkages to the neighboring Chinatown, Lincoln Heights, Cypress Park, Elysian and Heritage Square neighborhoods to nearby regional amenities, among its

numerous goals. The modified highway and street improvement standards are illustrated in the Street Modification Table, the Modified Street Standards Map, and Modified Street Cross-Sections illustrations, which can be found in **Appendix C**, *Cornfield Arroyo Seco Specific Plan (2013)*.

Furthermore, the existing CASP sets forth sidewalk, street lighting, street tree, street intersection design, landscaped median, and bicycle infrastructure regulations.

Mitigation Monitoring Plan

Section 21081.6 of the Public Resources Code and Section 15097 of the CEQA Guidelines require a Mitigation Monitoring or Reporting Plan (MMP) be adopted for all projects for which an Environmental Impact Report (EIR) or Mitigated Negative Declaration (MND) has been prepared.

Accordingly, the existing CASP incorporated the prior EIR Mitigation Monitoring Plan and describes the procedures for the implementation of the mitigation measures adopted for the existing CASP. The MMP for the existing CASP is anticipated to be in place through the horizon year of the existing CASP (2035) or until the CASP and EIR are updated. While the adopted CASP is a planning document, it is anticipated that development that occurs pursuant to the Plan will include the following phases: design (pre-construction), construction, and operation (post-construction both prior to and post-occupancy), and therefore some mitigation measures are tied to these phases.

Each mitigation measure is categorized by impact area, with an accompanying identification of:

- Performance Criteria/Monitoring Actions – this is the criteria that would determine when the measure has been accomplished and/or the monitoring actions to be undertaken to ensure the measure is implemented.
- The implementing agency – this is the agency or agencies that will actually undertake the measure.
- The enforcement agency and monitoring agency -- this is the agency or agencies that will monitor the measure and ensure that it is implemented in accordance with the MMP.

The MMP as it is incorporated into the existing CASP is implemented by the City of Los Angeles when individual development projects pursue a clearance implemented during project review, pursuant to Chapter 1 (Process) of the existing CASP, which can be found in **Appendix C**, *Cornfield Arroyo Seco Specific Plan (2013)*. The MMP will be updated as necessary and appropriate as part of the Proposed Project's EIR.

3.3 PROJECT OBJECTIVES

CEQA requires an EIR to include a statement of the objectives sought by a project proponent, in this case the City of Los Angeles. The statement of objectives should include the underlying purpose of the project.

Underlying Purpose of the Project

The purpose of the Proposed Project is to encourage the production of affordable, mixed-income, and permanent supportive housing in the Project Area, in a manner consistent with the underlying vision and purpose of the existing CASP, which is to implement the Central City North and Northeast Los Angeles Community Plans.

Objectives of the Proposed Project are as follows:

- Increase the production of affordable, mixed-income, and permanent supportive housing within the Project Area.
- Protect residents, especially low-income households, from indirect and direct displacement, and ensure stability of existing vulnerable communities.
- Design and regulate housing to promote health and well-being, increase access to amenities such as parks and public transit, contribute to a sense of place, foster community and belonging, and plan for a sustainable future.
- Build, operate, and maintain welcoming and accessible housing for Angelenos with unique needs, including those with disabilities, large families, older adults, and other people facing housing barriers and economic insecurity.
- Refine Plan standards, processes, and procedures to be more intuitive and transparent, with the goal of enhancing development certainty for both market-rate and affordable housing developers; and
- While reducing overall employment capacity, preserve employment areas that show a concentration of jobs, while supporting small and/or legacy businesses, local employment, and new productive uses and employment spaces, such as light industrial and general commercial uses.

3.4 PROJECT COMPONENTS

The Proposed Project would amend the text, map, and tables of the Cornfield Arroyo Seco Specific Plan (CASP or Specific Plan), including new land use and zoning regulations, incentives, and boundaries, for the purpose of encouraging affordable and mixed-income housing production. The Proposed Project would strengthen the existing CASP's affordable housing requirements, including the recalibration of the CASP's existing incentive zoning system; establish a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities; include provisions that facilitate the production of new 100% affordable housing and permanent supportive housing projects on public land; increase the zoning capacity for housing in targeted areas; and adopt a modernized zoning system based on the City's new modular Zoning Code.

The Proposed Project will include the adoption of necessary revisions and any other amendments necessary to implement this update, including amendments to General Plan elements (such as the Framework Element), Community Plans, the LAMC (Chapter 1 and Chapter 1A), and other ordinances to implement those updates.

The Proposed Project may also include additional amendments to the LAMC (Chapter 1 and Chapter 1A) and the Specific Plan to better comport the regulations of the Specific Plan to the structure and provisions of Chapter 1A. This may include moving Specific Plan provisions to Chapter 1A as part of the base zoning of the respective Community Plan, and potentially removing the Specific Plan designation, for simplicity and ease of implementation. Such amendments would not substantively change the effect of the regulations.

The proposed changes are provided in further detail below. The key components of the Proposed Project comprise of the following:

- **Updated Zoning.** The Proposed Project would accommodate additional housing capacity in the Project Area by expanding the predominantly residential Urban Village zoning designation to select parcels within the Project Area. Each of the Project Area's unique zones would be updated to permit a broader range of uses, such as 100 percent affordable housing and permanent supportive housing,

and to be more consistent with the standards and definitions of the City’s proposed new Zoning Code. A new Public Use zone would be utilized to more precisely regulate the types of uses allowed on publicly-owned land and to support the provision of community benefits. Additionally, the existing Greenway zone would be consolidated with the similar Open Space (OS) zone to reduce redundancy.

- **Updated Affordable Housing Incentives.** The Project Area’s existing zoning incentives would be restructured and recalibrated to deliver more affordable housing, while being simpler to understand and implement. The revised zoning incentives include a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities.
- **Updated Plan Boundaries.** The updated Specific Plan boundaries would exclude parcels that currently do not have CASP zoning (e.g., RD zones) to clarify the non-applicability of the Specific Plan on those parcels. The boundaries would also be modified to exclude the Greenway (Open Space) parcels adjacent to Elysian Park, which are the only parcels in the Project Area located within the Silver Lake-Echo Park-Elysian Valley Community Plan Area.
- **Updated Development Standards.** The building form, urban design, open space, parking, conservation, performance, sign, and streets standards of the Proposed Project would be updated to improve clarity and reduce redundancy.
- **Updated Administration Chapter.** The administration chapter of the Project would receive technical updates to improve ease of implementation, consistency, and clarity.
- **Updated Mitigation Monitoring Program.**

Proposed Land Use and Zoning Changes

The Proposed Project would update the existing zoning of the CASP by expanding the Urban Village zone, utilizing a new Public Use (P2) zone, and updating the use and FAR tables for existing CASP zones, as described in further detail below. The changes to the proposed zoning and land uses in the Project Area are summarized below in **Table 3-9**, while **Figure 3-6** is a map of proposed zoning under the Proposed Project.

TABLE 3-9 EXISTING AND PROPOSED ZONING				
Zone	No Project		Proposed Project	
	Area (Acres)	Percentage	Area (Acres)	Percentage
Urban Village	90	19%	132	28%
Urban Innovation	144	30%	65	14%
Urban Center	40	8%	30	6%
Greenway	74	15%	0	-%
RD1.5/RD2	29	6%	29	6%
CM	5	1%	5	1%
Open Space (OS)	35	7%	103	22%
PF	57	12%	0	0%
FWY	0	0%	40	8%
Public Use (P2)	0	0%	70	15%
C2	8	2%	8	2%
Total	483*	100%	483*	100%

* Total area shown excludes the area within public rights-of-way. The acreage per zone may not add up to the total area due to rounding.

Expansion of the Urban Village Zone

As described in Section 3.4, the existing CASP has four zones that are unique to the Project Area: Urban Innovation (mixed-use industrial), Urban Village (mixed-use residential), Urban Center (mixed-use commercial), and Greenway (open space). The Urban Village zone, which is the only Project zone that allows for predominantly residential development, comprises approximately 19 percent of land area (90 acres) among parcels within the Project Area.

One of the key objectives of the Proposed Project is to increase the production of affordable and mixed-income housing within the Project Area. The Proposed Project would increase the amount of land that is zoned Urban Village to 28 percent of land area (132 acres) among parcels within the Project Area, which is a 46 percent increase from the existing Specific Plan. This increase in Urban Village zoned land would expand where housing could be built in the Project Area and support an increase to its housing stock, while still retaining a substantial amount of land for the Specific Plan's other policy objectives, such as the preservation of open space and land for job-producing uses.

The Urban Village zone would generally be extended to two subareas of the Project Area: 1) the area west of the Los Angeles River, generally between Main Street and Naud Street, and 2) the area generally bounded by the Los Angeles River to the west, the Arroyo Seco and State Route 110 to the north, and Interstate 5 to the east. The retention and extension of the Urban Village zone would help support the production of affordable and mixed-income housing in the Project Area while also preserving existing residential uses, such as HACLA's 415-unit William Mead Homes. The analysis in the proceeding sections analyzes future buildout of the Urban Village zone coupled with the projected expansion of its boundaries to include additional sites that could include housing. The analysis in this Draft EIR evaluates the impacts of reasonably anticipated development for existing parcels including grading/site preparation, construction activity, and operation.

New Public Use District (P2)

The Proposed Project would utilize a new Public Use District (P2) to more clearly demarcate land that is publicly-owned, support the joint public and private development of community-serving uses, and allow by-right 100% affordable housing projects. Currently, 34 percent of land area (165 acres) within the Project Area is owned by a government agency, with approximately half of that land (77 acres) having an Urban Innovation, Urban Village, or Urban Center zoning designation that does not reflect the public ownership of those parcels.

The new Public Use District would allow government buildings, structures, offices, and service facilities. Other uses may be permitted based on the most permissive zoning of adjoining properties; however, such uses must be a joint public and private development approved in accordance with the discretionary processes and procedures set forth in the updated Specific Plan. In contrast to the Urban Innovation, Urban Village, or Urban Center zones, solely private developments would not be permitted.

The new Public Use District would be applied to approximately 70 acres of publicly-owned parcels within the Project Area. Not all publicly-owned properties would receive the Public Use zoning designation. For example, freeways would retain the existing Public Facilities (PF) zone designation, while parks would have an Open Space (OS) zone designation. Publicly-owned properties that are currently zoned Urban Village would keep their existing zoning.

In sum, the new Public Use zone would allow for a broader range of uses to occur on certain publicly-owned parcels, depending on the zoning of adjoining properties, but such development would require a discretionary review process and would be limited to joint public and private development. Government buildings, structures, offices, and service facilities would be allowed ministerially.

Updated Use Table for Project Area

The Proposed Project would replace the existing *Use Classification Table* and *Use Limits Table* (see **Table 3-5** and **Table 3-6**), which is proprietary to the existing CASP, with an updated use table substantially based on that of the City's proposed new Zoning Code.¹ The updated list of uses and definitions would be aligned with the proposed *Use Article* of the new Zoning Code to enhance consistency between the documents and improve ease of implementation.

While the format of the use table would change, the general uses allowed for each of the existing CASP zones would largely be unchanged. The Urban Innovation, Urban Village, and Urban Center Use Districts will continue to remain mixed-use industrial, residential, and commercial zones, respectively. However, the Proposed Project would incorporate a few changes to the use limits to further support the production of affordable and mixed-income housing.

For example, the existing Urban Village zone's limitation of multi-family residential uses to 90 percent of a development project's total floor area would be lifted, allowing for purely residential buildings in the Urban Village Use District, instead of mandating a mix of uses within the same building. The additional flexibility afforded by this change increases the feasibility of residential development, especially affordable and mixed-income housing projects.

The existing Urban Innovation and Urban Center zones also prescribe a mix of uses, limiting multi-family residential uses to no more than 15 percent of a development project's total floor area. The Proposed Project would continue to prioritize job-producing uses over residential development in these zones. However, rather than a cap on the percentage of residential uses allowed, the Proposed Project would establish a minimum Floor Area Ratio (FAR) of industrial, commercial, or other job-producing uses within a development project in the Urban Innovation and Urban Center Use District. This approach is consistent with the standards of the proposed new Zoning Code and would result in less ambiguity and greater ease of implementation compared to the existing proprietary system.

The Proposed Project would exempt 100 percent restricted affordable housing and supportive housing projects from the minimum job-producing FAR requirements of the Urban Innovation and Urban Center zones. This change would substantially increase the area where affordable and supportive housing could be built in the Project Area compared to the existing Specific Plan by allowing those uses in all three of the Project's "Urban" Use Districts: Urban Innovation, Urban Village, and Urban Center.

FAR, Height, and Density

The existing Specific Plan regulates the intensity of development through Floor Area Ratio (FAR) and building height regulations. Each parcel is assigned a Base FAR and Maximum FAR depending on the parcel's zone along with other detailed criteria. Additionally, minimum and maximum average building heights are established for each parcel in a Building Heights Map.

The Proposed Project would update the existing FAR and building height regulations to utilize a new system substantially similar to that of the *Form Article* in the new Zoning Code. Under the Proposed Project, a parcel's zoning designation would be decoupled from its FAR regulations. These changes would help to simplify implementation of the building form regulations, while retaining largely the same FAR and building height limits of the existing Specific Plan. **Table 3-10** summarizes the new Form Districts that would regulate FAR and building height under the Proposed Project, while **Figure 3-7** shows where the Form Districts would be applied to parcels within the Specific Plan:

¹See Draft Environmental Impact Report (EIR) for the Downtown Community Plan Update/New Zoning Code for Downtown Community Plan.

Figure 3-7 Proposed Project Form Districts

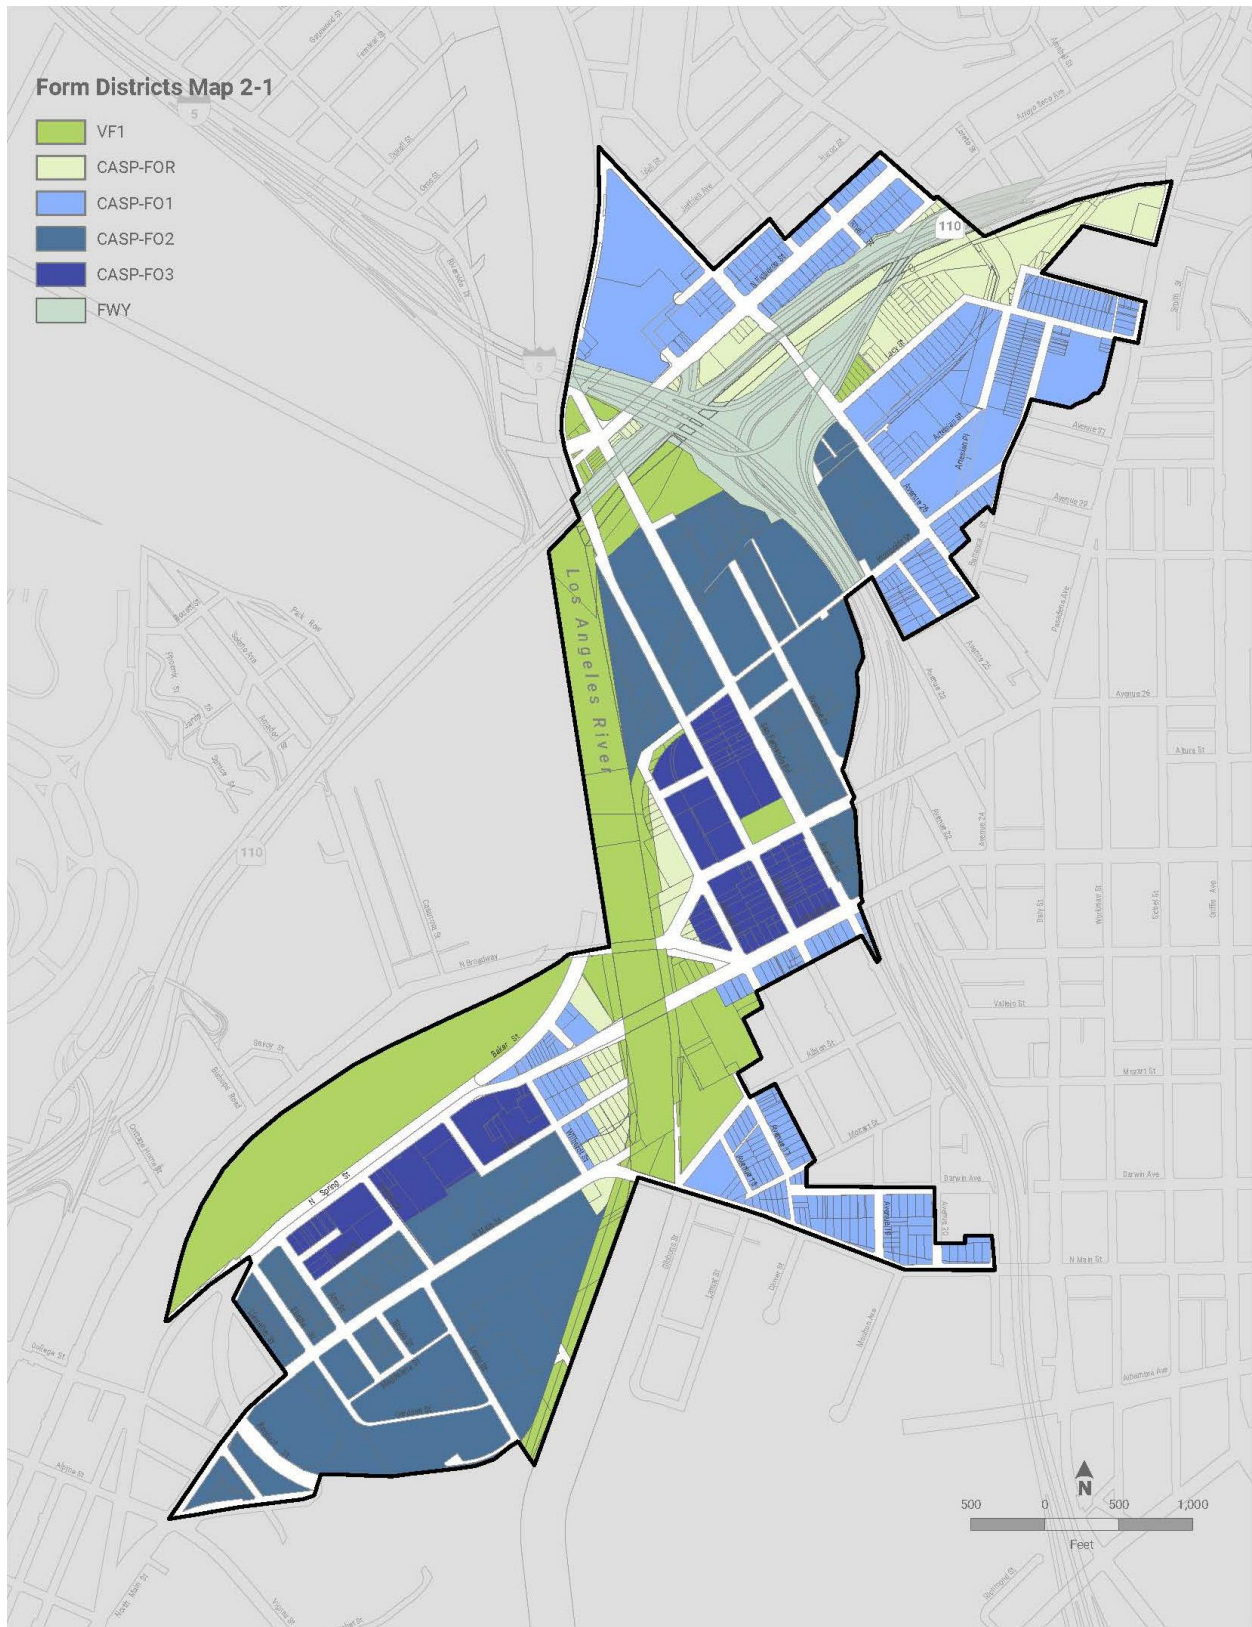

TABLE 3-10 PROPOSED FORM DISTRICTS - FAR AND HEIGHT				
Form District	Lot Coverage (Max)	Base FAR (Max)	Bonus FAR (Max)	Max Story Height
CASP-GW	25%	1.5	1.5	-
CASP-R	50%	1.5	2	5
CASP-1	85%	1.5	3	-
CASP-2	85%	1.5	4	-
CASP-3	85%	1.5	5	-

The existing Specific Plan does not regulate density by limiting the number of units allowed on a lot. The Proposed Project would continue to not regulate density in this manner and, instead, regulate building intensity through FAR and height regulations.

Reasonably Anticipated Development

The Proposed Project would continue to accommodate future growth in the Project Area, including the employment, housing, and population growth projections through the planning horizon year 2040. With implementation of the Proposed Project, the zoning designations of the Project Area would be updated to continue accommodating the population growth, housing, and employment demand projected by SCAG through the year 2040. The Proposed Project would also accommodate growth in the City consistent with the City's Framework Element policies, the SCS, and SB 375.

To assess potential environmental impacts of the Proposed Project, the reasonably anticipated development that is anticipated to occur in 2040 as a result of the Proposed Project was determined. The reasonably anticipated development of the Project Area was determined based on assumptions about the level of development that can be anticipated to occur during the life of the updated Specific Plan (through the year 2040, or approximately 20 years into the future, coincident with the adopted 2016-2040 RTP/SCS).¹ A key factor in determining reasonably anticipated development is the allocation of land and the distribution of uses to reflect the development patterns most likely to be built, or that are reasonably expected to occur. This approach is consistent with the approach used by SCAG to comply with federal laws that require RTPs to reflect development patterns most likely to be built in the region. As SCAG is a guiding precept, it is the City's responsibility while planning for the entire City in light of its Framework Element, the Sustainable Communities Strategy, and SB 375 policies, to determine whether any given specific plan or community plan should meet, exceed, or be under SCAG's expected projections for that specific plan or community plan area, and prepare a specific plan or community plan update in light of that responsibility.

The development growth assumptions for the Proposed Project, shown in **Table 3-11**, are based on the acreage of land designated for each type of function (by zone); allowable development capacity in each designation; anticipated levels of development in the life of the Proposed Project; discussion with existing public agencies; and potential development constraints.

With growth, grading is expected over the plan horizon. This grading would not occur simultaneously throughout the Project Area but is projected to occur in order to accommodate total population growth. It is reasonably anticipated that there could be up to 200,000 cubic yards of grading at any given time and for a wide range of probable construction activities which are expected to occur, such as site preparation and remediation, if necessary. Projected daily worker and truck trips with associated haul routes are also expected to increase as a result of the Proposed Project.

¹While the 2020-2045 RTP/SCS is the most recently adopted RTP/SCS, this EIR uses socioeconomic data from the 2016-2040 RTP/SCS to be consistent with the City's current Travel Demand Forecasting (TDF) model. As described in Section 2.4.3, the population, housing, and employment projections of these two regional plans are consistent with each other in the Project Area.

TABLE 3-11 REASONABLY ANTICIPATED DEVELOPMENT OF THE PROPOSED PROJECT COMPARED TO SCAG FORECAST				
	2021 Baseline /a/	Existing Plan Reasonably anticipated development /b/	Proposed Project Reasonably anticipated development /b/	SCAG 2040 Growth Forecast /c/
Housing	2,012	12,773	20,036	5,039
Population	6,027	36,021	56,501	14,444
Employment	5,411	10,005	8,263	8,797
/a/ SCAG 2016-2040 RTP/SCS interpolated to 2021, adjusted /b/ LADCP 2021 /c/ SCAG 2016-2040 RTP/SCS (includes portions of whole Transportation Assessment Zones outside of Project Area)				

Updated Affordable Housing Requirements

As described herein, the existing CASP has an incentive-based zoning system that grants developers additional floor area rights, in exchange for reserving a portion of units for low-income households. The system seeks to capture the land value increases that result from rezoning and public investment to create public benefits such as affordable housing.

The Proposed Project would update and recalibrate these incentives to deliver more affordable units, while being simpler to understand and implement. The current incentive system would be replaced with a new graduated base and bonus system (Community Benefits Program), similar to that found in the proposed new Zoning Code for the Downtown Community Plan, intended to establish a clearer set of objective standards for projects that wish to build beyond their base zoning. The proposed Community Benefits Program is separate from and may be supplemented by other affordable housing requirements or fees, such as inclusionary zoning or the Affordable Housing Linkage Fee (AHLF).

The main incentive used to garner public benefits under the Proposed Project is through floor area rights (depicted as Floor Area Ratio, or FAR). As noted, Form Districts would outline Base and Bonus FAR for each parcel. The Base FAR is available by-right. The Bonus FAR is available for projects that participate in the Community Benefits Program.

The Community Benefits Program for the Project is structured into two different levels. The scale of benefits required to achieve the bonus incentives would increase in proportion to the level of bonus development rights.

Level 1: Under Level 1, Housing Development Projects can double their permitted FAR (e.g., increase from 1.5 FAR to 3.0 FAR) in exchange for providing Restricted Affordable Units:

- Acutely-Low (households with incomes at 0-15% of Area Median Income); or
- Extremely-Low (households with incomes at 0%-30% of Area Median Income); or
- Very Low (households with incomes at 30%-50% of Area Median Income); or
- Low (households with incomes at 50%-80% of Area Median Income); or
- Moderate-for-sale (households with incomes at 80%-120% of Area Median Income).

Level 1 of the Community Benefits Program does not apply to non-housing development projects and non-housing development projects are not subject to the above affordable housing requirements to achieve

bonus development potential and can instead access bonus incentives by providing community benefits under Level 2 described below.

Level 2: Housing projects that fully exhaust Level 1 (i.e., double their FAR) can access additional development rights above Level 1 and up to the maximum Bonus FAR prescribed by the Form District, by providing Publicly Accessible Open Space, Community Facilities, or by providing more Restricted Affordable Units. Non-housing development projects must provide other community benefits (i.e., not affordable housing) to achieve the same level of bonus FAR.

Additional Affordable Housing: A project may choose to provide additional affordable housing above the required amounts in Level 1 to access additional FAR up to the maximum Bonus FAR.

Publicly Accessible Private Open Space: If a project chooses to provide publicly accessible private open space to access the available bonus development potential, it is required to allocate a percentage (depending on the zoning Form District and the amount of bonus FAR) of its overall lot area as Publicly Accessible Open Space. These spaces are required to comply with location, access, and informational sign requirements, meet design, shade, and landscaping standards and include amenities such as restrooms and drinking water fountains.

Community Facilities: If a project chooses to provide a Community Facility to access bonus development potential, it is required to set aside a minimum of 5,000 square feet and provide additional Floor Area towards a Community Facility for every additional bonus FAR. Community Facilities may be provided in the form of schools, social services, public facilities, community-serving small businesses, or daycare services. Other examples of eligible Community Facilities include public or non-profit health and counseling clinics, small business resource centers, job training centers, commissary kitchens for food vendors, cultural centers, and libraries.

To ensure that public benefits are provided on-site, the Community Benefits Program of the Proposed Project would not include the existing CASP's Transfer of Floor Area Ratio program.

The feasibility of the Program, including requirements in addition to or in excess of the Community Benefits Program described herein, was evaluated in a market analysis. The proposed system explicitly prioritizes the creation of much needed affordable housing, to make the Project Area more affordable, especially for lower-income households, in proximity to existing and anticipated jobs, amenities, services and transit resources. The system also deliberately focuses on a set menu of benefits that are most needed in the Project Area, so as not to dilute the impact of the Program. To better facilitate housing production, the Community Benefits Program is designed to be implemented through a ministerial process, and therefore, includes a predefined set of standards and requirements that qualify as community benefits under the Community Benefits Program. At this time, it is too speculative to identify which projects would participate in the Community Benefits Program, so for the purpose of this analysis it is assumed all projects on a property zoned Urban Village would access the Level 1 incentives for a FAR of 3.0 rather than the Base FAR of 1.5.

Updated Plan Boundaries

The updated Project Area boundaries would exclude parcels that currently do not have CASP zoning to clarify the non-applicability of the Specific Plan on those parcels. It would also include the removal of Greenway (Open Space) parcels adjacent to Elysian Park. The Proposed Project would exclude the following types of parcels from the Project Area:

- Existing C2-zoned properties within the Project Area.
- Existing RD1.5- and RD2-zoned properties within the Project Area.
- Existing CM-zoned parcels within the Project Area; and

- Existing GW-zoned parcels within the Project Area located within the Silver Lake-Echo Park-Elysian Valley Community Plan (i.e., part of Elysian Park).

The total land area of the Specific Plan would decrease from approximately 600 acres to approximately 550 acres (8 percent reduction) including area devoted to public rights-of-way. Properties no longer within the Specific Plan boundaries would retain their existing RD1.5, RD2, CM, or C2 zones and would not be subject to any of the regulations or review processes of the Specific Plan. The GW-zoned parcels would be rezoned as OS (Open Space) under the Silver Lake-Echo Park-Elysian Valley Community Plan. The updated Project Area boundaries are shown in **Figure 3-8**.

Updated Development Standards

As summarized below, the existing CASP sets forth building form, urban design, open space, parking, environmental conservation, performance, signage, and street standards for the Project Area. The Proposed Project would largely retain these existing standards but would update them as necessary to improve clarity and reduce redundancy, as well as to reflect current regulatory conditions. Key standards will be updated in a manner consistent with Citywide standards, including a new system of Form Districts, Frontage Districts, and Development Standards similar to that of the proposed new Zoning Code.

Building Form and Urban Design

The Proposed Project would establish new Form Districts that consolidate and update existing regulations, including lot size, building coverage, upper-story bulk, and building mass standards, in addition to the FAR and Height standards. The Proposed Project would also establish new Frontage Districts that consolidate and update existing regulations relating to setbacks, minimum ground floor and upper floor transparency, entrance location and spacing, minimum ground story height, and ground floor elevation.

Open Space

As described herein, the existing CASP establishes open space regulations to achieve various goals such as: providing inviting, safe and accessible public space; increasing recreational opportunities for residents, employees, and visitors; and providing pedestrian linkages throughout the Project Area.

The existing open space regulations of the CASP would be updated and consolidated through new Form Districts, Frontage Districts, and Development Standards for clarity and ease of implementation, and to reflect current regulatory conditions. These new requirements include standards such as minimum lot amenity space, minimum residential amenity space, minimum frontage planting area, and frontage fence and wall types.

There are currently 108 acres of land in the Project Area with a Greenway or Open Space zoning designation, which would change to 103 acres of land under the Proposed Project due to the addition of a new Public Use (P2) zoning designation, which will be applied to publicly-owned land including certain open space parcels. Existing public open space within or adjacent to the Project Area includes the Los Angeles Historic Park, Albion Riverside Park, Rio de Los Angeles State Park, Elysian Park, and Downey Park and would not be affected by the Proposed Project. The Proposed Project would consolidate the existing Greenway zone with the similar Open Space (OS) zone to reduce redundancy.

Parking and Signage

The existing CASP establishes regulations pertaining to parking and access, including no minimum vehicle parking requirements, electric vehicle charging stations, bicycle parking requirements, parking lot and structure design standards, vehicular access standards to public buildings, and drop-off zones.

Figure 3-8 Updated Project Area Boundaries

The Proposed Project would establish a new set of Development Standards that consolidate and update the existing parking and access standards for clarity and ease of implementation, and to reflect current regulatory conditions. The new Development Standards would continue to address parking requirements, and parking structure design, as well as permitted signage. The Proposed Project would continue to not have minimum automobile parking requirements.

Conservation and Performance

The existing CASP sets forth environmental conservation standards that are intended to reduce energy demand, recycle water and decrease demand for potable water, reduce waste and use of new materials, and reduce demand on natural resources. The existing CASP also sets forth performance standards that are intended to provide for a safe, clean, and healthy environment; minimize the effects of noise and vibration on the surrounding environment; and reduce the visual impact of utility facilities.

The Proposed Project would update the environmental conservation and performance standards of the existing CASP to reflect current regulatory conditions. Existing standards that conflict with or have been superseded by more recent environmental protection measures, such as those found in the building code and/or other City ordinances, would be removed and/or updated.

Streets

The Proposed Project would retain the existing street designations as set forth in the adopted CASP and illustrated in the Street Modifications Table and Modified Street Standards Map, which can be found in **Appendix C, Adopted Cornfield Arroyo Seco Specific Plan (2013)**. No changes to the transportation network are proposed as part of the Proposed Project.

The Proposed Project's cross-section illustrations of select non-arterial streets may be updated to further enhance the pedestrian experience and build linkages to open space and other amenities. The Proposed Project would clarify the long-term implementation of sidewalk, street lighting, street tree, street intersection design, landscaped median, and bicycle infrastructure standards. Regulations that conflict with or have been superseded by more recent measures, including those from other City agencies responsible for the public right-of-way, will be removed, consolidated, and/or updated.

Updated Administrative Chapter

The administration chapter of the Proposed Project would receive technical updates to improve ease of implementation, consistency, and clarity and to reflect current regulatory conditions. The Proposed Project would further clarify the Project's relationship to the Municipal Code as well as the processes and procedures related to the Project's implementation. The Proposed Project would retain the existing ministerial review process of the existing CASP for development projects that do not reach the thresholds for Project Compliance discretionary review.

3.5 PROJECT TIMELINE AND PHASES

The Proposed Project is an update to the existing CASP that would guide development in the Project Area through 2040. The Proposed Project does not propose specific planned development, and therefore, does not include a construction schedule or phasing plan. The Proposed Project is anticipated to be adopted in 2023 with implementation starting after adoption and continuing through 2040.

3.6 REQUIRED APPROVALS

Approval of the following would be required by the City Council in order to implement the Proposed Project:

- Certification of the Project EIR; and Adoption of Amendments to the Cornfield Arroyo Specific Plan, including text and maps.
- Adoption of Amendments to the City's Zoning Map in LAMC Chapter 1 and 1A to rezone portions of the Project Area with updated zone classifications and to update the Project Area boundaries.
- Adoption of Amendments to Community Plans (Land Use Element of the General Plan), including the Central City North Community Plan, Northeast Los Angeles Community Plan, and Silver Lake-Echo Park-Elysian Valley Community Plan land use maps.
- Amendments to the General Plan Framework, Circulation Map (Appendix E), Mobility Plan and other Citywide General Plan Elements, and ordinances, as necessary; and
- Amendments to all other relevant ordinances and actions as necessary to ensure consistency of regulations and implementation of the Community Plan amendments.

Approval of the Proposed Project would not require action by any agency other than the City of Los Angeles.

4.0 ENVIRONMENTAL ANALYSIS

4.0.1 INTRODUCTION TO THE ANALYSIS

This chapter, Environmental Analysis, is the primary focus of this Draft EIR. The following Sections 4.1 to 4.17 contain discussions of the potential environmental effects of implementation of the Proposed Project. Each environmental issue is considered in a separate section, which contains a discussion of the environmental setting, the regulatory setting, the methodology, and the thresholds of significance applicable to the environmental issue being analyzed. Each section also includes the impact analyses for the Proposed Project, mitigation measures, conclusions regarding the level of significance after mitigation, and cumulative impact analyses for each of the environmental issues.

4.0.2 SCOPE OF IMPACTS

IMPACT ANALYSIS

In the following sections, the analysis considers the indirect impacts from the approval of the Proposed Project.

- 4.1 Aesthetics
- 4.2 Air Quality
- 4.3 Biological Resources
- 4.4 Cultural Resources
- 4.5 Energy
- 4.6 Geology and Soils
- 4.7 Greenhouse Gas Emissions
- 4.8 Hazards and Hazardous Materials
- 4.9 Hydrology and Water Quality
- 4.10 Land Use and Planning
- 4.11 Noise
- 4.12 Population, Housing and Employment
- 4.13 Public Services
- 4.14 Recreation
- 4.15 Transportation and Traffic
- 4.16 Tribal Cultural Resources
- 4.17 Utilities and Service Systems

4.0.3 FORMAT OF SECTIONS

The analysis of each environmental impact category is organized to include the following subsections:

EXISTING SETTING

This subsection includes a description of existing conditions in the area of potential impact under baseline conditions. CEQA Guidelines Section 15125(a) requires that an EIR include a description of the physical environmental conditions in the vicinity of a proposed project as they exist at the time the Notice of Preparation (NOP) is published. The NOP for this EIR was published on April 8, 2021. Thus, the Draft EIR uses 2021 as the baseline existing conditions.

REGULATORY FRAMEWORK

This subsection includes an identification of federal, state, and local laws, regulations, policies, plans, and in some instances, regulating agencies, that regulate, plan or have jurisdiction over the environmental area of concern.

THRESHOLDS OF SIGNIFICANCE

This subsection identifies the criteria by which the components of the Proposed Project are measured to determine if the Proposed Project would cause a substantial or potentially substantial adverse change in the existing environmental conditions.

This EIR relies upon CEQA Guidelines Appendix G thresholds as the threshold of significance unless another is specifically identified in the EIR. The City may rely on thresholds of significance adopted by regulatory agencies, such as South Coast Air Quality Management District (SCAQMD) or any others deemed appropriate by the City and supported by substantial evidence.

Discussion in both thresholds and methodology subsections found in the sections associated with each individual impact area provide further explanation of which thresholds are used. As to each environmental topic, the City has selected the thresholds that ensure as comprehensive an analysis of the Proposed Project's potential environmental impacts as possible, given the constraints of attempting to analyze a Specific Plan that will be implemented over 20 years or more.

Finally, all impact questions, except as indicated below, are interpreted to take into account the following mandatory findings of significance from CEQA Guidelines Section 15065(a):

- (1) The project has the potential to substantially degrade the quality of the environment; substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; substantially reduce the number or restrict the range of an endangered, rare or threatened species; or eliminate important examples of the major periods of California history or prehistory. [Considered in Sections 4.3, Biological Resources, and 4.4, Cultural Resources.]*
- (2) The project has the potential to achieve short-term environmental goals to the disadvantage of long-term environmental goals. [Considered in impact analysis in Sections 4.1 through 4.18.]*

- (3) *The project has possible environmental effects that are individually limited but cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. [Considered in the cumulative analysis in each impact Sections 4.1 through 4.18.]*
- (4) *The environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly. [Considered in all impact analysis Sections 4.1 through 4.18.]*

METHODOLOGY

This subsection summarizes the methods, procedures and techniques used to estimate the impacts of the Proposed Project.

As described in the “Thresholds of Significance” discussion above, the methodology subsection also further clarifies which thresholds—Appendix G or the City thresholds or others—are used when describing the methods, procedures and techniques used to estimate the Proposed Project’s impacts. Generally, a methodology discussion notes whether the environmental impacts being analyzed identify potential impacts that are localized (e.g., population, housing, employment; land use) or would generally affect the entire Project Area, City, or region (e.g., air quality or greenhouse gas emissions). Consequently, this subsection may describe the geographic extent to which the Proposed Project could potentially affect for each environmental topic area. In some instances, where applicable, the methodology includes consideration of a broader geographic area beyond the boundaries of the Project Area or City.

IMPACTS

This subsection analyzes the effects of the Proposed Project against the baseline conditions to determine whether the Project would result in significant impacts to the environment. As discussed in prior chapters, the baseline, unless expressly provided otherwise in this EIR, is the existing conditions at the time the NOP was published.

For each significant impact or potentially significant impact identified, this subsection also recommends appropriate and reasonable mitigation measures to avoid or minimize impacts to the extent feasible. In addition, this subsection includes a discussion of whether a significant and unavoidable impact would be reduced to a less-than-significant level after mitigation or would remain significant and unavoidable.

The analysis of the Project is quantified using growth projections (i.e., housing, population, and employment numbers) for many of the impact areas. As discussed in Chapter 2, Project Description, the Project identifies and analyzes reasonably anticipated housing, population, and employment in the future.

The following terms are used to describe the level of significance of impacts, including before and after mitigation measures are imposed:

No Impact

No Impact applies where an environmental issue is evaluated, and it is determined that the Proposed Project would have no effect or impact in that category. No Impact conclusions are supported by information showing that the impact does not apply to the Proposed Project (e.g., the Project Area falls outside a fault rupture zone).

Less-Than-Significant Impact

Less-Than-Significant Impact applies where the Proposed Project would create only less than significant impacts that do not exceed the defined threshold of significance. CEQA does not require mitigation for less-than-significant impacts.

Less-Than-Significant with Mitigation Incorporated Impact

Less-Than-Significant with Mitigation Incorporated Impact applies to an impact that exceeds the defined threshold of significance, but for which mitigation is identified to reduce the impact to a less-than-significant level.

Significant and Unavoidable Impact

Significant and Unavoidable Impact applies to an impact that exceeds the defined threshold of significance and cannot be eliminated or reduced to a less-than-significant level through implementation of feasible mitigation measures.

The Impact Analysis discussion includes the following parts:

a. Discussion

Provides discussion presenting evidence that substantiates the impact conclusion.

b. Mitigation Measures

When an impact is initially identified as significant or potentially significant, feasible mitigation measures that would avoid or reduce the magnitude of impact are identified. If the impact conclusion is no impact or less than significant after the impact analysis discussion, this part is not included or is identified as not applicable.

c. Significance of Impacts/Summary of Impacts After Mitigation

This part identifies the level of significance after mitigation. If the Proposed Project would have a potentially significant impact before mitigation, a discussion will be provided to determine whether the potentially significant impact would be reduced to a less-than-significant level after mitigation or would remain significant and unavoidable.

CUMULATIVE IMPACTS

This subsection analyzes cumulative impacts associated with the Proposed Project. Pursuant to CEQA Guidelines Section 15130, an EIR shall discuss cumulative impacts of a project when its incremental effect is cumulatively considerable. “Cumulatively considerable” means that the incremental effects of the Proposed Project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. A finding of No Impact would also mean that the effect is not cumulatively considerable.

Cumulative impacts are the changes in the environment that result from the incremental impact of development of the Proposed Project and other projects with related impacts. For example, transportation impacts of two nearby projects may be insignificant when analyzed separately but could have a significant impact when analyzed together.

CEQA Guidelines Section 15130 allows that the discussion of cumulative impacts shall reflect the severity of the impacts and the likelihood of occurrence, but the discussion need not provide as much detail as is provided for the effects attributable to the project alone.

CEQA Guidelines Section 15130 allows for two approaches to study cumulative impacts: using a list of past, current and probable future projects or relying on a summary of projections (growth forecasts) from adopted local, regional or statewide plans. Because the Proposed Project is specific plan update covering a large area of the City over an approximately 20-year planning period, unless otherwise indicated, the cumulative impacts analysis in this EIR relies on the summary of projections method, utilizing the Southern California Association of Governments (SCAG) projections.

REFERENCES

This subsection identifies the sources and technical studies utilized in the preparation of this EIR. These reports are referenced throughout the document where appropriate.

This page intentionally left blank.

4.1 AESTHETICS

This section provides an overview of aesthetics and evaluates the impacts related with the Project Area. Topics addressed include visual character, views and vistas, scenic resources, and light and glare.

ENVIRONMENTAL SETTING

GENERAL VISUAL CHARACTER

Citywide

The City of Los Angeles is visually and aesthetically diverse. The City's physical boundaries are generally defined by the San Gabriel Mountains in the north, the Santa Susana Mountains, Santa Monica Mountains, and Pacific Ocean in the west, Pacific Ocean in the South, and Verdugo Mountains, San Rafael Hills, and San Gabriel Valley in the east. The Santa Monica Mountains and Los Angeles River bisect the City, separating the San Fernando Valley in the north from the Los Angeles metropolitan basin in the south. Generally, northern Los Angeles, specifically the San Fernando Valley, is comprised of larger areas of open space and natural elements. Central Los Angeles to the southern tip of the City is highly urbanized.

Project Area

The Project Area is located in the eastern portion of Los Angeles and a majority of the area is a Transit Priority Area (TPA), as shown on **Figure 4.1-1**, below. In particular, the Project Area is generally bordered by the neighborhoods of Chinatown to the south, Lincoln Heights to the east, Cypress Park to the north, and Elysian Park to the west. The Project Area is almost entirely urbanized and primarily characterized by a variety of high and low intensity development areas with an assortment of different development scales and a variety of visual character, including scattered parks, residential neighborhoods, commercial districts, restaurants, and industrial manufacturing facilities.

The Project Area is generally flat and does not contain substantial geographic features when compared to other areas of the City. For reference purposes, Interstate 5 (I-5) and State Route-110 (SR-110) bisect the northern portion of the Project Area, just west of the Lincoln Heights neighborhood. The visual character of the Project Area consists of urban development and streetscapes characterized by different cultural and architectural enclaves that have become iconic to the City landscape and in this particular area of the City. The existing built environment within the Project Area varies as a result of different phases of development that have occurred throughout the Project Area over time. With a majority of the Project Area encompassing industrial related land uses, the Project Area can generally be split into four sections including a northern section, western section, central section, and eastern section. Further information on the Project Area districts can be found in **Table 4.1-1**, below. General Project Area photos are provided in subsequent

Figure 4.1-1 Project Area Boundary KPOV

TABLE 4.1-1 PROJECT AREA DISTRICTS	
Western Section	The section west of the Los Angeles River is characterized by blocks of industrial buildings constructed throughout the 20th century. The section along Spring Street historically surrounded the Southern Pacific River Station, which is now Los Angeles State Historic Park. In 2005, the State Park was the site of an art project by Lauren Bon called “Not a Cornfield,” which is where the Cornfield Arroyo Seco Specific Plan gets part of its name. One of the more notable industrial buildings in the section is the Raphael Junction Block/NY Suspenders Factory, a flatiron-shaped building adjacent to the State Park. The western section also includes Los Angeles Department of Water and Power (LADWP) generating and maintenance facilities and William Mead Homes Public Housing. A rare extant section of the Zanja Madre, the main irrigation ditch that fed the early Pueblo de Los Angeles, is located just north of the State Park along the Metro L Line (Gold) alignment.
Central Section	The section between the Los Angeles River and I-5, south of Arroyo Seco is mixed in character, containing residential, commercial, and industrial uses, often adjacent to each other. Five or six blocks on the south side of Broadway Street contain a concentration of late 19th and early 20th century residences, as well as the Albion Elementary School. Albion Cottages and Milagro Market (HCM #442) are located in this small residential area. Broadway and Pasadena Avenue act as commercial corridors through the area. Industrial properties are interspersed throughout the section, but the north half of the section is particularly industrial in character. The Lincoln Heights Jail (HCM #587) is located in the Central section, as is the old Fuller Paint Company (remodeled into loft housing), and Goodwill Industries. The Brewery Art Colony, housed in the old Pabst Brewery and Edison Steam Power Plant (HCM #388), is just outside the Project Area boundaries on the south side of Main Street.
Eastern Section	Located east of I-5 and south of Arroyo Seco, this section is largely industrial, with the exception of a few old homes left over from the original residential tract that existed before industry expanded into it. The Lincoln Heights Gold Line stop is located in this section, which has spurred apartment and condominium development in recent years. Lacy Street is defined by a mix of historic and new buildings, including the old Columbia Mills (now Lacy Street Studios), Lacy Street Neighborhood Park, the North Central Animal Care Center, and former offices of the Cannon Electric Development Company. Other industries in the area were historically involved in metal work, from the manufacture of brass to general fabrication of metal objects and building materials.
Northern Section	The section north of Arroyo Seco comprises mainly the properties facing Figueroa Street and Avenue 26, which are largely commercial in character. Properties along Figueroa Street have seen extensive redevelopment and remodeling over the last half of the 20th century, leading to a mix of older one-story commercial buildings, a neighborhood movie theater (converted to a store), gas stations, and a Googie-style IHOP restaurant. The former Los Angeles Railway Huron Substation is located in this section (HCM #404), as is the former Lawry’s California Center (now the Los Angeles River Center and Gardens).

SCENIC VIEWS AND VISTAS

The term “views” generally refer to visual access to, or the visibility of, a particular natural or manufactured visual resource (e.g., a prominent geologic feature or historic resource) from a given vantage point or corridor. Scenic views focus on a particular object, scene, setting, or feature of visual interest. Panoramic views, or vistas, provide visual access to a large geographic area, for which the field of view can be wide and extend into the distance. Panoramic views are usually associated with vantage points looking out over urban or natural areas that provide a geographic orientation and view not commonly available. Examples of panoramic views might include an urban skyline, a valley, a mountain range, the ocean, or other water bodies. The City’s General Plan Conservation Element defines scenic views or vistas as the panoramic public views of natural features, including views of the ocean, striking or unusual natural terrain, or unique urban or historic features. Public access to these views is typically from park lands, publicly-owned sites, and public rights-of-way.

Citywide Views and Vistas

As noted above, scenic views or vistas are the panoramic public view access to natural features, including views of the ocean, striking or unusual natural terrain, or unique urban or historic features. Public access to these views is from park lands, private and publicly owned sites, and public rights-of-way. Scenic views and vistas are located throughout the City. Some prominent scenic views and vistas in the City include Pacoima Wash, San Gabriel Mountains, Santa Susana Mountains, San Pedro’s coastal bluffs, Griffith Park, and Elysian Park.

Scenic protection provisions are contained in the community plans for the City. Some protections include height limits and building setback requirements. Some scenic highways, including the Mulholland Drive Scenic Parkway, are regulated by specific plan ordinances that contain design provisions intended to protect natural ridge tops, neighborhood visual ambience, public views, and other features.

Project Area Views and Vistas

Scenic vistas in the Project Area include the downtown skyline to the south and limited views of the San Gabriel Mountains, Elysian Park, and the hills surrounding Dodger Stadium to the west. Due to the density and relative heights of buildings and urban development throughout a majority of the Project Area, views of these vistas are largely obstructed at the ground level. Intervening buildings, street bridges, freeway overpasses, and street trees block most views of these areas. Though the Elysian Park hills and the San Gabriel Mountains are visible from several areas of the Project Area, these views are also partially obstructed by buildings, transmission towers, and electric lines. Limited views of the San Gabriel Mountains are available from the ground level along various north-south streets primarily in the northern half of the Project Area. Limited views of Elysian Park and the hills surrounding Dodger Stadium are also available at the ground level primarily at discrete vantage points in the center to southern portions of the Project Area, although intermittently interrupted by existing rolling hills and landscaping.

Publicly accessible panoramic views of the Project Area are provided from freeways in and adjacent to the Project Area as well as surrounding areas such as the Hollywood Hills and Griffith Park, due to their elevation relative to the flat nature of the Project Area. From these vistas, the intense urban development that characterizes both the low-rise commercial and residential structures of the existing Urban Innovations Subarea can be observed.

The streets, sidewalks, and freeways that traverse the Project Area generally provide views of urban development and urban streetscapes, including public views of historic buildings, parks, and iconic skyscrapers to the south and towards Downtown Los Angeles. These views are typically limited to close-

in foreground views, though some high-rise skyscrapers can be viewed from over 1-mile away at street level.

SCENIC RESOURCES

Scenic resources may include natural or urban features. Natural features can include open space; native or ornamental vegetation/landscaping; topographic or geologic features; and natural water sources. Urban features can include structures, or a collection of structures of architectural or historic significance or visual prominence; public plazas, art, or gardens; trees or landscaping protected by the City; consistent design elements along a street or within a district; pedestrian amenities; and landscaped medians or park areas. Scenic resources contribute to the aesthetic character or image of a given area.

Citywide Resources

Landforms and Geology

The City of Los Angeles has several features that contribute to its visual landscape. The Los Angeles Basin is located at the center of the mountain ranges that surround the City and County of Los Angeles. Approximately 214 of the 478 square miles within the City are comprised of hills and mountains and include portions of several mountain ranges: Santa Monica Mountains, Santa Susana Mountains, Verdugo Mountains, and San Gabriel Mountains. The Santa Monica Mountains are the most visible feature from many areas of the City (City of Los Angeles 2001).

The western boundary of the City is the coastline, characterized by sandy beaches, rocky cliffs, and open space. Another prominent feature, the Los Angeles River, bisects the northern portion of the City from the central portion; however, much of the river is channelized and concrete-lined and is not considered a scenic resource.

Open Space and Parks

The City of Los Angeles Department of Recreation and Parks (DRP) owns and operates parks and recreational facilities throughout the City. Within the City of Los Angeles there are several hundred small and large public recreational sites, including over 444 park sites (DRP 2018). The City's open spaces include the San Gabriel Mountain Range, beaches, an intricate network of rivers and trails, and 36,000 acres of park and recreation spaces, and the pedestrian paths (City of Los Angeles 2017). The City is also home to Griffith Park, one of the largest urban parks in North America. The DRP also maintains 13 lakes and 92 miles of hiking trails (DRP 2018). For additional information on parks and recreational facilities, refer to Section 4.17, *Parks and Recreation*.

Historical Resources

The City of Los Angeles is full of rich history. As of November 7, 2017, there are 1,150 historic-cultural monuments in the City of Los Angeles, including residences, government buildings, places of worship, natural elements, and parks (City of Los Angeles 2017). The City has also designated 35 Historic Preservation Overlay Zones. For additional information on historical resources, refer to Section 4.4, *Cultural Resources*.

Scenic Highways

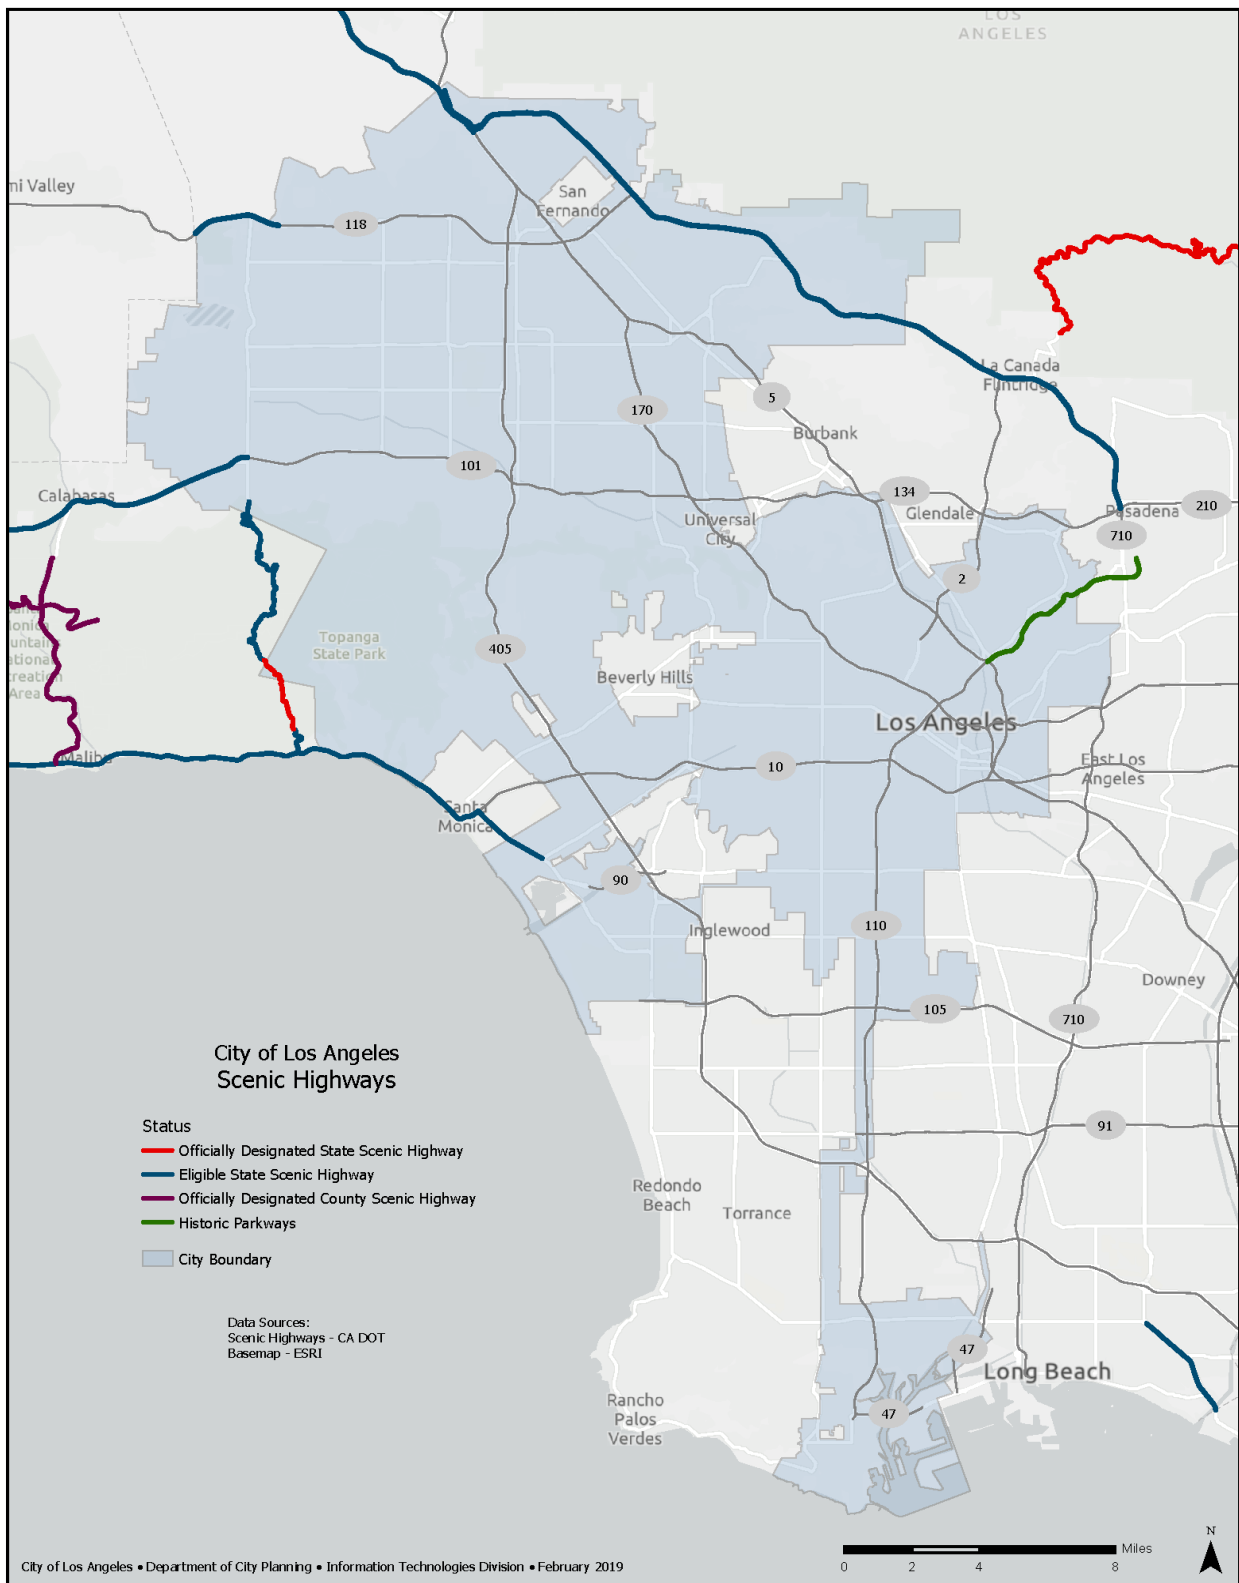

State scenic highways are designated by Caltrans. Although the Mobility Plan 2035 identifies a number of state scenic highways, the official Caltrans list of state scenic highways is available online. The only officially designated state scenic highway that crosses through the City is a small portion of a 3.5-mile segment of Topanga Canyon Boulevard (State Route 27), which was designated a state scenic highway in

2017. State Route 27 is in the western portion of the Palisades Highlands community, approximately 20 miles from the Project Area. Several eligible state scenic highways pass through portions of Los Angeles, including Interstate-5 from Interstate 210 to the northern City limit, U.S. Route 101 from Topanga Canyon Boulevard to the western City limit, State Route 118 from De Soto Avenue to the western City limit, Interstate 210 from Interstate-5 to the eastern City limit, State Route 1 from Venice Boulevard to the City boundary adjacent to Santa Monica, and State Route 1 north of Interstate 10. There are no designated or eligible state scenic highways located in the Specific Plan Area.

In addition to Caltrans designated state scenic highways, the City designates certain corridors within City highways or byways for preservation of their scenic resources, including noteworthy medians, access to notable viewsheds, or dramatic passes. There are approximately 60 designated scenic highways and byways in the Mobility Plan 2035, with one designated highway, the Arroyo Seco Parkway, located in the Plan Area.

The Arroyo Seco Parkway is a National Civil Engineering Landmark, a National Scenic Byway, and one of two California Historic Parkways, as shown in **Figure 4.1-21**, below. Additional information related to the Arroyo Seco Parkway is provided below under the Project Area resources subsection.

Figure 4.1-21 State and County Scenic Highways

Project Area Resources

Landforms and Geology

A majority of the land surface in the Project Area is urbanized and developed with a range of residential, commercial, industrial, cultural, and open space uses, most of which are paved which limits the extent of exposed surface soils. Geologic units in the Los Angeles region include Tertiary sedimentary bedrock formations overlain by older and younger surficial sediments, primarily alluvium and older alluvium consisting of gravel and sand (City of Los Angeles 1996).

Open Space and Parks

The Project Area contains small scattered open space areas. Most are located within the northern portion, just south of the Interstate 5 Freeway in addition to other smaller city parks scattered throughout the Project Area. The following is a more comprehensive list of existing and planned parks in the Project Area, as well as various outdoor green gathering spaces:

- Albion Riverside Park
- River Garden Park
- Radio Hills Garden
- Lacy Street Neighborhood Park
- Ed P. Reyes River Greenway
- Downey Recreation Center
- LA State Historic Park (the Cornfields)

The Los Angeles River and its associated tributaries and flood plains are also considered prominent topographic and open space features in the City. The River generally defines the center of the Project Area. However, as discussed, the portion of the Los Angeles River within the Project Area is channelized, concrete-lined, and generally not used for public recreation. The areas of the river used for recreation zones are located on Broadway and Casanova Street and are only open for limited periods of time during the year for specific activities.

Historical Resources

As discussed in Section 4.4, *Cultural Resources*, the SurveyLA historic resources survey program provides a comprehensive list of all historical resources within this area of Los Angeles based on the findings of the *Cornfield Arroyo Seco Specific Plan Historic Resources Survey*. According to the SurveyLA Report, the Project Area contains several individually eligible historical resources.

Of the approximately 1,600 unique parcels within the CASP survey area, 50 were digitally photographed and entered into the FiGSS database. Each of the surveyed properties was assigned a California Historical Resources status code according to level of significance. Of this number, 23 properties appeared to meet SurveyLA eligibility criteria under one or more themes and were recorded on the appropriate DPR forms. **Table 4.1-2** provides additional examples of historical resources within the Project Area and their respective historical context as provided in the SurveyLA Report (SurveyLA 2011):

TABLE 4.1-2 EXAMPLES OF CORNFIELD ARROYO SECO HISTORICAL RESOURCES	
Context	Historical Resource
Commercial Development (1850-1980)	Multifamily Property (1905) – 227, 229, and 231 Avenue 19
	Industrial Loft (1924- 1954) – 1250 N. Main Street
	Residence/deli (1898-1926) – 510 Avenue 17; 1801 N. Main Street
Public and Private Institutional Development (1850-1980)	Municipal Power Plant (1946– 2000) – 1630 N. Main Street
	Oil Co. Office (1914) – 1727 N. Spring Street
	School (1937) — 322 S. Avenue 18
Entertainment Industry (1928)	Arroyo Theatre (1928) – 3232 N. Figueroa Street

The Project Area contains some of the oldest developed areas of Los Angeles (SurveyLA 2011). This area contains designated resources from the late 19th and early-20th centuries. Most of the Project Area is characterized by residential and commercial use zones in which many historical industrial buildings are distributed throughout, such as the Municipal Power Plant. Also, the Standard Oil Company of California buildings on North Spring Street served as sales department and provided industrial facilities for one of the most powerful corporations in the world. Rockefeller’s Standard Oil of California was one of the “seven sisters” that ran the oil industry during the 20th century and later became Chevron Corporation. Today, the building provides a window to Los Angeles’ past and serve as symbols of the industries that allowed the city to grow.

See Section 4.4, *Cultural Resources*, for a more detailed list of historical resources within the Project Area. To note, there are no Historic Preservation Overlay Zones (HPOZs) in the Project Area

Scenic Highways

No State-designated scenic highways or scenic parkways (or proposed scenic highways or parkways) are located in the Project Area and no state-designated scenic highways provide views of the Project Area (Caltrans 2011). The nearest state-designated historic scenic parkway is the portion of the 110 Freeway bounded by the Interstate 210 freeway to the north and the I-5 Freeway to the south that intersects the Project Area. Views of the Project Area from the Historic Parkway are obstructed by the hills of Elysian Park near Dodger Stadium to the west of the Project Area.

According to the City’s Mobility Plan 2035, City-designated scenic highways should be either: 1) arterial streets or state highways that traverse areas of natural scenic quality in undeveloped or sparsely developed areas of the City; or 2) arterial streets that traverse urban areas of cultural, historical, or aesthetic value which merit protection and enhancement (City of Los Angeles 2016). Scenic highways have special controls for protection and enhancement of scenic resources. Scenic Highway Guidelines (for those designated scenic highways for which there is no adopted scenic corridor plan) are given in Appendix B of the City’s Mobility Plan 2035. The portion of Stadium Road between the I-5 freeway and California SR-110 at the western boundary of the Project Area is the only City-designated scenic highway that the Mobility Element identifies near the Project Area. This road runs along the eastern and southern boundary of Dodger Stadium near Elysian Park, but outside of the Project Area. Views from this road near Dodger Stadium are generally obstructed by adjacent residential development and tree-lined banked hillsides. Views from the road at the closest point to the Project Area are primarily of urban development in the Lincoln Heights subarea to the east and across SR-110 and minimal areas just north of Chinatown.

Landscaped Parkways and Roadway Medians

A majority of the streets in the Project Area are heavily trafficked arterials, and generally do not contain significant landscaping or landscaped medians. The Arroyo Seco Parkway is the only official parkway that travels into or through the Project Area. The Arroyo Seco Parkway (SR-110) runs northeasterly from the four-level interchange with the 101 Freeway just outside of downtown Los Angeles to East Glenarm Street in Pasadena. It is a National Civil Engineering Landmark, a National Scenic Byway, and one of two California Historic Parkways, the other being State Route 163 through Balboa Park in San Diego (Caltrans 2011). Since 2011 the Arroyo Seco Parkway and its associated features have been listed in the National Register of Historic Places as the Arroyo Seco Parkway Historic District. However, only the portion of the Parkway north of the Interstate 5 Freeway is designated as a state scenic and historic parkway. Views from the Arroyo Seco Parkway are primarily of adjacent low- and mid-rise industrial and residential urban development.

Urban Visual Character

While scenic vistas encompass long-range views and often emphasize large-scale natural features, views are also affected by their more immediate visual surroundings. Local aesthetics, typically found on a neighborhood level, also contribute to the urban visual character of the Project Area. Development densities and types, distinctive neighborhoods and commercial districts, recognizable architectural elements, prominent public institutions/landmarks, and other elements all contribute to the City's aesthetic quality.

As previously described, development in the Project Area primarily consists of centrally focused industrial related land with interspersed residential land uses that are scattered with pockets of open space parks and commercial areas. Structures in the Project Area range from low-rise, one- to two-story, to several stories in height situated within the residential Urban Village and Urban Innovation zones along I-5 in the eastern portion of the Project Area.

LIGHT AND GLARE

Citywide

The character of the City is highly diverse and consists of various levels of urbanization. As discussed above, the northern portion of the City encompasses more open spaces and is generally less intensely developed and the central to southern portion of the City is highly urbanized. As such, the intensity of lighting depends on the location within the City and can vary from low intensity of nighttime illumination near suburban and equestrian areas to high intensity in high-density urban areas.

Throughout the City, there are currently more than 210,000 streetlights that provide illumination for City roadways and sidewalk areas. All lighting installed in the City is required to meet National Lighting levels that provide visibility and reduce sky glow and glare (City of Los Angeles 2018). Sources of light throughout the City also include floodlights at sports fields or arenas, residences, airports, electronic billboards, and vehicles traveling on roads and freeways.

Existing conditions information for glare cannot be summarized at the citywide level as conditions depend on site specific conditions and vary widely throughout the City.

Project Area

Light

Given the nature of high-density urban development, most of the Project Area is characterized by moderate to high intensities of nighttime illumination. Nighttime lighting is necessary to provide and maintain safe,

secure, and attractive environments. However, lighting has the potential to produce spillover light and glare and, if designed incorrectly, could be considered unattractive or could be annoying or obtrusive to residents. Light that falls beyond the intended area is referred to as nighttime spillover light or light trespass. Nighttime spillover light can adversely affect light sensitive uses at nighttime, especially residences.

Throughout the Project Area, a high level of ambient nighttime light exists as is characteristic of downtown urban environments. Nighttime artificial lighting sources include street, securing, and wayfinding outdoor lighting; vehicle headlights; illuminated pole signs used for advertisements; interior building illumination; lighted buildings; and lighted graphic signs. These artificial lighting sources result in high ambient nighttime light levels near all areas of the Project Area due to the close proximity of commercial development and night life amenities near residential land uses. Moderate levels of ambient nighttime lighting characterize the Project Area due to the more limited use of exterior lighting in low-rise manufacturing and commercial developments. Streetlights are located throughout the entirety of the Project Area. Existing street lights are on approximately 40-foot-tall street light poles at street intersections and 25- to 30-foot-tall streetlights along sidewalks.

Ambient light levels or illumination is measured in foot-candles (fc). A fc is a unit of measure or the intensity of light falling in one square foot of surface area equal to one lumen per square foot. **Table 4.1-3** describes the foot-candle (fc) range of various types of light.

TABLE 4.1-3 FOOT-CANDLE VALUES OF COMMON LIGHT SOURCES	
Illumination Source	Foot-Candles (LUX/FX)
Full Daylight	1,000
Full Moon	0.1
Office Lighting	70-150
Street Lighting	0.6-1.6
<i>SOURCE: City of Los Angeles, Department of Public Works Bureau of Street Lighting Design Standards and Guidelines, 2007.</i>	

As viewed from surrounding locations, the nighttime lighting environment in the Project Area varies. Bright luminaries and surfaces of the Project Area can be viewed from considerable distance by specific receptors, such as freeways and high-rise structures. Nighttime lighting is lowest in the residential areas of the Project Area near Dodger Stadium, Elysian Park, and the far eastern edges of Lincoln Heights.

Glare

Glare is a common phenomenon in Southern California primarily due to the occurrence of a high number of days per year with direct sunlight and the highly urbanized nature of the region, resulting in a large concentration of reflective surfaces. Daytime glare can result from sunlight reflecting off glass, other structural fixtures of buildings, and windshields of parked and moving vehicles within the roadways in the Project Area. Although a majority of existing structures throughout the Project Area are composed of non-reflective materials, such as concrete, stucco, brick, and plaster, a few buildings that may contain glass on their exterior façade. Nighttime glare can occur from a variety of light sources including street lights and lighting of commercial and residential structures.

SHADE AND SHADOWS

Shading refers to the effect of shadows cast upon adjacent areas. The consequences of shadows upon land uses may be positive, including cooling effects during warm weather, or negative such as the loss of natural light necessary for solar energy purposes or the loss of warming influences during cool weather. Shadows are cast in a clockwise direction from west/northwest to east/northeast from approximately 7:00 a.m. to 3:00 p.m. or later depending on the time of the year: Summer Solstice (June 21), Spring/Fall Equinoxes

(March 20 and September 22), and Winter Solstice (December 21). Generally, the shortest shadows are cast during the Summer Solstice and then grow increasingly longer until the Winter Solstice. During the Winter Solstice, the sun appears lower in the sky and shadows are at their maximum coverage lengths. Shadows cast during the Winter Solstice represent the greatest potential shade and shadow impacts.

Citywide

Shadow effects depend on several factors, including local topography, the height and massing of buildings, and existing uses. However, existing conditions regarding shade and shadows cannot be summarized at the citywide level as they depend on site specific conditions and vary widely throughout the City.

Project Area

Shadow effects depend on several factors, including local topography, the height and massing of buildings, and existing uses. Due to the relatively dense arrangement of existing commercial, industrial, and residential buildings within the developed portions of the Project Area, shadow effects already exist in the Project Area. Shading provided by existing development in the Project Area can restrict access to sunlight but can also provide welcome cooling in an area frequently characterized by high temperatures. Mid-rise buildings cast longer shadows than low-rise buildings. Within the Project Area, taller buildings are generally located in the center near existing industrial land uses, and the effects of shadows cast in this area affecting public spaces where people gather for long periods, such as parks and open spaces, are minimal.

REGULATORY FRAMEWORK

STATE

Senate Bill 743 (SB 743)

On September 2013, Governor Brown signed into law SB 743, which instituted changes to the California Environmental Quality Act (CEQA) when evaluating environmental impacts of projects in areas served by transit. While the focus of SB 743 is to address how transportation impacts are evaluated, it also limits the extent to which aesthetic impacts are evaluated under CEQA. SB 743 (Public Resources Code [PRC] Section 21099 (d)(1)) exempts development projects located in Transit Priority Areas (TPAs), from review of aesthetic impacts under CEQA. Specifically, this bill states that aesthetic impacts of a residential, mixed-use residential, or employment center project on an infill site within a TPA shall not be considered significant impacts on the environment. Therefore, aesthetic impacts within a TPA are considered less than significant in environmental analyses. A TPA is defined as an area within one-half mile of a major transit stop that is existing or planned.

California Department of Transportation (Caltrans) State Scenic Highways

California's Scenic Highway Program was created by the Legislature in 1963. Its purpose is to protect and enhance the natural scenic beauty of California highways and adjacent corridors through special conservation treatment. State laws governing the Scenic Highway Program are found in the Streets and Highways Code, Sections 260 through 263. A highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view. Caltrans defines a State Scenic Highway as any freeway, highway, road, or other public right-of-way that traverses an area of exceptional scenic quality. Eligibility for designation as a State Scenic Highway is based on vividness, intactness, and unity of the roadway. The status of a proposed State Scenic Highway changes from eligible to officially-

designated when the local governing body applies to Caltrans for scenic highway approval, adopts a Corridor Protection Program, and receives notification from Caltrans that the highway has been officially designated a State Scenic Highway. There are no designated state scenic highways in the City of Los Angeles, including the Project Area.

LOCAL

City of Los Angeles General Plan Framework, Conservation Element, and Mobility Plan 2035

The Framework Element planning policies regarding urban form, neighborhood design and the conservation of open space and other scenic resources, described in Section 1.1 of Chapter 1, *Introduction and Community Profile*, are intended to improve community and neighborhood livability in the City of Los Angeles. Framework Element Open Space and Conservation policies seek to conserve resources and use open space to enhance community and neighborhood character in the City.

The Conservation Element (adopted in 2001) includes a discussion of the existing landforms and scenic vistas in the City of Los Angeles. Objectives, policies, and programs included in this element are intended to ensure the protection of natural terrain and landforms, unique site features, scenic highways, and panoramic public views as City staff and decision-makers consider future land use development and infrastructure projects.

The Mobility Plan 2035 (adopted in 2016) provides an inventory of City-designated scenic highways. Scenic highways depicted in the City have special controls for protection and enhancement of scenic resources. The Mobility Plan 2035 includes Scenic Highway Guidelines for those designated scenic highways for which there is no adopted scenic corridor plan.

Objectives, policies, and programs included in the General Plan Framework, Conservation Element and Mobility Plan 2035 are intended to ensure the protection of natural terrain and landforms, unique site features, scenic highways, and panoramic public views as City staff and decision-makers consider future land use development and infrastructure projects. Applicable goals, objectives, and policies of these General Plan elements are shown in **Table 4.1-4**. See Section 4.8, *Land Use and Planning*, for a discussion of land use consistency for the proposed Project.

TABLE 4.1-4 RELEVANT GENERAL PLAN AESTHETICS GOALS, OBJECTIVES, AND POLICIES	
General Plan Framework	
Goal 5A	A livable City for existing and future residents and one that is attractive to future investment. A City of interconnected, diverse neighborhoods that builds on the strengths of those neighborhoods and functions at both the neighborhood and citywide scales.
Objective 5.1	Translate the Framework Element's intent with respect to citywide urban form and neighborhood design to the community and neighborhood levels through locally prepared plans that build on each neighborhood's attributes, emphasize quality of development, and provide or advocate "proactive" implementation programs.
Policy 5.1.1	Use the Community Plan Update process and related efforts to define the character of communities and neighborhoods at a finer grain than the Framework Element permits.
Objective 5.2	Encourage future development in centers and in nodes along corridors that are served by transit and are already functioning as centers for the surrounding neighborhoods, the community or the region.
Policy 5.2.1	Designate centers and districts in locations where activity is already concentrated and/or where good transit service is or will be provided.

TABLE 4.1-4 RELEVANT GENERAL PLAN AESTHETICS GOALS, OBJECTIVES, AND POLICIES	
Policy 5.2.2	<p>Encourage the development of centers, districts, and selected corridor/boulevard nodes such that the land uses, scale, and built form allowed and/or encouraged within these areas allow them to function as centers and support transit use, both in daytime and nighttime. Additionally, develop these areas so that they are compatible with surrounding neighborhoods, as defined generally by the following building characteristics:</p> <ul style="list-style-type: none"> • Buildings in neighborhood districts generally should be low rise (one- to two-stories), compatible with adjacent housing, and incorporate the pedestrian-oriented design elements defined in Policies 5.8.1 and 3.16.1 - 3.16.3. They should also be located along sidewalks with appropriate continuous storefronts. • Buildings in community centers generally should be two to six stories in height, with the first several stories located along the sidewalk. They should also incorporate the pedestrian-oriented elements defined in policy 5.8.1. Either housing or office space may be located above the ground floor storefronts. • The built form of regional centers will vary by location. In areas, such as Wilshire and Hollywood Boulevards, buildings will range from low- to mid-rise buildings, with storefronts situated along pedestrian-oriented streets. Regional centers should contain pedestrian-oriented areas and incorporate the pedestrian-oriented design elements defined in Policies 5.8.1 and 3.16.1 – 3.16.3. • Buildings located at activity nodes along mixed-use boulevards generally shall have the same characteristics as either neighborhood districts or community centers, depending on permitted land use intensities. Housing over ground floor storefronts or in place of commercial development shall be encouraged along mixed-use boulevards.
Objective 5.5	Enhance the livability of all neighborhoods by upgrading the quality of development and improving the quality of the public realm.
Policy 5.5.3	Formulate and adopt building and site design standards and guidelines to raise the quality of design citywide.
Policy 5.5.4	Determine the appropriate urban design elements at the neighborhood level, such as sidewalk width and materials, street lights and trees, bus shelters and benches, and other street furniture.
Policy 5.5.6	Identify building and site design elements for commercial or mixed-use streets in centers that may include: the height above which buildings must step back; the location of the building base horizontal articulation; and other design elements.
Policy 5.5.7	Promote the undergrounding of utilities throughout the City's neighborhoods, districts, and centers.
Objective 5.6	Conserve and reinforce the community character of neighborhoods and commercial districts not designated as growth areas.
Policy 5.6.1	Revise community plan designations as necessary to conserve the existing urban form and community character of areas not designated as centers, districts, or mixed-use boulevards.
Objective 5.7	Provide a transition between conservation neighborhoods and their centers.
Policy 5.7.1	Establish standards for transitions in building height and for on-site landscape buffers.
Objective 5.8	Reinforce or encourage the establishment of a strong pedestrian orientation in designated neighborhood districts, community centers, and pedestrian-oriented subareas within regional centers, so that these districts and centers can serve as a focus of activity for the surrounding community and a focus for investment in the community.
Policy 5.8.1	<p>Buildings in pedestrian-oriented districts and centers should have the following general characteristics:</p> <ul style="list-style-type: none"> • An exterior building wall high enough to define the street, create a sense of enclosure, and typically located along the sidewalk; • A building wall more-or-less continuous along the street frontage; • Ground floor building frontage designed to accommodate commercial uses, community facilities, or display cases; • Shops with entrances directly accessible from the sidewalk and located at frequent intervals; • Well-lit exteriors fronting on the sidewalk that provide safety and comfort commensurate with the intended nighttime use, when appropriate;

TABLE 4.1-4 RELEVANT GENERAL PLAN AESTHETICS GOALS, OBJECTIVES, AND POLICIES	
	<ul style="list-style-type: none"> • Ground floor building walls devoted to display windows or display cases; • Parking located behind the commercial frontage and screened from view and driveways located on side streets where feasible; • Inclusion of bicycle parking areas and facilities to reduce the need for vehicular use; and • The area within 15 feet of the sidewalk may be an arcade that is substantially open to the sidewalk to accommodate outdoor dining or other activities.
Policy 5.8.2	<p>The primary commercial streets within pedestrian-oriented districts and centers should have the following characteristics:</p> <ul style="list-style-type: none"> • Sidewalks: 15-17 feet wide (see illustrative street cross-sections). • Mid-block medians (between intersections): landscaped where feasible. • Shade trees, pruned above business signs, to provide a continuous canopy along the sidewalk and/or palm trees to provide visibility from a distance. • Pedestrian amenities (e.g., benches, pedestrian-scale lighting, special paving, window boxes, and planters).
Policy 5.8.4	Encourage that signage be designed to be integrated with the architectural character of the buildings and convey a visually attractive character.
Conservation Element	
Land Form & Scenic Vista Objective	Protect and reinforce natural and scenic vistas as irreplaceable resources and for the aesthetic enjoyment of present and future generations.
Land Form & Scenic Vista Policy	Continue to encourage and/or require property owners to develop their properties in a manner that will, to the greatest extent practical, retain significant existing land forms (e.g., ridge lines, bluffs, unique geologic features) and unique scenic features (historic, ocean, mountains, unique natural features) and/or make possible public view or other access to unique features or scenic views.
Mobility Plan 2035	
Objective 11	Preserve and enhance access to scenic resources and regional open space.
Policy 11.1	Designate scenic highways and scenic byways which merit special consideration for protection and enhancement of scenic resources.
Policy 11.2	Provide for protection and enhancement of views of scenic resources along or visible from designated scenic highways through implementation of guidelines set forth in this 2035 Mobility Plan.
Policy 11.3	Consider aesthetics and scenic preservation in the design and maintenance of designated scenic highways and of those scenic byways designated in Community Plans.
Policy 11.4	Establish Scenic Corridor Plans, where appropriate, which set forth corridor boundaries and development controls in harmony with each corridor's specific scenic character.
Plan for a Healthy LA	
Policy 2.2	Promote a healthy built environment by encouraging the design and rehabilitation of buildings and sites for healthy living and working conditions, including promoting enhanced pedestrian-oriented circulation, lighting, attractive and open stairs, healthy building materials and universal accessibility using existing tools, practices, and programs.
Policy 3.3	Continue to support the implementation of the Los Angeles River Revitalization Master Plan to create a continuous greenway of interconnected parks and amenities to extend open space and recreational opportunities.
Policy 3.4	Promote opportunities for physical activity for users of all ages and abilities by continuing to improve the quality of existing park and open space facilities and creating recreation programs that reflect the city's rich diversity and local community needs.

OVERLAY PLANS WITHIN THE PROJECT AREA

The following discussion pertains to communities and neighborhoods in the Project Area.

City of Los Angeles Planning and Zoning Code and Building Regulations

LAMC Chapter 1 contains the Planning and Zoning Code, and Chapter 9 contains Building Regulations. The purpose of the Planning and Zoning Code is to designate and regulate the location, use, height and size of buildings. The Planning and Zoning Code regulates the aesthetics and visual quality of development projects. It includes development regulations specific to each zone and also addresses parking, landscaping, land form protection, lighting, and a number of other topics that influence the aesthetics of a development project. The Planning and Zoning Code also includes design regulations that seek to affect the physical alteration of streets, intersections, alleys, pedestrian walkways, and landscaping.

The following LAMC Sections regulate issue areas pertaining to the aesthetics of development in the City of Los Angeles. Those sections from Chapter 1 of the LAMC referenced below will be carried over to Chapter 1A of the LAMC (the New Zoning Code); although the regulations may be modified to meet the structure of the New Zoning Code, they would meet the intent of these existing regulations.

Lighting

Chapter 1, Article 2, Sec. 12.21 A5(k). All lights used to illuminate a parking area shall be designed, located and arranged so as to reflect the light away from any streets and any adjacent premises.

Chapter 1, Article 7, Sec. 17.08C. Plans for street lighting system shall be submitted to and approved by the Bureau of Street Lighting.

Chapter 9, Article 3, Sec. 93.0117. No exterior light source may cause more than two foot-candles (21.5 lux) of lighting intensity or generate direct glare onto exterior glazed windows or glass doors; elevated habitable porch, deck, or balcony; or any ground surface intended for uses such as recreation, barbecue or lawn areas or any other property containing a residential unit or units.

Chapter 9, Article 1, Section 91.6205 (K)4. Signs are prohibited if they contain flashing, mechanical and strobe lights in conflict with the provisions of Section 80.08.4 and 93.6215 of this code.

Chapter 9, Article 1, Section 91.6205M. No sign shall be arranged and illuminated in such a manner as to produce a light intensity of greater than three foot-candles above ambient lighting, as measured at the property line of the nearest residentially zoned property

Land Form Preservation

Chapter 1, Article 7, Section 17.50-E. Establishes slope-density regulations which restrict density on the basis of the calculated average of the ungraded slopes at selected contours within a parcel that is proposed for divisions of land

Chapter 1, Article 2, Section 12.21-A.17. Establishes the hillside overlay zone within which restricted densities and other requirements for neighborhood and environmental compatibility apply.

City of Los Angeles Baseline Hillside Ordinance

The Baseline Hillside Ordinance is part of the City's Planning and Zoning Code and applies to all properties zoned R1, RS, RE (9, 11, 15, 20, and 40), and RA and are designated as Hillside Area in the Department of City Planning Hillside Area Map, as defined in LAMC Section 12.03. It designates and regulates the

setback, height, and size of residential buildings in the Hillside Area. Its purpose is to limit the scale of development within the residential zoned parcels within the hillside.

Los Angeles Administrative Code (LAAC) Cultural Heritage Ordinance (Section 22.171)

The provisions of the Cultural Heritage Ordinance are codified in Division 22, Chapter 9, Article 1 of the LAAC, commencing with Section 22.171. The Ordinance created a Cultural Heritage Commission and criteria for designating Historic-Cultural Monuments (HCM). HCMs, along with all other historically significant resources, are considered scenic resources. The designation of a historic building as an HCM requires that the resource be considered when analyzing the aesthetic impacts of a project and delays demolition by up to a year. See Section 4.4, *Cultural Resources* for a discussion of this Ordinance.

City of Los Angeles Historic Preservation Overlay Zone (HPOZ) Ordinance

In addition to the designation of individual sites as HCMs, the City of Los Angeles also has a separate ordinance and procedure for the designation of historic districts, or HPOZ. This Ordinance, which is found in LAMC Chapter I, Article 2, Section 12.20.3, is intended to recognize, preserve, and enhance buildings, structures, landscaping, natural features, and areas within the City having historic, architectural, cultural, or aesthetic significance in the interest of the health, economic prosperity, cultural enrichment, and general welfare of the people. See Section 4.4, *Cultural Resources* for a discussion of this Ordinance.

City of Los Angeles Tree and Shrub Preservation Ordinance

Protected trees are considered aesthetic resources. The City of Los Angeles adopted an ordinance for the Preservation of Protected Trees (Ordinance No. 177,404; LAMC Chapter IV, Article 6) which became law on April 23, 2006. The ordinance protects the following tree species:

- All native Oak tree species (*Quercus* spp), but excluding the Scrub Oak (*Quercus dumosa*)
- Western Sycamore (*Platanus racemosa*)
- California Bay (*Umbellularia californica*)
- California Black Walnut (*Juglans californica*)

The ordinance applies to trees that are four inches or greater in diameter at 4.5 feet above ground, and on any lot size. Protected tree removal requires a removal permit by the City of Los Angeles Department of Public Works (LADPW). Ordinance-protected trees on private property and streets rights-of-way are protected by the City's Tree Preservation Ordinance; therefore, any act that may cause the failure or death of a protected tree requires inspection by the Los Angeles Department of Public Works (LADPW) Urban Forestry Division. In the event that the LADPW approves a tree removal, replacement of the tree is required with at least two trees of a protected variety.

City of Los Angeles Citywide Design Guidelines

The City of Los Angeles has created Citywide Design Guidelines to carry out the common design objectives that maintain neighborhood form and character for residential, commercial, and industrial uses. The guidelines are intended for developers, architects, and advisory and decision-making bodies when evaluating development projects. Specific design regulations relating to individual communities can be found in the Community Plan Urban Design Chapter of each of the City's 35 Community Plans or special zoning designations, such as Specific Plans, Community Design Overlay Districts, designated historic properties, and historic districts. The Citywide Design Guidelines applies to all areas of the City, but it is particularly applicable to those areas within the City that do not currently have adopted design guidelines. In cases where the Citywide Design Guidelines conflict with a provision in a Community Plan Urban

Design Chapter or a special zoning designation, the Community Plan's specific requirements would prevail. The previous sentence is stated verbatim in each of the three Citywide Design Guidelines (Residential, Commercial, and Industrial) in a section called "Relationship Between the General Plan, Zoning Code, Citywide Guidelines, and Community-Specific Design Guidelines."

Clean Up Green Up Supplemental Use District

In 2016, the City Council approved Ordinance #184246 to establish a Clean Up Green Up Supplemental Use District within Boyle Heights, as well as other areas of the City. The Clean Up Green Up Ordinance establishes "green zones" to reduce cumulative health impacts resulting from incompatible land uses, establish a citywide Conditional Use for asphalt manufacturing and refinery facilities, and increase the notification requirement for projects within a surface mining district. The Clean Up Green Up Ordinance also includes provisions that impact aesthetics such as applicable standards regarding lighting, building heights, and landscaping.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the State CEQA Guidelines, the Proposed Project would have a significant impact related to aesthetics if it would:

- Have a substantial adverse effect on a scenic vista (Threshold 4.1-1)
- Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway (Threshold 4.1-2)
- In a non-urbanized area, substantially degrade the existing visual character quality of public views of the site and its surroundings. (Public views are those that are experienced from publicly accessible vantage point.) If the project is in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality (Threshold 4.1-3)
- Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area (Threshold 4.1-4)

METHODOLOGY

This impact discussion considers impacts from inside and outside the Project Area where the visual resources identified in the existing setting may be affected by the Proposed Project. This impact section analyzes impacts from reasonably anticipated development of the Proposed Project.

As shown in **Figure 4.1-1**, above, the majority of the Project Area is located within Transit Priority Areas (TPAs). TPAs are defined as areas within 0.5-mile of a major transit stop. As discussed previously, under SB 743, residential, mixed-use, and employment center projects in a TPA are exempt from aesthetic impacts analysis. Most development that is reasonably foreseeable in the TPAs of the Proposed Project would be residential, mixed use, or an employment center and would, therefore, as a matter of law, not have aesthetic impacts under CEQA. Aesthetics is provided here for informational purposes only. Notwithstanding the relevant language of SB 743 codified at PRC Section 21099(d), SB 743 does not expressly apply to planning projects. Therefore, to be conservative, this EIR will consider aesthetic impacts from the implementation of the Proposed Project in all of the Project Area, including TPAs and including from development that would qualify for SB 743 exemption.

The evaluation of aesthetic impacts is a subjective exercise, both in identifying valued aesthetic resources and identifying impacts to valued aesthetic resources. Considerations for determining impacts under the various categories of aesthetic resources and impact thresholds are discussed below.

Scenic Vistas/Obstruction of Views

For the purposes of the CEQA analysis, impacts to views typically consist of the loss or obstruction of a valued public view (e.g., scenic vista, particularly a panoramic view of areas that have visual interest, or iconic structure), or changes in the character of the viewshed that detract from a valued public view, such as the elimination or obstruction of natural and/or man-made features that were formerly part of a valued viewshed. The assessment method identifies whether such viewpoints exist within the Project Area and whether the content of the view would be adversely affected by the Project Area diminishment of a scenic vista would occur if the Proposed Project would introduce buildings or development that contrast enough with a visually interesting view, so that the content and quality of the view is permanently affected. The loss of a private view would not be an impact for purposes of this analysis. The City does not protect private views. The loss of private views from development is expected in an urban environment.

Visual Character

The concept of visual character is not explicitly defined in the CEQA Guidelines. In this aesthetics discussion, potential visual character impacts are assessed based on industry-accepted definitions of visual character. Visual character can be defined in terms of the overall impression formed by the relationship between perceived visual elements of the built, urban environment.

Elements contributing to the impression of the character of an area include the following:

- Height and mass of proposed buildings compared to existing development.
- The compatibility between uses and activities with the built environment.
- The quality of the public realm, including roadways, sidewalks, plazas, parks, and street furniture.
- The nature and quality of landscaping that is visible to the general public.
- The relationship between built and unbuilt space, or building “coverage.”; and
- The presence of shade/shadows

Impacts to the visual character of an area generally relate to the removal of features with aesthetic value, the introduction of contrasting urban features into a local area, and the degree to which the elements of the Proposed Project detract from the visual character of an area.

Although the threshold of significance in Appendix G focuses on whether the Proposed Project conflicts with applicable zoning and other regulations governing scenic quality for urbanized areas, as the City is changing the applicable zoning with the Proposed Project, the analysis in this impact assessment will analyze whether the Proposed Project would be expected to degrade the existing visual character or quality of public view of the Project Area and its surrounding area for the Proposed Project.

Light and Glare

Light and glare impacts are typically associated with outdoor artificial light during the evening and nighttime hours. Glare may also be a daytime occurrence caused by the reflection of sunlight or artificial light from highly polished surfaces, such as window glass and reflective building cladding materials, and may interfere with the safe operation of a motor vehicle on adjacent streets. In this aesthetics discussion,

light and glare impacts are assessed qualitatively based on anticipated future development as well as applicable City regulations pertaining to acceptable levels and sources of light and glare.

PROJECT IMPACTS

Threshold 4.1-1	Have a substantial adverse effect on a scenic vista
------------------------	---

Impact 4.1-1 **Proposed Project:** The Proposed Project would allow for greater development density and intensity throughout the Project Area. However, the Project Area is already highly-developed and lacks major identified scenic resources. In addition, future development would not block views of scenic resources from identified public view locations. Impacts to scenic vistas would be *less than significant*.

Project Impact

As identified in the Existing Setting section, the Project Area is generally not an area from which views of scenic vistas are readily available. Scenic vistas in the Project Area include limited views of the San Gabriel Mountains, Elysian Park areas to the west, and the hills surrounding Dodger Stadium. However, these vistas are largely obstructed at the ground level due to the Project Area’s dense urban development, flat topography, lower elevation, and varying building heights. Most views are obstructed by intervening buildings, street bridges, freeway overpasses, and street trees. Due to the close proximity of mid-rise structures and the distance from the nearest mountains (approximately half mile), scenic views of natural resources are generally not available at the ground level.

Publicly accessible panoramic views of the Project Area are available from surrounding areas, including freeways and portions of Griffith Park and Dodger Stadium. These views include intense urban development that characterizes low-rise commercial and industrial structures and mid-rise structures within the industrial center core of the Project Area. As shown in Photo 1 of **Figure 4.1-21**, above, views of the Project Area from Elysian Park are primarily of low to mid-rise industrial buildings. Development further east of this area is obstructed or not visible due to smaller building heights, which would house of majority of the residential zoned land uses.

The Proposed Project would generally retain the same allowable building heights and FAR as the existing Specific Plan (maximum FAR ranging from 3:1 to 5:1). The permitted FAR would continue to allow for the development of low- to mid-rise structures within areas with the Hybrid Industrial general plan land use designation. However, in general, increases in building height would not obstruct public views of scenic resources or vistas because structures would not block existing views along public rights-of-way and views of urban streetscapes would not be substantially altered. Furthermore, the Proposed Project would not alter existing street alignments such that existing views would become blocked. Construction would largely involve infill development in already developed areas and preservation of open space areas and historical structures would be prioritized. Furthermore, each land use designation would contain specific form districts that regulate the permitted height of structures. Consequently, any change to the existing views of scenic vistas from the Project Area due to future development would be incremental since these views are already largely obstructed by existing development. Any changes to existing views of urban streetscapes would also be incremental since most existing streetscape views are limited to close-foreground views and are relatively unaffected by any increased building height.

New structures reasonably expected from the Proposed Project would be visible from publicly accessible vantage points outside of the Project Area, including the Elysian Hills, surrounding freeways, and portions of Griffith Park. However, this development would only add to the existing urban character of Los Angeles. As discussed previously, the only Project Area features that are visible from these vistas are the existing mixed-use structures that may be present within the Project Area; other resources further to the east are not

visible. Therefore, the addition of more structures would not block views of any identified scenic resources but, rather, would contribute to the existing urban skyline that characterizes this particular area of Los Angeles from other areas of the City.

Lastly, the Proposed Project includes standards and regulations consistent with the Framework Element’s policies that are intended to protect scenic vistas. These regulations include District Boundary Transition standards that regulate the upper-story bulk of buildings. Framework Policies 5.5.6, 5.5.7, and 5.7.1 aim to protect scenic vistas by encouraging the use of step-backs in heights for higher floors of buildings, promoting the use of underground utilities, and establishing standards for transitions in heights of buildings. Based on the above and the fact that the Proposed Project will not detrimentally impact any protected scenic vista, the Proposed Project has no conflict with the Conservation and Framework Element.

Overall, although the Proposed Project would result in new structures that have greater heights and density than what currently exists in the Project Area, the new building heights and density would not result in the loss or obstruction of scenic vistas available from public vista points. Impacts to scenic vistas would be *less than significant*.

Mitigation Measures

None required for the Proposed Project.

Threshold 4.1-2	Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway
------------------------	--

Impact 4.1-2 **Proposed Project:** There are no State scenic highways in the Project Area. Therefore, the Proposed Project would have *no impact* on scenic resources within a state scenic highway.

Project Impact

The Palisades Highlands community contains a portion of State Route 27 is the only State designated highway in the City, well outside the Project Area. A portion of the Arroyo Seco Parkway through the northeastern portion of the City is a National Civil Engineering Landmark, a National Scenic Byway, and one of two California Historic Parkways. However, only the portion of the Parkway north of the Interstate 5 Freeway outside of the Project Area is designated as a state scenic and historic parkway. Only the southernmost portion of the parkway enters the Project Area near Dodger Stadium and the 101 freeway/110 freeway interchange, and this portion of the Parkway is not designated as scenic or historic.

From the southern boundary of the Project Area, views from the non-designated portions of the Parkway include intermittent partial views of historic buildings such as Los Angeles City Hall and other high-rise structures to the south, as trees, hills, and vegetation obstruct views to the east and west. Views from the Parkway are primarily of adjacent low- and mid-rise commercial and residential urban development. The Proposed Project largely retain the existing CASP’s maximum FARs, which may see the future development of new structures with heights greater than today. However, this would not substantially degrade the overall views of the area. It is not expected that any impacts to the Parkway would occur from the Proposed Project.

Because there are no state scenic highways in the Project Area, the Proposed Project would have *no impact* to scenic resources within a state scenic highway.

Mitigation Measures

None required for either the Proposed Project.

Threshold 4.1.3	If the project is in a non-urbanized area, would the project substantially degrade the existing visual character quality of public views of the site and its surroundings? If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality, or where it proposes to change the applicable zoning and other regulations governing scenic quality, would it degrade the visual character of the project area and its surrounding area?
------------------------	---

Impact 4.1-3 **Proposed Project:** Reasonably anticipated development from the Proposed Project would alter the visual character of portions of the Project Area, including changes in building height and massing and associated increases in shadows/shading. However, development would be consistent with the goals and policies of the General Plan Framework and changes would likely benefit and generally enhance the visual character of the Project Area. The overall impact to the visual character of the Project Area would be *less than significant*.

Plan Impact

Reasonably anticipated development from the Proposed Project would involve increased building heights and development intensities and would provide a greater mix of uses in the Project Area through updated zoning designations that are intended to foster a greater mix of uses beyond that which already exist within the Project Area, in particular, residential uses. While the proposed zoning designations may allow for a change in the existing visual character, development patterns would be consistent with the 2016-2040 RTP/SCS because the Proposed Project would focus development and improvements around employment centers and transit-served areas. **Figure 4.1-22** shows the general layout of the proposed zoning designations. Changes to visual character within the Project Area would result primarily from increased building densities through the implementation of the Proposed Project. As previously discussed, the Project Area is currently characterized by high-density urban development with a wide range in building heights across the various subareas and districts and a highly industrial environment. Reasonably anticipated development from the Proposed Project, as directed by the proposed zoning changes would increase the height, scale, and density of buildings and other structures in the Project Area. Such changes would represent a change in the visual character of some areas. However, future development would likely benefit and improve the visual character and quality in some of these areas or would simply increase the number of midrise buildings in areas that already contain such structures. New development would be designed with contextual form and frontage regulations, to be compatible with existing visual character. The Proposed Project would also include standards to encourage location of parking underground and require screening or wrapping with active uses, when located above ground which would enhance the visual quality of the Plan Area. Additionally, as discussed in Section 4.4, *Cultural Resources*, it is possible that future development within the Project Area could result in demolition and/or significant alteration to some historical resources that are found within the Project Area. Implementation of the Proposed Project could contribute to the loss of historical resources in the Project Area. In particular, the existing visual character of the Project Area and its adjacent communities is varied in terms of building ages, uses, heights, and massing. While individual buildings may be impacted, future development is not expected to substantially degrade this varied visual character related to historic resources.

Aside from residential uses, future reasonably anticipated development from the Proposed Project elsewhere in the Project Area would be industrial uses and, as a result, would be visually consistent with such adjacent existing uses. Further, more broadly, the Proposed Project would include building design regulations to address factors that influence the visual character in the Plan Area including building

orientation, building scale, height and massing, parking, building façade/frontage, and landscaping. Specifically, form and frontage districts in the Proposed Project would set limits for building height, step-backs, and massing, across the new proposed land use designations to help provide cohesive height and bulk transitions across future structures within the Project Area.

As discussed in Existing Setting, shadow effects already exist in the Plan Area, especially in areas with taller buildings. With implementation of the Proposed Project, new buildings could be built up to 5:1 Floor Area Ratio (FAR). The new buildings could potentially increase shade effects along public spaces, such as public rights-of-way (i.e., sidewalks and roadways) or parks. These shade effects are characteristics that are commonly found in an urban environment. The increased shade effects also can be considered beneficial, particularly during warmer seasons and sunny days, by providing cooling and cover from high heat days. Additionally, shade effects could make an urban environment more pedestrian friendly. Thus, the potential increase in shade and shadows are not expected to substantially degrade the existing visual character or quality of the Project Area. Overall, implementation of the Proposed Project is anticipated to enhance the visual character of the Project Area.

The Proposed Project would largely retain the existing building form regulations and standards of the existing CASP, including a similar Floor Area Ratio (FAR). For example, the Proposed Project would set forth a Base FAR of 1.5 for most properties, with a maximum Bonus FAR ranging from 2.0 to 5.0 depending on the Form District in which the property is located. By comparison, the existing CASP has a Maximum FAR generally ranging from 1.8 to 6.0, which is similar to the Proposed Project. Whereas the existing CASP regulates building heights by establishing both a minimum building height and maximum average building height, the Proposed Project would regulate building intensity through FAR instead, with targeted story limitations for sensitive areas near the Los Angeles River and Arroyo Seco, and upper-story bulk regulations for properties adjacent to existing lower-intensity residential neighborhoods. With the above said, it should be noted that any comparison of existing plan to proposed plan is for informational purposes and not impact analysis as CEQA requires impact analysis to consider existing physical conditions to future plan conditions.

Conclusion

The Proposed Project would not conflict with applicable zoning or other regulations governing visual quality or substantially degrade the existing visual character or of public views of the Project Area or surrounding area and impacts would be *less than significant*.

Mitigation Measures

Mitigation is not required for changes in visual character. See Section 4.4, *Cultural Resources*, for mitigation measures for historical resource impacts.

Threshold 4.1.4	Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area
------------------------	--

Impact 4.1-4 **Proposed Project:** Reasonably anticipated development from the Proposed Project could introduce new sources of light and glare in the Project Area. However, development in a majority of the Project Area already incurs high levels of nighttime lighting and glare, such that any additional effects would be incremental. In addition, future development would comply with applicable regulations regarding permitted lighting and glare. The impact from light and glare would be *less than significant*.

Project Impact

Lighting

A high level of ambient nighttime light is common to urbanized areas within the Project Area due to the high development intensity throughout the Project Area. A majority of the Project Area experiences high levels of ambient nighttime lighting from sources including exterior mounted building lights, vehicle headlights, safety lights, streetlights and streetlamps, illuminated signs, and interior building lights. Nighttime lighting levels are lower in the residential areas at the eastern end of the Project Area near Lincoln Heights.

Reasonably anticipated development from the Proposed Project would result in increased development density, intensity, and building heights throughout a majority of the Project Area. With these increases, it could be reasonably anticipated that illumination from new development (security lighting, parking lot lighting, ornamental lighting, pedestrian scale lights, lighting from ground floor storefronts and signs) would increase illumination. Where reasonably anticipated development would occur as the result of implementation of the Proposed Project, it could be anticipated that lighting would be increased at mid-

block for pedestrian safety, security, and ornamental lighting. In addition, it could be anticipated that future development under the Proposed Project, particularly development projects of substantial scale, would result in the introduction of lighting in areas where currently lighting levels are low or where lighting levels along sidewalks is interrupted by darkened or shadowed areas. However, as a majority of the Project Area under the Proposed Project would be characterized by industrial, commercial, and civic development uses that already incur high ambient levels of nighttime lighting, any additional lighting from new development would be incremental. Residential uses in these areas, which are considered light-sensitive, would be exposed to high nighttime lighting levels, however as these areas currently incur high nighttime lighting from existing surrounding commercial development, light impacts would not substantially increase.

All future Project Area development would be required to adhere to the lighting provisions of the LAMC to reduce potential impacts from light as well as new lighting provisions proposed as part of the Proposed Project. The LAMC contains specific regulations with respect to lighting. LAMC Section 12.21 A.5(k) (amended by Ordinance No. 171,858) that all lights used to illuminate parking areas shall be designed, located and arranged so as to reflect the light away from any street and any adjacent premises. Additionally, any new lighting would be designed to conform to applicable standards including LAMC Sections 93.0117, which pertains to outdoor lighting affecting residential property (no more than two foot-candles of lighting intensity from a light source is allowed on adjacent residential property). In addition, General Plan Framework Policies 5.5.3, 5.5.4, and 5.8.1 call for the formulation of building and site design standards, determination of appropriate urban design elements, and lighting commensurate with intended nighttime use. Adherence to these standards on all new development in the Project Area would reduce lighting impacts to a *less than significant* level.

Glare

Glare is a common phenomenon in the Project Area primarily due to the occurrence of a high number of days per year with direct sunlight and the highly urbanized nature of the region. The majority of existing structures in the Project Area are comprised of non-reflective materials such as concrete, wood, stucco and plaster. However, some structures consist of considerable amounts of reflective floor-to-ceiling glass windows. Reasonably anticipated development from the Proposed Project would be generally consistent with the level of reflective surfaces on existing development and would comply with LAMC Chapter 9, Article 3, Section 93.0117 and Chapter 9, Article 1, Section 91.6205M, for light and glare affecting residential uses. These standards prohibit the use of highly reflective or deeply tinted glass. Adherence to applicable standards on all new development in the Project Area would reduce glare impacts to a *less than significant* level.

Mitigation Measures

None required for either the Proposed Project.

CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable aesthetic impacts includes the entire City of Los Angeles and immediately surrounding areas.

Scenic Vistas

Cumulative impacts to scenic vistas would result if citywide development would block scenic views within the Los Angeles Basin, such as views of the San Gabriel Mountains or the Pacific Ocean or affect scenic resources in or near the city. Some prominent scenic views and vistas in the City include San Gabriel Mountains, San Pedro's coastal bluffs, Griffith Park, and Elysian Park. Scenic vistas that provide panoramic views of the Downtown urban skyline and other urban development outside of the Project Area are provided

from such locations as the Hollywood Hills, adjacent freeways, and Griffith Park. While implementation of the Proposed Project and other citywide development would alter views of the City by allowing new development with building or greater mass and height than what currently exists, such development would not block views of scenic resources from these vistas. Cumulative development generally would not create additive effects to individual view locations since view changes would be location specific and because future development is not expected to directly alter scenic resources such as the mountains or ocean. As such, the incremental effects of the Proposed Project on scenic vistas would not be cumulatively considerable. Cumulative impacts from the Proposed Project to Scenic Vistas would be *less than significant*.

Scenic Resources – Scenic Highways

Future development in Los Angeles would incrementally alter visual conditions citywide, including within the viewsheds of state scenic highways in the City. These include State Route 27 from Pacific Coast Highway (PCH or State Route 1) to Mulholland Drive, Interstate 5 from Interstate 210 to the northern City limit, U.S. Route 101 from Topanga Canyon Boulevard to the western City limit, State Route 118 from De Soto Avenue to the western City limit, Interstate 210 from Interstate 5 to the eastern City limit, State Route 1 from Venice Boulevard to the City boundary adjacent to Santa Monica, and State Route 1 north of Interstate 10. However, it is not anticipated that new development would fundamentally change views from these highways or block views of any identified visual resources. Overall, the Proposed Project would not contribute to any cumulative aesthetic impacts along that parkway or any other scenic highway. As such, the incremental effects of the Proposed Project on scenic resources would not be cumulatively considerable. Cumulative impacts to scenic resources from the Proposed Project would be *less than significant*.

Visual Character

Impacts to visual character are location-specific. Consequently, changes to the visual character of one area of the City would not alter the visual character of other neighborhoods or otherwise have additive effects on the visual character of another neighborhood. As such, although development across the City may collectively alter the visual character of many Los Angeles communities and neighborhoods, cumulative impacts to visual character would not occur. Shade and shadow impacts are also location-specific; therefore, although development across the City may increase shadows in specific locations, shadows would be limited to the immediate area of each new development and development in one community or neighborhood would not add to shadow impacts in another community or neighborhood. Cumulative shadow impacts would not occur.

As discussed under Impact 4.1-3, implementation of the Proposed Project is expected to generally improve the visual character of the Project Area by replacing underutilized and vacant parcels, such as parking lots, with new development that is consistent with Proposed Project standards. This would remove lower-quality visual character features from the Project Area. For the above reasons and because the Proposed Project would ensure that new development meets certain standards that would enhance visual character, the incremental effects of the Proposed Project would not be cumulatively considerable. As such, there would be *no significant cumulative impacts* to visual character of the Project Area and citywide from implementation of the Proposed Project.

Light and Glare

Light and glare levels vary considerably throughout Los Angeles, but light levels are generally consistent with that associated with urban and suburban environments. The incremental increase in light and glare associated with future development throughout the City would not be expected to substantially alter overall citywide light/glare conditions. In addition, impacts related to light and glare are location-specific. Consequently, incremental changes to light or glare conditions that may result from an individual

development project in one area of the City would not alter light or glare conditions in other neighborhoods or otherwise have additive effects to citywide or regional light/glare levels.

A majority of the nearby communities are generally separated by distance, topography, the Los Angeles River, and/or major freeways. Consequently, although implementation of the Proposed Project may incrementally increase lighting levels, light and glare increases on adjacent areas and the city would be limited, due to a variety of barriers to light propagation, including buildings in the Plan Area.

The Project Area is an already urbanized and characterized by high levels of light and glare. Therefore, as discussed under Impact 4.1-4, the addition of new development would not dramatically change overall light or glare conditions in the Project Area. Nearby communities are generally separated from the Project Area by distance and, in some cases, by topography, the Los Angeles River, and/or major freeways and buildings in the Project Area. Consequently, although Project Area wide development may incrementally increase lighting levels, the effects of the Proposed Project on light and glare conditions on the adjacent communities and citywide would be limited, since, as noted above, a variety of barriers to light propagation (including buildings) are present in the area. Further, as discussed above, all future development in the Project Area and throughout the City would continue to adhere to existing and proposed LAMC light and glare standards. Future development in other areas of the City would be required to comply with City lighting standards. Based on the above information, the incremental effects of the Proposed Project on light and glare conditions would not be cumulatively considerable. Cumulative impacts to light and glare would be *less than significant*.

4.2 AIR QUALITY

This section examines the degree to which the Proposed Project may result in significant adverse changes to air quality. Both short-term construction emissions occurring from activities, such as grading and haul truck trips, and long-term effects related to the ongoing operation of individual development projects are discussed in this section. The analysis focuses on air pollution from two perspectives: daily emissions and pollutant concentrations. “Emissions” refer to the actual quantity of pollutant measured in pounds per day (ppd). “Concentrations” refer to the amount of pollutant material per volumetric unit of air and are measured in parts per million (ppm), parts per billion (ppb), or micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).

The potential for the Proposed Project to conflict with or obstruct implementation of the applicable air quality plan, to violate an air quality standard or contribute substantially to an existing or projected air quality violation, to result in a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment, or to expose sensitive receptors to substantial pollutant concentrations are also discussed. Air quality data utilized in the preparation of this section is included as Appendix E to this Draft Environmental Impact Report (EIR).

ENVIRONMENTAL SETTING

AIR POLLUTANTS

Los Angeles is located in the South Coast Air Basin (SCAB), named so because its geographical formation is that of a basin, with the surrounding mountains trapping the air and its pollutants in the valleys below. The SCAB includes all of Orange County and the non-desert portions of Los Angeles, San Bernardino, and Riverside Counties. The regional climate within the SCAB is considered to be semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity. The air quality in the SCAB is primarily influenced by a wide range of emissions sources – such as dense population centers, heavy vehicular traffic, and industry – and weather.

The general region lies in the semi-permanent high-pressure zone of the eastern Pacific Ocean, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The SCAB experiences warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The SCAB is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the west and high mountains around the rest of its perimeter.

The SCAB basin experiences a persistent temperature inversion (increasing temperature with increasing altitude) as a result of the Pacific high. This inversion limits the vertical dispersion of air contaminants, holding them relatively near the ground. As the sun warms the ground and the lower air layer, the temperature of the lower air layer approaches the temperature of the base of the inversion (upper) layer until the inversion layer finally breaks, allowing vertical mixing with the lower layer. This phenomenon is observed in mid to late afternoons on hot summer days. Winter inversions frequently break by midmorning.

The combination of stagnant wind conditions and low inversions produces the greatest pollutant concentrations. On days of no inversion or high wind speeds, ambient air pollutant concentrations are lowest. During periods of low inversions and low wind speeds, air pollutants generated in urbanized areas are transported predominantly onshore into Riverside and San Bernardino counties. In the winter, the greatest pollution problem is the accumulation of carbon monoxide (CO) and nitrogen oxides (NO_x) due to

low inversions and air stagnation during the night and early morning hours. In the summer, the longer daylight hours and the brighter sunshine combine to cause a reaction between hydrocarbons and NO_x to form photochemical smog.

Air pollutant emissions in the SCAB are generated by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point sources and area sources. Point sources occur at an identified location and are usually associated with manufacturing and industry. Examples of point sources are boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and produce many small emissions. Examples of area sources include residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and consumer products, such as barbecue lighter fluid and hair spray. Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircraft, ships, trains, race cars, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment, such as when fine dust particles are pulled off the ground surface and suspended in the air during high winds.

Both the federal and state governments have established ambient air quality standards for outdoor concentrations of various pollutants in order to protect public health and welfare. These pollutants are referred to as “criteria air pollutants” as a result of the specific standards or criteria that have been adopted for them. Federal and state ambient air quality standards (AAQS) have been set at levels considered safe to protect public health, including the health of “sensitive” populations, such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

Criteria Air Pollutants

The federal Clean Air Act (CAA) requires the United States Environmental Protection Agency (USEPA) to set National Ambient Air Quality Standards (NAAQS) for maximum allowable concentrations of six "criteria" pollutants in outdoor air. The six pollutants are CO, lead (Pb), ground-level ozone (O₃), nitrogen dioxide (NO₂), particulate matter (respirable particulate matter [PM₁₀] and fine particulate matter [PM_{2.5}]), and sulfur dioxide (SO₂). The standards are set at a level that protects public health with an adequate margin of safety for six common air pollutants (also known as "criteria air pollutants"). In addition, toxic air contaminants (TAC) are a concern in the SCAB. The characteristics of each of these pollutants are briefly described below.

Ozone

O₃ is a highly oxidative unstable gas, produced by a photochemical reaction (triggered by sunlight) between NO_x and reactive organic gas (ROG)/volatile organic compounds (VOC)¹. VOC are composed of non-methane hydrocarbons (with some specific exclusions), and NO_x is composed of different chemical combinations of nitrogen and oxygen, mainly nitric oxide and NO₂. NO_x is formed during the combustion of fuels, while VOC are formed during combustion and evaporation of organic solvents. As a highly reactive molecule, O₃ readily combines with many different components of the atmosphere. Consequently, high levels of O₃ tend to exist only while high VOC and NO_x levels are present to sustain the O₃ formation process. Once the precursors have been depleted, O₃ levels rapidly decline. Because these reactions occur on a regional rather than local scale, O₃ is considered a regional pollutant. Groups most sensitive to O₃

¹ CARB defines VOC and ROG similarly as, “any compound of carbon excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate,” with the exception that VOC are compounds that participate in atmospheric photochemical reactions. For the purposes of this analysis, ROG and VOC are considered comparable in terms of mass emissions, and the term VOC is used in this EIR.

include children, the elderly, people with respiratory disorders, and people who exercise strenuously outdoors (USEPA 2022a). Depending on the level of exposure, O₃ can

- cause coughing and sore or scratchy throat;
- make it more difficult to breathe deeply and vigorously and cause pain when taking a deep breath;
- inflame and damage the airways;
- make the lungs more susceptible to infection;
- aggravate lung diseases such as asthma, emphysema, and chronic bronchitis; and/or
- increase the frequency of asthma attacks.

Carbon Monoxide

CO is a colorless, odorless gas produced by the incomplete combustion of carbon-containing fuels, such as gasoline or wood. In urban areas, such as the Project Area, automobile exhaust accounts for the majority of CO emissions. CO concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike O₃, motor vehicles operating at slow speeds are the primary source of CO in the SCAB. The highest ambient CO concentrations are generally found near congested transportation corridors and intersections. Other sources of CO include the incomplete combustion of petroleum fuels at power plants and fuel combustion from wood stoves and fireplaces during the winter. When CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease. People with heart disease have restricted blood flow which results in a lack of oxygen to the heart muscle. These people are especially vulnerable to the effects of CO when exercising or under increased stress when the heart needs more oxygen than usual. In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina (USEPA 2021a).

Nitrogen Dioxide

NO₂, is a nitrogen oxide compound that is produced by the combustion of fossil fuels, such as in internal combustion engines (both gasoline and diesel powered), as well as point sources, especially power plants. Of the seven types of NO_x compounds, NO₂ is the most abundant in the atmosphere. As ambient concentrations of NO₂ are related to traffic density, commuters in heavy traffic areas, such as urban areas like the Project Area, may be exposed to higher concentrations of NO₂ than those indicated by regional monitors. NO₂ is a reactive, oxidizing gas and an acute irritant capable of damaging cell linings in the respiratory tract. Such exposures over short periods can aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), and increase hospital admissions and visits to emergency rooms. Longer exposures to elevated concentrations of NO₂ may contribute to the development of asthma and potentially increase susceptibility to respiratory infections. People with asthma, as well as children and the elderly are generally at greater risk for the health effects of NO₂ (USEPA 2021b). NO₂ absorbs blue light and causes a reddish brown cast to the atmosphere and reduced visibility. It can also contribute to the formation of O₃/smog and acid rain.

Particulate Matter

PM₁₀ and PM_{2.5}, consist of extremely small, suspended particles or droplets 10 microns and 2.5 microns or smaller in diameter, respectively. Some sources of particulate matter, like pollen and windstorms, are naturally occurring. However, in populated areas like the Project Area, most particulate matter is caused by road dust, diesel soot, combustion products, abrasion of tires and brakes, and construction activities. PM₁₀ can cause increased respiratory disease, lung damage, cancer, premature death, reduced visibility, surface soiling. For PM_{2.5}, short-term exposures (up to 24-hours duration) have been associated with respiratory

issues such as acute bronchitis and asthma attacks. In addition, PM_{2.5} can cause premature mortality, increased hospital admissions for heart or lung issues, and restricted activity days. These adverse health effects have been reported primarily in infants, children, and older adults with preexisting heart or lung diseases (California Air Resources Board [CARB] 2022a).

Sulfur Dioxide

SO₂ is included in a group of highly reactive gases known as “oxides of sulfur.” The largest sources of SO₂ emissions are from fossil fuel combustion at power plants (73 percent) and other industrial facilities (20 percent). Smaller sources of SO₂ emissions include industrial processes such as extracting metal from ore and burning fuels with a high sulfur content by locomotives, large ships, and off-road equipment. Short-term exposures to SO₂ can harm the human respiratory system and make breathing difficult. People with asthma, particularly children, are sensitive to these effects of SO₂ (USEPA 2021b).

Lead

Lead is a metal found naturally in the environment, as well as in manufacturing products. The major sources of lead emissions historically have been mobile and industrial. However, due to the USEPA’s regulatory efforts to remove lead from gasoline, atmospheric Pb concentrations have declined substantially over the past several decades. The most dramatic reductions in Pb emissions occurred with the permanent phase-out of leaded gasoline, controls on emissions on emissions of Pb compounds through EPA’s air toxics program, and other national and state regulations. The result was a decrease of airborne Pb concentrations by 98 percent between 1980 and 2005 (USEPA 2022c). As a result of phasing out leaded gasoline, metal processing is currently the primary source of Pb emissions. The highest Pb level in the air is generally found near Pb smelters. Other stationary sources include waste incinerators, utilities, and Pb-acid battery manufacturers. Pb can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems, and cardiovascular system depending on exposure. Pb exposure also affects the oxygen-carrying capacity of the blood. The Pb effects most likely encountered in current populations are neurological in children. Infants and young children are susceptible to Pb exposures, contributing to behavioral problems, learning deficits, and lowered IQ (USEPA 2021c).

Toxic Air Contaminants

TACs are a diverse group of air pollutants that may cause or contribute to an increase in deaths or serious illness, or that may pose a present or potential hazard to human health. TACs include both organic and inorganic chemical substances that may be emitted from a variety of common sources, including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations, and research and teaching facilities. One of the main sources of TACs in California is diesel engine exhaust that contains solid material known as diesel particulate matter (DPM). More than 90 percent of DPM is less than one micron in diameter (about 1/70th the diameter of a human hair) and thus is a subset of PM_{2.5}. Because of their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lungs (CARB 2022b).

TACs commonly associated with gasoline dispensing stations include the organic compounds of benzene, toluene, and xylene. In particular, benzene is a known human carcinogen and can result in short-term acute and long-term chronic health impacts (USEPA 2022d). Between 1990 and 2005, benzene in California’s air was reduced by over 75 percent due to implementation of control technologies, such as vapor recovery systems, and reductions of benzene levels in gasoline (CARB 2005). Today, gasoline dispensing facilities account for a relatively small fraction of total benzene emissions. However, near source exposure resulting from gasoline dispensing facilities, particularly very high throughput retail or wholesale facilities, can result in elevated health risks to nearby sensitive receptors.

TACs are different than criteria pollutants because ambient air quality standards have not been established for TACs. TACs occurring at extremely low levels may still cause health effects and it is typically difficult to identify levels of exposure that do not produce adverse health effects. TAC impacts are described by carcinogenic risk and by chronic (i.e., long duration) and acute (i.e., severe but of short duration) adverse effects on human health.

EXISTING CONDITIONS

Citywide (Regional) Air Quality

Ambient air quality is determined primarily by the type and number of pollutants emitted into the atmosphere, as well as the size, topography, and meteorological conditions of a geographic area. The SCAB has low mixing heights and light winds, which help to accumulate air pollutants. Exhaust emissions from mobile sources generate the majority of VOC, CO, NO_x, and SO_x both in the SCAB generally and specifically the Los Angeles County portion of the SCAB. Area-wide sources generate the most airborne particulates (i.e., PM₁₀ and PM_{2.5}) in both the SCAB and Los Angeles County. Measurements of ambient concentrations of criteria pollutants are used by the USEPA and CARB to assess and classify the air quality of each air basin, county, or, in some cases, a specific urbanized area. The classification is determined by comparing actual monitoring data with national and state standards. If a pollutant concentration in an area is lower than the standard, the area is classified as being in “attainment.” If the pollutant concentration exceeds the standard, the area is classified as a “non-attainment” area. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated “unclassified.”

The USEPA and CARB use different standards for determining whether the SCAB is in attainment. Under the California Clean Air Act (CCAA) the State has developed the California ambient air quality standards (CAAQS), which are generally more stringent than the NAAQS. In addition to the federal criteria pollutants, the CAAQS also specify standards for visibility-reducing particles, sulfates, hydrogen sulfide, and vinyl chloride. Federal and State standards are summarized in **Table 4.2-1**. The attainment status for the Los Angeles County portion of the SCAB with regard to the NAAQS and CAAQS are shown in **Table 4.2-2**.

TABLE 4.2-1 AMBIENT AIR QUALITY STANDARDS			
Air Pollutant	Average Time	State Standard	Federal Standard
Ozone (O ₃)	1-Hour	0.09 ppm	-
	8-Hour	0.07 ppm	0.07 ppm
Carbon Monoxide (CO)	1-Hour	20.0 ppm	35.0 ppm
	8-Hour	9.0 ppm	9.0 ppm
Nitrogen Dioxide (NO ₂)	1-Hour	180 ppb	100 ppb
Sulfur Dioxide (SO ₂)	1-Hour	250 ppb	75 ppb
	24-Hour	40 ppb	140 ppb
Sulfates (SO ₄)	24-Hour	25 µg/m ³	-
Fine Particulate Matter (PM _{2.5})	24-Hour	-	35 µg/m ³
	Annual Arithmetic Mean	12 µg/m ³	12 µg/m ³ (Primary) 15 µg/m ³ (Secondary)
Respirable Particulate Matter (PM ₁₀)	24-Hour	50 µg/m ³	150 µg/m ³

Citywide Sensitive Receptors

There is a strong connection between health risk and the proximity of the source of air pollution. Local jurisdictions have the responsibility for determining land use compatibility for sensitive receptors. A sensitive receptor is a person in the population who is particularly susceptible to health effects due to exposure to an air contaminant. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. CARB has identified the following population groups who are most likely affected by air pollution: children less than 14 years of age, adults over 65 years of age, athletes, and people with cardiovascular and chronic respiratory diseases. Land uses where these population groups are likely to spend a substantial amount of time are considered sensitive receptors. According to the South Coast Air Quality Management District (SCAQMD), sensitive receptors include the following (SCAQMD 2005):

- Schools, playgrounds and childcare centers
- Long-term health care facilities
- Rehabilitation centers
- Convalescent centers
- Hospitals

- Retirement homes
- Residences

Project Area Air Quality

The SCAQMD divides the SCAB into 38 source receptor areas (SRAs), wherein 38 monitoring stations operate to monitor the various concentrations of air pollutants in the region. The Proposed Project includes areas located in SRA 1, which covers a portion of Central Los Angeles County. SCAQMD's Los Angeles-North Main Street air monitoring station collects ambient air quality data for SRA 1. This station monitors emission levels of O₃, NO₂, PM₁₀, and PM_{2.5}. **Table 4.2-3** identifies the federal and State ambient air quality standards for the relevant air pollutants, along with the ambient pollutant concentrations that were measured between 2019 and 2021, the most current data available.

According to air quality data from SCAQMD's Los Angeles-North Main Street monitoring station shown in **Table 4.2-3**, ozone concentrations did exceed the national 1-hour standard once in 2020. In addition, concentrations exceeded the state 1-hour standard for 15 days between 2020 and 2021. Ozone concentrations also exceeded the national and State 8-hour standards for 26 days between 2019 and 2021. PM₁₀ concentrations did not exceed the national 24-hour standard between 2019 and 2021; however, concentrations exceeded the State 24-hour standard for 63 days during the same time period. PM_{2.5} concentrations exceeded the national 24-hour standard for 26 days between 2019 and 2021. Concentrations of NO₂ and CO did not exceed national or State standards between 2019 and 2021. SO₂ is not monitored within the SCAB; therefore, it is not reported in the analysis. SCAQMD also operates and maintains an air monitoring network for TACs. The Multiple Air Toxics Exposure Study (MATES-V) program measured concentrations of 19 key compounds, including both gases and particulates, at 10 fixed sites throughout the Basin (SCAQMD 2021). The monitoring study was accompanied by a computer modeling exercise in which the SCAQMD estimated the risk of cancer from breathing toxic air pollution throughout the region based on emissions and weather data. MATES-V found that the population-weighted average air toxics cancer risk for the SCAB using multiple-pathway factors is 454 in a million. The MATES V risk in the SCAB is estimated to be 55 percent lower than the corresponding risk during the MATES IV period (997 in-a-million for multiple pathway risk). Much of the air toxics cancer risk reduction was due to the 51 percent reduction of diesel particle emissions between 2012 and 2018. Los Angeles County continues to have the highest air toxics cancer risk in the SCAQMD jurisdiction, which includes Orange, Riverside, and San Bernardino counties. Although the single highest grid cell is the one encompassing the Los Angeles International Airport (LAX), there are several grid cells in the ports area that are above 900-in-a-million for air toxics cancer risk (SCAQMD 2021).

TABLE 4.2-3 SUMMARY OF AMBIENT AIR QUALITY IN THE PROJECT AREA			
Air Pollutants Monitored Within SRA 1 (Central Los Angeles Area)	Year		
	2019	2020	2021
Ozone (O₃)			
Maximum 1-hour concentration measured	0.093 ppm	0.185 ppm	0.099 ppm
Number of days exceeding previous National 0.124 ppm 1-hour standard	0	1	0
Number of days exceed State 0.09 ppm 1-hour standard	0	14	1
Maximum 8-hour concentration measured	0.080 ppm	0.118 ppm	0.085 ppm
Number of days exceeding National and State 0.07 ppm 8-hour standard	2	22	2

TABLE 4.2-3 SUMMARY OF AMBIENT AIR QUALITY IN THE PROJECT AREA			
Carbon Monoxide (CO)			
Maximum 1-hour concentration measured	2.0 ppm	2.1 ppm	2.0 ppm
Number of days exceeding State 20 ppm 1-hour standard	0	0	0
Nitrogen Dioxide (NO₂)			
Maximum 1-hour concentration measured	69.7 ppb	61.8 ppb	77.8 ppb
Number of days exceeding State 180 ppb 1-hour standard	0	0	0
Annual Average	18 ppb	18 ppb	18 ppb
Does measured annual average exceed National 100 ppb annual average standard?	No	No	No
Does measured annual average exceed State 30 ppb annual average standard?	No	No	No
Suspended Particulates (PM₁₀)			
Maximum 24-hour concentration measured	93.9 µg/m ³	185.2 µg/m ³	138.5 µg/m ³
Number of days exceeding National 150 µg/m ³ 24-hour standard	0	0	0
Number of days exceed State 50 µg/m ³ 24-hour standard	15	34	14
Annual Arithmetic Mean (AAM)	23 µg/m ³	33.1	26
Does measured AAM exceed National 150 µg/m ³ AAM standard?	No	No	No
Does measured AAM exceed State 20 µg/m ³ AAM standard?	Yes	Yes	Yes
Fine Particulates (PM_{2.5})			
Maximum 24-hour concentration measured	43.5 µg/m ³	175.0 µg/m ³	61.0 µg/m ³
Number of days exceeding National 35.0 µg/m ³ 24-hour standard	1	12	13
Annual Arithmetic Mean (AAM)	10.8 µg/m ³	15 µg/m ³	14.8 µg/m ³
Does measured AAM exceed National 15 µg/m ³ AAM standard?	Yes	No	No
Does measured AAM exceed State 12 µg/m ³ AAM standard?	Yes	Yes	Yes

CASP Sensitive Receptors

The Project Area currently contains a mix of industrial, commercial, residential, and institutional uses. Residential uses are presently found throughout the Project Area, often adjacent to non-residential uses, including the 415-unit William Mead Housing in the southwest portion of the Project Area; single-family, duplex, and multi-family dwellings between Albion Park and Interstate 5 in the southeast portion of the Project Area; and multi-family residential buildings near the Metro L Line Lincoln/Cypress Station. Additional sensitive receptors within the Project Area include kindergarten through 12th grade schools, such as Albion Elementary School, and Alliance Susan & Eric Smidt Technology High School. These areas are described in detail in Section 4.10, *Land Use and Planning*, and illustrated on **Figure 4.10-1**. As described in Section 4.13, *Public Services*, there are also four LAUSD schools and 14 parks and recreational facilities in the Project Area.

REGULATORY FRAMEWORK

Federal, State, and Local land use and planning laws, Regulations, and adopted plans applicable to the Proposed Project are summarized below.

FEDERAL

Federal Clean Air Act

The Federal Clean Air Act (CAA) was enacted in 1970 and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990.² The CAA is the comprehensive federal law that regulates air emissions in order to protect public health and welfare.³ The USEPA is responsible for the implementation and enforcement of the CAA, which establishes federal National Ambient Air Quality Standards (NAAQS), specifies future dates for achieving compliance, and requires the USEPA to designate areas as attainment, nonattainment, or maintenance. The CAA also mandates that each state submit and implement a State Implementation Plan (SIP) for each criteria pollutant for which the state has not achieved the applicable NAAQS. The SIP includes pollution control measures that demonstrate how the standards for those pollutants will be met. The sections of the CAA most applicable to land use development projects include Title I (Nonattainment Provisions) and Title II (Mobile Source Provisions).⁴

Title I requirements are implemented for the purpose of attaining NAAQS for criteria air pollutants. **Table 4.2-5**, South Coast Air Basin Attainment Status, shows the NAAQS currently in effect for each criteria pollutant. The Air Basin fails to meet national standards for O₃ and PM_{2.5} and, therefore, is considered a federal “non-attainment” area for these pollutants.

Title II pertains to mobile sources, which includes on-road vehicles (e.g. cars, buses, motorcycles) and non-road vehicles (e.g. aircraft, trains, construction equipment). Reformulated gasoline and automobile pollution control devices are examples of the mechanisms the USEPA uses to regulate mobile air emission sources. The provisions of Title II have resulted in tailpipe emission standards for vehicles, which have been strengthened in recent years to improve air quality. For example, the standards for NO_X emissions have been lowered substantially and the specification requirements for cleaner burning gasoline are more stringent.

The NAAQS, and the CAAQS for the California criteria air pollutants (discussed below), have been set at levels considered safe to protect public health, including the health of sensitive populations and to protect public welfare.

TABLE 4.2-4 SOUTH COAST AIR BASIN ATTAINMENT STATUS

Pollutant	Averaging Period	Federal Standard ^{a,b}	California Standard ^{a,b}	South Coast Air Basin Attainment Status ^c	
				Federal Standard ^d	California Standard ^d
Ozone (O ₃)	1-hour	—	0.09 ppm (180 µg/m ³)	—	Non-Attainment
	8-hour	0.070 ppm (137 µg/m ³)	0.07 ppm (137 µg/m ³)	Non-Attainment (Extreme)	Non-Attainment
Respirable Particulate Matter (PM ₁₀)	24-hour	150 µg/m ³	50 µg/m ³	Attainment	Non-Attainment
	Annual	—	20 µg/m ³		
Fine Particulate Matter (PM _{2.5})	24-hour	35 µg/m ³	—	Non-Attainment (Serious)	Non-Attainment
	Annual	12 µg/m ³	12 µg/m ³		
Carbon Monoxide (CO)	1-hour	35 ppm (40 mg/m ³)	20 ppm (23 mg/m ³)	Attainment	Attainment
	8-hour	9 ppm (10 mg/m ³)	9.0 ppm (10 mg/m ³)		
Nitrogen Dioxide (NO ₂)	1-hour	0.10 ppm (188 µg/m ³)	0.18 ppm (339 µg/m ³)	Attainment	Attainment
	Annual	0.053 ppm (100 µg/m ³)	0.030 ppm (57 µg/m ³)		
Sulfur Dioxide (SO ₂)	1-hour	0.075 ppm (196 µg/m ³)	0.25 ppm (655 µg/m ³)	Unclassified/ Attainment	Attainment
	3-hour	0.5 ppm (1,300 µg/m ³)	—		
	24-hour	—	0.04 ppm (105 µg/m ³)		
	Annual	—	—		
Lead (Pb)	30-day average	—	1.5 µg/m ³	Partial Non- Attainment	Attainment
	Rolling 3-month average	0.15 µg/m ³	—		
Sulfates	24-hour	—	25 µg/m ³	—	Attainment
Hydrogen Sulfide (H ₂ S)	1-hour	—	0.03 ppm (42 µg/m ³)	—	Unclassified

ppm = parts per million by volume
 µg/m³ = micrograms per cubic meter

^a An ambient air quality standard is a concentration level expressed in either parts per million or micrograms per cubic meter and averaged over a specific time period (e.g., 1 hour). The different averaging times and concentrations are meant to protect against different exposure effects. Some ambient air quality standards are expressed as a concentration that is not to be exceeded. Others are expressed as a concentration that is not to be equaled or exceeded.

^b Ambient Air Quality Standards based on the 2022 AQMP (Air Quality Management Plan).

^c "Attainment" means that the regulatory agency has determined based on established criteria, that the Air Basin meets the identified standard. "Non-attainment" means that the regulatory agency has determined that the Air Basin does not meet the standard. "Unclassified" means there is insufficient data to designate an area, or designations have yet to be made.

^d California and Federal standard attainment status based on SCAQMD's 2016 AQMP and 2018 updates from CARB.

<https://ww2.arb.ca.gov/resources/documents/maps-state-and-federal-area-designations>. ^e An attainment re-designation request is pending.

STATE

California Clean Air Act

The California Clean Air Act (CCAA), signed into law in 1988, requires all areas of the State to achieve and maintain the CAAQS by the earliest practicable date. The California Air Resources Board (CARB), as part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both federal and State air pollution control programs within California. In this capacity, CARB conducts research, sets the CAAQS, compiles emission inventories, develops suggested control measures, provides oversight of local programs, and prepares the SIP. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hair spray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

California Code of Regulations

The California Code of Regulations (CCR) is the official compilation and publication of regulations adopted, amended or repealed by state agencies pursuant to the Administrative Procedure Act. The CCR includes regulations that pertain to air quality emissions. Specifically, Section 2485 in Title 13 of the CCR states that the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to five minutes at any location. In addition, Section 93115 in Title 17 of the CCR states that operations of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emissions standards.

State Programs for Toxic Air Contaminants

The California Air Toxics Program is an established two-step process of risk identification and risk management to address potential health effects from exposure to toxic substances in the air. In the risk identification step, CARB and OEHHA determine if a substance should be formally identified, or “listed,” as a TAC in California. In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce risk. Based on results of that review, CARB has promulgated a number of Airborne Toxic Control Measures (ATCMs), both for stationary and mobile sources, including On-Road and Off-Road Vehicle Rules. These ATCMs include measures such as limits on heavy-duty diesel motor vehicle idling and emission standards for off-road diesel construction equipment in order to reduce public exposure to DPM and other TACs. These actions are also supplemented by the AB 2588 Air Toxics “Hot Spots” program and SB 1731, which require facilities to report their air toxics emissions, assess health risks, notify nearby residents and workers of significant risks if present, and reduce their risk through implementation of a risk management plan. SCAQMD has further adopted two rules to limit cancer and non-cancer health risks from facilities located within its jurisdiction. Rule 1401 (New Source Review of Toxic Air Contaminants) regulates new or modified facilities, and Rule 1402 (Control of Toxic Air Contaminants from Existing Sources) regulates facilities that are already operating. Rule 1402 incorporates requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities.

Diesel Risk Reduction Program

CARB identified particulate emissions from diesel-fueled engines as TACs in August 1998. Following the identification process, the ARB was required by law to determine if there is a need for further control, which moved us into the risk management phase of the program. CARB developed the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and the Vehicles and the Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines. The Diesel Advisory Committee approved these documents on September 28, 2000, paving the way for the next step in the

regulatory process: the control measure phase. During the control measure phase, specific statewide regulations designed to further reduce DPM emissions from diesel-fueled engines and vehicles have and continue to be evaluated and developed. The goal of each regulation is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce DPM emissions.

REGIONAL

Southern California Association of Governments

SCAG is a council of governments for Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties. As a regional planning agency SCAG serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. Although SCAG is not an air quality management agency, it is responsible for developing transportation, land use, and energy conservation measures that improve air quality. The 2022 Air Quality Management Plan (AQMP) incorporates the population growth projections contained within SCAG's 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), or Connect SoCal. The 2020 RTP/SCS was developed through a four-year planning process to update population, housing and employment data as well as transportation strategies for the region through the horizon year of 2045 (SCAG 2020). The 2020 RTP/SCS is discussed in greater detail in Section 4.7, Greenhouse Gases.

South Coast Air Quality Management District

The SCAQMD is the agency principally responsible for comprehensive air pollution control in the SCAB. To that end, the SCAQMD, a regional agency, works directly with the Southern California Association of Governments (SCAG), county transportation commissions, and local governments, and cooperates actively with all State and federal government agencies. The SCAQMD develops rules and regulations, establishes permitting requirements, inspects emissions sources, monitors air quality, and provides regulatory enforcement through such measures as educational programs, monitors or fines, when necessary. The SCAQMD is responsible for developing programs to reduce emissions from stationary, mobile, and indirect sources to meet national and state AAQS. It has responded to this requirement by preparing a series of AQMP.

Air Quality Management Plan and RTP/SCS

To meet the NAAQS and CAAQS, the SCAQMD has adopted a series of air quality management plans (AQMPs), which serve as a regional blueprint to develop and implement an emission reduction strategy that will bring the area into attainment with the standards in a timely manner. The most significant air quality challenge in the Air Basin is to reduce NO_x emissions sufficiently to meet the 2037 ozone standard deadline for the non-Coachella Valley portion of the South Coast Air Basin, as NO_x plays a critical role in the creation of ozone. The 2022 AQMP includes strategies to ensure the SCAQMD does its part to further the Air District's ability to meet the 2015 federal ozone standards. The district would need to reduce emissions of NO_x by 67 percent beyond what is required by the adopted rules and regulations in 2037 to meet the 2015 federal ozone standard (SCAQMD 2022). The 2022 AQMP builds on the measures already in place from the previous AQMPs and includes a variety of additional strategies such as regulation, accelerated deployment of available cleaner technology, best management practices, co-benefits from existing programs, incentives, and other CAA measures to meet the 8-hour ozone standard. Since NO_x emissions also lead to the formation of PM_{2.5}, the NO_x reductions needed to meet the ozone standards will likewise lead to improvement of PM_{2.5} levels and attainment of annual PM_{2.5} standards (SCAQMD 2017).⁵

⁵ Estimates are based on the inventory and modeling results and are relative to the baseline emission levels for each attainment year (see Final 2016 AQMP for detailed discussion).

The SCAQMD's strategy to meet the NAAQS and CAAQS distributes the responsibility for emission reductions across federal, State, and local levels and industries. The majority of these emissions are from heavy-duty trucks, ships, and other State and federally regulated mobile source emissions that are beyond SCAQMD's control. The 2022 AQMP is composed of stationary and mobile source emission reductions from traditional regulatory control measures, incentive-based programs, co-benefits from climate programs, mobile source strategies, and reductions from federal sources, which include aircraft, locomotives, and ocean-going vessels. These strategies are to be implemented in partnership with the CARB and USEPA. The district will not meet the standard without significant federal action. In addition to federal action, the 2022 AQMP relies on substantial future development of advanced technologies to meet the standards, including the transition to zero and low emission technologies. Of the needed NO_x emissions reductions, 46 percent will come from federal actions, 34 percent from CARB actions, and 20 percent will come directly from SCAQMD actions (SCAQMD 2022).

The AQMP also incorporates the transportation strategy and transportation control measures from SCAG's 2020-2045 RTP/SCS Plan (Connect SoCal) (SCAG 2020). SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial counties, and addresses regional issues relating to transportation, the economy, community development, and the environment. SCAG coordinates with various air quality and transportation stakeholders in southern California to ensure compliance with the federal and State air quality requirements. Pursuant to California Health and Safety Code Section 40460, SCAG has the responsibility of preparing and approving the portions of the AQMP relating to the regional demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies. SCAG is required by law to ensure that transportation activities "conform" to, and are supportive of, the goals of regional and State air quality plans to attain the NAAQS. Connect SoCal includes transportation programs, measures, and strategies generally designed to reduce vehicle miles traveled (VMT), which are contained in the AQMP. The SCAQMD combines its portion of the AQMP with those prepared by SCAG (SCAQMD 2022). Connect SoCal and Transportation Control Measures, included as Appendix IV-C of the 2022 AQMP, are based on SCAG's Connect SoCal.

The 2022 AQMP forecasts the 2037 emissions inventories "with growth" based on SCAG's Connect SoCal. The region is projected to see a 12 percent growth in population, 17 percent growth in housing units, 11 percent growth in employment, and 5 percent growth in VMT between 2018 and 2037. Despite regional growth in the past, air quality has improved substantially over the years, primarily due to the effects of air quality control programs at the local, State, and federal levels (SCAQMD 2022).

SCAQMD Air Quality Guidance Documents. The SCAQMD published the CEQA Air Quality Handbook (approved by the AQMD Governing Board in 1993) to provide local governments with guidance for analyzing and mitigating project-specific air quality impacts. The CEQA Air Quality Handbook provides standards, methodologies, and procedures for conducting air quality analyses. However, the SCAQMD is currently in the process of replacing the CEQA Air Quality Handbook with the Air Quality Analysis Guidance Handbook. While this process is underway, the SCAQMD has provided supplemental guidance on the SCAQMD website.

The SCAQMD has also adopted land use planning guidelines in its *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*, which considers impacts to sensitive receptors from facilities that emit TAC emissions. SCAQMD's siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for sensitive land uses proposed in proximity to freeways and high-traffic roads, and the same siting criteria for distribution centers and dry cleaning facilities). The SCAQMD's document introduces land use-related policies that rely on design and distance parameters to minimize emissions and lower potential health risk. SCAQMDs guidelines are voluntary initiatives recommended for consideration by local planning agencies.

The SCAQMD has published a guidance document called the *Final Localized Significance Threshold Methodology* for CEQA evaluations that is intended to provide guidance when evaluating the localized effects from mass emissions during construction or operation of a project. The SCAQMD adopted additional guidance regarding PM_{2.5} emissions in a document called *Final Methodology to Calculate Particulate Matter (PM)_{2.5} and PM_{2.5} Significance Thresholds*. The latter document has been incorporated by the SCAQMD into its CEQA significance thresholds and *Final Localized Significance Threshold Methodology*.

The SCAQMD has also developed programs to attain and maintain the NAAQS and CAAQS. These include air quality rules and regulations for stationary sources, area sources, point sources, and certain mobile source emissions. The SCAQMD is also responsible for establishing stationary source permitting requirements and for ensuring that new, modified, or relocated stationary sources do not create net emission increases. All projects within SCAQMD jurisdiction are subject to SCAQMD rules and regulations, including, but not limited to the following:

- **Rule 401 Visible Emissions** – This rule prohibits an air discharge that results in a plume that is as dark as or darker than what is designated as No. 1 Ringelmann Chart by the United States Bureau of Mines or of such opacity as to obscure an observer’s view for an aggregate of three minutes in any one hour.
- **Rule 402 Nuisance** – This rule prohibits the discharge of “such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of people or the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.”
- **Rule 403 Fugitive Dust** – This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM₁₀ emissions to less than 50 micrograms per cubic meter (µg/m³) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Mitigation measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the USEPA.
- **Rule 1113 Architectural Coatings** – This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories. This rule limits VOCs in architectural coatings used in the SCAQMD jurisdiction. These limits are application-specific and are updated as availability of low-VOC products expands.
- **Rule 1138 – Control of Emissions from Restaurant Operations** - This rule specifies PM and VOC emissions and odor control requirements for commercial cooking operations that use chain-driven charbroilers to cook meat.
- **Rule 1146.2 – Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters** - This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NO_x emissions from natural gas-fired water heaters, boilers, and process heaters as defined in this rule.
- **Rule 1168 Adhesive and Sealant Applications** – This rule reduces emissions of VOCs and eliminates emissions of chloroform, ethylene dichloride, methylene chloride, perchlorethylene, and trichloroethylene from the application of adhesives, adhesive bonding primers, adhesive primers, sealants, sealant primers, or any other primers.

- **Rule 1186 – PM10 Emissions from Paved and Unpaved Roads, and Livestock Operations -** This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM10 emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).**Regulation XIII New Source Review –** This regulation contains Rules 1300 through 1325, which set forth pre-construction review requirements for new, modified, or relocated facilities, to ensure that the operation of such facilities does not interfere with progress in attainment of the NAAQS, and that future growth within SCAQMD is not unnecessarily restricted. The specific air quality goal of this regulation is to achieve no net increases from new or modified permitted sources of nonattainment air contaminants or their precursors.
- **Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities -**This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.
- **Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines -** This rule applies to stationary compression ignition (CI) engines greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.
- **Rule 2305 Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program -** The WAIRE Program has compliance and reporting requirements for warehouse owners and operators to reduce nitrogen oxide and diesel emissions from the goods movement industry, help meet federal air quality standards and improve public health. It applies to warehouses that have at least 100,000 square feet of indoor floor space in single building. WAIRE was adopted May 7, 2021 by the South Coast Air Quality Management District. Under WAIRE, owners are required to submit information about their buildings and tenants. Warehouse operators are required to earn a specific number of points every year through a menu-based point system, based on the number of truck trips made to and from the warehouse. Mitigation fees may be paid as an option. The compliance program is being phased in based on the size of a warehouse, starting in 2022 with warehouses that are larger than 250,000 square feet; 2023 for warehouses between 150,000 square feet and 250,000 square feet; and 2024 for warehouses between 100,000 square feet and 150,000 square feet.

LOCAL

City of Los Angeles General Plan Air Quality Element

The *Air Quality Element of the City of Los Angeles General Plan* (City Air Quality Element), adopted on November 24, 1992, sets forth the goals, objectives and policies that guide the City in the implementation of its air quality improvement programs and strategies. The City Air Quality Element acknowledges that numerous efforts are underway at the regional, county and city levels addressing clean air concerns and that coordination of these various efforts and the involvement of the area’s residents are crucial to the achievement of state and federal AAQS.

The City’s Air Quality Element acknowledges the interrelationships among transportation and land use planning in meeting the City’s mobility and clean air goals. Mutually reinforcing strategies need to be developed which work to reduce the use of single occupant vehicles and which work to reduce vehicle trips and vehicle miles traveled (VMT).

The City Air Quality Element establishes six goals:

- Good air quality in an environment of continued population growth and healthy economic structure;
- Less reliance on single-occupant vehicles with fewer commute and non-work trips;
- Efficient management of transportation facilities and system infrastructure using cost-effective system management and innovative demand-management techniques;
- Minimize impacts of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation and air quality;
- Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels and the implementation of conservation measures including passive measures such as site orientation and tree planting; and
- Citizen awareness of the linkages between personal behavior and air pollution and participation in efforts to reduce air pollution.

The City is also responsible for the implementation of transportation control measures as outlined in the AQMP. Through capital improvement programs, the City can fund infrastructure that contributes to improved air quality by requiring such improvements as bus turnouts as appropriate, installation of energy-efficient streetlights, and synchronization of traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation measures.

Plan for a Healthy Los Angeles

The *Plan for a Healthy Los Angeles*, adopted by the City Council on March 31, 2015, lays the foundation to create healthier communities for all residents in the City. As an element of the General Plan, it provides high-level policy vision, along with measurable objectives and implementation programs, to elevate health as a priority for the City's future growth and development. With a focus on public health and safety, the *Plan for a Healthy Los Angeles* provides a roadmap for addressing the most basic and essential quality-of-life issues: safe neighborhoods, a clean environment (i.e., improved ambient and indoor air quality), the opportunity to thrive, and access to health services, affordable housing, and healthy and sustainably produced food.

Safety Element

The updated Safety Element, adopted by the City Council on November 24, 2021, includes an objective and policies to address climate change, including air quality.

TABLE 4.2-5 CITY OF LOS ANGELES SAFETY ELEMENT	
Objective 1.2	Confront the global climate emergency by setting measurable targets for carbon reduction that are consistent with the best available methods and data, center equity and environmental justice, secure fossil free jobs, and foster broader environmental sustainability and resiliency.
Policy 1.2.1	Environmental Justice. In keeping with the Plan for a Healthy LA, build a fair, just and prosperous city where everyone experiences the benefits of a sustainable future by correcting the long running disproportionate impact of environmental burdens faced by low income families and communities of color.
Policy 1.2.2	Renewable Energy. Aggressively pursue renewable energy sources, transitioning away from fossil based sources of energy and toward 100% renewable energy sources.
Policy 1.2.6	Mobility. In keeping with the Mobility Plan, build a comprehensive and integrated transportation network that changes how Angelenos get around and reduces car dependency.
Policy 1.2.7	Zero Emissions Vehicles. In keeping with the Mobility Plan, work toward zero emissions transportation and goods movement and increases zero emissions infrastructure including charging.
Policy 1.2.8	Industrial Emissions and Air Quality Monitoring. In keeping with the Air Quality Element, ensure that every Angeleno can breathe clean, healthy air by addressing air pollution from all sources, with a particular emphasis on prioritizing the health and wellbeing of overburdened families and delivering environmental justice.
Policy 1.2.11	Urban Ecosystem and Resilience. In keeping with the Conservation and Open Space Elements, create a more temperate biodiverse city with more green space for people and habitat.
Policy 1.2.13	Lead by Example. Leverage government owned properties and publicly-driven investments to realize broader climate change goals.

Los Angeles Green Plan

The City has begun to address the issue of global climate change by publishing *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming* (LA Green Plan). This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities. According to the LA Green Plan, the City is committed to the goal of reducing emissions of CO₂ to 35 percent below 1990 levels. To achieve this, the City will:

- Increase the generation of renewable energy;
- Improve energy conservation and efficiency; and
- Change transportation and land use patterns to reduce dependence on automobiles.

The LA Green Plan is discussed in greater detail in Section 4.7, *Greenhouse Gases*

City of Los Angeles Green Building Code

In December 2010, the Los Angeles City Council adopted various provisions of the CalGreen Code as part of Ordinance No. 181,480, thus codifying certain provisions of the CalGreen Code as the new Los Angeles Green Building Code (LA Green Building Code). As a result of continuing updates to the CalGreen Code, the City adopted the City of Los Angeles has adopted the 2019 California Green Building Standards Code, with amendments. The adoption is noted in Ordinance 186488, January 22, 2021. The LA Green Building Code applies to the construction of every new building, every new building alteration with a permit valuation of over \$200,000, and every building addition unless otherwise noted. Specific mandatory requirements and elective measures are provided for three categories: (1) low-rise residential buildings; (2) non-residential and high-rise residential buildings; and (3) additions and alterations to non-residential and high-rise residential buildings.

City of Los Angeles Clean Up Green Up Ordinance

The City of Los Angeles adopted a Clean Up Green Up Ordinance (Ordinance Number 184,245) on April 13, 2016, which among other provisions, includes provisions related to ventilation system filter efficiency in mechanically ventilated buildings. This Ordinance added Sections 95.314.3 and 99.04.504.6 to the Los Angeles Municipal Code (LAMC) and amended Section 99.05.504.5.3 to implement building standards and requirements to address cumulative health impacts resulting from incompatible land use patterns. Section 99.04.504.6, which became effective June 4, 2016, mandates that regularly occupied areas in mechanically ventilated buildings within 1,000 feet of a freeway be provided with air filtration media for outside and return air that meet a Minimum Efficiency Report Value (MERV) of 13. This Ordinance requires that these filters be installed prior to occupancy, and recommendations for maintenance with filters of the same value shall be included in the operation and maintenance manual. The only exception to Section 99.04.504.3 applies to existing mechanical equipment. Additionally, Section 99.05.504.3 states that regularly occupied areas in all mechanically ventilated buildings shall be provided with air filtration media for outside and return air that meets a MERV of 8. An exception is provided for existing mechanical equipment and for new ventilation units meeting certain 2013 California Energy Code requirements. These additions to the LAMC are designed to address cumulative health impacts in highly polluted areas resulting from incompatible land use patterns within the City of Los Angeles.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the California Environmental Quality Act (CEQA) Guidelines, the Proposed Project's air quality impacts would be significant if the Proposed Project would:

- Conflict with or obstruct implementation of the applicable air quality plan (Threshold 4.2-1)
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (Threshold 4.2-2)
- Expose sensitive receptors to substantial pollutant concentrations (Threshold 4.2-3)
- Result in other emissions (such as those leading to odor) adversely affecting a substantial number of people (Threshold 4.2-4)

Specific quantitative thresholds used to define these general CEQA thresholds are discussed below.

SCAQMD Thresholds

The SCAQMD has developed specific CEQA regional and localized significant thresholds (LSTs) to assess air quality impacts associated with individual development projects. The regional and local construction significance thresholds for individual projects in the Project Area are shown in **Table 4.2-4**. The regional thresholds apply throughout the Proposed Project, while LSTs vary depending on the air monitoring areas, or source receptor areas, in which a development project is located.

LSTs were devised in response to concern regarding exposure of individuals to criteria pollutants in local communities and have been developed for NO_x, CO, PM₁₀, and PM_{2.5}. LSTs represent the maximum emissions from a project that will not cause or contribute to an air quality exceedance of the most stringent applicable federal or state ambient air quality standard at the nearest sensitive receptor, taking into

consideration ambient concentrations in each SRA, distance to the sensitive receptor, and project size. LSTs have been developed for emissions within construction areas up to five acres in size.

The Proposed Project is located entirely within SRA 1, Central Los Angeles. Due to the density of development in the Project Area, the LST values for SRA 1 are some of the most protective in the SCAB for regulating localized emissions and preventing exposure of sensitive receptors to substantial pollutant concentrations. The LST values for development projects with lot sizes from less than one acre up to five acres in SRA 1 are displayed in the table. As appropriate, analysis of individual projects in the Project Area must address the appropriate threshold based on the size of the project site and the proximity of sensitive receptors. **Table 4.2-6** presents the LST values for development sites within 25 meters of sensitive receptors, the most conservative thresholds.

The regional operational significance thresholds for individual projects throughout Los Angeles, including the Project Area, are shown in **Table 4.2-7**. These quantitative thresholds are considered when making a significance determination using the State CEQA Guidelines Appendix G thresholds, above, as appropriate. Localized analyses of on-site emissions associated with individual projects are typically limited to industrial and commercial land uses that involve considerable on-site heavy duty vehicle traffic or employ stationary sources of substantial air pollutant emissions.

The SCAQMD is also tasked with managing exposure of sensitive receptors to air toxics and health risk. According to SCAQMD methodology, health effects from carcinogenic air toxics are described in terms of individual cancer risk. “Individual Cancer Risk” is the likelihood that a person continuously exposed to concentrations of TACs over a 70-year lifetime will contract cancer based on the use of standard risk assessment methodology. The SCAQMD has stated that the incremental cancer risk should not exceed 10 persons in one million, and the chronic and acute risks should not exceed a calculated Hazard Index value of 1.0. The SCAQMD quantitative thresholds are considered when making a significance determination based on the State CEQA Guidelines Appendix G thresholds, above, as appropriate.

TABLE 4.2-6 SCAQMD DAILY CONSTRUCTION EMISSIONS THRESHOLDS				
Criteria Pollutant¹	Regional Threshold (Pounds Per Day)	On-Site Localized Thresholds for SRA-1 (Pounds Per Day)²		
		1 Acre	2 Acres	5 Acres
Volatile Organic Compounds (VOC)	75	-	-	-
Nitrogen Oxides (NO _x)	100	41 ³	60 ³	89 ³
Carbon Monoxide (CO)	550	680	1,048	1,861
Sulfur Oxides (SO _x)	150	-	-	-
Respirable Particulates (PM ₁₀)	150	5	8	16
Fine Particulates (PM _{2.5})	55	2 ⁴	4 ⁴	6 ⁴

NOTE: ROG = reactive organic gases, CO = carbon monoxide, NO_x = nitrogen oxides, SO_x = sulfur oxides, SO₂ = sulfur dioxide, PM₁₀ = particulate matter 10 microns in diameter or less, PM_{2.5} = particulate matter 2.5 microns or less in diameter.

¹The SCAQMD has adopted a significance threshold of three (3) pounds per day for lead (Pb). Reasonably expected construction projects from the Proposed Project would not include sources of lead emissions, and a discussion of air quality impacts from lead emissions is excluded from the air quality impact analyses.

²Localized significance thresholds are based on a 25-meter receptor distance because most of the Project Area is densely developed.

³The screening criteria for NO_x were developed based on the 1-hour NO₂ CAAQS of 0.18 ppm. Subsequently to publication of the SCAQMD’s guidance the U.S. EPA has promulgated a 1-hour NO₂ NAAQS of 0.100 ppm. This is based on a 98th percentile value, which is more stringent than the CAAQS. Because SCAQMD’s LSTs have not been updated to address this new standard, to determine if project emissions would result in an exceedance of the 1-hour NO₂ NAAQS, an approximated LST was estimated to evaluate the federal 1-hour NO₂ standard. The revised LST threshold is calculated by scaling the NO₂ LST for by the ratio of 1-hour NO₂ standards (federal/state) (i.e., NO_x lbs/day * (0.10/0.18) = new lbs/day).

⁴The screening criteria for PM_{2.5} were developed based on an Annual CAAQS of 15 mg/m³. Subsequently to publication of the SCAQMD’s guidance the annual standard was reduced to 12 mg/m³. Because SCAQMD’s LSTs have not been updated to address this new standard, to determine if project emissions would result in an exceedance of the annual PM_{2.5} CAAQS, an approximated LST was estimated. The revised LST threshold is calculated by scaling the PM_{2.5} LST for by the ratio of 24-hour PM_{2.5} standards (federal/state) (i.e., PM_{2.5} lbs/day * (12/15) = new lbs/day).

SOURCE: SCAQMD 2009, 2019.

TABLE 4.2-7 SCAQMD DAILY OPERATIONAL EMISSIONS THRESHOLDS				
Criteria Pollutant¹	Regional Threshold (Pounds Per Day)	On-Site Localized Thresholds for SRA-1 (Pounds Per Day)²		
		1 Acre	2 Acres	5 Acres
Volatile Organic Compounds (VOC)	55	-	-	-
Nitrogen Oxides (NO _x)	55	41 ³	60 ³	89 ³
Carbon Monoxide (CO)	550	680	1,048	1,861
Sulfur Oxides (SO _x)	150	-	-	-
Respirable Particulates (PM ₁₀)	150	2	2	4
Fine Particulates (PM _{2.5})	55	1 ⁴	2 ⁴	2 ⁴

NOTE: ROG = reactive organic gases, CO = carbon monoxide, NO_x = nitrogen oxides, SO_x = sulfur oxides, SO₂ = sulfur dioxide, PM₁₀ = particulate matter 10 microns in diameter or less, PM_{2.5} = particulate matter 2.5 microns or less in diameter.

¹SCAQMD has adopted a significance threshold of three (3) pounds per day for lead. The operation of reasonably anticipated development from the Proposed Project would not include sources of lead emissions, and a discussion of air quality impacts from lead emissions is excluded from the air quality impact analyses.

²Localized significance thresholds are based on a 25-meter receptor distance because most of the Project Area is density developed.

³The screening criteria for NO_x were developed based on the 1-hour NO₂ CAAQS of 0.18 ppm. Subsequently to publication of the SCAQMD's guidance the U.S. EPA has promulgated a 1-hour NO₂ NAAQS of 0.100 ppm. This is based on a 98th percentile value, which is more stringent than the CAAQS. Because SCAQMD's LSTs have not been updated to address this new standard, to determine if project emissions would result in an exceedance of the 1-hour NO₂ NAAQS, an approximated LST was estimated to evaluate the federal 1-hour NO₂ standard. The revised LST threshold is calculated by scaling the NO₂ LST for by the ratio of 1-hour NO₂ standards (federal/state) (i.e., NO_x lbs/day * (0.10/0.18) = new lbs/day).

⁴The screening criteria for PM_{2.5} were developed based on an Annual CAAQS of 15 mg/m³. Subsequently to publication of the SCAQMD's guidance the annual standard was reduced to 12 mg/m³. Because SCAQMD's LSTs have not been updated to address this new standard, to determine if project emissions would result in an exceedance of the annual PM_{2.5} CAAQS, an approximated LST was estimated. The revised LST threshold is calculated by scaling the PM_{2.5} LST for by the ratio of 24-hour PM_{2.5} standards (federal/state) (i.e., PM_{2.5} lbs/day * (12/15) = new lbs/day).

SOURCE: SCAQMD 2009; 2019.

METHODOLOGY

Air quality impacts resulting from implementation of the Proposed Project are assessed at a programmatic level because information on specific development projects is not known for the Project Area as a whole. The SCAQMD *CEQA Air Quality Handbook* states that the air quality assessment should be as comprehensive as possible at a programmatic level. In the absence of SCAQMD programmatic thresholds, the EIR evaluates broad air quality impacts and examines the Proposed Project's consistency with the 2022 AQMP. Consistency with this plan would ensure compliance with regional and local air quality goals. The analysis also broadly examines temporary construction emissions, long-term operational emissions, localized pollutant concentrations, TACs, and odors. Common sources of construction emissions include heavy-duty off-road construction equipment exhaust, fugitive dust, and architectural coatings. Sources of operational emissions include the use of consumer products, motor vehicle trips attracted to or generated by a land use, and on-site combustion of natural gas. The VMT estimate used in the emissions analysis is based on projections provided by Fehr and Peer for the Proposed Project (Fehr and Peers 2022). The Proposed Project does not include any stationary sources of lead emissions. Therefore, implementation of the Proposed Project would not result in substantial emissions of lead, and this pollutant is not discussed further in this analysis. A best-effort approach to disclose all reasonably foreseeable impacts based on available information is used consistent with the requirements of CEQA.

The baseline for analysis used in this section and throughout this EIR is the existing condition. This is the same baseline that has been used in the City's most recent community plan EIRs, including the Downtown Los Angeles Community Plan EIR, the West Adams and South/Southeast Los Angeles Community Plan EIRs, as well as the SCAG 2016-2040 RTP/SCS Program EIR, and the latest 2020-2045 RTP/SCS EIR. The use of the existing conditions as the CEQA baseline is reasonable based on these precedents *Development Assumptions*

Table 4.2-8 summarizes the land use assumptions used in the California Emissions Estimator Model (CalEEMod):

TABLE 4.2-8 CALEEMOD LAND USE ASSUMPTIONS			
Land Use Categories	Existing (2021)	2040 (No Project)	2040 (With Project)
Residential – Mid-Rise Apartments ¹	2,012 units	12,773	20,036 units
Retail – Strip Mall ²	898,321 square feet	3,877,426 square feet	3,908,109 square feet
Commercial – Government Office Building	327,487	846,246	607,941
Industrial – Industrial Park	4,049,585	8,556,485	6,146,957
¹ Proposed Project is expected to add both affordable and market-rate apartment units between a building height of three to seven floors. ² The amount of commercial/retail square footage is based on SCAG's Employment Density Study and the Proposed Project's existing and estimated future buildout job forecast for the area. The average for all commercial land use types in Los Angeles County is 420 square feet per employee. Sources: SCAG 2001, SCAG 2016			

Construction Assumptions

Construction emissions were estimated for equipment exhaust emissions and truck trips for a number of example individual construction projects using CalEEMod, version 2022.1. Equipment emission factors in CalEEMod are based on CARB data. Equipment was assumed to operate for eight hours per day. Truck emission factors in CalEEMod are from EMFAC2021 and trucks were assumed to travel 40 miles per day, with a one-way distance of 20 miles to the disposal site. Fugitive dust and architectural coating emissions are qualitatively discussed because it would be speculative to quantify lot acreage and the size of buildings to be coated. To estimate construction emissions, example individual construction project scenarios were developed with varying equipment usage and hauling truck trip intensity. The scenarios were not associated with a specific land use and include generalized assumptions regarding construction scheduling and practices, except for fugitive dust control through site watering twice a day to reflect compliance with SCAQMD Rule 403. These example projects account for four scales of intensity with respect to equipment usage and truck trips, as itemized below.

- Two (2) pieces of heavy-duty equipment, 10 construction workers, and 25 truck trips per day
- Four (4) pieces of heavy-duty equipment, 20 construction workers, and 50 truck trips per day
- Eight (8) pieces of heavy-duty equipment, 40 construction workers, and 100 truck trips per day
- Ten (10) pieces of heavy-duty equipment, 50 construction workers, and 150 truck trips per day

These equipment inventories and truck volumes are representative of a reasonable range of construction activity intensity for individual projects based on previous development in Los Angeles. Maximum daily regional and localized emissions were quantified for these construction scenarios and assessed in the context of the SCAQMD significance thresholds. The analysis of reasonably expected construction projects from the Proposed Project assumes a baseline of zero for daily criteria pollutant emissions, which is extremely conservative given that there are generally multiple large and small construction projects going on in the City and Project Area at any given time.

As discussed in the Regulatory Framework, SCAQMD's Rule 403, Fugitive Dust, is a control requirement for preventing, mitigating and controlling the release of airborne particulate matter emissions from earth moving activities. It is mandatory for all construction projects in the SCAB to comply with Rule 403 or face violations that would incur fines. Specific Rule 403 control requirements include, but are not limited to, applying water in sufficient quantities to prevent the generation of visible dust plumes, applying soil

binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the project site, and maintaining effective cover over exposed areas. Compliance with Rule 403 would reduce PM_{2.5} and PM₁₀ emissions associated with construction activities by approximately 61 percent (SCAQMD 2007). New construction would also be subject to VOC emission limits for architectural coatings, adhesives and sealants in the City’s 2017 Los Angeles Green Building Code. In addition, SCAQMD Rules 1113 and 1168 establish VOC limits to control emissions from the application of architectural coatings, adhesives, and sealants.

Operational Assumptions

Operational emissions, estimated using CalEEMod, would be comprised of mobile source emissions, energy emissions, and area source emissions. Area source emissions are generated by landscape maintenance equipment, consumer products, and architectural coating. Default CalEEMod assumptions for natural gas fireplaces were used to estimate hearth emissions from the Proposed Project. Emissions attributed to energy use include electricity and natural gas consumption for space and water heating. Energy use emissions were calculated according to the methodology explained in Appendix C of the CalEEMod User Guide, Version 2022.1. The energy use estimates account for the 2019 Building Energy Efficiency Standards (Title 24). This is a conservative assumption since the energy use estimates do not account for potential energy efficiency measures required by subsequent Title 24 updates in 2022, 2025, and 2028. Mobile source emissions were estimated using vehicle activity data presented in Section 4.15, *Transportation and Traffic*, and vehicle emission rates from CARB’s EMFAC2017 model. **Table 4.2.9** shows vehicle trips and VMT for the 2021 existing condition and the 2040 Proposed Project conditions. Although the reasonably anticipated development would reduce average VMT and daily trips per service population, the total amount of VMT and vehicle trips would increase in the project area.

TABLE 4.2.9 VEHICLE ACTIVITY DATA (DAILY) FOR THE PROPOSED PROJECT				
Activity	Existing (2021)	No Project (2040)	With Project (2040)	Project (2040) vs. Existing (2021) ¹
CASP VMT	328,439	841,339	983,961	+655,522 (200%)
CASP Daily Trips	41,323	125,638	155,383	+114,060 (276%)
CASP VMT per Service Population	28.7	18.3	15.2	-13.5 (-47%)
CASP Daily Trips per Service Population	3.6	2.7	2.4	-1.2 (-34%)

VMT = Vehicle Miles Traveled
¹ Quantities may not sum due to independent rounding.
 Source: Fehr & Peers 2022

Concurrent Construction and Operations

There is no comprehensive timeline for the construction of individual projects within the CASP area through the horizon year of 2040, and it is not possible to estimate the rate of redevelopment over such a long timeframe. Similar to what is already occurring within the Project Area under existing and ongoing conditions, sources of air pollutant emissions involved in the construction of individual projects would be active while operational emissions are continuously occurring. The City cannot reasonably anticipate if growth would be linear or sporadic between 2022 and 2040. Given the uncertainty of year-to-year growth, interim year emissions analyses are unlikely to yield reasonably accurate portrayal of emissions prior to 2040. It would also be inappropriate to consider construction emissions in combination with ongoing operational emissions, as the SCAQMD air quality significance thresholds were derived separately and the SCAQMD handbook explicitly states that operational emissions begin when construction is completed. It would not serve the goal of providing an informational document to combine hypothetical construction projects with operational emissions in an interim emissions scenario, nor is this approach standard practice

for air quality impacts assessments under CEQA. Without a robust understanding of project details including the schedules under which individual projects would be constructed, the exercise of combining construction and operational emissions would not bolster the disclosure of air quality impacts.

PROJECT IMPACTS

Threshold 4.2-1	Conflict with or obstruct implementation of the applicable air quality plan
------------------------	---

Impact 4.2-1 **Proposed Project:** The Proposed Project would generate growth that is consistent with the 2020-2045 RTP/SCS and 2022 AQMP. As a result, the Proposed Project would not conflict with and obstruct implementation of the 2020-2045 RTP/SCS or the 2022 AQMP. Thus, impacts related to population growth under the Proposed Project would be *less than significant*.

As discussed in the Regulatory Framework, the overall strategy for the 2022 AQMP is designed to meet applicable federal and state requirements, including attainment of ambient air quality standards (SCAQMD 2022). The focus of the AQMP is to demonstrate attainment of the federal 2015 8-hour Ozone ambient air quality standard by August 2038 for “extreme” nonattainment areas and August 2033 for “severe” nonattainment areas. The AQMP provides base year emissions and future baseline emission projections that provide a snapshot of future air quality conditions, including the effects from already adopted rules and regulations. In doing so, the AQMP relies upon the most recent planning assumptions and the best available information, including CARB’s mobile source emission factors for the on-road mobile source emissions inventory; CARB’s in-use fleet inventory for the off-road mobile source emission inventory; the latest point source inventory; updated area source inventories; and SCAG’s forecast growth assumptions based on the RTP/SCS.

The 2022 AQMP was adopted in December 2022 and represents the most updated regional blueprint for achieving federal air quality standards and clean air (SCAQMD 2022). The 2022 AQMP adapts previously conducted regional air quality analyses to account for the recent unexpected drought conditions and presents a approach to demonstrate attainment of the 2015 8-hour ozone NAAQS for the SCAB. Directly applicable to reasonably anticipated development expected from the Proposed Project, the 2022 AQMP proposes robust NO_x reductions from residential and commercial appliances, commercial cooking, and commercial space heating. Individual development projects throughout Los Angeles will be required to comply with existing and new regulatory measures set forth by the SCAQMD.

Project Impact

The air quality plans applicable to the Proposed Project are the 2020-2045 RTP/SCS and the 2022 AQMP. As mentioned in the Regulatory Framework, the primary objectives of the RTP/SCS that are aimed at reducing air pollution consist of adding density in proximity to transit stations and encouraging mixed-use development and active transportation. A detailed review of the Proposed Project’s consistency with the 2020-2045 RTP/SCS is provided in sections 4.7, *Greenhouse Gases*, 4.10, *Land Use and Planning*, and 4.15, *Transportation and Traffic*. As discussed in these sections, the Proposed Project is consistent with goals and policies of the 2020-2045 RTP/SCS.

The 2022 AQMP was prepared to accommodate growth, to reduce the high levels of pollutants in areas under the jurisdiction of SCAQMD, to improve the region’s air quality, and to minimize the impact on the economy. Consistency with the AQMP can be assessed by determining how a project accommodates increases in population or employment. The population and employment assumptions used by SCAQMD to estimate regional emissions in the AQMP are obtained from SCAG forecasts for cities and unincorporated areas within the SCAQMD’s jurisdiction. As discussed in Section 2, *Project Description*, the Department of City Planning uses SCAG forecasts as a benchmark when updating plans. While the

Proposed Project is expected to result in population and housing exceeding SCAG forecasts for the Project Area, it would not result in growth exceeding SCAG citywide projections for 2040. The City has discretion in how it allocates growth across the City to meet other objectives and has historically allocated more growth to the Project Area than SCAG, consistent with the City's General Plan Framework. Reasonably expected growth from the Proposed Project would not exceed the SCAG 2040 population or employment projections for the City as a whole. Therefore, the Proposed Project would not exceed the assumptions in the AQMP.

Further, as discussed in Section 4.12, *Population and Housing and Employment*, the Proposed Project would not induce significant population growth, although it would serve to accommodate predicted growth in appropriate locations near existing transportation infrastructure, as encouraged in the RTP/SCS (SCAG 2020). Because the Proposed Project would increase reasonably anticipated development in the CASP area in a way that would be consistent with citywide growth forecasts, it would not exceed the assumptions in the AQMP.

As discussed in section 4.7, *Greenhouse Gases*, and 4.10, *Land Use and Planning*, the Proposed Project would be consistent with applicable goals of the 2020-2045 RTP/SCS. Specifically, the Proposed Project would incentivize new development opportunities around existing transit systems; direct growth to transit hubs and corridors; encourage mixed-use development; and encourage a variety of mobility options, such as making streets walkable to promote pedestrian-friendly environments. These objectives are consistent with the 2020-2045 RTP/SCS and the AQMP, as well as the City's General Plan Framework Element and Air Quality Element. Thus, the Project's reasonably anticipated development would not exceed the 2020 RTP/SCS and AQMP growth projections; therefore, impacts related to conflicting with or obstructing implementation of the applicable air quality plans under the Proposed Project would be *less than significant*.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Less than Significant

Threshold 4.2-2	Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard
------------------------	---

Impact 4.2-2 **Proposed Project:** Reasonably anticipated development from the Proposed Project would result in construction emissions of NO_x to potentially exceed SCAQMD regional significance threshold, and SCAQMD local significance thresholds for NO_x, PM₁₀, and PM_{2.5}. Furthermore, reasonable anticipated development from the Proposed Project would result in operational emissions of VOC, NO_x, CO, PM₁₀, and PM_{2.5} that exceed SCAQMD regional thresholds. These exceedances would constitute a considerable net increase of PM₁₀, PM_{2.5} and ozone precursor (NO_x and VOC) emissions in the SCAB. Proposed Project features and proposed mitigation measures would reduce impacts to the maximum extent feasible, but emissions would remain above thresholds. Therefore, Proposed Project impacts associated with construction emissions (NO_x, PM₁₀, and PM_{2.5}) and operational emissions (VOC, NO_x, CO, PM₁₀ and PM_{2.5}) would be *significant and unavoidable*.

Project Impact

Construction Emissions

Table 4.2-10 shows the estimated average daily construction emissions associated with the four sample construction activity scenarios described under *Methodology*. These scenarios are representative of construction activity intensities for residential and commercial development in the Project Area.

Results of the emissions modeling demonstrate that daily emissions of NO_x from heavy-duty diesel equipment and trucks during construction activities could exceed the SCAQMD regional thresholds under reasonably expected circumstances for projects that involve the use of eight pieces of equipment and 100 heavy truck trips per day or more.

TABLE 4.2-10 ESTIMATED MAXIMUM DAILY CONSTRUCTION EMISSIONS						
Example Scenarios – Daily Activity¹	Pounds Per Day					
	VOC	NO_x	CO	SO_x	PM₁₀	PM_{2.5}
2 Heavy-Duty Equipment, 25 Truck Trips	2	28	21	<1	7	4
4 Heavy-Duty Equipment, 50 Truck Trips	5	55	42	<1	14	8
8 Heavy-Duty Equipment, 100 Truck Trips	10	110	83	<1	29	16
10 Heavy-Duty Equipment, 150 Truck Trips	12	142	105	<1	37	20
<i>Regional Significance Threshold</i>	<i>75</i>	<i>100</i>	<i>550</i>	<i>150</i>	<i>150</i>	<i>55</i>
Threshold Exceedance?	No	Yes	No	No	No	No

NOTE: VOC: volatile organic compound; NO_x: nitrogen oxides; CO: carbon monoxide; SO_x: sulfur oxides; PM₁₀: particulate matter measuring 10 microns in diameter or less; PM_{2.5}: particulate matter measuring 2.5 microns in diameter or less

¹Equipment exhaust was estimated using CalEEMod and 8 hours of operation per day. Truck emissions were estimated using CalEEMod and a trip length of 40 miles.

SOURCE: See Appendix E for modeling results and assumptions.

Although not reflected in **Table 4.2-10**, maximum daily VOC emissions may vary greatly depending on the area of coatings applied in a given day; and as such, even smaller projects may have potential to exceed SCAQMD regional thresholds. Health effects of VOCs may include eye, nose, throat irritation, headaches, loss of coordination, nausea, damage to liver, kidney, and central nervous system. The SCAQMD has also published Rules 1113 and 1186 that limit VOC content in architectural coating applications. VOC content limits for architectural coatings substantially reduces the likelihood that off-gassing emissions from

painting, finishing, and paving activities would exceed applicable SCAQMD air quality significance thresholds.

Based on all of the above, construction activity under the Proposed Project would be a potentially significant **impact** related to regional construction emissions.

Localized Construction Emissions

As discussed under Significance Thresholds, the SCAQMD has also developed specific LSTs to assess construction and operational air quality impacts associated with individual development projects. The LST values are specific to the SRA in which an individual project is located and based on proximity to the nearest sensitive receptor(s). A localized construction analysis would be speculative given the lack of a construction location and construction activities under the Proposed Project. However, it is reasonable to assume that some individual projects in the Project Area would involve construction activity adjacent to sensitive receptors (e.g., residences and schools).

As a conservative exercise, maximum daily emissions from on-site exhaust sources during construction activities were quantified and compared to LST values for individual construction projects in the Project Area. **Table 4.2-11** compares emissions from these hypothetical construction scenarios to the applicable LSTs. Under certain circumstances, unmitigated equipment emissions combined with fugitive dust emissions associated with the construction of future development occurring under the Proposed Project could potentially exceed the LSTs for NO_x, PM₁₀ and PM_{2.5}. Fugitive dust emissions would be reduced through compliance with SCAQMD Rule 403 for activities requiring earthwork and material movement, such as demolition, grading, and excavation.

TABLE 4.2-11 ESTIMATED MAXIMUM DAILY ON-SITE CONSTRUCTION EMISSIONS				
Example Scenarios – Daily Activity¹	Pounds Per Day²			
	NO_x	CO	PM₁₀	PM_{2.5}
2 Heavy-Duty Equipment	23	19	1	1
4 Heavy-Duty Equipment	46	37	2	2
8 Heavy-Duty Equipment	92	74	4	4
10 Heavy-Duty Equipment	116	93	5 ³	5
<i>SRA 1 Local Significance Threshold</i>	<i>41⁴</i>	<i>680</i>	<i>5</i>	<i>2⁵</i>
Threshold Exceedance?	Yes	No	Yes	Yes
<p>NOTE: VOC: volatile organic compound; NO_x: nitrogen oxides; CO: carbon monoxide; SO_x: sulfur oxides; PM₁₀: particulate matter measuring 10 microns in diameter or less; PM_{2.5}: particulate matter measuring 2.5 microns in diameter or less</p> <p>¹Equipment exhaust was estimated using CalEEMod and 8 hours of operation per day. Truck emissions were estimated using CalEEMod and a trip length of 40 miles. Some numbers may not add up precisely due to rounding considerations.</p> <p>²Emissions reported include on-site exhaust emissions only.</p> <p>³Emissions for PM₁₀ were 5.21 pounds per day but rounded down to 5 pounds per day.</p> <p>⁴The screening criteria for NO_x were developed based on the 1-hour NO₂ CAAQS of 0.18 ppm. Subsequently to publication of the SCAQMD's guidance the U.S. EPA has promulgated a 1-hour NO₂ NAAQS of 0.100 ppm. This is based on a 98th percentile value, which is more stringent than the CAAQS. Because SCAQMD's LSTs have not been updated to address this new standard, to determine if project emissions would result in an exceedance of the 1-hour NO₂ NAAQS, an approximated LST was estimated to evaluate the federal 1-hour NO₂ standard. The revised LST threshold is calculated by scaling the NO₂ LST for by the ratio of 1-hour NO₂ standards (federal/state) (i.e., NO_x lbs/day * (0.10/0.18) =new lbs/day).</p> <p>⁵The screening criteria for PM_{2.5} were developed based on an Annual CAAQS of 15 mg/m³. Subsequently to publication of the SCAQMD's guidance the annual standard was reduced to 12 mg/m³. Because SCAQMD's LSTs have not been updated to address this new standard, to determine if project emissions would result in an exceedance of the annual PM_{2.5} CAAQS, an approximated LST was estimated. The revised LST threshold is calculated by scaling the PM_{2.5} LST for by the ratio of 24-hour PM_{2.5} standards (federal/state) (i.e., PM_{2.5} lbs/day * (12/15) =new lbs/day).</p> <p>SOURCE: See Appendix E for modeling results and assumptions.</p>				

Based on the above, implementation of the Proposed Project could result in a *potentially significant impact* related to localized construction emissions of NO_x, PM₁₀, and PM_{2.5} due to equipment exhaust emissions.

Operational Emissions

Reasonably expected future development from the Proposed Project would generate long-term regional air pollutant emissions, which would result from mobile sources (motor vehicle exhaust) and area sources, such as consumer products and natural gas combustion. Emissions from motor vehicle exhaust were estimated using VMT data for existing conditions (2021), the future without project conditions, (2040 without the Proposed Project), and future with project conditions (2040 with the Proposed Project). Impact analysis is based on comparing existing conditions to future with project conditions. Future without project is provided for information and not for impact analysis. **Table 4.2.9** under *Methodology* shows the estimated regional daily VMT associated with all vehicle trips having origins or destinations in the Project Area for the aforementioned conditions. While total daily VMT would increase from existing conditions to 2040 with Proposed Project conditions, per service population VMT would decrease from 28.7 to 15.2 (see Section 4.15, *Transportation and Traffic*). The increase in VMT can be attributed to regional growth, as well as the increases in households and employment in the Project Area resulting from implementation of the Proposed Project, which are described in Section 4.12, *Population, Housing, and Employment*.

Operation of the Proposed Project would generate criteria air pollutant emissions associated with area sources (e.g., architectural coatings, consumer products, and landscaping equipment), energy sources (i.e., use of natural gas for space and water heating), and mobile sources (i.e., vehicle trips to and from the project site). The Proposed Project would increase residential, commercial, industrial, and public facilities land uses for the 2040 reasonably anticipated development.. Operational emissions were based on the reasonably anticipated development for the Proposed Project. As discussed above, the 2040 without Proposed Project was included for informational purposes and was not relied on for impact analysis or conclusions. **Table 4.2-12** presents existing and buildout year estimates of the residential units, commercial, industrial, and public facility square footages within the Project Area.

TABLE 4.2-12 PROJECT AREA LAND USE SUMMARY				
Scenario	Residential Units	Commercial Reasonably Anticipated Development (sf)	Industrial Reasonably Anticipated Development (sf)	Public Facility Reasonably Anticipated Development (sf)
2040 With Proposed Project	20,036	3,908,109	6,146,957	607,941
2040 Without Proposed Project	12,773	3,877,426	8,556,485	846,246
Existing Conditions	2,012	898,321	4,049,585	372,487
SOURCE: SCAG 2021. sf = square feet				

Mobile vehicle trip data and reasonably anticipated development estimates presented in **Table 4.2.9** and **Table 4.2-12**, respectively, were used to generate estimates of daily regional emissions. **Table 4.2-13** shows regional emissions under Existing Conditions, in 2040 without the Proposed Project, and in 2040 with the Proposed Project.

While emissions from mobile sources are generally expected to decrease over time as a result of statewide emissions reductions measures, the anticipated ambient growth in residential housing and commercial land use would result in increased use of consumer products and natural gas. As shown in **Table 4.2-13**, NO_x and CO would exceed the regional thresholds with reasonably anticipated development from the Proposed Project. The Proposed Project would increase area and energy source emissions when compared to existing

conditions. Area emissions would increase through the use of consumer products, which is the predominant contributor to operational VOC emissions. The use of consumer products varies by land use type and is typically analyzed on a project-specific scale. When compared to existing conditions, future development in the Project Area, as detailed in **Table 4.2-13**, could result in daily emissions of VOC that would exceed the SCAQMD regional significance thresholds due to heavily expanded use of consumer products. In addition, reasonably anticipated development from the Proposed Project could result in daily emissions of PM₁₀ and PM_{2.5} from area sources and mobile sources (brake and tire wear) that would exceed the SCAQMD regional significance thresholds. However, CARB continually applies increasingly stringent regulations on sources of ozone precursors and particulate matter statewide, and it is likely that the emissions presented in this document represent conservative estimates of emissions from reasonably anticipated development. Nevertheless, for purposes of this analysis, impacts related to regional operational emissions associated with the Proposed Project did not include any assumptions for increased stringent standards for non-mobile source emissions and the Proposed Project emissions for PM_{2.5}, PM₁₀, CO, NO_x and VOC are considered *potentially significant*.

TABLE 4.2-13 ESTIMATED OPERATIONAL EMISSIONS BY SOURCE						
Scenario	Daily Emissions (Pounds/Day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}

Net Daily Emissions²						
Change from Existing Conditions	819	378	2,266	6	301	60
<i>SCAQMD Regional Significance Threshold</i>	<i>55</i>	<i>55</i>	<i>550</i>	<i>150</i>	<i>150</i>	<i>55</i>
Threshold Exceeded?	Yes	Yes	Yes	No	Yes	Yes
<small>1 Note the 2040 Without Proposed Project scenario is included for informational purposes, and not for impact analysis or conclusions. 2 Net emissions refer to the difference between Proposed Project and existing conditions; negative values expressed in parentheses. SOURCE: See Appendix E for model results.</small>						

Operational LST emissions were not quantified in this analysis since project-level data was not included for the Proposed Project. In addition, each individual project would vary in size and distance to sensitive receptors, which affects the applicable threshold each individual project would be tie to for on-site emissions. Therefore, it would be speculative to estimate localized on-site emissions for operational activity. Project-level developments for the Proposed Project under CEQA would implement and be evaluated against the operational LST thresholds.

Mitigation Measures

4.2-2 Construction Emissions Reduction

The City shall require all projects that involve construction-related activity to comply with the following and require the developers to notify any contractors, and include in any agreements with contractors and subcontractors, the following, or equivalent, best management practices in construction specifications:

AQ1-1: Dust Control Compliance with SCAQMD Rule 403

a. Applicability Threshold

Any Project whose construction activities involve the use of construction equipment and require a permit from City of Los Angeles Department of Building and Safety.

b. Standard

Consistent with SCAQMD Rule 403, best available dust control measures shall be implemented during Ground Disturbance Activities and active construction operations capable of generating dust.

AQ1-2: Equipment

a. Applicability Threshold

Any Project whose construction activities involve the use of construction equipment and require a permit from LADBS.

b. Standard

Maintain construction equipment in good, properly tuned operating condition, as specified by the manufacturer, to minimize exhaust emissions. Documentation demonstrating that the equipment has been maintained in accordance with the manufacturer's specifications shall be maintained per the proof of compliance requirements in Subsection I.D.6 of the Environmental Protection Measures Handbook.

All construction equipment shall achieve emissions reductions that are no less than what could be achieved by a Tier 3 diesel emissions control strategy for a similarly sized engine as defined by California Air Resources Board regulations.

AQ1-3: Vehicle Idling Limit and Notification Signs

a. Applicability Threshold

Any Project whose construction activities involve the use of construction vehicles and require a permit from LADBS.

b. Standard

Vehicle idling during construction activities shall be limited to five minutes as set forth in the California Code of Regulations, Title 13, Section 2449. Signs shall be posted in areas where they will be seen by vehicle operators stating idling time limits.

AQ1-4: Non-Diesel Fueled Electrical Power

a. Applicability Threshold

Any Project whose construction activities involve the use of construction equipment and require a permit from LADBS.

b. Standard

Electricity from power poles rather than temporary gasoline or diesel-powered generators shall be used To the Extent Available and Feasible.

AQ1-5: Emissions Standards for Off-Road Construction Equipment Greater than 50 Horsepower

a. Applicability Threshold

Any Project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day.

b. Standard

All off-road diesel-powered construction equipment equal to or greater than 50 horsepower shall meet the U.S. Environmental Protection Agency's (USEPA) Tier 4 emission standards during construction, or use alternative fuels (such as compressed natural gas, liquid petroleum gas, unleaded gasoline, or electricity.). Operators shall maintain records of all off-road equipment associated with Project construction to document that each piece of equipment used meets these emission standards per the proof of compliance requirement in Subsection I.D.6.

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

AQ1-6: Use of Low Polluting Fuels

a. Applicability Threshold

Any Project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve at least 5,000 cubic yards of on-site cut/fill on any given day.

b. Standard

Construction equipment less than 50 horsepower shall use low polluting fuels (i.e., compressed natural gas, liquid petroleum gas, unleaded gasoline, or electricity).

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

AQ1-7: Emission Standards for On-Road Haul Trucks

a. Applicability Threshold

Any Project whose construction activities involve the use of construction equipment, require a permit from LADBS, and involve more than 90 round-trip haul truck trips on any given day for demolition debris and import/export of soil.

b. Standard

Construction haul truck operators for demolition debris and import/export of soil shall use trucks that meet the California Air Resources Board's (CARB) 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of nitrogen oxides (NO_x) emissions. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards per the proof of compliance requirements in Subsection I.D.6 of the Environmental Protection Measures Handbook.

In lieu of compliance with the above requirement, an air quality study prepared in accordance with the SCAQMD's Air Quality Handbook may be provided by the Applicant or Owner demonstrating that Project construction activities would not exceed the SCAQMD's regional and localized construction thresholds.

AQ1-8: Routes for On-Road Haul Trucks

a. Applicability Threshold

Any Project whose construction activities involve the use of construction vehicles and require a permit from LADBS.

b. Standard

Construction contractors shall reroute construction trucks away from congested streets or Sensitive Uses, as feasible. The burden of proving that compliance is infeasible shall be upon the Applicant or Owner. Where avoiding Sensitive Uses and congested streets altogether is infeasible, routing away from Sensitive Uses shall be prioritized over routing away from congested streets.

Significance After Mitigation

Construction Emissions

As indicated above, construction projects with more than eight heavy duty pieces of equipment on-site and operating 8 hours per day and over 100 daily truck trips would be expected to exceed SCAQMD regional threshold for NO_x and SCAQMD LSTs for NO_x, PM₁₀, and PM_{2.5}.

Mitigation Measure 4.2-2 would reduce regional and local emissions generated by various construction activities, including equipment operation, truck trips, and painting. For construction impacts, the use of Tier 4 equipment would result in a 50 to 90 percent reduction in NO_x and PM emissions from diesel-powered off-road construction equipment relative to Tier 3 engines, which are typically used as the industry standard. Requiring engines meeting Tier 4 emissions standards is becoming more common as the equipment is more widely available and would reduce emissions for some construction projects that would otherwise have significant impacts based on SCAQMD thresholds to a less than significant level. Los Angeles County Metropolitan Transportation Authority (LACMTA, or "LA Metro") already requires the use of Tier 4 engines in all their construction projects. However, on-road heavy-duty haul trucks are not regulated under the same off-road emissions standards and the City cannot feasibly require all construction-related on-road trucks operating within City limits to adhere to more stringent engine emissions standards.

Specific reduction in emissions below the SCAQMD significance thresholds cannot be demonstrated in the absence of specific project details to assess. It is reasonable to assume that construction activities for a development project in the Project Area could generate emissions that would exceed the significance thresholds despite Mitigation Measure 4.2-2. Therefore, the Proposed Project is considered to result in a ***significant and unavoidable*** regional and localized construction impact related to violating an air quality standard and/or contributing substantially to an existing or projected air quality violation.

Therefore, after mitigation, construction related emissions for NO_x, PM₁₀, and PM_{2.5} would remain ***significant and unavoidable***.

Operational Emissions

With respect to long-term operational impacts, the Proposed Project's focus on mixed use and transit-oriented development would generally minimize per capita emissions associated with vehicle trips, as described above. Adherence to the City's green building standards on all new development, as described in detail in Section 4.5, Energy, would minimize emissions associated with energy use. In addition, removing

fireplaces, utilizing low VOC coating, and implementing solar panels could reduce emissions associated with operational activity. Individual projects would comply with the latest iteration of Title 24, which would implement more efficient appliances from its predecessor version. Additional feasible mitigation beyond these Proposed Project features and citywide standards is not available.

No feasible mitigation measures are available to reduce long-term VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions associated with implementation of the Proposed Project to below SCAQMD thresholds. The VOC content of consumer products manufactured, distributed, sold, and used within the Project Area is regulated at the State level, and there is no jurisdictional authority to enforce consumer products VOC content within the Project Area. No feasible mitigation measures are available to reduce long-term VOC emissions associated with implementation of the Proposed Project to below SCAQMD thresholds. Impacts related to operational emissions under the Proposed Project would remain *significant and unavoidable*.

Associated Health Effects (Sierra Club v. County of Fresno)

The Court in *Sierra Club v. County of Fresno* held that projects with significant air quality impacts need to “relate the expected adverse air quality impacts to likely health consequences or explain why it is not feasible at the time of drafting to provide such an analysis, so that the public may make informed decisions regarding the costs and benefits of the project.” Based on the above analysis and conclusions, the Proposed Project is expected to result in significant unavoidable impacts from construction emissions for NO_x, PM_{2.5}, and PM₁₀, and from operational emissions for NO_x, VOC, CO, PM_{2.5} and PM₁₀.

There is no established pathway to accurately quantify ozone-related health impacts caused by NO_x or VOC emissions from relatively small projects. The SCAQMD does not explicitly define “relatively small project;” however, it is assumed that the Specific Plan would be considered a relatively small project in the scheme of the overall Basin. SCAQMD acknowledges that it may be feasible to analyze air quality related health impacts for projects on a regional scale with very high emissions of NO_x and VOCs, where impacts are regional. The example SCAQMD provided in its amicus brief in the *Sierra Club v. County of Fresno* decision was for proposed Rule 1315, which authorized various newly-permitted sources to use offsets from the District’s “internal bank” of emission reductions. The CEQA analysis accounted for essentially all of the increases in emissions due to new or modified sources in the District between 2010 and 2030, or approximately 6,620 pounds per day of NO_x and 89,947 pounds per day of VOC, to expected health outcomes from ozone and particulate matter (e.g., 20 premature deaths per year and 89,947 school absences in the year 2030 due to ozone). Accordingly, in this case it would not be feasible to directly correlate project emissions of VOC or NO_x with specific health impacts from ozone. Further, SCAQMD’s amicus brief notes that ozone formation is not linearly related to emissions. Therefore, ozone impacts vary depending on the location of the emissions, the location of other precursor emissions, meteorology, and seasonal impacts, and because ozone is formed later and downwind from the actual emission. Lead agencies that use SCAQMD’s thresholds of significance may determine that a project would have a significant air quality impact and must apply all feasible mitigation measures; however, it would not be able to precisely correlate the project to quantifiable health impacts, unless the emissions are sufficiently high to use a regional modeling program, which is not the case for the Project Area.

With respect to PM_{2.5}, although CARB has a methodology that can predict expected mortality for large amounts of PM_{2.5}, this methodology is not suited for small projects and may provide unreliable results due to a variety of uncertainties, such as the representativeness of the population used in the methodology, as well as the specific source of PM and the corresponding health impacts. The use of this methodology for small source could result in unreliable findings and would not provide meaningful information. As such, it is not appropriate for the Proposed Project.

While a number of models and tools are available to quantify emissions, these models are limited by a number of factors in determining health impacts of individual development and infrastructure projects as

well as local plan-level projects. The USEPA currently performs health impact assessments (HIAs) using the Community Multiscale Air Quality model for pollutant transport modeling and Environmental Benefits Mapping and Analysis Program - Community Edition (BENMAP-CE) for health impact calculations. However, these models are designed to estimate health impacts over a large scale (e.g., city-wide, state-wide). In addition, the CMAQ model requires inputs such as regional sources of pollutants and global meteorological data, which are not readily accessible. Other general limitations of the current suite of models include not being able to model concentrations or dispersion of pollutants, the unsuitability of regional models in providing accurate results for local-level plans or individual projects, and limitations on being able to correlate concentrations to related health effects.

As noted in the *Public Health Effects and Sierra Club v. County of Fresno* White Paper, “For local plans or projects that exceed any identified SCAQMD air quality threshold, City EIR documents are able to identify and disclose generalized health effects of certain air pollutants but are currently limited and are unable to establish an accurate connection between any local plan or project and a particular health effect. At this time, it is infeasible for City EIRs to directly link a plan or project’s significant air quality impacts with a specific health effect. A number of factors contribute to this uncertainty, including the regional scope of air quality monitoring and planning, technological limitations for accurate modeling at a local plan- or project-level, and the intrinsically complex nature between air pollutants and health effects in conjunction with local environmental variables.”

Threshold 4.2-3	Expose sensitive receptors to substantial pollutant concentrations.
------------------------	---

Impact 4.2-3 **Proposed Project:** Construction under the Proposed Project may expose sensitive receptors to substantial pollutant concentrations. Implementation of Mitigation Measure 4.2-2 and adherence to existing regulations would minimize exposure to substantial pollutant concentrations. Operational emissions would not expose sensitive receptors to substantial pollutant concentrations. This impact would be *less-than significant with mitigation* for construction and *less than significant* for operation.

Project Impact

Regarding health risks from existing emissions sources, the California Supreme Court ruling in *California Building Industry Association vs. Bay Area Air Quality Management District* (December 17, 2015) held that “agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project’s future users or residents. But when a proposed project’s risks exacerbate those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the project’s impact on the environment – and not the environment’s impact on the project – that compels an evaluation of how future residents or users could be affected by exacerbated conditions.”

Construction

The greatest potential for exposure to substantial pollutant concentrations and TAC emissions during construction would be diesel particulate emissions associated with heavy duty equipment operations and truck traffic. Diesel exhaust causes health effects from both short-term or acute exposures, and long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Acute exposure to diesel exhaust may cause irritation to eyes, nose, throat and lungs, and some neurological effects, such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbated asthma. Chronic exposure to diesel exhaust in experimental animal inhalation studies has shown a range of dose-dependent lung inflammation and cellular changes in the lung and immunological effects. Based upon human and laboratory studies,

there is considerable evidence that diesel exhaust is a carcinogen. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings. As discussed under Impact 4.2-2, construction-related emissions of particulates (PM₁₀ and PM_{2.5}) generated primarily by diesel fuel combustion would potentially exceed SCAQMD thresholds.

The specific locations of future construction activity in the Project Area are not currently known. The construction health risk analysis here and under Impact 4.2-2 is speculative given the lack of a construction location and construction activities.

However, a review of several published EIRs for the largest development projects recently analyzed in the City did not show any significant impacts resulting from construction related to TACs. For example, none of the following recently reviewed projects had significant impacts from construction related TACs:

- Olympia Project: 1.84 million new square feet, occupying a whole city block, and 284,000 cubic yards of soil export (Los Angeles 2018a);
- 2134 Violet Street Project: 569,448 square feet, involving a whole City block, with 239,000 cubic yards of soil export (Los Angeles 2020a);
- Crossroads Project: 1.4 million square feet in Hollywood Plan Area, 647,753 cubic yards of soil export (Los Angeles 2017);
- Times Mirror: 1.5 million square feet on 3.6-acre city block, involving 37-story tower and a 53-story tower, and export of 364,000 cubic yards of soil (Los Angeles 2019); and
- 5th and Hill: 260,689 square feet on .38-acre site, involving 53-story building, with 25,092 cubic yards of soil export (Los Angeles 2018b).

The only City EIR that was identified that found a potential impact related to TACs under a conservative worst-case scenario was the 6220 Yucca Project, which involved demolition of an existing structure and construction of 210 multi-family residential units, 136 hotel rooms and approximately 12,570 square feet of commercial/restaurant uses on a 1.16-acre site, with export 120,000 cubic yards of soil. The EIR found that impacts would be less than significant with mitigation (Los Angeles 2020b). The mitigation is substantially similar to mitigation measure 4.2-2, as it relates to using Tier 4 equipment. Based on the above, it is not foreseeable that projects in the Project Area would have significant impacts related to TACs. The only project identified with potential significant impacts relied on a conservative measurement but found that application of standard mitigation reduced to less than significant. Any project that is as large as the 6220 Yucca Project would be subject to Site Plan review and would be required to undergo project level environmental review.

Notwithstanding the above, to be conservative, it is concluded that the Proposed Project could potentially result in substantial pollutant concentrations during construction activities. As a result, this impact would be ***potentially significant***.

Operation

Residential and commercial land uses are not considered land uses that generate substantial TAC emissions based on review of the air toxic sources listed in SCAQMD's and CARB's guidelines. It is expected that quantities of hazardous TACs generated on-site (e.g., cleaning solvents, paints, landscape pesticides, etc.) for the types of proposed residential and commercial land uses would be below thresholds warranting further study under the California Accidental Release Program. The industrial land use for the reasonably anticipated development would be light industrial facilities that do not generate substantial air toxics stated in SCAQMD and CARB's guidelines. However, the use of toxic compounds by an industrial facility would be strictly regulated through the SCAQMD permitting process, which requires detailed health risk

assessments, when applicable. In addition, the use of generators or emergency generators would be permitted through SCAQMD, which would not generate substantial air toxins. New industrial sources of emissions are subject to SCAQMD Rule 1401, New Source Review of Toxic Air Contaminants. This Rule specifies limits for maximum individual cancer risk, cancer burden, and noncancer acute and chronic hazard index from new permit units, relocations, or modifications to existing permit units that emit toxic air contaminants. Compliance with the SCAQMD permitting process and Regulation XIV would ensure that equipment associated with new industrial facilities would not generate TAC emissions exceeding the SCAQMD standards or adversely affect sensitive land uses. In addition, new discretionary development in the Project Area would be required to comply with PRC Section 21151.8, which requires assessment of hazardous pollutants within 0.25 miles of a new elementary or secondary school. This legal requirement within the PRC protects staff and students at new schools from significant health risks from exposure to TACs. Because the project would not include substantial TAC sources and is consistent with CARB and SCAQMD guidelines, it would not result in the exposure of off-site sensitive receptors to significant amounts of carcinogenic or toxic air contaminants. Impacts would be *less than significant*.

CO Hotspots

Another pollutant for which land development, and in particular increased traffic congestion, can potentially create impacts is CO. Elevated CO levels can occur at roadway intersections that experience high traffic volumes and high levels of engine idling. Historically, mobile source-related CO concentrations at high-volume (e.g., congested) intersections have been linked to health concerns according to USEPA and SCAQMD. According to the *2004 Revision to the California State Implementation Plan for Carbon Monoxide*, requirements for cleaner vehicles, equipment, and fuels have cut peak CO levels in half since 1980 despite growth (CARB 2004). However, with cleaner technologies, automobile emissions of CO have steadily declined over the years and in 2001, the SCAB met both the federal and state 8-hour CO standards at all monitoring stations for the first time. CO attainment was also demonstrated in the 2003 AQMP and the region has remained in attainment of CO standards ever since. The busiest intersection evaluated in 2003 was that at Wilshire Boulevard and Veteran Avenue (located outside the Project Area), which has a daily traffic volume of approximately 100,000 vehicles per day. The 2003 1-hour concentration for this intersection was 4.6 ppm, which indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 400,000 vehicles per day (Los Angeles 2016). With implementation of the Proposed Project, 155,383 daily vehicle trips are expected within the Project Area. There are no intersections in the Project Area that would experience daily trip volumes exceeding 400,000 vehicles per day (Fehr & Peer 2022). Furthermore, the Proposed Project has no potential to generate localized CO concentrations at intersections that exceed state CO standards. Impacts related to CO standards would therefore be *less than significant*.

Mitigation Measures

Proposed Project

Construction

Mitigation Measure 4.2-2.

Significance After Mitigation

Construction

Mitigation Measure 4.2-2 would reduce TAC emissions generated by construction activities, including equipment operation. For example, Tier 4 engines with horsepower ratings between 175 and 750 generate 90 percent less exhaust emissions, including diesel particulate matter, than Tier 2 or 3 engines (Los Angeles

2020b). Imposition of Mitigation Measure 4.2-2 would reduce impacts to *less than significant with mitigation*.

Operation

Less than significant without mitigation.

Threshold 4.2-4	Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people
------------------------	--

Impact 4.2-4 **Proposed Project:** The Proposed Project’s reasonably anticipated development for residential and commercial uses are not typically associated with odor complaints in the Project Area. Any light industrial uses would be subject to development standards, including buffer and screening requirements, to ensure compatibility with surrounding uses, and therefore would not result in exposure to off-site sensitive receptors. The Proposed Project includes standards for new buildings that would insulate against odor issues. Therefore, this impact would be *less than significant*.

Project Impact

Construction Odors

Potential sources that could emit odors during construction activities include equipment exhaust and paving and painting activities. Such odors are localized, generally confined to the immediate area surrounding a construction site and transitory in nature. In addition, odors associated with construction activities are not those typically associated with odor complaints. Construction activities in the Project Area would utilize typical construction techniques, and the odors would be typical of most construction sites and temporary in duration. Construction activity would not cause a significant odor nuisance reasonably anticipated development for the Proposed Project would not result in any other emissions that could adversely affect a substantial number of people. Therefore, impacts related to construction odors under the Proposed Project would be *less than significant*.

Operational Odors

According to the SCAQMD *CEQA Air Quality Handbook*, land uses and industrial operations that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies and fiberglass molding. Residential and commercial development are not included in this list. The light industrial uses are subject to development standards, including buffer and screening requirements, to ensure compatibility with surrounding uses; heavy industrial uses would not be permitted. The Proposed Project’s development would comply with Mitigation Measure Human Health Hazard in the CASP and City of LA Municipal Code Section 521.09, Noxious or Offensive Odors, code to prevent offensive odors from on-site activities to surrounding properties or the public. In addition, the Proposed Project would not generally promote the development of land uses inconsistent with those already existing in the CASP Area. On-site trash receptacles would have the potential to create adverse odors. Consistent with the Mayor’s Clean Streets LA Program, trash receptacles would be located and maintained in a manner that promotes odor control and would not result in substantially adverse odor impacts. Restaurant uses that may generate odors would be similar to existing uses within the Project Area and would be subject to the provisions of SCAQMD Rule 402 related to the prevention of public nuisance odors affecting a substantial number of people. Therefore, impacts related to operational odors under the Proposed Project would be *less than significant*.

Mitigation Measures

No significant impact related to odor has been identified; therefore, mitigation is not required for the Proposed Project.

CUMULATIVE IMPACTS

As discussed in subsection 4.2.2, *Environmental Setting*, the SCAB includes all of Orange County and the non-desert portions of Los Angeles, San Bernardino, and Riverside Counties. Cumulative projects would include any reasonably anticipated development in the Basin for regional air quality impacts, as well as reasonably anticipated development in the Project Area for localized air quality impacts. Air pollutant emissions in the SCAB are primarily generated by stationary and mobile sources.

AQMP Consistency

discussed in *Regulatory Framework* the SCAQMD is responsible for developing programs to reduce emissions from stationary, mobile, and indirect sources to meet national and state AAQS. The most recent of these programs is the 2022 AQMP. The 2022 AQMP represents a thorough analysis of existing and potential regulatory control options, includes available, proven, and cost-effective strategies, and seeks to achieve multiple goals in partnership with other entities promoting reductions in GHG emissions and toxic risk, as well as efficiencies in energy use, transportation, and goods movement.

AQMP consistency is discussed under Impact 4.2-1. As discussed therein, the Proposed Project's reasonably anticipated growth would not conflict with the 2020-2045 RTP/SCS. The AQMP was prepared to accommodate growth, to reduce the high levels of pollutants within areas under the jurisdiction of the SCAQMD, and to minimize the impact on the economy. Consistency with the AQMP is assessed by determining how a project accommodates increases in population or employment. The population and employment assumptions used by the SCAQMD to estimate regional emissions in the AQMP are obtained from SCAG projections for cities and unincorporated areas in the SCAQMD's jurisdiction. The Proposed Project would facilitate population growth not exceeding the SCAG population forecasts for the City as a whole. Therefore, implementation of the Proposed Project **would not conflict with the AQMP and would not contribute to a cumulatively considerable impact.**

Air Quality Standards

In order to assess cumulative impacts of emissions, the SCAQMD recommends that projects be evaluated to determine whether they would be consistent with AQMP performance standards and project-specific emissions thresholds. In the case of the Proposed Project, air pollutant emissions would be considered to be cumulatively considerable if the new sources of emissions exceed SCAQMD project-specific emissions thresholds. The cumulative context for consideration of most air quality impacts is the SCAB. The context for localized significance thresholds is within 1,500 feet of the project site per SCAQMD LST guidance, as health risks generally decrease by about 90 percent at 1,500 feet from the emission source (SCAQMD 2017).

As discussed under Impact 4.2-2, construction activities could result in significant impacts related to regional and localized emissions, along with TAC concentrations. Because construction activities are of limited duration and in a limited area, it is unlikely that construction currently underway would overlap with reasonably expected construction from the Proposed Project. However, without a specific construction schedule, timing and emission levels cannot be accurately estimated. Therefore, reasonably expected construction from the Proposed Project has the potential to be cumulatively considerable. Implementation of Mitigation Measure 4.2-2 would reduce regional and local emissions generated by various construction activities, including equipment operation, truck trips, and painting. However, it is possible that construction

activities associated with individual development projects citywide could generate emissions that would exceed the significance thresholds despite incorporation of Mitigation Measure 4.2-2. Because the SCAQMD indicates that projects that have significant impacts at a project level must also be determined to be significant at a cumulative level, this would result in a significant and unavoidable cumulative impact related to regional emissions of NO_x and localized emissions of NO_x, PM₁₀, and PM_{2.5}, along with TAC concentrations. In addition, operational emissions of VOCs, NO_x, CO, PM₁₀, and PM_{2.5} would potentially exceed SCAQMD thresholds and substantially contribute to cumulative long-term air quality impacts. Thus, the incremental effect of the Proposed Project related to construction activity and operation would be cumulatively considerable and cumulative impacts would be *significant and unavoidable*.

Operational Toxic Air Contaminants and CO Hotspots

As indicated under Impact 4.2-3, the Proposed Project would not result in localized CO concentrations that exceed SCAQMD CO significance thresholds. In addition, residential, commercial, and light industrial land uses are not considered land uses that generate substantial TAC emissions based on review of the air toxic sources listed in SCAQMD's and CARB's guidelines. Therefore, operational impacts on TAC and CO would be *less than significant*.

Odor

The Proposed Project's reasonably anticipated development for residential and commercial land uses are not typically associated with odor complaints. Any light industrial uses would be subject to development standards, including buffer and screening requirements, to ensure compatibility with surrounding uses. Heavy industrial uses are not permitted under the Proposed Project. While construction activity can emit odors, construction activity has not been identified as a source of odor complaints. Accordingly, future development occurring under the Proposed Project would not cause a construction-related odor nuisance. On-site trash receptacles would have the potential to create adverse odors. Consistent with the Mayors Clean Streets LA Program, trash receptacles would be located and maintained in a manner that promotes odor control. Cumulative impacts from Proposed Project related to odors is *less than significant*.

4.3 BIOLOGICAL RESOURCES

This section assesses potential impacts to biological resources. Topics addressed in this section include habitats and sensitive species; Significant Ecological Areas (SEAs); wetlands, streams, rivers, and riparian habitat; wildlife movement; Habitat Conservation Plans (HCPs); and other applicable plans, policies, and ordinances related to biological resources.

ENVIRONMENTAL SETTING

The City of Los Angeles (City) encompasses approximately 478 square miles and is surrounded by the San Gabriel Mountains to the north, the Santa Susana Mountains, Santa Monica Mountains, and Pacific Ocean to the west, the Pacific Ocean to the south, and the Verdugo Mountains, San Rafael Hills, and San Gabriel Valley to the east. Approximately 214 of 478 square miles in the City encompass hills and mountains that provide habitat for wildlife. Generally, open space is located in the northern portion of the City and the central and southern portions are highly urbanized. The City is also bisected by the channelized Los Angeles River (River).

The Cornfield Arroyo Seco Plan (CASP or “Project Area”) is approximately 600 acres (0.93 square miles) and is predominantly developed, with transportation infrastructure being a central feature of the Project Area. Interstate 5 (I-5) and State Route-110 (SR-110) bisect the northern portion of the Project Area. Entrances and exits to and from SR-110 are located on the northern perimeter of the Project Area. Entrances and exits to I-5 are located at North Broadway/Pasadena Avenue and at Avenue 26 across from Lacy Street. Other major arterials located in the Project Area include Figueroa Street in the northern portion, San Fernando Road in the central portion, and Spring Street in the southern portion. The Project Area is fully urbanized, and generally lacks native biological habitat. The Los Angeles River and Arroyo Seco, as well as small portions of parks and open space, trees, and minor urban landscaping, are the only sources of biological habitat in and around the Project Area.

SENSITIVE SPECIES AND HABITATS

Sensitive Natural Communities are plant communities listed with a high State rarity or threat ranking by the California Department of Fish and Wildlife (CDFW). Special-status species are sufficiently rare plant or animal species that are designated as endangered, threatened, candidate, or as some other special status, by federal, state, or local agencies, or by one or more collaborating conservation organizations, such as The California Native Plant Society (CNPS) and require special consideration or protection as a result. CDFW’s special-status species lists and the California Natural Diversity Database (CNDDDB) were consulted to determine whether any sensitive species could occur in the Project Area. CDFW’s Special Vascular Plants, Bryophytes, and Lichens List and Special Animals List are compilations of special-status plant and animal species, their designation, as well as any special considerations (e.g., only nesting individuals or specific populations protected) that are updated at least yearly. CNDDDB is a computerized inventory of status and locations of rare plants, animals, and communities that CDFW and/or the U.S. Fish and Wildlife Service (USFWS) have identified as rare, threatened, or endangered, or otherwise considered species of special concern in California.

Table 4.3-1 details special-status animal species and plant species listed on the CNDDDB that have been identified in the Project Area.

Table 4.3-1 lists ten special-status animals that have historical records in the CNDDDB from the Project Area, the oldest of which dates back as far as 130 years. Of those, two species have the Federal and State-listed status of endangered: least Bell’s vireo (*Vireo bellii pusillus*) and southwestern willow flycatcher (*Empidonax traillii extimus*). The most recent records for least Bell’s vireo and southwestern willow flycatcher in the Project Area occurred in 1894 and 1897, respectively. Both species are presumed to be extirpated from the Project Area (i.e., no longer in existence in the area). The bank swallow (*Riparia riparia*) is listed as state-threatened. The bank swallow was last observed in the Project Area in 1894 and is listed as extirpated in the Project Area. None of the other species are federal- or state-listed. There are six animal Species of Special Concern: the western mastiff bat (*Eumops perotis californicus*), burrowing owl (*Athene cunicularia*), big free-tailed bat (*Nyctinomops macrotis*), western spadefoot (*Spea hammondi*), Southern California legless lizard (*Anniella stebbinsi*), and American badger (*Taxidea taxus*). Hoary bat (*Lasiurus cinereus*) has no federal or state listing but is included with these species because of its inclusion in the CNDDDB. No special-status animal species have been sighted in the Project Area in the last 38 years.

Table 4.3-1 lists three plant species with historical occurrences in the Project Area, the oldest of which dates back 120 years. The plant species are listed as rare, threatened, or endangered by the CNPS, and have varying degrees of threatened severity in the state of California. Greata’s aster (*Symphoyotrichum greatae*) is not very threatened, prostrate vernal pool navarretia (*Navarretia prostrata*) is seriously threatened, and Salt Spring checkerbloom (*Sidalcea neomexicana*) is moderately threatened. All three plant species are listed as possibly extirpated and none have been documented from the Project Area in the last 91 years.

TABLE 4.3-1 SPECIAL-STATUS PLANT AND ANIMAL SPECIES OCCURRING IN THE PROJECT AREA						
Scientific Name	Common Name	Habitat	Federal Status ¹	State Status ²	CDFW ³	Rare Plant Rank ⁴
Plants						
<i>Symphoyotrichum greatae</i>	Greata’s aster	Chaparral, cismontane woodland, broadleaved upland forest, lower montane coniferous forest, riparian woodland. Mesic canyons. 335-2015 m.	None	None	n/a	1B.3
<i>Navarretia prostrata</i>	prostrate vernal pool navarretia	Coastal scrub, valley and foothill grassland, vernal pools, meadows and seeps. Alkaline soils in grassland, or in vernal pools. Mesic, alkaline sites. 3-1235 m.	None	None	n/a	1B.1
<i>Sidalcea neomexicana</i>	Salt Spring checkerbloom	Playas, chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub. Alkali springs and marshes. 0-1530 m.	None	None	n/a	2B.2
Animals						
<i>Anniella stebbinsi</i>	Southern California legless lizard	Generally south of the Transverse Range, extending to northwestern Baja California. Occurs in sandy or loose loamy soils under sparse vegetation. Disjunct populations in the Tehachapi and Piute Mountains in Kern County.	None	None	SSC	n/a

TABLE 4.3-1 SPECIAL-STATUS PLANT AND ANIMAL SPECIES OCCURRING IN THE PROJECT AREA

Scientific Name	Common Name	Habitat	Federal Status ¹	State Status ²	CDFW ³	Rare Plant Rank ⁴
<i>Spea hammondi</i>	western spadefoot	Occurs primarily in grassland habitats but can be found in valley-foothill hardwood woodlands.	None	None	SSC	n/a
<i>Riparia riparia</i>	bank swallow	Colonial nester; nests primarily in riparian and other lowland habitats west of the desert. Requires vertical banks/cliffs with fine-textured/sandy soils near streams, rivers, lakes, ocean to dig nesting hole.	None	Threatened	None	n/a
<i>Athene cunicularia</i>	burrowing owl	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.	None	None	SSC	n/a
<i>Vireo bellii pusillus</i>	least Bell's vireo	Summer resident of Southern California in low riparian in vicinity of water or in dry river bottoms; below 2000 ft. Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, Baccharis, mesquite.	Endangered	Endangered	None	n/a
<i>Empidonax traillii extimus</i>	southwestern willow flycatcher	Riparian woodlands in Southern California.	Endangered	Endangered	None	n/a
<i>Taxidea taxus</i>	American badger	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	None	None	SSC	n/a
<i>Nyctinomops macrotis</i>	big free-tailed bat	Low-lying arid areas in Southern California. Need high cliffs or rocky outcrops for roosting sites. Feeds principally on large moths.	None	None	SSC	n/a
<i>Lasiurus cinereus</i>	hoary bat	Prefers open habitats or habitat mosaics, with access to trees for cover and open areas or habitat edges for feeding. Roosts in dense foliage of medium to large trees. Feeds primarily on moths. Requires water.	None	None	None	n/a

TABLE 4.3-1 SPECIAL-STATUS PLANT AND ANIMAL SPECIES OCCURRING IN THE PROJECT AREA

Scientific Name	Common Name	Habitat	Federal Status ¹	State Status ²	CDFW ³	Rare Plant Rank ⁴
<i>Eumops perotis californicus</i>	western mastiff bat	Many open, semi-arid to arid, habitats, including conifer & deciduous woodlands, coastal scrub, grasslands, chaparral, etc. Roosts in crevices in cliff faces, high buildings, trees and tunnels.	None	None	SSC	n/a

Habitat types in the Project Area include urban developments, landscaped parks and other open spaces, and the Los Angeles River. No HCPs or Natural Community Conservation Plans (NCCPs) occur within the Project Area.

SIGNIFICANT ECOLOGICAL AREAS

Significant Ecological Areas (SEAs) are officially designated areas within Los Angeles County with irreplaceable biological resources. They are ecologically important land and water systems that support valuable habitat for plants and animals, and are often integral to the preservation of rare, threatened, or endangered species and the conservation of biological diversity.

There are no designated SEAs in the Project Area. The closest SEAs are Griffith Park to the northwest of the Project Area and the Puente Hills SEA to the east of the Project Area. Both of these SEAs occur more than 5 miles from the Project Area.

WETLANDS, STREAMS, AND RIPARIAN HABITATS

Wetlands are transitional lands between water and land systems where the water table is usually at or near the surface or the land is covered by shallow water, e.g., marshes and bogs. Riparian areas are those plant communities adjacent to and affected by surface or ground water of perennial or ephemeral water bodies such as rivers, streams, lakes, ponds, or other drainages. Wetlands and riparian vegetation provide a range of functions, such as water quality maintenance, flood control, bank stabilization, groundwater replenishment, and food, cover, and water for a diversity of wildlife species. Riparian vegetation and wetlands may also serve as stopover points for migrating birds. During the 20th century an estimated 95 percent of the wetlands along the Los Angeles coast disappeared, largely due to water being diverted by flood control and drainage systems, development of wetlands, encroachment, water contamination, and other impacts associated with urbanization.

A wetland is an area of land that is either inundated or saturated with surface or groundwater during a sufficient enough time period to support vegetation adapted for life in saturated soil conditions. Riparian areas are those plant communities adjacent to and dependent upon surface or groundwater, usually adjacent to rivers, streams, lakes, ponds, or other drainages. Wetlands and riparian vegetation provide many valuable functions, such as water quality maintenance, flood control, bank stabilization, groundwater replenishment, and food, cover, and water sources for a diversity of wildlife, for both residents and migratory species.

According to the USFWS National Wetlands Inventory, the only wetland areas in the Project Area are the Los Angeles River and Arroyo Seco. The portions of the Los Angeles River and Arroyo Seco in the Project Area are classified as Low Perennial Riverine with stretches of the River and Arroyo Seco containing artificial substrate (i.e., concrete) bottom that does not support riparian vegetation. Other portions of the River within the Project Area have an unconsolidated bottom that contains 25 percent cover of particles smaller than stones (less than 6-7 cm), and a vegetative cover less than 30 percent. The portions of the Los Angeles River and Arroyo Seco within the Project Area have potential to support limited riparian vegetation.

WILDLIFE CORRIDORS

Wildlife corridors are land segments that connect two or more large habitat areas and provide a habitat for movement of animals between those areas. They encourage protection and health of animal populations by enabling access to food, cover and water resources, and broader animal interchange for healthy species propagation and exchange of genetic material. Corridors can consist of several discontinuous areas such as wetlands, roadside vegetation, or small open spaces that act as stepping-stones across a larger uninhabitable landscape. However, they are often linear in nature such as riparian corridors, ridgelines, or powerline rights-of-way. Loss of corridors especially impacts large carnivores that need extensive territory for survival. As freeways and other barriers block corridors and as habitats shrink, large animals are forced from the city or are unable to survive.

The Project Area is entirely urbanized, and no Essential Connectivity Areas or Natural Landscape Blocks identified in the California Essential Habitat Connectivity Project (Spencer et al. 2010) are present in the Project Area. However, the Project Area does contain Natural Areas Smaller than 2,000 acres and the Los Angeles River is a Potential Riparian Connection that runs through the Project Area and could facilitate wildlife movement. Coyotes are known to use the Los Angeles River and may use it as a connector both to urban areas that supply food (i.e., trash and small pets) and shelter, as well as to more natural areas such as Elysian Park and Griffith Park.

HERITAGE TREES AND ORDINANCE-PROTECTED TREES AND SHRUBS

Heritage trees are individual trees of any size or species that are specially designated by the Los Angeles Department of Recreation and Parks (DRP) as “heritage” because of their historical, commemorative, or horticultural significance. Nominations are generally made by DRP staff members or community members. The City of Los Angeles online GIS mapper, NavigateLA, provides an inventory of all heritage trees on City park and recreation center properties.

As discussed below under *Regulatory Framework*, native Oak, Western or California Sycamore, California Bay, Southern California Black Walnut, toyon, and Mexican elderberry are protected by City Ordinance. Removal of these species requires a permit and replacement of lost trees or shrubs.

Per the NavigateLA mapper discussed above, ten heritage trees have been identified in the Project Area. All ten trees are located around the Downey Playground and Recreation Center and include six Canary Island date palms (*Phoenix canariensis*), two lavender trumpet trees (*Tabebuia avellanadae*), one camphor

tree (*Cinnamomum camphora*), and one California fan palm (*Washingtonia filifera*) (**Figure 4.3-1**). Additional protected trees could also be present on individual public and private properties throughout the Project Area.

REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding Biological Resources at the federal, state, and local levels. As described below, these plans, guidelines, and laws include the following:

- Federal Endangered Species Act
- Migratory Bird Treaty Act
- California Endangered Species Act
- California Migratory Bird Protection Act
- California Native Plant Protection Act
- Porter-Cologne Water Quality Control Act
- California Fish and Wildlife Code - Fully Protected Species and Species of Special Concern
- Fish and Wildlife Code Sections 3503 and 3513
- City of Los Angeles Municipal Code – Protected Trees and Shrubs
- City of Los Angeles Framework Element
- City of Los Angeles Conservation Element
- Los Angeles River Revitalization Master Plan
- River Implementation Overlay
- City of Los Angeles Stormwater Pollution Control Measures for Development Planning and Construction Activities Ordinance
- City of Los Angeles General Plan Open Space Element
- Heritage Trees

FEDERAL

National Environmental Policy Act

The National Environmental Policy Act (NEPA) was signed into law on January 1, 1970, and was one of the first laws written that established the broad national framework for protecting our environment. NEPA's basic policy is to assure that all branches of the federal government give proper consideration to the environment prior to undertaking any major federal action that significantly affects the environment. NEPA requirements are invoked when airports, buildings, military complexes, highways, parkland purchases, and other federal activities are proposed, including activities by state or local governments

Figure 4.3-1 Heritage Trees

using federal monies. Environmental Assessments (EAs) and Environmental Impact Statements (EISs), which are assessments of the likelihood of impacts from alternative courses of action, are required from all Federal agencies and are the most visible NEPA requirements.¹

NEPA requires federal agencies to assess the environmental effects of their proposed actions prior to making decisions. Regulations are codified annually in the *U.S. Code of Federal Regulations* (CFR). Title 40: Protection of Environment is the section of the CFR that deals with EPA's mission of protecting human health and the environment.² Title I of NEPA contains a Declaration of National Environmental Policy. This policy requires the federal government to use all practicable means to create and maintain conditions under which man and nature can exist in productive harmony.

Section 102 in Title I of the Act requires federal agencies to incorporate environmental considerations in their planning and decision-making through a systematic interdisciplinary approach. Specifically, all federal agencies are to prepare detailed statements assessing the environmental impact of and alternatives to major federal actions significantly affecting the environment. These statements are commonly referred to as Environmental Impact Statements (EIS) and Environmental Assessments (EA). The role of a federal agency in the NEPA process depends on the agency's expertise and relationship to the proposed action. The agency carrying out the federal action is responsible for complying with the requirements of NEPA. In some cases, there may be more than one federal agency involved in the proposed action. In this situation, a lead agency is designated to supervise the preparation of the environmental analysis. Federal agencies, together with state, tribal or local agencies, may act as joint lead agencies.³

Clean Water Act Section 404 and 401

Pursuant to Section 404 of the Clean Water Act, the Army Corps of Engineers (ACOE) and the United States Environmental Protection Agency (EPA) regulate the discharge of dredged and/or fill material into “waters of the United States” Navigable waters means waters of the United States, including the territorial seas. Waters of the United States means: (1) Jurisdictional waters. For purposes of the Clean Water Act, 33 U.S.C. 1251 et seq. and its implementing regulations, subject to the exclusions in paragraph (2) of this section, the term “waters of the United States” means: (i) The territorial seas, and waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including waters which are subject to the ebb and flow of the tide; (ii) Tributaries; (iii) Lakes and ponds, and impoundments of jurisdictional waters; and (iv) Adjacent wetlands.⁴ The term “wetlands” (a subset of waters of the United States) is defined in 33 Code of Federal Regulations (CFR) 328.3(b) as “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.”

Section 401 of the Clean Water Act requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into waters of the United States to obtain a certification that the discharge will comply with applicable effluent limitations and water quality standards. The certification must be obtained from the state in which the discharge originates or would originate, or, if appropriate, from the interstate water pollution control agency having jurisdiction over the affected waters at the point where the discharge originates or would originate. A certification obtained for the construction

of any facility must also pertain to the subsequent operation of the facility. Responsibility for the protection of water quality in California rests with the State Water Resources Control Board (SWRCB) and its nine Regional Water Quality Control Boards (RWQCBs). The agency with jurisdiction over projects in the City of Los Angeles is the Los Angeles Regional Water Quality Control Board.

U.S. Army Corps of Engineers

The U.S. Army Corps of Engineers (USACE) has primary federal responsibility for administering regulations that concern waters and wetlands in the Project area. In this regard, USACE acts under two statutory authorities, the Rivers and Harbors Act (33 U.S.C., Sections 9 and 10), which governs specified activities in navigable waters, and the Clean Water Act (Section 404), which governs specified activities in waters of the United States, including wetlands and special aquatic sites. Wetlands and non-wetland waters (e.g., rivers, streams, and natural ponds) are a subset of waters of the United States and receive protection under Section 404 of the Clean Water Act. USACE has primary federal responsibility for administering regulations that concern waters and wetlands in the project area under statutory authority of the Clean Water Act (Section 404). In addition, the regulations and policies of various federal agencies mandate that the filling of wetlands be avoided to the maximum extent feasible. USACE requires obtaining a permit if a project proposes placing structures within navigable waters and/or alteration of waters of the United States.

Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act (16 U.S.C. 661 et seq.) requires that federal agencies consult with the U.S. Fish and Wildlife Service, the National Marine Fisheries Service and State wildlife agencies for activities that affect, control, or modify waters of any stream or bodies of water, in order to minimize the adverse impacts of such actions on fish and wildlife resources and habitat. This consultation is generally incorporated into the process of complying with Section 404 of the Clean Water Act, NEPA or other federal permit, license, or review requirements.

Marine Mammal Protection Act

The Marine Mammal Protection Act of 1972, and as amended, establishes federal responsibility for the protection and conservation of marine mammal species by prohibiting the harassment, hunting, capture, or killing of any marine mammal. The primary authority for implementing the act belongs to the United States Fish and Wildlife Service and National Marine Fisheries Service.⁵

Federal Noxious Weed Act

Federal Noxious Weed Act - Public Law 93-629 (7 U.S.C. 2801 et seq.; 88 Stat. 2148), enacted January 3, 1975, established a Federal program to control the spread of noxious weeds. The Secretary of Agriculture was given the authority to designate plants as noxious weeds by regulation, and the movement of all such weeds in interstate or foreign commerce was prohibited except under permit. The Secretary was also given authority to inspect, seize and destroy products, and to quarantine areas if necessary to prevent the spread of such weeds. The Secretary was also authorized to cooperate with other Federal, State and local agencies, farmers associations and private individuals in measures to control, eradicate, or prevent or retard the spread of such weeds.⁶

Federal Endangered Species Act

The federal Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 et seq.), provides the regulatory framework for the protection of plant and animal species (and their associated critical habitats), which are formally listed, proposed for listing, or candidates for listing as endangered or threatened under the ESA. The ESA has four major components: (1) provisions for listing species; (2) requirements for consultation with the United States Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service; (3) prohibitions against “taking” of listed species; and (4) provisions for permits that allow an incidental “take.”⁷

The USFWS implements the ESA through a program that identifies and provides for protection of various species of fish, wildlife, and plants deemed to be in danger of or threatened with extinction. As part of this regulatory act, ESA provides for designation of critical habitat, defined in ESA Section 3(5)(A) as specific areas within the geographical range occupied by a species where physical or biological features “essential to the conservation of the species” are found and that “may require special management considerations or protection.” Critical habitat may also include areas outside the current geographical area occupied by the species that are nonetheless “essential for the conservation of the species.” The ESA also requires preparation of recovery plans for listed species.

Section 7 of the ESA requires federal agencies to aid in the conservation of listed species, and to ensure that the activities of federal agencies will not jeopardize the continued existence of listed species or adversely modify designated critical habitat. During the CEQA review process, the USFWS and the National Marine Fisheries Service are each given the opportunity to comment on the potential of a project to impact listed plants and animals to ensure adequate protection of listed species that may be affected by the project.

Migratory Bird Treaty Act

All migratory bird species that are native to the United States or its territories are protected under the federal Migratory Bird Treaty Act (MBTA). The MBTA prohibits any person unless permitted by regulations, to “pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird, included in the terms of this Convention...for the protection of migratory birds...or any part, nest, or egg of any such bird” (16 U.S. Code 703). The list of migratory birds protected by the MBTA includes nearly all bird species native to the United States. The statute was extended in 1974 to include parts of birds, as well as eggs and nests. Thus, it is illegal under the MBTA to take (including killing, capturing, selling, trading, and transport) protected migratory bird species without prior authorization by the Department of Interior U.S. Fish and Wildlife Service.⁸ Activities that result in removal or destruction of an active nest (a nest with eggs or young being attended by one or more adults) would violate the MBTA. While destruction of a nest by itself is not prohibited under the MBTA, nest destruction that results in the unpermitted take of migratory birds or their eggs, is illegal and fully prosecutable under the MBTA.

⁷ The California Endangered Species Act defined the term “take” as follows: “to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill, Fish & Game Code, §86.” California Department of Fish & Wildlife, *Threatened and Endangered Species*, available online at: <https://wildlife.ca.gov/Conservation/CESA>, accessed on May 17, 2022. Federal Endangered Species Act defines a “take” as follows: “Harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.” 16 U.S.C., §1532 (19). U.S. Fish & Wildlife Service, *Endangered Species Act*, 16 U.S.C. 1531-1544. Available online at: <https://www.fws.gov/law/endangered-species-act>, accessed on May 17, 2022.

⁸ U.S. Fish & Wildlife Service, *Migratory Bird Treaty Act of 1918*. Available online at: <https://www.fws.gov/birds/policies-and-regulations/laws-legislations/migratory-bird-treaty-act.php>, accessed on May 17, 2022.

With respect to nesting birds, although the MBTA does not itself provide specific take avoidance measures, the United States Fish and Wildlife Service and California Department of Fish and Wildlife, over time, have developed a set of measures sufficient to demonstrate take avoidance, included during construction activities, which include conducting brush removal, tree trimming, building demolition and/or construction, or grading activities outside of the nesting season. California Department of Fish and Wildlife biologists have defined the nesting season as February 15 through August 31 (January 15 to August 31 for raptors). If other timing restrictions make it impossible to avoid the nesting season, prior to issuance of a grading, construction or building permit including demolition permit, the following measures are required as described below:

- Vegetation removal activities shall be scheduled outside the nesting season (September 1 to February 14 for songbirds; September 1 to January 14 for raptors) to avoid potential impacts to nesting birds. This includes vegetation removal associated with on-going fuel modification activities.
- Any construction activities or fuel modification activities that occur during the nesting season (February 15 to August 31 for songbirds; January 15 to August 31 for raptors) shall require that all suitable habitats be thoroughly surveyed for the presence or absence of nesting birds by a qualified biologist monitor (i.e., a professional biologist with a minimum of two years of avian survey experience or equivalent) before the commencement of clearing. If any active nests are detected, a buffer of at least 300 feet (500 feet for raptors), or as determined appropriate by the qualified biologist monitor, shall be delineated, flagged, and avoided until the nesting cycle is complete as determined by the qualified biologist monitor.

STATE

California Department of Fish and Wildlife

Stream and Riparian Habitat

Pursuant to California Fish and Game Code Section 1600, CDFW has authority over all perennial, intermittent, and ephemeral rivers, streams, and lakes in the state, and requires any person, state or local governmental agency, or public utility to notify the CDFW before beginning any activity that would “substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake” that supports fish or wildlife resources.

A stream is defined as a “body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation” (California Code of Regulations, Title 14 §1.72). A Lake or Streambed Alteration Agreement may be required for any proposed project that would result in an adverse impact to a river, stream, or lake. CDFW jurisdiction typically extends to the top of the bank and out to the outer edge of adjacent riparian vegetation if present. However, CDFW can take jurisdiction over a body of flowing water and the landform that conveys it, including water sources and adjoining landscape elements that are byproducts of and affected by interactions with flowing water without regard to size, duration, or the timing of flow.⁹

⁹ California Department of Fish & Wildlife, *Water Rights*, 2022. Available online at: <https://wildlife.ca.gov/Conservation/Watersheds/Water-Rights>, accessed on May 18, 2022.

Special-Status Wildlife Protection

Special Animal

Special-status wildlife species are those species included on the CDFW “Special Animals” list.¹⁰ “Special Animal” is a general term that refers to all of the taxa the CNDDDB is interested in tracking, regardless of their legal or protection status. The CDFW considers the taxa on this list to be those of greatest conservation need. The species on this list generally fall into one or more of the following categories:

- Officially listed or proposed for listing under the state and/or federal Endangered Species Acts.
- State or federal candidate for possible listing.
- Taxa that meet the criteria for listing, even if not currently included on any list, as described in
- Section 15380 of the California Environmental Quality Act Guidelines.
- Taxa considered by the Department to be a Species of Special Concern.
- Taxa that are biologically rare, very restricted in distribution, declining throughout their range, or have a critical vulnerable stage in their life cycle that warrants monitoring.
- Populations in California that may be on the periphery of a taxon’s range but are threatened with extirpation in California.

CDFW Species of Special-Concern

A Species of Special Concern (SSC) is a species, subspecies, or distinct population of an animal native to California that currently satisfies one or more of the following (not necessarily mutually exclusive) criteria.

- Is extirpated from the State or, in the case of birds, is extirpated in its primary season or breeding role
- Is listed as Federally-, but not State-, threatened or endangered; meets the State definition of threatened or endangered but has not formally been listed
- Is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for State threatened or endangered status
- Has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for State threatened or endangered status

It is the goal and responsibility of CDFW to maintain viable populations of all native species. To this end, CDFW has designated certain vertebrate species as SSC because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction. The goal of designating SSCs is to halt or reverse their decline by calling attention to their plight and addressing the issues of concern early enough to secure their long-term viability. Not all SSCs have declined equally; some species may be just starting to decline, while others may have already reached the point where they meet the criteria for listing as a threatened or endangered under state and/or federal endangered species acts.

¹⁰ California Natural Diversity Database (CNDDDB). California Department of Fish and Wildlife. Special Animals List 2021. <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109406&inline>, accessed 11/22/2021.

Special-Status Plant Protection

Special Plant

“Special Plants” is a broad term used to refer to all the plant taxa inventoried by the CDFW’s CNDDDB, regardless of their legal or protection status. Special Plants include vascular plants as well as high priority bryophytes (mosses, liverworts, and hornworts) and lichens. Special Plant taxa are species, subspecies, or varieties that fall into one or more of the following categories. Not all plants within each category are necessarily tracked as Special Plants but these categories are often used as a starting point when determining which plants are tracked by the CNDDDB:

- Officially listed by California or the Federal Government as Endangered, Threatened, or Rare;
- A candidate for state or federal listing as Endangered, Threatened, or Rare;
- Taxa listed in the California Native Plant Society’s Inventory of Rare and Endangered Plants of California;
- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the California Environmental Quality Act (CEQA) Guidelines; these taxa may indicate “None” under listing status, but note that all California Rare Plant Rank 1 and 2 and some Rank 3 and 4 plants may fall under Section 15380 of CEQA;
- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation;
- A Bureau of Land Management, U.S. Fish and Wildlife Service, or U.S. Forest Service Sensitive Species/Species of Conservation Concern;
- Population(s) in California that may be peripheral to the major portion of a taxon’s range but are threatened with extirpation in California; and
- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g., wetlands, riparian, vernal pools, old growth forests, desert aquatic systems, native grasslands, valley shrubland habitats).

California Fish and Game Code Section 1600

Under sections 1600 et. seq. of California Fish and Game Code, CDFW regulates activities that would divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake that supports fish or wildlife and requires a Streambed Alteration Agreement for such activities. The CDFW issues a Streambed Alteration Agreement with any necessary mitigation to ensure protection of the State’s fish and wildlife resources. The CDFW has jurisdiction over riparian habitats associated with watercourses.

California State Water Resources Control Board/Regional Water Quality Control Board

The California State Water Resources Control Board (SWRCB) and the RWQCB maintain regulatory responsibility for management of wetlands and waterbodies in California and may review wetland delineations in concert with the USACE under Section 401 of the Clean Water Act.

Together the SWRCB and Los Angeles RWQCB have jurisdiction over “waters of the State,” (WOS) which are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. The SWRCB or local RWQCB have not established regulations for field determinations of waters of the state except for wetlands currently. The RWQCB are affected by or shares USACE jurisdiction unless

isolated conditions or ephemeral waters are present. Each local RWQCB may delineate their jurisdictions of waters of the State differently based on current interpretations of jurisdiction.

Procedures for defining RWQCB jurisdiction pursuant to the SWRCB's *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* went into effect May 28, 2020. The SWRCB define an area as wetland if, under normal circumstances:

- (i) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both;
- (ii) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and
- (iii) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

The SWRCB's Implementation Guidance for the Wetland Definition and Procedures for Discharges of Dredge and Fill Material to Waters of the State (2020), states that waters of the U.S. and waters of the State should be delineated using the standard USACE delineation procedures, taking into consideration that the methods shall be modified only to allow for the fact that a lack of vegetation does not preclude an area from meeting the definition of a wetland.

NatureServe Element Ranking for Plants

The CNDDDB uses a ranking methodology maintained and periodically revised by NatureServe. It includes a Global rank (G rank), describing the rank for a given taxon over its entire distribution and a State rank (S rank), describing the rank for the taxon over its state distribution. For subspecies and varieties, there is also a "T" rank describing the global rank for the subspecies or variety. The next section of this document details the criteria used to assign element ranks, from G1 to G5 for the Global rank and from S1 to S5 for the State rank, as described below:

- G1 - Critically imperiled; at very high risk of extinction or elimination due to very restricted range, very few populations or occurrences, very steep declines, very severe threats, or other factors.
- G2 - Imperiled; at high risk of extinction or elimination due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- G3 - Vulnerable; at moderate risk of extinction or elimination due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- G4 - Apparently secure; at fairly low risk of extinction or elimination due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
- G5 - Secure; at very low risk of extinction or elimination due to a very extensive range, abundant populations or occurrences, and little to no concern from declines or threats
- S1 - Critically imperiled; at very high risk of extirpation in the jurisdiction due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
- S2 - Imperiled; at high risk of extirpation in the jurisdiction due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- S3 - Vulnerable; at moderate risk of extirpation in the jurisdiction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- S4 - Apparently secure; at a fairly low risk of extirpation in the jurisdiction due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.

- S5 - Secure; at very low or no risk of extirpation in the jurisdiction due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

California Rare Plant Ranks

The California Rare Plant Rank (CRPR) status applies to plants only. The CRPRs are a ranking system originally developed by the CNPS to better define and categorize rarity in California's flora. All plants tracked by the CNDDDB are assigned to a CRPR category. These categories are:

- 1A Presumed extirpated in California and either rare or extinct elsewhere
- 1B Rare or Endangered in California and elsewhere
- 2A Presumed extirpated in California, but more common elsewhere
- 2B Rare or Endangered in California, but more common elsewhere
- 3 Plants for which we need more information – Review list
- 4 Plants of limited distribution – Watch list

In addition, the CRPR use a decimal-style threat rank. The threat rank is an extension added onto the CRPR and designates the level of threats by a 1 to 3 ranking with 1 being the most threatened and 3 being the least threatened. Most CRPRs read as 1B.1, 1B.2, 1B.3, etc. Note that some Rank 3 plants do not have a threat code extension due to difficulty in ascertaining threats for these species. Rank 1A and 2A plants also do not have threat code extensions since there are no known extant populations of the plants in California.

Natural Community Conservation Act

The Natural Community Conservation Act (NCCA) (CFG Chapter 10, Division 3, Sections 2800 et seq.) was enacted in 1991. NCCA is administered by CDFW. The goal of this Act is to identify and secure habitat areas for protection of biodiversity. Habitat areas are identified by CDFW, and plans are prepared for habitat protection. When a development project is proposed, a determination is made concerning the potential impacts of the project on biodiversity and the best means of avoiding or mitigating them. NCCA allows local, state, or federal agencies to enter into agreements with public and private entities to implement a "natural community conservation plan" (NCCP); e.g., habitat and species protection within a specified geographic area. Participation in an NCCP does not exempt a development project from CEQA. Mitigation measures pursuant to CEQA may, as an alternative, include participation in an NCCP to reduce the burden for on-site mitigation.

Sensitive Vegetation Communities

Sensitive vegetation communities are natural communities and habitats that are either unique, of relatively limited distribution in the region, or of particularly high wildlife value. These resources have been defined by federal, state, and local conservation plans, policies, or regulations. The CDFW ranks such vegetation communities as "threatened" or "very threatened" and keeps records of their occurrences in the California Natural Diversity Database (CNDDDB). Sensitive vegetation communities are also identified by the CDFW on its List of California Natural Communities Recognized by the CNDDDB. Impacts to these vegetation communities and habitats identified in local or regional plans, policies, regulations, or by federal or state agencies must be considered and evaluated under CEQA.¹¹

¹¹ California Department of Fish & Wildlife, *Natural Communities*. Available online at: <https://wildlife.ca.gov/Data/VegCAMP/Natural-Communities>, accessed on May 10, 2022.

Habitat Conservation Plans

HCPs, designated under the federal Endangered Species Act Section 10(a)(1)(B), are federal planning documents designed to conserve the ecosystems upon which listed species depend, ultimately contributing to their recovery. HCPs provide a “take permit” when a project will affect a species identified as listed, non-listed or eligible under the act and detail how those impacts will be minimized or mitigated, and how the HCP is to be funded.¹² No HCPs are located in the Project Area.

California Endangered Species Act

Under the California Endangered Species Act, the California Department of Fish and Wildlife (CDFW) is responsible for maintaining a list of threatened and endangered species (California Department of Fish and Game Code Section 2070).¹³ The CDFW also maintains a list of candidate species, which are species formally under review for addition to either the list of endangered species or the list of threatened species.

The California Endangered Species Act prohibits the take of plant and animal species that the California Fish and Game Commission has designated as either threatened, rare, or endangered in California. “Take” in the context of this regulation means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill a listed species (California Fish and Game Code Sections 86 and 2080). The take prohibitions also apply to candidates for listing under the California Endangered Species Act. However, Section 2081 of the act allows the department to issue permits for the minor and incidental take of species by an individual or permitted activity listed under the act.

In accordance with the requirements of the California Endangered Species Act, an agency reviewing a project within its jurisdiction must determine if any state-listed endangered, rare, threatened, or candidate species could be present in the project area. The agency also must determine if the project could have a potentially significant impact on such species. In addition, the CDFW encourages informal consultation on any project that could affect any state-listed endangered, rare, threatened, or candidate species.

California Migratory Bird Protection Act

Assembly Bill 454 (AB 454), the California Migratory Bird Protection Act, which expires on January 20, 2025, makes unlawful the taking or possession of any migratory nongame bird designated in the federal MBTA before January 1, 2017, any additional migratory nongame bird that may be designated in the federal act after that date, or any part of those migratory nongame birds, except as provided by rules and regulations adopted by the United States Secretary of the Interior under the federal act before January 1, 2017, or subsequent rules or regulations adopted pursuant to the federal act, unless those rules or regulations are inconsistent with the Fish and Game Code.

¹² U.S. Fish and Wildlife Service, *Habitat Conservation Plans: Overview*. Available online at: <http://www.fws.gov/endangered/what-we-do/hcp-overview.html>, accessed May 13, 2022.

¹³ *The commission shall establish a list of endangered species and a list of threatened species. The commission shall add or remove species from either list if it finds, upon the receipt of sufficient scientific information pursuant to this article, and based solely upon the best available scientific information, that the action is warranted. (Amended by Stats. 2018, Ch. 329, Sec. 4. (SB 473) Effective January 1, 2019.) State of California, Senate Bill No. 473 – Chapter 329, September 2018. Available online at: https://leginfo.ca.gov/faces/billPdf.xhtml?bill_id=201720180SB473&version=20170SB47391CHP, accessed on May 18, 2022.*

California Native Plant Protection Act

The California Native Plant Society (CNPS) maintains a list of special-status plant species based on collected scientific information. Designation of these species by CNPS has no legal status or protection under federal or state endangered species legislation. CNPS designations are defined as List 1A (plants presumed extinct); List 1B (plants rare, threatened, or endangered in California and elsewhere); List 2 (plants rare, threatened, or endangered in California, but more numerous elsewhere); List 3 (plants about which more information is needed – a review list); and List 4 (plants of limited distribution - a watch list). In general, plants appearing on CNPS List 1A, 1B, or 2 meet the criteria of Section 15380 of the CEQA Guidelines; thus, substantial adverse effects to these species would be considered significant. Additionally, plants constituting CNPS List 1A, 1B, or 2 meet the definitions of California Department Fish and Game Code Section 1901 (Native Plant Protection Act) or Sections 2062 and 2067 (California Endangered Species Act).

Porter-Cologne Water Quality Control Act

Waters of the State are defined by the Porter-Cologne Water Quality Control Act as “any surface water or groundwater, including saline waters, within the boundaries of the state.” The RWQCB protects all waters in its regulatory scope but has special responsibility for isolated wetlands and headwaters. These water bodies have high resource value, are vulnerable to filling, and may not be regulated by other programs, such as Section 404 of the Clean Water Act. Waters of the State are regulated by the RWQCB under the State Water Quality Certification Program, which regulates discharges of dredged and fill material under Section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act. Projects that require a Corps permit, or fall under other federal jurisdiction, and have the potential to impact waters of the State are required to comply with the terms of the State Water Quality Certification Program. If a proposed project does not require a federal license or permit but does involve activities that may result in a discharge of harmful substances to waters of the State, the RWQCB has the option to regulate such activities under its State authority in the form of Waste Discharge Requirements or Certification of Waste Discharge Requirements.

California Fish and Wildlife Code - Fully Protected Species and Species of Special Concern

The classification of “fully protected species” was the CDFW’s initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under CESA and/or FESA. The California Fish and Wildlife Code Sections (fish at Section 5515, amphibians and reptiles at Section 5050, birds at Section 3511(b), and mammals at Section 4700) dealing with “fully protected” species state that these species “may not be taken or possessed at any time and no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to take any fully protected species,” although take may be authorized for necessary scientific research. This language makes the “fully protected” designation the strongest and most restrictive regarding the “take” of these species. In 2003, the California Fish and Wildlife Code sections dealing with fully protected species were amended to allow the CDFW to authorize takings resulting from recovery activities for state-listed species.

Species of “special concern” are broadly defined as animals not listed under the FESA or CESA, but that are nonetheless of concern to the CDFW because they are declining at a rate that could result in listing or because they historically occurred in low numbers and known threats to their persistence currently exist.¹⁴ This designation is intended to result in special consideration for these animals by the CDFW, land

¹⁴ California Department of Fish & Wildlife, *Species of Special Concern*. Available online at: <https://wildlife.ca.gov/Conservation/SSC>, accessed May 17, 2022.

managers, consulting biologists, and others, and is intended to focus attention on the species to help avert the need for listing under FESA and CESA, and recovery efforts that might ultimately be required. This designation is also intended to stimulate collection of additional information on the biology, distribution, and status of poorly known at-risk species, and focus research and management attention on them. Although these species generally have no special legal status, they may require consideration under CEQA during project review if they meet the definition of endangered, rare, or threatened species in CEQA Guidelines Section 15380, which is not limited to listed species.

Fish and Wildlife Code Sections 3503 & 3513

According to Section 3503 of the California Fish and Game Code it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird (except English sparrows (*Passer domesticus*) and European starlings (*Sturnus vulgaris*)). Section 3503.5 specifically protects birds in the orders Falconiformes and Strigiformes (birds-of-prey). Section 3513 essentially overlaps with the Migratory Bird Treaty Act (MBTA), prohibiting the take or possession of any migratory non-game bird. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered a “take” by the CDFW. The same procedures identified above to avoid a violation of the federal Migratory Bird Treaty Act are recognized by the CDFW to avoid a take in violation of these provisions.

LOCAL

Los Angeles City Fire Department (LAFD) Brush Clearance Requirements

According to Chapter 49 of the California Fire Code (Section 4906.3), which regulates hazardous vegetation and fuel management:

Hazardous vegetation and fuels around all applicable buildings and structures shall be maintained in accordance with the following laws and regulations:

- **Public Resources Code, Section 4291.** “Maintain defensible space of 100 feet from each side and from the front and rear of the structure.... The amount of fuel modification necessary shall take into account the flammability of the structure as affected by building material, building standards, location, and type of vegetation. Fuels shall be maintained in a condition so that a wildfire burning under average weather conditions would be unlikely to ignite the structure.”
- **California Code of Regulations, Title 14, Division 1.5, Chapter 7, Subchapter 3, Section 1299** (see guidance for implementation "General Guideline to Create Defensible Space"). “(A) Dead and dying woody surface fuels and aerial fuels shall be removed. Loose surface litter, normally consisting of fallen leaves or needles, twigs, bark, cones, and small branches, shall be permitted to a maximum depth of three inches (3 in.). (B) Cut annual grasses and forbs down to a maximum height of four inches (4 in.). (C) All exposed wood piles must have a minimum of ten feet (10 ft.) of clearance, down to bare mineral soil, in all directions.”
- **California Code of Regulations, Title 19, Division 1, Chapter 1, Subchapter 1, Section 3.07.** “(1) Maintain around and adjacent to such building or structure a firebreak made by removing and clearing away, for a distance of not less than 30 feet on each side thereof or to the property line, whichever is nearer, all flammable vegetation or other combustible growth. This section does not apply to single specimens of trees, ornamental shrubbery, or similar plants which are used as ground cover, if they do not form a means of rapidly transmitting fire from the native growth to any building or structure. (2) Maintain around and adjacent to any such building or structure additional fire protection or firebreak made by removing all bush, flammable vegetation, or combustible growth which is located from 30 feet to 100 feet from such building or structure or to the property line, whichever is nearer, as may be required by the enforcing agency if he finds that, because of

extra hazardous conditions, a firebreak of only 30 feet around such building or structure is not sufficient to provide reasonable fire safety. Grass and other vegetation located more than 30 feet from such building or structure and less than 18 inches in height above the ground may be maintained where necessary to stabilize the soil and prevent erosion.”

These codes require fuel management and maintenance of defensible space, particularly in Very High Fire Hazard Severity Zones as well as adjacent to existing structures. The codes do not provide exceptions to fuel modification requirements for the purposes of maintaining habitat around protected trees or sensitive habitat. These requirements for fuel management include trees, as well as shrubs and grasses.

City of Los Angeles Municipal Code – Protected Trees and Shrubs

Native species of oak (*Quercus* sp., except scrub oak [*Q. dumosa*]), Southern California black walnut (*Juglans californica*), California bay laurel (*Umbellularia californica*) and western sycamore (*Platanus racemosa*) trees at least four inches in diameter (cumulative for multi-trunked trees) at 4.5 feet above the ground level at the base of the tree (or “diameter-at-breast height,” or DBH) are protected in the City under Ordinance No. 177,404, which became effective April 23, 2006. On December 11, 2020, the City adopted Ordinance No. 186,873, extending protection status to include two native shrub species, the Mexican Elderberry (*Sambucus mexicana*) and Toyon (*Heteromeles arbutifolia*) shrubs and amending provisions of Sections 12.21, 17.02, 17.05, 17.06, 17.51, 46.00, 46.01, 46.02, 46.03, 46.04, and 46.06 of the Los Angeles Municipal Code (LAMC).

Section 17.05 of the LAMC prohibits, without a permit, the removal of any regulated protected tree including “acts which inflict damage upon root systems or other parts of the tree...” and requires replacement of all regulated protected trees that are removed on at least a four-to-one basis with trees that are of a protected variety. Replacement trees must be at least 15 gallons or larger, measure one inch or more in diameter at a foot above the base, and measure at least seven feet in height from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced. A protected tree shall only be replaced by other protected tree varieties and shall not be replaced by shrubs, and similarly, a protected shrub shall only be replaced by other protected shrub varieties and shall not be replaced by trees, to the extent feasible as determined by the Advisory Agency, Board of Public Works (Board), or certified arborist. Further, when replacing more than two protected trees or shrubs, the permit at issue must be considered at a full public hearing of the Board. The City also requires preparation of a report by a tree expert identifying protected on-site trees, impacts to trees related to grading and construction, and mitigation measures for impacts to protected trees. However, native trees that have been planted as part of a tree planting program are exempt from this Ordinance and are not considered protected.

City of Los Angeles Framework Element

The Citywide General Plan Framework Element (Framework Element) establishes the conceptual basis for the City’s General Plan. The Framework Element sets forth a comprehensive Citywide long-range growth strategy and defines Citywide policies regarding land use, housing, urban form and neighborhood design, open space and conservation, economic development, transportation, infrastructure and public services. Chapter 6, Open Space and Conservation, of the City’s Framework Element identifies goals, objectives, and policies for the City relative to biological resources. As shown in Table 4.3-2, Objective 6.1 of the Open Space and Conservation Chapter of the City’s Framework Element specifies the protection of “the City’s natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City’s natural resources to contribute to the sustainability of the region.” Policy 6.1.2 requires the coordination of “City operations and development policies for the protection and conservation of open space resources, by ... preserving habitat linkages, where feasible, to provide wildlife corridors and to protect natural animal ranges.”

City of Los Angeles Conservation Element

The Conservation Element adopted in 2001 (Los Angeles, City of. 2001a), contains policies related to the identification and protection of sensitive plant, animal species, significant ecological areas (SEAs) and other resources. State law recognizes that state requirements regarding the content of one element may overlap the requirements of another. As allowed by State law, Los Angeles has opted to incorporate natural open space agricultural and other open space features of the State’s open space requirements into the Conservation Element, which primarily addresses preservation, conservation, protection, and enhancement of the city’s natural resources.

State law intends that conservation elements address "conservation, development, and utilization of natural resources including water and hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources." State general plan legislation was amended (1995) to require that preparation of the water portion of the general plan address water and land reclamation, water (including ocean) pollution, regulation and use of land in stream beds, erosion, watershed protection, flood control and rock, sand and gravel resources. Open space, as defined by the California Government Code (Section 65560), is "any parcel or area of land or water that essentially is unimproved and devoted to an open-space use," including:

- preservation of natural resources, e.g., preservation of flora and fauna (animal habitats), bird flyways, ecologic and other scientific study areas, watershed;
- managed production of resources, e.g., recharge of ground water basins or containing mineral deposits that are in short supply;
- outdoor recreation, e.g., beaches, waterways, utility easements, trails, scenic highway corridors; and/or public health and safety, e.g., flood, seismic, geologic or fire hazard zones, air quality enhancement.¹⁵

TABLE 4.3-2 RELEVANT GENERAL PLAN FRAMEWORK ELEMENT BIOLOGICAL RESOURCES GOALS, OBJECTIVES, AND POLICIES	
Goal/Objective/Policy	Goal/Objective/Policy Description
Framework Element	
Goal 6A	An integrated Citywide/regional public and private open space system that serves and is accessible by the City's population and is unthreatened by encroachment from other land uses
Objective 6.1	Protect the City's natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region.
Policy 6.1.1	Consider appropriate methodologies to protect significant remaining open spaces for resource protection and mitigation of environmental hazards, such as flooding, in and on the periphery of the City, such as the use of tax incentives for landowners to preserve their lands, development rights exchanges in the local area, participation in land banking, public acquisition, land exchanges, and Williamson Act contracts.
Policy 6.1.2	Coordinate City operations and development policies for the protection and conservation of open space resources, by: <ul style="list-style-type: none"> • Encouraging City departments to take the lead in utilizing water re-use technology, including graywater and reclaimed water for public landscape maintenance purposes and such other purposes as may be feasible.

¹⁵ City of Los Angeles, *Conservation Element of the City of Los Angeles General Plan, at p.I-2, 2001*. Available online at: https://planning.lacity.org/odocument/28af7e21-ffdd-4f26-84e6-dfa967b2a1ee/Conservation_Element.pdf, accessed on May 17, 2022.

TABLE 4.3-2 RELEVANT GENERAL PLAN FRAMEWORK ELEMENT BIOLOGICAL RESOURCES GOALS, OBJECTIVES, AND POLICIES	
Goal/Objective/Policy	Goal/Objective/Policy Description
	<ul style="list-style-type: none"> Preserving habitat linkages, where feasible, to provide wildlife corridors and to protect natural animal ranges; and Preserving natural viewsheds, whenever possible, in hillside and coastal areas.
Policy 6.1.3	Reassess the environmental importance of the County of Los Angeles designated Significant Ecological Areas (SEAs) that occur within the City of Los Angeles and evaluate the appropriateness of the inclusion of other areas that may exhibit equivalent environmental value.
Policy 6.1.4	Conserve, and manage the undeveloped portions of the City's watersheds, where feasible, as open spaces which protect, conserve, and enhance natural resources.
Policy 6.1.5	Provide for an on-site evaluation of sites located outside of the targeted growth areas, as specified in amendments to the community plans, for the identification of sensitive habitats, sensitive species, and an analysis of wildlife movement, with specific emphasis on the Framework Element's Technical Background Report and Environmental Impact Report.
Policy 6.1.6	Consider preservation of private land open space to the maximum extent feasible. In areas where open space value determines the character of the community, development should occur with special consideration of these characteristics.
Policy 6.1.7	Encourage an increase of open space where opportunities exist throughout the City to protect wild areas such as the Sepulveda Basin and Chatsworth Reservoir.
Conservation Element – Endangered Species	
Policy 1	Continue to require evaluation, avoidance, and minimization of potential significant impacts, as well as mitigation of unavoidable significant impacts of sensitive animal and plant species and their habitats and habitat corridors relative to land development activities.
Policy 2	Continue to administer city-owned and managed properties so as to protect and/or enhance the survival of sensitive plant and animal species to the greatest practical extent.
Policy 3	Continue to support legislation that encourages and facilitates protection of endangered, threatened, sensitive and rare species and their habitats and habitat corridors.
Conservation Element – Habitat	
Policy 1	Continue to identify significant habitat areas, corridors, and buffers and to take measures to protect, enhance and/or restore them.
Policy 2	Continue to protect, restore, and/or enhance habitat areas, linkages, and corridor segments, to the greatest extent practical, within City owned or managed sites.
Policy 3	Continue to work cooperatively with other agencies and entities in protecting local habitats and endangered, threatened, sensitive, and rare species.
Policy 4	Continue to support legislation that encourages and facilitates protection of local native plant and animal habitats.
SOURCE: City of Los Angeles. 2021b. The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan, originally adopted 1996, re-adopted 2001; City of Los Angeles, City of Los Angeles General Plan Conservation Element, adopted 2001.	

Los Angeles River Revitalization Master Plan

The City of Los Angeles adopted the Los Angeles River Revitalization Master Plan (LARRMP) in 2007 with the goal of restoring the ecological and hydrological functioning of the River, through the recreation of a riparian habitat corridor in the channel, and through the removal of concrete walls where feasible. This would help restore a continuous, functioning riparian ecosystem that supports vegetation as well as birds and mammals, and developing fish passages, fish ladders, and riffle pools.

Development and implementation of the LARRMP would maintain the River as a resource that provides flood protection and opportunities for recreational and environmental enhancement, as well as intend to improve the aesthetics of the region, enrich the quality of life for residents, and help sustain the economy of the region. Goals of the plan include:

- Establishing environmentally sensitive urban design guidelines, land use guidelines, and development guidelines for the River zone that would create economic development opportunities to enhance and improve River-adjacent communities by providing open space, housing, retail spaces such as restaurants and cafes, educational facilities, and places for other public institutions.
- Improving the environment, enhancing water quality, improving water resources, and improving the ecological functioning of the River
- Providing public access to the River
- Providing significant recreation space and open space, new trails, and improve natural habitats to support wildlife
- Preserving and enhancing the flood control features of the River
- Fostering growth in community awareness of the River, and pride in the River

River Implementation Overlay

The River Implementation Overlay (RIO) is a citywide zoning ordinance (No. 183,145) that applies to properties in close proximity to the Los Angeles River. Per Section 13.17(a), the purposes of the ordinance include but are not limited to: supporting the goals of the LARRMP, contributing to the environmental and ecological health of the City's watersheds, and providing a native habitat and supporting local species. Specific references are made in the ordinance to the LARRMP's native landscaping guidelines.

City of Los Angeles Stormwater Pollution Control Measures for Development Planning and Construction Activities Ordinance

Through LAMC Section 64.72, the City of Los Angeles has established Low Income Development (LID) practices and standards that aim to mitigate stormwater pollution and maximize open, green, and pervious areas on all new developments or redevelopments. The LID Ordinance requires developments of any kind to comply with the Development Best Management Practices Handbook. It also requires all development to be designed to manage and capture stormwater runoff to the maximum extent feasible. Suggested practices, in priority order, include infiltration, evapotranspiration, and capture and use, treated through high-removal-efficiency biofiltration/biotreatment systems.

City of Los Angeles General Plan Open Space Element

The Open Space Element of the General Plan includes goals, objectives, policies, and programs directed towards the regulation of publicly and privately owned lands both for the benefit of the public, and for the protection of individuals from the misuse of these lands. The Open Space Element provides guidance and general policies for the conservation and preservation of open space¹⁶ areas containing the City's environmental resources including air and water.

¹⁶ City of Los Angeles- Department of City Planning, *Open Space Plan*, at p.1. 1973. City Plan Case No. 24533. Available online at: https://planning.lacity.org/Code_Studies/GeneralElement/openspaceelement.pdf; accessed May 17, 2022.

Heritage Trees

The City of Los Angeles maintains an inventory of trees with historical, commemorative, or horticultural significance that the City intends to maintain and preserve on City properties, including parks. Heritage trees are not required to be one of the protected tree types covered by the Tree Preservation Ordinance. The list of heritage trees is maintained by the City of Los Angeles Department of Recreation and Parks (DRP).

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Thresholds of significance are based on the questions in Appendix G of the CEQA Guidelines. Biological resource impacts that may result from implementation of the Proposed Project would be significant if the Project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service (Threshold 4.3-1)
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service (Threshold 4.3-2)
- Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means (Threshold 4.3-3)
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites (Threshold 4.3-4)
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance (Threshold 4.3-5)
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan (Threshold 4.3-6)

METHODOLOGY

This section outlines the methodology for evaluating impacts to biological resources, including sensitive natural communities and special-status species. For purposes of this analysis, “special-status species” include:

- Plants and wildlife species listed as rare, threatened, or endangered under the ESA or the CESA
- Species that are candidates for listing under federal or state law
- Species designated by the USFWS as Proposed or Candidates for listing and/or species designated as Species of Special Concern by CDFW
- Species protected by the federal Migratory Bird Treaty Act
- Species identified as rare, threatened, or endangered by the California Native Plant Society (CNPS)

- Any other species that may be considered endangered or rare pursuant to CEQA Guidelines Section 15380(b)

The analysis of biological resource impacts was based on review of applicable biological resource databases, plans, and policies, as described in the Environmental Setting, as well as review of aerial photography such as Google Earth and aforementioned online database mappers. Impacts to biological resources could include the direct take of a species or the removal or disturbance of habitats from future development or more indirect delayed or secondary effects from future development, such as fragmentation, pollination interruption, plant and wildlife dispersal interruption, increased risk of fire, and increased invasion of non-native animals and plants that out-compete natives.

The impact area studied in this analysis considered potential impacts to biological resources in the CASP (including all open space areas), and portions of the Los Angeles River and Arroyo Seco within and immediately adjacent to the Project Area. With the exception of migratory birds, urban parcels within and adjacent to the CASP are not expected to contain special-status species or sensitive natural communities.

PROJECT IMPACTS

Threshold 4.3-1	Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service
------------------------	--

Impact 4.3-1 **Proposed Project:** The Project Area is urbanized and lacks suitable habitat that would support special-status plant or animal species; therefore, the potential to adversely affect endangered and special-status plant and animal species would be low. However, a variety of bird species protected by the MBTA are adapted to human activity and may utilize existing trees and shrubs for nesting or foraging. Temporary direct and indirect impacts from the Proposed Project include the removal or degradation (e.g., excessive noise, dust, or light) of this habitat. The following mitigation measures and regulatory requirements would ensure that temporary impacts to special-status species, such as the burrowing owl, which have been known to nest in manmade objects, and migratory birds would be *less than significant with mitigation*.

Project Impact

As shown in **Table 4.3-2**, there are ten special-status animals and three special status plants that have been reported from the Project Area. Of the identified species, none have been sighted in over 38 years in the Project Area. Three animal species are identified as endangered or threatened by the CDFW and/or USFWS, and six animal species are identified as Species of Special Concern. Three plant species are identified as having a CRPR of 1 or 2. The Proposed Project's potential impact on these sensitive species is discussed below.

The Proposed Project would not foreseeably result in modification of any portions of the Los Angeles River or Arroyo Seco because the Proposed Project does not include components that would affect the existing use, zoning, or land use designation of the Los Angeles River or Arroyo Seco. The segments of the Los Angeles River and Arroyo Seco located in the Project Area contain limited riparian or other habitat for plant or animal species, as it is channelized and located in an urban environment. Zoning updates as part of the Proposed Project include the expansion of the Open Space 1 (OS1) zone along the Los Angeles River and Arroyo Seco, while the existing Public Facilities zoning around the remaining sections of the Los

Angeles River within the Project Area would remain unchanged. The future introduction of riparian habitat into the Project Area is discussed in Impact 4.3-2.

Threatened and Endangered Animal Species

According to the CNDDDB, the most recent records for the endangered southwestern willow flycatcher (*Empidonax traillii extimus*) and least Bell's vireo (*Vireo bellii pusillus*) in the Project Area occurred in 1894 and 1897, respectively. Both species are presumed to be extirpated from the Project Area. The habitat for the southwestern willow flycatcher is riparian woodlands, which the Project Area does not contain. Impacts to the southwestern willow flycatcher are not likely to occur as a result of the Proposed Project. The habitat for least Bell's vireo is generally low riparian in vicinity of water or in dry river bottoms. The Project Area does not contain suitable riparian habitat. As such, impacts to the least Bell's vireo would not occur as a result of Project implementation. The bank swallow was last observed in the Project Area in 1894 and is listed as extirpated in the Project Area. The habitat for this species is primarily riparian and other lowland habitats west of the desert. The Project Area does not contain suitable riparian or lowland habitat. As such, impacts to bank swallow would not occur as a result of Project implementation. Areas upstream of the Project Area where more extensive riparian habitat is present do not contain recent occurrences of these species. Therefore, there would be **no impact** to threatened or endangered animal species as part of the proposed project.

Although there are no records in the CNDDDB for monarch butterfly (*Danaus plexippus* pop. 1, Federal Candidate), there have been several observations documented in iNaturalist. No observations of roosting trees in the Project Area have been documented in either the CNDDDB or iNaturalist. Impacts to this species would be **less than significant**.

Species of Special Concern

The Species of Special Concern that have been historically sighted in the Project Area include the burrowing owl, western spadefoot, Southern California legless lizard, American badger, big free-tailed bat, and western mastiff bat. According to CNDDDB, all six species are presumed to be extant in the Project Area. The burrowing owl was last documented in the Project Area in 1921, and the habitat includes open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. However, this species has been known to frequent disturbed areas and an iNaturalist record from 2018 occurs less than two miles from the Project Area. Western spadefoot was last documented in the Project Area in 1921, and the habitat includes grasslands, but can be found in valley-foothill hardwood woodlands. Southern California legless lizard was last documented in the Project Area in 1964 and occurs in sandy or loose loamy soils under sparse vegetation. American badger habitat includes drier open stages of most shrub, forest, and herbaceous habitats with friable soils. The CNDDDB occurrence date within Project Area for the American badger is Unknown. The western mastiff bat was last documented in the Project Area in 1990. Its habitat is defined as open and semi-arid to arid, including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. The big free-tailed bat was last documented in the Project Area in 1985, and habitat includes high cliffs and rocky outcroppings, which are used for roosting sites. The areas in which these six species were historically found are developed today with urban uses. The Project Area does not provide ideal or even marginal habitat for any of these species, although, burrowing owls have been known to nest in manmade objects such as pipes and riprap. However, due to the high level of disturbance in the Project Area, this species still has a low potential to occur. These species have a low potential to occur; however, if present in the Project Area, impacts would be **potentially significant**.

Rare Plant Species

Rare plant species that have been historically sighted in the Project Area include prostrate vernal pool navarretia (*Navarretia prostrata*), Salt Spring checkerbloom (*Sidalcea neomexicana*), and Greata's aster (*Symphyotrichum greatae*). All three plant species are possibly extirpated in the Project Area due to lack of suitable habitat and recent observations. The habitat for the prostrate vernal pool navarretia includes coastal scrub, grasslands, vernal pools, and meadows, and the species was last observed in the Project Area in 1907. The habitats for Salt Spring checkerbloom and Greata's aster include chaparral and coniferous forest, and the species was last observed in the Project Area in 1902 and 1932, respectively. Based on the type of habitat and quality of habitat for these species, all three plant species have a CNDDDB Occurrence Rank of None within the Project Area. There is *no impact*.

Migratory Birds

Project Area development could involve construction activity during the bird nesting season, which is generally from March 1 through August 31, and begins as early as February 1 for raptors. Much of the Project Area is highly urbanized and lacking trees likely to contain active bird nests. However, many bird species are now adapted to human disturbance and may nest throughout the Project Area. As such, tree trimming or removal as well as removal of vacant structures in the Project Area would have the potential to disturb any active nests, which could constitute a violation of the federal MBTA and/or the CFGC. In addition to direct impacts to nesting birds, temporary, indirect impacts including excessive noise or dust could affect birds and other wildlife using the Los Angeles River and Arroyo Seco. Therefore, impacts to active bird nests would be *potentially significant*.

Although the CEQA Guidelines do not identify the need to analyze environmental impacts from the Proposed Project on non-special status species, in light of a recent court decision in 2023, and out of an abundance of caution, we have included the following discussion. This is not intended to establish a precedent to include similar analyses in subsequent CEQA documents.

Temporary impacts, both direct and indirect from individual projects covered by the Proposed Project, include the removal or degradation (e.g., excessive noise or dust) of habitat (both nesting and foraging) for various wildlife species. Trees removed would not only reduce the amount of nesting habitat but also available perches and food for foraging. CDFW's comments on the Notice of Preparation identified wading bird habitat as a potential issue. The Proposed Project will not directly impact the Los Angeles River and Arroyo Seco; therefore, wading bird habitat will not be impacted. Due to the generally short-term nature of these impacts, the existing ongoing disturbances associated with urban development, the inclusion and protection of Open Space in the Proposed Project's design requirements, as well as the replacement of native habitats (i.e., River Area Planting native landscaping requirements under the Proposed Project and the planned Metro LA River Path), the Proposed Project is not anticipated to impact wildlife, including special status species. However, out of an abundance of caution, based on the above-described court decision regarding wildlife and implementing a conservative approach, there is a possibility that the Proposed Project may result in impacts to non-special status species wildlife for construction noise and dust. Using this conservative approach, the Proposed Project has the potential to cause significant impacts to wildlife and these impacts would be *potentially significant*.

Mitigation Measures

Mitigation Measure 4.3-1 and 4.3-2 below would address impacts related to the potential disturbance of special-status species. Additionally, Mitigation Measure AQ1-1 would reduce impacts from fugitive dust and Mitigation Measures 4.11-1 and 4.11-2 would reduce impacts from construction noise.

4.3-1 Biological Resources Assessment

For individual projects that will include disturbance of vegetation, trees, structures, or other areas where biological resources could be present, a qualified biologist shall be retained by the applicant to conduct an initial site assessment. The assessment will include a review of the California Natural Diversity Database (CNDDB) and iNaturalist maps to determine where sightings have occurred or habitats for nesting birds, or bat species have previously been identified. A site assessment survey may be required for sites that are in proximity to areas where habitats for nesting birds or bat species occur. Species-specific surveys may be required for sites that contain suitable habitats for nesting birds or bat species.

Mitigation Measures 4.3-2(a) and 4.3-2(b) below would address impacts related to the potential disturbance of active bird nests.

4.3-2(a) Pre-Construction Bird Nest Surveys and Avoidance

For projects in the Project Area, a pre-construction survey for nesting bird, including ground nest birds, shall be conducted no more than ten days prior to initiation of ground disturbance and vegetation removal activities for any grading or construction activity initiated during the bird nesting season (February 1 – August 31).

The nesting bird pre-construction survey shall be conducted on foot by a qualified biologist and shall include a 100-foot buffer around the construction site. If nests are found, an avoidance buffer (dependent upon the species, the proposed work activity, and existing disturbances associated with land uses outside of the site) shall be determined and demarcated by the biologist with bright orange construction fencing, flagging, construction lathe, or other means to mark the boundary. All construction personnel shall be notified as to the existence of the buffer zone and to avoid entering the buffer zone during the nesting season. No ground disturbing activities or vegetation removal shall occur within this buffer until the biologist has confirmed that breeding/nesting is completed and the young have fledged the nest. Encroachment into the buffer shall occur only at the discretion of the qualified biologist on the basis that the encroachment will not be detrimental to an active nest. A Statement of Compliance signed by the Applicant and Owner is required to be submitted to LADBS at plan check and prior to the issuance of any permit. Any survey, report, construction monitoring, and implementation of protective measures conducted shall be documented by a qualified biologist and shall be provided to the City upon request. Best management practices (BMPs) to avoid disturbing nesting birds, including burrowing owls, during construction include visually check all sections of pipe or other construction materials for the presence of wildlife before moving and capping or elevating the ends of all pipes or similar construction materials while storing to prevent wildlife from entering them.

4.3-2(b) Notification

All project applicants will be notified of and shall include on their plans an acknowledgement of the requirement to comply with the federal MBTA and CFGC to not destroy active bird nests and of best practices recommended by qualified biologist to avoid impacts to active nests, including checking for nests prior to construction activities during February 1-August 31 and what to do if an active nest is found, including inadvertently during grading or construction activities. Such best practices shall include giving an adequate construction and grading buffer to avoid the active nest during construction.

Significance After Mitigation

Implementation of the above mitigation measures would reduce potential impacts to special-status species such as the burrowing owl and active bird nests to a *less-than-significant* level by ensuring that active nests are identified and avoided, as necessary. Additionally, Mitigation Measure AQ1-1 would reduce impacts from fugitive dust and Mitigation Measures 4.11-1 and 4.11-2 would reduce impacts from construction noise. Therefore, impacts would *be less than significant with mitigation*.

Threshold 4.3-2	Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service
------------------------	--

Impact 4.3-2 **Proposed Project:** No riparian or sensitive natural communities are in or adjacent to the Project Area. As such, Plan implementation would have a *less than significant impact* with respect to natural communities.

Project Impact

There are no riparian habitats or sensitive natural communities located in the Project Area. In addition, there are no Significant Ecological Areas (SEAs) located in the Project Area. Although the Los Angeles River contains portions of riparian habitat located along the banks in some portions throughout the City, there are no riparian habitats in the Project Area. The Project Area does contain some vegetation, including algal blooms, along the portions of the River with an unconsolidated bottom. However, this vegetation is sparse and weedy, based on observations of the top bank during a reconnaissance survey, and would not be delineated as riparian.

The Los Angeles River Revitalization Master Plan proposes to enhance and create riparian habitat along the sides of the River, which could occur in the Project Area. A long-term goal of the River Master Plan is to restore the ecological and hydrological functioning of the River, through the recreation of a riparian habitat corridor within the channel, and through the removal of concrete walls where feasible. This would help restore a continuous, functioning riparian ecosystem that supports vegetation as well as birds and mammals, and developing fish passages, fish ladders, and riffle pools (City of Los Angeles 2007).

The Proposed Project does not include any development on the Los Angeles River or Arroyo Seco and development in the vicinity of the River or Arroyo Seco would be separated by the new Open Space and existing Public Facility zoning. Therefore, the Proposed Project would not interfere with implementation of the Los Angeles River Revitalization Master Plan. Since no riparian or sensitive communities currently exist, impacts would be *less than significant*.

Mitigation Measures

No significant impacts have been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.3-3	Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means
------------------------	--

Impact 4.3-3 **Proposed Project:** Implementation of the Proposed Project would not result in an adverse effect to the Los Angeles River or Arroyo Seco and no other wetlands are located in or adjacent to the Project Area. However, indirect impacts could result from excessive dust generated by developments occurring in the vicinity of the Los Angeles River and Arroyo Seco. Impacts to wetlands would be *less than significant with mitigation incorporated*.

Project Impact

According to the USFWS National Wetlands Inventory, the only wetlands in the Project Area are the Los Angeles River, which runs along the western edge and through the center of the Project Area boundary, and the Arroyo Seco, which runs through the northern boundary of the Project Area (USFWS 2022). The portions of the Los Angeles River and Arroyo Seco in the Project Area are classified as Low Perennial Riverine, with stretches of the River and Arroyo Seco containing artificial substrate bottom and the remainder being unconsolidated bottom. Reasonably anticipated development from the Proposed Project would not directly affect the Los Angeles River or Arroyo Seco. However, direct impacts to wetlands could occur from stormwater runoff and temporary, indirect impacts could result from excessive dust generated by developments occurring in the vicinity of the Los Angeles River and Arroyo Seco.

The Los Angeles River Revitalization Master Plan includes goals of improving water quality, and creating and restoring habitat within and adjacent to the River. These restoration goals intend to ensure that any growth directly adjacent to the River would improve and not degrade existing conditions. Any development that would occur in areas in the vicinity of the River or Arroyo Seco would be required to adhere to the Proposed Project's new Form District regulations, which require that any building be set back a minimum distance of 50 feet from the River or Arroyo Seco, as well as new River Area Planting requirements and Development Standard Rules set forth in the new Zoning Code to not disturb the River or Arroyo Seco, or otherwise conflict with the goals of the River Revitalization Master Plan. As described in Section 4.9, *Hydrology and Water Quality* of this Draft EIR, the City's Stormwater and Urban Runoff Pollution Control Ordinance would require future development in the Project Area to comply with the Standard Urban Stormwater Mitigation Plan (SUSMP) requirements, which require the inclusion of Best Management Practices in a project's design to prevent, control and reduce stormwater pollutants, if applicable; integrate LID practices and standards for stormwater pollution mitigation; and maximize open, green, and pervious space on all development consistent with the City's landscape ordinance and other related requirements to ensure that construction does not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality that could affect downstream waterways including the River. Implementation of the Proposed Project would not have an adverse effect to the Los Angeles River or Arroyo Seco and no other wetlands are located in or adjacent to the Project Area. However, indirect impacts from excessive dust generated by developments occurring in the vicinity of the Los Angeles River and Arroyo Seco could be *potentially significant*.

Mitigation Measures

Mitigation Measure AQ1-1 in section 4.2 *Air Quality* would address impacts related to fugitive dust.

Significance After Mitigation

The inclusion of Mitigation Measure AQ1-1 would reduce potential impacts from fugitive dust. Implementation of the above mitigation measures would reduce potential impacts to wetlands to a *less-than-significant* level by ensuring that fugitive dust is avoided.

Threshold 4.3-4	Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites
------------------------	--

Impact 4.3-4 **Proposed Project:** The Los Angeles River and Arroyo Seco serve as wildlife corridors in the Project Area. No portion of the Proposed Project would alter the Project Area's concrete-lined portion of the River or Arroyo Seco in any way, including allowing development that could impede wildlife movement along its course. Additionally, future development would be subject to outdoor lighting and glare standards, native landscaping requirements, and river setback standards. Impacts would be *less than significant*.

Project Impact

As discussed in the Environmental Setting, the Project Area is completely developed and does not contain any Essential Connectivity Areas or Natural Landscape Blocks. The Project Area does contain Natural Areas Smaller than 2,000 acres and, the Los Angeles River and Arroyo Seco are Potential Riparian Connections that run through the Project Area and could facilitate wildlife movement. However, no portion of the Proposed Project would alter the Project Area's concrete-lined portion of the River or Arroyo Seco in any way, including allowing development that could impede wildlife movement along its course. In addition, future development along the Los Angeles River and Arroyo Seco would follow all adjacency buffers, outdoor lighting and glare standards, and river setback standards within the Proposed Project. These include new River Area Planting native landscaping requirements, a river setback requirement, and additional lighting standards when along a Special River Lot Line, which for example limit outdoor lighting to no greater than 0.01 horizontal footcandles 15 feet beyond the site. Therefore, impacts would be *less than significant*.

Mitigation Measures

No significant impacts have been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.3-5	Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance
------------------------	---

Impact 4.3-5 **Proposed Project:** The City will comply with the goals, policies and programs of the General Plan Framework, Conservation Element, and the Los Angeles River Revitalization Master Plan in all of its discretionary actions and approvals, and future development resulting from the Proposed Project will comply with the City's Tree Preservation Ordinance; therefore, the Proposed Project will not conflict any local policies or ordinances. Impacts will be *less than significant*.

Project Impact

As discussed in **Table 4.3-3** below, the Proposed Project would not conflict with goals, policies, and programs of the General Plan Framework or the City Conservation Element. Reasonably anticipated development from the Proposed Project would include infill development in an urban area and, therefore,

would not interfere with natural resources or degrade the sustainability of natural resources in the region. The Proposed Project would not disrupt existing open space or encroach upon any natural settings. As discussed under Impact 4.3-2, any development that would occur in areas in the vicinity of the River or Arroyo Seco would be required to adhere to the Form District regulations, which require that any building be set back a minimum distance of 50 feet from the River, as well as new River Area Planting requirements and Development Standards set forth in the New Zoning Code in order to not disturb the River or otherwise conflict with the goals of the Los Angeles River Revitalization Master Plan.

TABLE 4.3-3 PROJECT CONSISTENCY WITH RELEVANT GENERAL PLAN FRAMEWORK ELEMENT BIOLOGICAL RESOURCES GOALS, OBJECTIVES, AND POLICIES	
Goal/Objective/Policy	Consistency
Framework Element	
<p>Goal 6A An integrated Citywide/regional public and private open space system that serves and is accessible by the City's population and is unthreatened by encroachment from other land uses.</p>	<p>Consistent The Proposed Project encompasses the Cornfield Arroyo Seco Specific Plan area in Los Angeles, an urban area that lacks substantial open spaces. Reasonably anticipated development from the Proposed Project would not adversely affect planned private or public open spaces. To the contrary, the Project encourages the preservation and enhancement of existing parks as well as the revitalization of adjacent segments of the Los Angeles River in accordance with the River Revitalization Master Plan.</p>
<p>Objective 6.1 Protect the City's natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region.</p>	<p>Consistent By facilitating infill development in the Project Area and focusing new development in an already urban portion of Los Angeles, the Proposed Project would help relieve pressure for encroachment of urban development into areas containing natural resources to accommodate projected growth.</p>
Conservation Element – Habitat	
<p>Policy 1 Continue to identify significant habitat areas, corridors, and buffers and to take measures to protect, enhance and/or restore them.</p>	<p>Consistent The Project Area encompasses an urban area that generally lacks native biological habitat. By facilitating development in an already urbanized area, the Proposed Project would avoid potential impacts to habitat areas and corridors. In addition, any development that would occur in areas adjacent to the river would be required to adhere to the development standards set forth in the new Zoning Code in order to not disturb the Los Angeles River or otherwise conflict with the goals of the River Revitalization Master Plan, which seeks to improve water quality, create and restore habitat within and adjacent to the river. Future development along the Los Angeles River and Arroyo Seco would follow all adjacency buffers, outdoor lighting and glare standards, and river setback standards within the Proposed Project. These include new River Area Planting native landscaping requirements, a river setback requirement, and additional lighting standards when along a Special River Lot Line.</p>
<p>Policy 2 Continue to protect, restore, and/or enhance habitat areas, linkages and corridor segments, to the greatest extent practical, within City owned or managed sites.</p>	<p>Consistent The Project Area is in an urban area of Los Angeles that generally lacks native biological habitat. By facilitating development in an already urbanized area, the Proposed Project would avoid potential impacts to habitat areas and corridors.</p>

TABLE 4.3-3 PROJECT CONSISTENCY WITH RELEVANT GENERAL PLAN FRAMEWORK ELEMENT BIOLOGICAL RESOURCES GOALS, OBJECTIVES, AND POLICIES	
<p>Policy 3 Continue to work cooperatively with other agencies and entities in protecting local habitats and endangered, threatened, sensitive, and rare species.</p>	<p>Not Applicable This policy is aimed at working with other entities to protect habitats, which is not the specific purpose of the Proposed Project. Nevertheless, as noted above, reasonably anticipated development from the Proposed Project would include infill development, thus relieving pressure for encroachment of urban development into areas containing natural resources.</p>
<p>Policy 4 Continue to support legislation that encourages and facilitates protection of local native plant and animal habitats.</p>	<p>Not Applicable This policy is aimed at support for legislation that would protect native plant and animal habitats, which is not the specific purpose of the Proposed Project. Nevertheless, as noted above, reasonably anticipated development from the Project would include infill development, thus relieving pressure for encroachment of urban development into areas containing natural resources.</p>
<p>SOURCE: City of Los Angeles. 2001b. The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan, originally adopted 1996, re-adopted 2001; City of Los Angeles, City of Los Angeles General Plan Conservation Element, adopted 2001.</p>	

It is illegal in the City of Los Angeles to remove or fatally harm protected trees and shrubs without issuance of a permit by the Los Angeles Department of Public Works (LADPW). As discussed above, DRP identifies heritage trees in the City, although heritage trees are not protected unless they are one of the protected species included in the Tree Preservation Ordinance. There are 10 heritage trees documented in the Project Area. Future development occurring in the Project Area is not expected to impact these heritage trees since these trees are located on public property and DRP is responsible for the maintenance and protection of heritage trees from injury.

Some ordinance-protected trees may be located on private property and in street rights-of-way. The number of protected trees within the Project Area is unknown. Per Protected Tree and Shrub Regulation 4(a), in the event that the LADPW approves a protected tree removal, replacement of the tree would be required with at least four trees of a protected variety (Ordinance No. 186,873). The Proposed Project does not include any components that would preclude implementation of or alter these policies or procedures. Thus, implementation of the Proposed Project would not conflict with any local policies or ordinances protecting biological resources, including protected trees. Therefore, impacts related to local policies or ordinances protecting biological resources would be *less than significant*.

Mitigation Measures

No significant impacts have been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.3-6	Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.
------------------------	---

Impact 4.3-6 **Proposed Project:** The Proposed Project would not conflict with any adopted Habitat Conservation Plans (HCPs), Natural Community Conservation Plans (NCCPs), or other approved local, regional, or state plans because no such plans apply to the Project Area. Thus, there would be *no impact*.

Project Impact

There are no HCPs located in or near the Project Area. There are no NCCPs or other local, regional, or state HCPs in or near the Project Area. The closest NCCP (Palos Verdes NCCP) and HCP (Orange County Transportation Authority HCP) are both located more than five miles from the Project Area.

Implementation of the Proposed Project does not have the potential to conflict with adopted HCPs, NCCPs, or other approved local, regional, or state HCPs because the Project Area is not subject to any such plans. Thus, there would be *no impact*.

Mitigation Measures

No significant impacts have been identified; therefore, mitigation is not required for the Proposed Project.

CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable biological resource impacts includes the Project Area and immediately adjacent areas that could be indirectly affected.

Sensitive Species and Habitats, including Riparian Habitats

Development in the Project Area and the immediately surrounding area, generally would not affect sensitive plant or animal species since Los Angeles is largely urbanized and the General Plan Framework and other policy documents primarily emphasize infill development in already urbanized areas that lack native biological habitats. Isolated individual projects within and surrounding the Project Area may adversely affect sensitive species and habitats, but such impacts would be addressed on a case-by-case basis as part of project-level environmental reviews. Cumulative impacts would not be significant. Moreover, as discussed under Impacts 4.3-1 through 4.3-3, because the Project Area is completely urbanized, implementation of the Proposed Project would not contribute to any cumulative impacts to sensitive species or habitats.

Trees located throughout the Project Area could potentially support migratory birds. As discussed previously, the MBTA protects migratory avian species, including sensitive species. Compliance with the MBTA throughout the City would ensure that cumulative impacts to migratory birds would not be significant. Mitigation Measures 4.3-1(a) and 4.3-1(b) have been included in this EIR as an added precaution to provide additional requirements to ensure compliance with federal and state requirements. These mitigation measures along with the MBTA would ensure that future development in the Project Area would not contribute to cumulatively considerable impacts related to bird nest disturbance.

Based on the above information, cumulative impacts to sensitive species and habitats could occur; however, the incremental contribution of the Proposed Project to sensitive species and habitats would not be cumulatively considerable and cumulative impacts related to sensitive species and habitats would be *less than significant*.

Wildlife Movement

As discussed under Impact 4.3-4, the Project Area encompasses the Los Angeles River and Arroyo Seco, which serve as wildlife movement corridors; therefore, the Project Area serves to encourage wildlife movement as opposed to deter it. Project Area development generally would not disrupt wildlife movement because future development in the Project Area would primarily focus on infill development where wildlife corridors are not present. Nevertheless, developments in Natural Areas Smaller than 2,000 acres may have the potential to affect wildlife movement. Based on this information, the incremental contribution of the Proposed Project would not be cumulatively considerable and cumulative impacts related to wildlife movement would be *less than significant*.

Heritage Trees and Other Protected Trees

The City's Tree Preservation Ordinance provides protection for four tree species and two shrub species citywide, as previously discussed. All future development in the Project Area would also be subject to these

existing ordinances and regulations. Compliance with the Tree Preservation Ordinance would ensure that there would be no net loss of protected trees or shrubs. Based on this information, the incremental effect of the Proposed Project is not cumulatively considerable and cumulative impacts related to Tree Preservation Ordinance and other local policies would be *less than significant*.

Habitat and Natural Community Plans

As discussed under Impact 4.3-6, no portion of the City or Project Area is subject to a Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan. Thus, cumulative impacts related to such plans would not occur and the incremental contribution of the Proposed Project would not be cumulatively considerable and the Project would have *no cumulative impact* related to Habitat and Natural Community Plans.

4.4 CULTURAL RESOURCES

This section provides an overview of cultural resources and evaluates impacts associated with the Proposed Project. Topics addressed include historical and archaeological resources, as well as human remains.

CULTURAL SETTING

INDIGENOUS HISTORY

Numerous chronological sequences have been devised to aid in understanding cultural changes in southern California. Building on early studies and focusing on data synthesis, Wallace (1955; 1978) developed a prehistoric chronology for the southern California coastal region that is still widely used today and is applicable to near-coastal and many inland areas, including the current project site. Four periods are presented in Wallace's prehistoric sequence: Early Man, Milling Stone, Intermediate, and Late Prehistoric. Although Wallace's (1955) synthesis initially lacked chronological precision due to a paucity of absolute dates (Moratto 1984), this situation has been alleviated in recent years by the compilation of thousands of radiocarbon dates obtained by southern California researchers (Byrd and Raab 2007). Several revisions have been made to Wallace's (1955) synthesis using radiocarbon dates and projectile point assemblages (e.g., Koerper and Drover 1983; Mason and Peterson 1994; Koerper et al. 2002).

Horizon I - Early Man (ca. 10,000 – 6000 BCE)

When Wallace defined the Horizon I (Early Man) period in the mid-1950s, there was little evidence of human presence on the southern California coast prior to 6000 BCE. Archaeological work in the intervening years has identified numerous pre-8000 Before Common Era (BCE) sites, both on the mainland coast and the Channel Islands (e.g., Erlandson 1991; Johnson et al. 2002; Moratto 1984; Rick et al. 2001). The earliest accepted dates for occupation in the region are from two of the northern Channel Islands, located off the coast of Santa Barbara. On San Miguel Island, Daisy Cave clearly establishes the presence of people in this area about 10,000 years ago (Erlandson 1991). On Santa Rosa Island, human remains have been dated from the Arlington Springs site to approximately 13,000 years ago (Johnson et al. 2002).

Recent data from Horizon I sites indicate the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas (e.g., Jones et al. 2002) and on Pleistocene lakeshores in eastern San Diego County (see Moratto 1984). Although few Clovis-like or Folsom-like fluted points have been found in southern California (e.g., Dillon 2002; Erlandson et al. 1987), it is generally thought the emphasis on hunting may have been greater during Horizon I than in later periods. Common elements in many sites from this period, for example, include leaf-shaped bifacial projectile points and knives, stemmed, or shouldered projectile points, scrapers, engraving tools, and crescents (Wallace 1978). Subsistence patterns shifted around 6000 BCE coincident with the gradual desiccation associated with the onset of the Altithermal climatic regime, a warm and dry period that lasted for about 3,000 years. After 6000 BCE, a greater emphasis was placed on plant foods and small animals.

Horizon II - Milling Stone (6000–3000 BCE)

The Milling Stone Horizon of Wallace (1955, 1978) and Encinitas Tradition of Warren (1968) (6000 to 3000 BCE) are characterized by subsistence strategies centered on collecting plant foods and small animals. Food procurement activities included hunting small and large terrestrial mammals, sea mammals, and birds; collecting shellfish and other shore species; near-shore fishing with barbs or gorges; the processing of yucca

and agave; and the extensive use of seed and plant products (Kowta 1969). The importance of the seed processing is apparent in the dominance of stone grinding implements in contemporary archaeological assemblages, namely milling stones (metates and slabs) and handstones (manos and mullers). Milling stones occur in large numbers for the first time during this period and are more numerous still near the end of this period. Recent research indicates Milling Stone Horizon food procurement strategies varied in both time and space, reflecting divergent responses to variable coastal and inland environmental conditions (Byrd and Raab 2007).

Milling Stone Horizon sites are common in the southern California coastal region between Santa Barbara and San Diego, and at many inland locations (e.g., Langenwalter and Brock 1985; Sutton 1993; True 1958). Wallace (1955, 1978) and Warren (1968) relied on several key coastal sites to characterize the Milling Stone period and Encinitas Tradition, respectively. These include the Oak Grove Complex in the Santa Barbara region, Little Sycamore in southwestern Ventura County, Topanga Canyon in the Santa Monica Mountains, and La Jolla in San Diego County. The well-known Irvine site (CA-ORA-64) has occupation levels dating between ca. 6000 and 4000 BCE (Drover et al. 1983; Macko 1998).

Stone chopping, scraping, and cutting tools made from locally available raw material are abundant in Milling Stone/Encinitas deposits. Less common are projectile points, which are typically large and leaf-shaped, and bone tools such as awls. Items made from shell, including beads, pendants, and abalone dishes, are generally rare. Evidence of weaving or basketry is present at a few sites. Kowta (1969) attributes the presence of numerous scraper-planes in Milling Stone sites to the preparation of agave or yucca for food or fiber. The mortar and pestle, associated with pounding foods such as acorns, were first used during the Milling Stone Horizon (Wallace 1955, 1978; Warren 1968).

Cogged stones and discoidals are diagnostic Milling Stone period artifacts, and most specimens have been found at sites dating between 4000 and 1000 BCE (Moratto 1984). The cogged stone is a ground stone object with gear-like teeth on its perimeter. Discoidals are similar to cogged stones, differing primarily in their lack of edge modification. Discoidals are found in the archaeological record subsequent to the introduction of the cogged stone. Cogged stones and discoidals are often purposefully buried and are found mainly in sites along the coastal drainages from southern Ventura County southward, with a few specimens inland at Cajon Pass, and heavily in Orange County (Dixon 1968:63; Moratto 1984). These artifacts are often interpreted as ritual objects (Eberhart 1961; Dixon 1968), although alternative interpretations (such as gaming stones) have also been put forward (e.g., Moriarty and Broms 1971).

Characteristic mortuary practices of the Milling Stone period or Encinitas Tradition include extended and loosely flexed burials, some with red ochre, and few grave goods such as shell beads and milling stones interred beneath cobble or milling stone cairns. “Killed” milling stones, exhibiting holes, may occur in the cairns. Reburials are common in the Los Angeles County area, with north-oriented flexed burials common in Orange and San Diego counties (Wallace 1955, 1978; Warren 1968).

Koerper and Drover (1983) suggest Milling Stone period sites represent evidence of migratory hunters and gatherers who used marine resources in the winter and inland resources for the remainder of the year. Subsequent research indicates greater sedentism than previously recognized. Evidence of wattle-and-daub structures and walls has been identified at several sites in the San Joaquin Hills and Newport Coast area (Mason et al. 1991, 1992, 1993; Koerper 1995; Strudwick 2005; Sawyer 2006), while numerous early house pits have been discovered on San Clemente Island (Byrd and Raab 2007). This architectural evidence and seasonality studies suggest semi-permanent residential base camps were relocated seasonally (de Barros 1996; Koerper et al. 2002; Mason et al. 1997) or permanent villages from which a portion of the population left at certain times of the year to exploit available resources (Cottrell and Del Chario 1981).

Horizon III - Intermediate (3000 BCE – CE 500)

Following the Milling Stone Horizon, Wallace's Intermediate Horizon and Warren's Campbell Tradition in Santa Barbara, Ventura, and parts of Los Angeles counties, date from approximately 3000 BCE to CE 500 and are characterized by a shift toward a hunting and maritime subsistence strategy, along with a wider use of plant foods. The Campbell Tradition (Warren 1968) incorporates David B. Rogers' (1929) Hunting Culture and related expressions along the Santa Barbara coast. In the San Diego region, the Encinitas Tradition (Warren 1968) and the La Jolla Culture (Moriarty 1966; Rogers 1939; 1945) persist with little change during this time.

During the Intermediate Horizon and Campbell Tradition, there was a pronounced trend toward greater adaptation to regional or local resources. For example, an increasing variety and abundance of fish, land mammal, and sea mammal remains are found in sites along the California coast during this period. Related chipped stone tools suitable for hunting are more abundant and diversified, and shell fishhooks become part of the tool kit during this period. Larger knives, a variety of flake scrapers, and drill-like implements are common during this period. Projectile points include large side-notched, stemmed, and lanceolate or leaf-shaped forms. Koerper and Drover (1983) consider Gypsum Cave and Elko series points, which have a wide distribution in the Great Basin and Mojave deserts between ca. 2000 BCE and CE 500, to be diagnostic of this period. Bone tools, including awls, were more numerous than in the preceding period, and the use of asphaltum adhesive was common.

Mortars and pestles became more common during this period, gradually replacing manos and metates as the dominant milling equipment. Hopper mortars and stone bowls, including steatite vessels, appeared in the tool kit at this time as well. This shift appears to correlate with the diversification in subsistence resources. Many archaeologists believe this change in milling stones signals a shift away from the processing and consuming of hard seed resources to the increasing importance of the acorn (e.g., Glassow et al. 1988; True 1993). It has been argued that mortars and pestles may have been used initially to process roots (e.g., tubers, bulbs, and corms associated with marshland plants), with acorn processing beginning at a later point in prehistory (Glassow 1997) and continuing to European contact.

Characteristic mortuary practices during the Intermediate Horizon and Campbell Tradition included fully face-down or face-up flexed burials, oriented toward the north or west (Warren 1968). Red ochre was used commonly, and abalone shell dishes were found infrequently. Interments sometimes occurred beneath cairns or broken artifacts. Shell, bone, and stone ornaments, including charmstones, were more common than in the preceding Encinitas Tradition. Some later sites include Olivella shell and steatite beads, mortars with flat bases and flaring sides, and a few small points. The broad distribution of steatite from the Channel Islands and obsidian from distant inland regions, among other items, attest to the growth of trade, particularly during the latter part of this period. Recently, Byrd and Raab 2007 (220–221) have suggested the distribution of Olivella grooved rectangle beads marks “a discrete sphere of trade and interaction between the Mojave Desert and the southern Channel Islands.”

Horizon IV- Late Prehistoric Horizon (CE 500–Historic Contact)

In the Late Prehistoric Horizon (Wallace 1955; 1978), which lasted from the end of the Intermediate (ca. CE 500) until European contact, there was an increase in the use of plant food resources in addition to an increase in land and sea mammal hunting. There was a concomitant increase in the diversity and complexity of material culture during the Late Prehistoric, demonstrated by more classes of artifacts. The recovery of a greater number of small, finely worked projectile points, usually stemless with convex or concave bases, suggests an increased usage of the bow and arrow rather than the atlatl (spear thrower) and dart for hunting. Other items include steatite cooking vessels and containers, the increased presence of smaller bone and shell circular fishhooks, perforated stones, arrow shaft straighteners made of steatite, a variety of bone tools,

and personal ornaments made from shell, bone, and stone. There is also an increased use of asphalt for waterproofing and as an adhesive.

Many Late Prehistoric sites contain beautiful and complex objects of utility, art, and decoration. Ornaments include drilled whole Venus clam (*Chione* spp.) and drilled abalone (*Haliotis* spp.). Steatite effigies become more common, with scallop (*Pecten* spp. and *Argopecten* spp.) shell rattles common in middens. Mortuary customs are elaborate and include cremation and interment with abundant grave goods. By CE 1000, fired clay smoking pipes and ceramic vessels began to appear at some sites (Drover 1971, 1975; Meighan 1954). The scarcity of pottery in coastal and near-coastal sites implies ceramic technology was not well developed in the area, or that ceramics were obtained by trade with neighboring groups to the south and east. The lack of widespread pottery manufacture is usually attributed to the high quality of tightly woven and watertight basketry which functioned in the same capacity as ceramic vessels.

During this period, there was an increase in population size accompanied by the advent of larger, more permanent villages (Wallace 1955). Large populations and, in places, high population densities are characteristic, with some coastal and near-coastal settlements containing as many as 1,500 people. Many of the larger settlements were permanent villages in which people resided year-round. The populations of these villages may have also increased seasonally.

In Warren's (1968) cultural ecological scheme, the period between CE 500 and European contact is divided into three regional patterns. The Chumash Tradition is present mainly in the region of Santa Barbara and Ventura counties; the Takic or Numic Tradition is present in the Los Angeles, Orange, and western Riverside counties region; and the Yuman Tradition is present in the San Diego region. The seemingly abrupt changes in material culture, burial practices, and subsistence focus at the beginning of the Late Prehistoric period are thought to be the result of a migration to the coast of peoples from inland desert regions to the east. In addition to the small triangular and triangular side-notched points similar to those found in the desert regions in the Great Basin and Lower Colorado River, Colorado River pottery and the introduction of cremation in the archaeological record are diagnostic of the Yuman Tradition in the San Diego region. This combination suggests a strong influence from the Colorado Desert region.

In Los Angeles, Orange, and western Riverside counties, similar changes (introduction of cremation, pottery, and small triangular arrow points) are thought to be the result of a Takic migration to the coast from inland desert regions. This Takic or Numic Tradition was referred to formerly as the "Shoshonean wedge" or "Shoshonean intrusion" (Warren 1968). This terminology, originally used to describe an Uto-Aztecan language group, is generally no longer used to avoid confusion with ethnohistoric and modern Shoshonean groups who spoke Numic languages (Heizer 1978; Shipley 1978:). Modern Gabrieliño/Tongva in this region are considered the descendants of the prehistoric Uto-Aztecan, Takic-speaking populations who settled along the California coast during this period or perhaps somewhat earlier.

For further discussion on the ethnographic history of the Gabrieliño/Tongva people in the Project Area, see Section 4.16, *Tribal Cultural Resources*.

POST-CONTACT

The following citywide history is largely summarized from the following SurveyLA-produced reports, accessible online via the links below.

- Historic Resources Survey Report Central City Community Plan Area (Architectural Resources Group 2016); <https://planning.lacity.org/preservation-design/survey-la-results-central-city>
- Historic Resources Survey Report Central City North Community Plan Area (Historic Resources Group 2016); <https://planning.lacity.org/preservation-design/survey-la-results-central-city-north>

The history of the Project Area as presented below is excerpted from a 2011 historic resources survey of the Project Area, produced for the City, accessible online via the following link:

- Historic Resources Survey Cornfield Arroyo Seco Specific Plan Area City of Los Angeles Los Angeles County, California (LSA 2011): https://planning.lacity.org/odocument/69e7fc7f-101f-4488-8c92-48d1059120b0/Cornfield_Arroyo_Seco_Specific_Plan_Historic_Resources_Survey_-_2011.pdf

Citywide History

Europeans first entered the area that now comprises the City of Los Angeles in 1769, as part of a Spanish expedition led by Gaspar de Portola. By 1779, colonial authorities selected a site along the Los Angeles River, then called Rio de Porciúncula, as the site for a pueblo. Los Angeles was established in 1781 by a contingent of 44 settlers. Long a local center of the hide and tallow trade, the pueblo remained frontier outpost through the period of Mexican rule (1821-1848). When the United States assumed possession of California at the end of the Mexican-American War of 1846-48, Los Angeles was small city of about 1,500 residents, though this figure may not reflect the pueblo's Native American population. A limited degree of development followed the influx into California during the Gold Rush era. By the 1860s, the city had become a center of the state's burgeoning cattle industry. Local development remained agricultural in character through much of the rest of the nineteenth century, with dairying and citrus farming vying for predominance in the regional economy.

The late nineteenth century was a period of rapid growth and economic change for the city. A turning point in the history of Los Angeles came in 1876, with the opening of a Southern Pacific (SP) rail line connecting the city to San Francisco and, by extension, the Transcontinental Railroad. This connection with the eastern United States—augmented by the completion of the Atchison, Topeka and Santa Fe (ATSF) Railway's transcontinental line in 1885—paved the way for a late nineteenth-century population boom and an accompanying wave of industrialization. A city of 102,000 by 1900, Los Angeles was transformed from a small, isolated agricultural community into Southern California's principal industrial hub by the end of the century, a fact that seemed to belie the city's reputation as a peaceful resort town. Mutually reinforcing expansions of the city's population and its industrial base fueled rapid urbanization outside the historic core. Residential neighborhoods began growing in the southern and western areas of the city, while a large industrial district started to take shape east of downtown, centered on the SP and ATSF depot and warehouse facilities. The lure of economic opportunity helped to secure the city's cosmopolitan character by the turn of the twentieth century. Several ethnic enclaves—including Chinatown, Little Tokyo, and Little Italy—formed in older districts in and near the historic pueblo in the nineteenth and early twentieth centuries.

Los Angeles' phenomenal pace of growth continued through the first half of the twentieth century. The construction of the Pacific Electric Railway and other commuter rail lines starting in the late nineteenth century facilitated the spread of suburban communities, both within the city limits and in independent bedroom communities throughout the Los Angeles Basin. Another factor in the city's continuing growth was the 1913 opening of the Los Angeles Aqueduct. This effort spearheaded by Water Department Superintendent William Mulholland secured a vital supply of Owens Valley water for the Los Angeles area. The Great Migration of African Americans following World War I transformed southeastern Los Angeles and adjacent communities, as transplants from the South settled in racially segregated neighborhoods in these areas. By the late 1920s, the Los Angeles area possessed a large and growing population, improved port facilities at San Pedro Bay, and a burgeoning oil industry. This combination of factors awakened Eastern manufacturers to the area's advantages as a location for West Coast branch factories, including those of major automakers and food processing firms. In turn, the same set of conditions led Federal authorities to locate several substantial war production factories in and around Los Angeles (Verge 1994). By 1950, the massive wartime influx of munitions factory workers and the first phase of a postwar population boom pushed of Los Angeles to a population of 1.9 million.

Postwar Los Angeles faced the twin challenges of rapid suburban expansion and the decline of its central business district. As federal subsidies under the G.I. Bill subsidized the suburbanization of the San Fernando Valley and other far-flung residential areas, a network of freeways, including four that cut through downtown, were erected to convey commuters and shoppers across the ever-widening city. The flight of middle-class residents from the central city, ongoing since the 1920s, led retailers to relocate to new shopping centers closer to their suburban clientele. By the 1950s, redevelopment officials believed, the situation in declining areas such as Bunker Hill was such that the city opted for the wholesale razing of large formerly residential areas. Following the loss of many residents and retailers, downtown Los Angeles was rebuilt largely with modern, high-rise office towers. The trend toward suburbanization held steady through much of the late 20th century. However, early steps toward a return of residents to the central city began in the 1970s, as artists settled in live-work spaces in the industrial district located east of downtown. City officials and real estate interests came to embrace the residential redevelopment of the central city around the turn of the twenty-first century, as several sections of the city's historic core were targeted for new development.

Cornfield Arroyo Seco Specific Plan Area History

The following history of the Project Area is excerpted from the 2011 historic resources survey of the Specific Plan area (LSA 2011).

The Project survey area contains some of the oldest developed areas of Los Angeles. The site where Gaspar de Portola's 1769 expedition camped in Los Angeles is believed to be along the Los Angeles River just south of where it is joined by the Arroyo Seco Wash. In 1781, settlers from Spain and Mexico founded the Pueblo de Los Angeles about a mile south of the survey area along the river.

Agriculture provided the main source of industry for the nascent Pueblo, which grew slowly along the river during most of the nineteenth century. By 1820, the Pueblo was home to 650 California residents. In 1847, the U.S. gained possession of the Pueblo during the Mexican-American War. Under U.S. control, the riverfront began to industrialize. The Southern Pacific Railroad/River Station was completed in the 1870s and triggered a large wave of European and Chinese immigrants. The River Station became a major industrial and commercial center, connecting Los Angeles to major U.S. cities and the East. Much of the early growth of Los Angeles can be attributed to the development of the riverfront industrial center.

In the early 20th century, Los Angeles expanded across the river east into Lincoln Heights. In 1910, Henry G. Parker and Hugo Eckardt constructed the first monumental bridge across the Los Angeles River. The classically styled North Main Street Bridge connected East Los Angeles to Downtown. One year later, in 1911, the Buena Vista Viaduct (now called the North Broadway-Buena Vista Bridge) was completed. At the time, this bridge was the longest and widest concrete arch bridge in California. Designers Homer Hamlin and Alfred P. Rosenheim incorporated Ionic arches and balustrades to complement the North Main Street Bridge. Eighteen years later, the North Spring Street Viaduct was completed. John C. Shaw designed the North Spring Street Viaduct to relieve traffic on the North Broadway Bridge. Shaw's design continued the classical style of the two earlier bridges, linking the three bridges as a thematic sub-group that connects Lincoln Heights to Downtown. All three bridges were designated as City Historic Cultural Monuments in 2008.

Some of the original industrial and commercial buildings still exist along the riverfront. The Standard Oil Company of California buildings on North Spring Street served as sales department and provided industrial facilities for one of the most powerful corporations in the world. Rockefeller's Standard Oil of California was one of the "seven sisters" that ran the oil industry during the 20th century and later became Chevron Corporation. The Baker Iron Works Site, on North Broadway, was an influential industrial pioneer in Los Angeles. Baker played a major role

in stimulating growth in California, particularly through the production of streetcars, water distribution systems, and oil drilling products.

In the following years, the area surrounding Baker became the premier steel and iron manufacturing center in California. In addition, Baker was a major supplier to the United States military during World Wars I and II. Located on North Spring Street, Capitol Milling Company was one of Los Angeles' leading enterprises, specializing in milling grains to produce flour, cereal, and food. The nearby Southern Pacific Railroad allowed Capitol Milling to transport products nationwide. Today, these buildings provide a window to Los Angeles' past and serve as symbols of the industries that allowed the city to grow.

The concentration of industry near the river fostered the growth of new immigrant communities, including vibrant Italian, Mexican, and Chinese districts. These communities introduced new cultural elements and helped to establish Los Angeles as a global city. In 1917, Santo Cambianica, an Italian immigrant, opened the San Antonio Winery near the Los Angeles River.

Lincoln Heights

As commercial and industrial activity grew downtown in the late nineteenth century, new arrivals to Los Angeles looked to adjacent land surrounding downtown as the setting for the City's first suburbs. Similar subdivisions were recorded concurrently in areas east, south, and north of Downtown. The community of Lincoln Heights was built on the higher plain southeast of the confluence of the river and Arroyo Seco, subdividing the former farmlands. This new community was linked to downtown Los Angeles along Downey Avenue and served by horse-drawn streetcars. The main north-south road, San Fernando Road/Avenue 20, passed through Lincoln Heights and connected it to northern and southern California. Into the twentieth century, Lincoln Heights grew into a small town with a classic mix of residential neighborhoods around a small downtown located between Broadway and Five Points. At the same time, owing to its location as the mouth of a pass to the north, the first rail lines linking northern and southern California were built, paralleling the Los Angeles River. Along with the railroads came the first industrial uses, some directly rail-related in the form of rail yards, such as the Cornfield site, and some uses that were served by the rail. The residential small-town character of Lincoln Heights began to erode.

By the end of World War II, Lincoln Heights transformed into a predominantly working-class neighborhood. This transformation accelerated with the construction of the Golden State Freeway (I-5) in the 1950s, replacing the historic north-south Route 99 that used San Fernando Road and Avenue 20, split Lincoln Heights in half at its core and destroyed the neighborhood's important relationship with downtown, the river, and the historic origins of Los Angeles.

Railroads and Industry

After the rapid development of the 1920s, more and more industry began to locate in Lincoln Heights along the riverbanks following the railroad. Early land use districting ordinances had already established industrial use areas along the rail and river corridor, which were hardened further into discrete zones around 1920. The mixed-use character of Lincoln Heights with its residential neighborhoods was "pushed" to the east, with older neighborhoods nearer the river displaced by industrial lands.

Meanwhile, plagued by the river's unpredictability and constant flooding, the U.S. Army Corps of Engineers began to channelize the river in the 1930s. Ever since, the once natural resource has served as a flood control system and carried storm water and other runoff south to San Pedro and the harbor.

In 1996, one of the largest undeveloped parcels within the area was proposed to be developed as an industrial park but the surrounding neighborhoods resoundingly rejected the concept and instead demanded that the parcel, which was known as “the Cornfield,” be set aside as a park. With the assistance of the Trust for Public Land, the State of California purchased the 33-acre property and is today developing conceptual plans to develop the Los Angeles State Historic Park. With the introduction of the Gold Line only a few short years later, in 2002, and subsequently the interest in the revitalization of the River and the Arroyo Seco, the stage was set for developer speculation and the pressure for residential conversion began.

CULTURAL RESOURCES

Los Angeles contains a wide range of cultural resource types spanning the entire history of Los Angeles from pre-Contact, through the Spanish pueblo era, the Mexican era, and the American era. Cultural heritage can be generally categorized as “tangible” or “intangible.” Tangible cultural heritage includes the movable and immovable physical representations of heritage, including objects, archaeological sites, buildings, structures, districts, and landscapes. Intangible cultural heritage includes those aspects of heritage that are more ephemeral, such as events, traditions, organizations, knowledge, and the interaction between communities and their environment. Intangible cultural heritage is not a regulated category, and intangible resources cannot be identified as historical resources under CEQA, but they can inform the significance of tangible cultural resources.

HISTORICAL RESOURCES

CEQA considers “historical resources” to be part of the environment that could be impacted by a project. Historical resources are defined to include resources that have been designated by a state or local agency or found eligible to be designated by the state or local agency. Properties can be designated at the national, state, and/or local level. The State Register includes those resources that have been designated at the national or state level. The City has two types of formal designation: those designated as Historic Cultural Monuments and those properties in a Historic Preservation Overlay Zone (HPOZ). Below is a summary of those resources that have been designated at the National, State or local level in the Project Area, as well as summary of those designated Citywide.

In regard to eligible historical resources, the City has commissioned numerous surveys, prepared by qualified architectural historians, to identify those resources (buildings, structures, improvements) that could be potentially eligible for designation based on documentary research and visual review of the resource itself, or photographs of the resource. The principal survey relied on by the City to identify eligible resources for purposes of CEQA compliance is SurveyLA, which is further described below.

Designated Historical Resources

State and National

Currently, the Project Area contains five state- and/or federally designated and eligible historical resources, including two historic districts listed on or eligible for the National Register (see **Table 4.4-1**). In addition, based on a previous study conducted outside the Project Area, the Los Angeles River, which traverses the Project Area, has presumed eligibility for listing in the National Register as a primary element of a historic district (Rincon Consultants 2020).

1630 N. Main Street

The Department of Water and Power General Services Headquarters Historic District is located at 1630 N Main Street. A collection of 11 public utility buildings built in 1946, the buildings range from two to three stories and are designed with elements of International, Art Deco and Beaux Arts architectural styles. Due to significant associations and the Department of Water and Power's role in the development of Los Angeles, the district was determined eligible for the National Register in 1995 and, as a result, was automatically listed on the California Register (Office of Historic Preservation 2022).

William Mead Homes/Ann Street Project

Located at 1300 N. Cardinal Street, William Mead Homes/Ann Street Project consists of a grouping of 27 three-story apartment buildings. with Streamline Moderne and International Style architectural elements. Constructed in 1942, the property is significant as one of the first public housing projects in the city and for well as its association with defense production during World War II. Architecturally, it is also significant as an example of Garden City design principles. In 2002, the property was determined eligible for the National Register and, as a result, automatically listed in the California Register (Office of Historic Preservation 2022).

Spring Street Viaduct (Also referred to as North Spring Street Bridge in HCM)

The Spring Street Viaduct was completed in 1910 and built to carry North Spring Street over the Los Angeles River. The bridge is associated with a major bridge building program in Los Angeles, which was conducted between 1909 and 1932. The bridge was determined eligible for listing in the National Register in 1986 and automatically listed in the California Register, as a result. The resource is also designated as an HCM #900 in 2008 under the name North Spring Street Bridge, No. 53C0859 (OHP 2022; City of Los Angeles, Department of City Planning 2023).

Lincoln Heights Jail

Constructed in 1927, the Lincoln Heights Jail is located at 401 North Avenue 19. In 2021, the five-story building Art Deco-style institutional building was determined eligible for the National Register and, as a result, automatically listed in the California Register. The property is also designated as HCM #587 (Office of Historic Preservation 2022; City of Los Angeles, Department of City Planning 2021).

Arroyo Seco Parkway Historic District

The resource is a historic district consisting of 60 total properties, 45 of which are contributors. Notable features of the district include a concrete rigid frame bridge, concrete arch spandrel bridge, an Art Deco tunnel, vernacular pedestrian and equestrian tunnel, and parkways. The district was determined eligible for the National Register due to its significant associations with transportation planning, freeway construction, bridge and tunnel architecture, and engineering between 1938-1953. A section of the southern half of the resource partially overlaps with the northern portion of the plan area.

Local – HPOZ

There are 35 designated HPOZs in the City. An additional HPOZ is proposed, 27th and 28th Street, and another is currently inactive, Holmby-Westwood. The majority of the HPOZs are located in the central portion of the City and range in size from neighborhoods of approximately 50 parcels to more than 4,000 properties. While most HPOZs are primarily residential, there are several that have a mix of single-family and multi-family residential, and some that include commercial and industrial properties (City of Los Angeles 2022).

Cornfield Arroyo Seco Specific Plan Area Historic Preservation Overlay Zones

The Project Area does not currently contain any HPOZs.

Local – HCM

The City’s Office of Historic Resources has recorded thousands of HCMs throughout the City, officially recognizing and providing protection to some of Los Angeles’ historical resources (City of Los Angeles 2021). The HCM list is continually updated as new resources are designated.

Citywide Historic-Cultural Monuments

As of May 5, 2021, there are 1,217 HCMs in the City (City of Los Angeles 2021).

Cornfield Arroyo Seco Specific Plan Area Historic-Cultural Monuments

Currently, the Project Area contains 9 City-designated HCMs. A review of the Office of Historic Preservation Built Environment Resources Database identified three additional properties that were recommended eligible, but not designated, as HCMs. Eligible and designated HCMs are discussed in brief below (not including those which are designated at the state and national level and previously discussed above).

Los Angeles Railway Huron Substation (HCM #404)

The Los Angeles Railway Huron Substation is an electrical substation located at 2640 North Huron Street. The substation was constructed in 1906 as part of the Los Angeles Railway system. It was designated as an HCM in 1988 (City of Los Angeles, Department of Planning 2021). No further information on the property’s eligibility for HCM designation was available.

North Broadway-Buena Vista Street Bridge, No. 53C0545 (HCM #907)

The North Broadway-Buena Vista Street Bridge, No. 53C0545 was constructed in 1909 to carry North Broadway over the Los Angeles River. Constructed in 1909, is significant, in part, for its associations with a City bridge building program that erected several monumental bridges over the Los Angeles River between 1909 and 1932. The bridge is also architecturally significant as the first major Beaux-Arts bridge constructed by the City (City of Los Angeles, Department of City Planning 2023). The bridge was designated as an HCM in 2008 and has also been determined eligible for the National Register and listed in the California Register (City of Los Angeles, Department of Planning 2021; 2023).

River Station Area (HCM #82)

The River Station Area at 1231 North Spring Street, is significant as the site of the city’s first train station and as the city’s oldest industrial area (City of Los Angeles, Department of City Planning 2023). It was designated as an HCM in 1971 (City of Los Angeles, Department of Planning 2021).

Standard Oil Company Sales Department Building/Woman's Building (HCM #1160)

The Standard Oil Company Sales Department Building/Woman's Building is a private commercial and institutional building located at 1727 North Spring Street. Constructed in 1892, the building is significant for its associations with the Standard Oil Company and its role in the development of Los Angeles, as well as for the building’s use by women’s rights organizations City of Los Angeles, Department of City Planning 2023). It was designated as an HCM in 2018 (City of Los Angeles, Department of Planning 2021).

Raphael Junction Block Building (HCM #872)

The Raphael Junction Block Building is an industrial warehouse constructed in 1884. Located at 1635-1637 North Spring Street, the building is significant as one of the city's oldest standing warehouses and represents the surrounding "Cornfields" area's development into one of the city's important shipping and storage hubs (City of Los Angeles, Department of City Planning 2023). It was designated as an HCM in 2007 (City of Los Angeles, Department of Planning 2021).

Albion Cottages and Milagro Market (HCM #442)

Constructed in 1890, Albion Cottages and Milagro Market is a residential and commercial property located at 1801-1813 Albion Street. In part, its significance derives from the property's collection of Italianate-style cottages, which are some of the earliest existing development in Los Angeles. In addition, Milagro Market, also located on the property, remains as a good example of the "mom and pop"-type market that defined neighborhood grocery sales in the years before World War II (City of Los Angeles, Department of City Planning 2023). The property was designated as an HCM in 1989 (City of Los Angeles, Department of Planning 2021).

North Main Street Bridge, No. 53C1010 (HCM #901)

Constructed in 1910, the North Main Street Bridge, No. 53C1010, carries North Main Street over the Los Angeles River. In part, it is significant for its association with a bridge building program that erected several monumental bridges over the Los Angeles River between 1909 and 1932. The bridge is also architecturally significant as an example of a monumental Beaus Arts-style bridge (City of Los Angeles, Department of City Planning 2023). The bridge was designated as an HCM in 2008 (City of Los Angeles, Department of Planning 2021).

2646 North Figueroa Street

Constructed in 1924, 2646 North Figueroa Street is a two-story commercial building elements of Art-Deco style architecture. The building was previously recommended for eligible for designation at the local level; however, available documentation does not provide further information related to the determination of eligibility (Office of Historic Preservation 2022).

Arroyo Theater

Located at 3236 North Figueroa Street, the Arroyo Theater is a was constructed in 1928 with elements of Spanish Colonial Revival and Churrigueresque architectural styles. The building was previously recommended eligible for HCM designation as a good example of a pre-World War II-Era neighborhood theater, but is not eligible for the National Register of California Register due to alterations (Office of Historic Preservation 2022; City of Los Angeles, Department of City Planning 2023).

2325 Huron Street

The property at 2325 Huron Street is a one-story residence with elements of Folk Victorian architectural style constructed in 1895. The property was previously recommended eligible for designation as an HCM. Available documentation provides not further information (Office of Historic Preservation 2022).

Eligible Historical Resources

Local Surveys

Citywide

SurveyLA identifies and evaluates potential built-environment resources and historic districts for National Register, California Register of Historical Resources (California Register), and local listing. SurveyLA field surveys have been completed for all 35 CPAs in the City of Los Angeles. All individual survey reports have been completed and data entry into HistoricPlacesLA, the City's online information and management database to inventory, map, and describe significant historical resources, is ongoing. HistoricPlacesLA may be accessed online via the link below. As discussed below, because the Project Area was surveyed in 2011, it was not subject to recordation for SurveyLA (HistoricPlacesLA: <http://www.historicplacesla.org/>)

Project Area

LSA Associates prepared a survey titled Historic Resources Area, Project Area, in 2011. To inform future planning considerations in the Project Area, the study identified, documented, and evaluated, at the intensive level, selected properties for eligibility for the National Register, California Register, and HCM designation. Because the Project Area was subject to the 2011 historical resources inventory, it was excluded from the SurveyLA Central City North CPA or Northeast Los Angeles CPA survey areas, which the Project Area overlaps. The Central City North CPA was documented for SurveyLA in 2016 and the Northeast Los Angeles CPA in 2017.

The Project Area survey is consistent with the SurveyLA methodology, which identifies the following resource types:

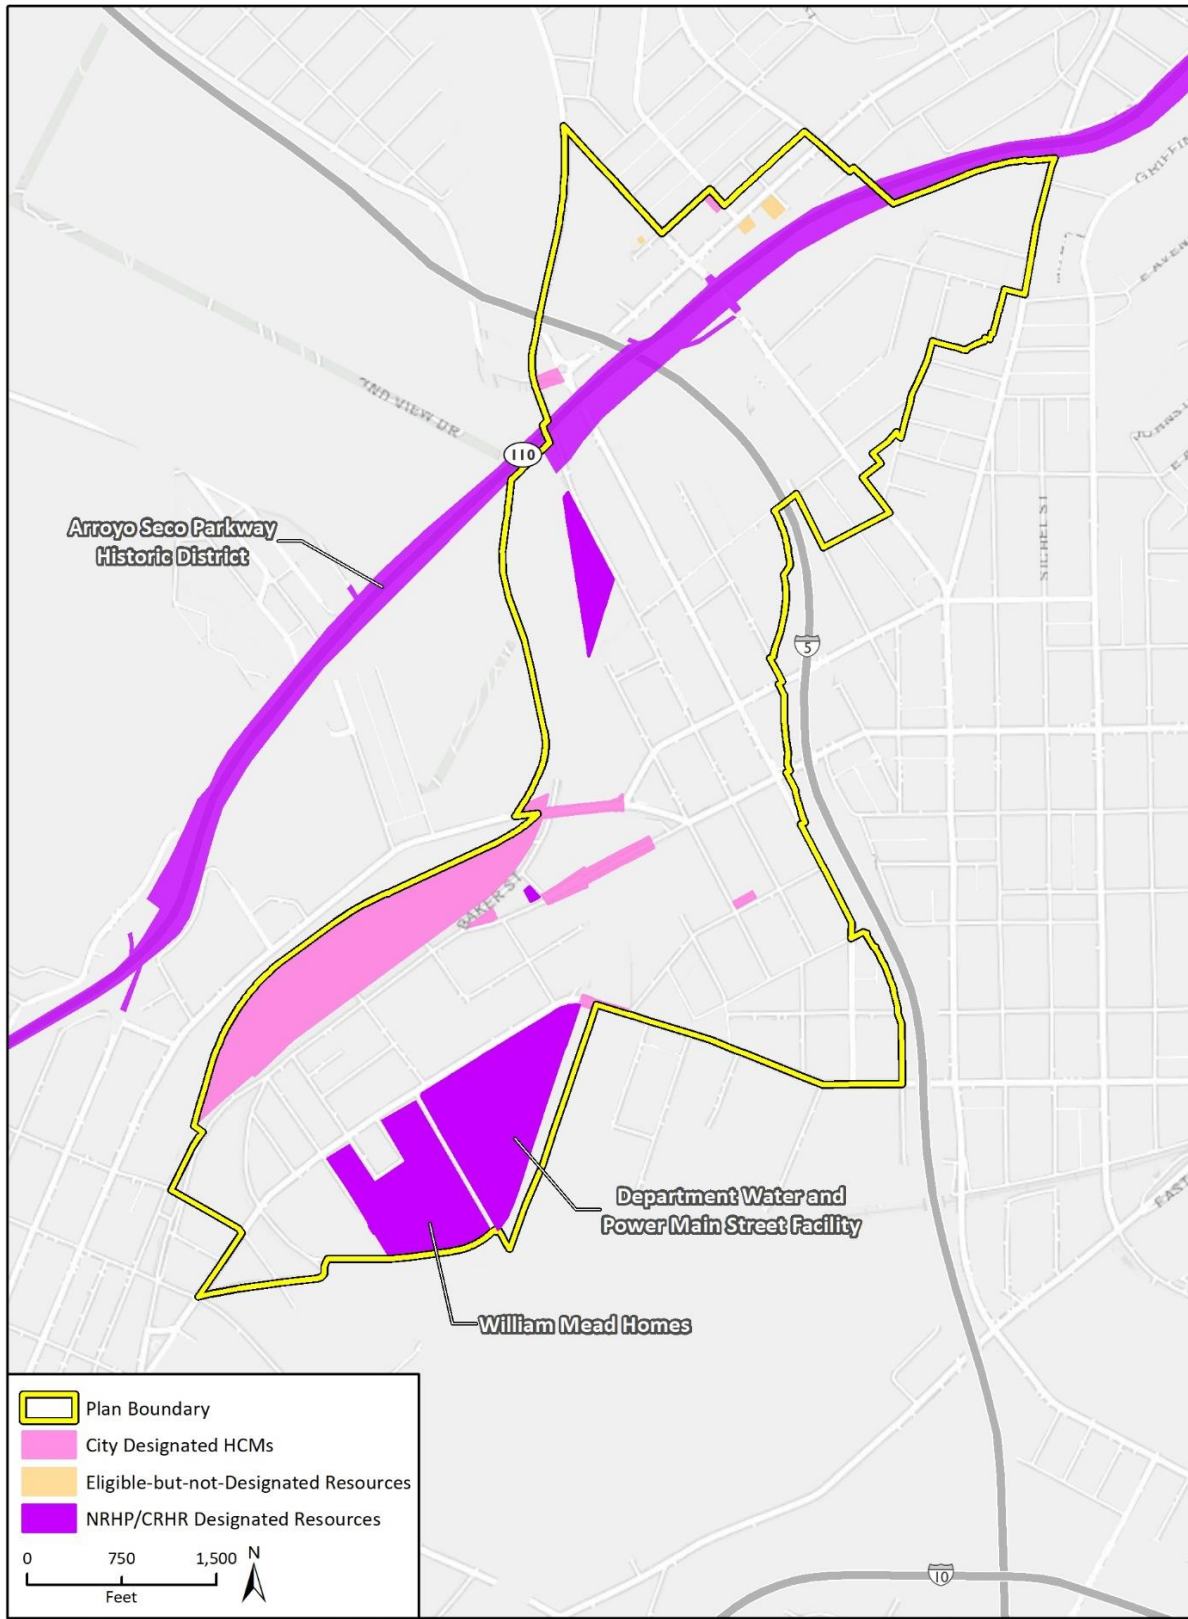

- Individual Resources are generally resources located within a single assessor parcel such as a residence or duplex. However, a parcel may include more than one individual resource if each appears to be significant.
- Non-Parcel Resources are not associated with Assessor Parcel Numbers and generally do not have addresses. Examples may include street trees, street lamps, landscaped medians, bridges, and signs.
- Historic Districts and Multi-Property Resources are areas that are related geographically and by theme. Districts may include single or multiple parcels depending on the resource. Examples of resources that may be recorded as historic districts include residential neighborhoods, garden apartments, commercial areas, large estates, school and hospital campuses, and industrial complexes. These areas require additional analysis and field work for HPOZ determination. District contributors and non-contributors are located within resources recorded as historic districts. Non-contributing resources may be those that are extensively altered, built recently, or that do not relate to historic contexts and themes defined for the district.
- Planning Districts are areas that are related geographically and by theme, but do not meet eligibility standards for designation, and as such are not considered "historical resources" as defined by CEQA (and will not be analyzed as such for purposes of this EIR). This is generally because the majority of the contributing features have been altered, resulting in a cumulative impact on the overall integrity of the area and making it ineligible as a Historic District. The Planning District determination, therefore, is used as a tool to inform new Community Plans being developed by the Department of City Planning. These areas have consistent planning concepts, such as height, massing, setbacks, and street trees, which may be considered in the local planning process.

The 2011 survey identified and evaluated 19 individual resources that were recommended eligible for the National Register, California Register, and HCM designation, and one property was recommended eligible

for HCM designation alone. Two individual properties selected for the 2011 survey were previously determined eligible for listing in the National Register and listed in the California Register and were not reevaluated for historical significance as part of the survey. The 2011 survey did not identify historic districts or non-parcel resources that had not been previously identified. Four additional properties were assigned an OHP status code of 6L, meaning they each warrant consideration in the planning process. A property assigned a 6L status code does not qualify as a historical resource pursuant to CEQA. Two areas were identified as non-eligible planning areas, the River Station Historic Vernacular Landscape and Albion Street Community Planning Area.

Figure 4.4-1a displays known, eligible and designated historical resources located in the Project Area, as identified in a review of the National Register, California Register, HCM list, and California Office of Historic Preservation Built Environment Resources Directory. City of Los Angeles HCMs are grouped together and shaded pink; National Register and California Register designated resources are grouped together and shaded purple; eligible resources are grouped together and shaded peach. Many of the resources depicted are listed or eligible for multiple designations (for example a resource may be a designated HCM and also listed in the National Register). In such situations, only the highest level of designation is displayed (in the aforementioned example, the resource would be grouped and displayed as National Register designated). Also included are **Figure 4.4-1b**, **Figure 4.4-1c**, and **Figure 4.4-1d**, which display the locations of districts, multi-property sites, non-parcel, and individual properties in the Project Area that were identified in the 2011 Project Area historical resources survey as potentially eligible for historic designation.

Archaeological Sites

As discussed above, people have been living and using the land in the City and Project Area for thousands of years. Prehistoric and historic-period archaeological sites are known to exist throughout the City.

In August 1993, 196 prehistoric sites, 50 historic-period sites, and 10 undefined isolated occurrences had been recorded in the City. Of these, at least 26 sites were known to contain human burials, and 10 sites had both prehistoric and historic components. The prehistoric sites include named Native American villages, buried deposits and features, pit houses, occupied caves and rock shelters, bedrock mortars, camp sites, cemeteries, and rock art (City of Los Angeles 2006). Historic-period archaeological sites primarily include privies and refuse deposits dating to the Spanish, Mexican, and early American settlement of the City, especially before the advent of citywide sewer and trash systems. Historic archaeological sites are also known to exist throughout the Project Area and include sites associated with the Spanish settlement at the Los Angeles pueblo beginning in 1781, Mexican settlement of the Area, and early American settlement and the establishment of the City. Remnants of the Zanja Madre, for example, the original aqueduct that carried water from the Los Angeles River to the pueblo, have been unearthed in the Project Area. The Zanja Madre was constructed within a month of the founding of the Los Angeles Pueblo. The ditch originated near the modern North Broadway bridge north of the City and extended southward to the original Plaza, crossing through the western and southwestern portion of the Project Area along the way. By 1870, there were over 50 miles of zanja including smaller ditches branching off of the Zanja Madre (**Figure 4.4-2**). During this time, the zanjias were enclosed by brick or replaced with piping (Gumprecht 1999). The system was mostly abandoned in 1906, with only small portions of zanjias used as part of the storm drain system. (Gust and Parker 2004). Portions of the abandoned zanjias have been unearthed throughout the City, including portions of the Zanja Madre within the Project Area.

REGULATORY FRAMEWORK

FEDERAL

National Historic Preservation Act and National Register of Historic Places

The National Historic Preservation Act of 1966 established the National Register of Historic Places (National Register) as “an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the Nation’s historic resources and to indicate what properties should be considered for protection from destruction or impairment” (36 Code of Federal Regulations [CFR] 60). The National Register recognizes a broad range of cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes. Within the National Register, approximately 2,500 (3 percent) of the more than 90,000 districts, buildings, structures, objects, and sites are recognized as National Historic Landmarks or National Historic Landmark Districts as possessing exceptional national significance in American history and culture (National Park Service n.d.).

Whereas individual historic properties derive their significance from one or more of the criteria discussed in the subsequent section, a historic district derives its importance from being a unified entity, even though it is often composed of a variety of resources. With a historic district, the historic resource is the district itself. The identity of a district results from the interrelationship of its resources, which can be an arrangement of historically or functionally related properties (National Park Service 1997a). A district is defined as a geographic area of land containing a significant concentration of buildings, sites, structures, or objects united by historic events, architecture, aesthetic, character, and/or physical development. A district’s significance and historic integrity determine its boundaries. Other factors include:

- Visual barriers that mark a change in the historic character of the area or that break the continuity of the district, such as new construction, highways, or development of a different character;
- Visual changes in the character of the area due to different architectural styles, types, or periods, or to a decline in the concentration of contributing resources;
- Boundaries at a specific time in history, such as the original city limits or the legally recorded boundaries of a housing subdivision, estate, or ranch; and
- Clearly differentiated patterns of historical development, such as commercial versus residential or industrial (National Park Service 1997b).

Within historic districts, properties are identified as contributing and non-contributing. A contributing building, site, structure, or object adds to the historic associations, historic architectural qualities, or archaeological values for which a district is significant because:

- It was present during the period of significance, relates to the significance of the district, and retains its physical integrity; or
- It independently meets the criterion for listing in the National Register.

A resource that is listed in or eligible for listing in the National Register is considered “historic property” under Section 106 of the National Historic Preservation Act.

Criteria

To be eligible for listing in the National Register, a resource must be at least 50 years of age, unless it is of exceptional importance as defined in Title 36 CFR, Part 60, Section 60.4(g). In addition, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Four criteria for evaluation have been established to determine the significance of a resource:

- A. Are associated with events that have made a significant contribution to the broad patterns of our history;
- B. Are associated with the lives of persons significant in our past;
- C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- D. Have yielded, or may be likely to yield, information important in prehistory or history (National Park Service 1997a).

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. National Register Bulletin #15 states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are “those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning... is made clear” (National Park Service 1997a). A property must represent an important aspect of the area’s history or prehistory and possess the requisite integrity to qualify for the National Register.

Integrity

In addition to meeting one or more of the criteria of significance, a property must have integrity, which is defined as “the ability of a property to convey its significance” (National Park Service 1997a). The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance. In general, the National Register has a higher integrity threshold than State or local registers.

In the case of districts, integrity means the physical integrity of the buildings, structures, or features that make up the district as well as the historic, spatial, and visual relationships of the components. Some buildings or features may be more altered over time than others. In order to possess integrity, a district must, on balance, still communicate its historic identity in the form of its character defining features.

Criteria Considerations

Certain types of properties, including religious properties, moved properties, birthplaces or graves, cemeteries, reconstructed properties, commemorative properties, and properties that have achieved significance within the past 50 years are not considered eligible for the National Register unless they meet one of the seven categories of Criteria Considerations A through G, in addition to meeting at least one of the four significance criteria discussed above, and possess integrity as defined above (National Park Service 1997a). Criteria Consideration G is intended to prevent the listing of properties for which insufficient time may have passed to allow the proper evaluation of their historical importance (National Park Service 1997a). The full list of Criteria Considerations is provided below:

- A. A religious property deriving primary significance from architectural or artistic distinction or historical importance; or
- B. A building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event; or
- C. A birthplace or grave of a historical figure of outstanding importance, if there is no other appropriate site or building directly associated with his or her productive life; or
- D. A cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or
- E. A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or
- F. A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own historical significance; or
- G. A property achieving significance within the past 50 years if it is of exceptional importance.

Secretary of the Interior's Standards

The National Park Service issued the Secretary of the Interior's Standards with accompanying guidelines for four types of treatments for historic resources: Preservation, Rehabilitation, Restoration, and Reconstruction. The most applicable guidelines should be used when evaluating a project for compliance with the Secretary of the Interior's Standards. Although none of the four treatments, as a whole, apply specifically to new construction in the vicinity of historic resources, Standards #9 and #10 of the Secretary of the Interior's Standards for Rehabilitation provides relevant guidance for such projects. The Standards for Rehabilitation are as follows:

1. A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces and spatial relationships.
2. The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.
3. Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.
4. Changes to a property that have acquired significance in their own right will be retained and preserved.
5. Distinctive materials, features, finishes and construction techniques or examples of craftsmanship that characterize a property will be preserved.
6. Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.
7. Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.
8. Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.

9. New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.
10. New additions and adjacent or related new construction will be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired (National Park Service 2017).

It is important to note that the Secretary of the Interior's Standards are not intended to be prescriptive but, instead, provide general guidance. They are intended to be flexible and adaptable to specific project conditions to balance continuity and change, while retaining materials and features to the maximum extent feasible. Their interpretation requires exercising professional judgment and balancing the various opportunities and constraints of any given project. Not every Standard necessarily applies to every aspect of a project, and it is not necessary for a project to comply with every Standard to achieve compliance.

Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act (NAGPRA) requires federal agencies to return Native American cultural items to the appropriate Federally recognized Indian tribes or Native Hawaiian groups with which they are associated (National Park Service 2022).

Archaeological Resources Protection Act

The Archaeological Resources Protection Act (ARPA) of 1979 governs the excavation, removal, and disposition of archaeological sites and collections on federal and Native American lands. This act was most recently amended in 1988. ARPA defines archaeological resources as any material remains of human life or activities that are at least 100 years of age, and which are of archeological interest. ARPA makes it illegal for anyone to excavate, remove, sell, purchase, exchange, or transport an archaeological resource from federal or Native American lands without a proper permit (National Park Service 2007).State

California Environmental Quality Act

The California Environmental Quality Act (CEQA) is the principal statute governing environmental review of projects occurring in the state and is codified in Public Resources Code (PRC) Section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA Section 21084.1, a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.

Public Resources Code Section 21084.1 provides:

[A]n historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources. Historical resources included in a local register of historical resources, as defined in subdivision (k) of Section 5020.1, or deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1, are presumed to be historically or culturally significant for purposes of this section, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant. The fact that a resource is not listed in, or determined to be eligible for listing in, the California Register of Historical Resources, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1 shall not preclude a lead agency from determining whether the resource may be an historical resource for purposes of this section.

CEQA Guidelines Section 15064.5 recognizes that historical resources include: (1) resources listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources; (2) resources included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any objects, buildings, structures, sites, areas, places, records, or manuscripts which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

If a lead agency determines that an archaeological site is a historical resource, the provisions of PRC Section 21084.1 and CEQA Guidelines Section 15064.5 apply. If an archaeological site does not meet the criteria for a historical resource contained in the CEQA Guidelines, then the site may be treated in accordance with the provisions of PRC Section 21083, if it meets the criteria of a unique archaeological resource. As defined in PRC Section 21083.2, a unique archaeological resource is an archaeological artifact, object, or site, about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If an archaeological site meets the criteria for a unique archaeological resource as defined in PRC Section 21083.2, then the site is to be treated in accordance with the provisions of PRC Section 21083.2, which state that if the lead agency determines that a project would have a significant effect on unique archaeological resources, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place (PRC Section 21083.1[a]). If preservation in place is not feasible, mitigation measures shall be required. The CEQA Guidelines note that if an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment (CEQA Guidelines Section 15064.5(c)(4)).

A significant effect under CEQA would occur if a project results in a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5(a). Substantial adverse change is defined as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired." According to CEQA Guidelines Section 15064.5[b][2], the significance of a historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that:

- A. Convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
- B. Account for its inclusion in a local register of historical resources pursuant to PRC Section 5020.1(k) or its identification in a historical resources survey meeting the requirements of PRC Section 5024.1(g) Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- C. Convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a Lead Agency for purposes of CEQA.

In general, a project that complies with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings is considered to have impacts that are less than significant (CEQA Guidelines, 15064.5[b][3]).

California Register of Historical Resources

The California Register of Historical Resources (California Register) is "an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1[a]). The California Register was enacted in 1992, and its regulations became official on January 1, 1998. The California Register is administered by the California Office of Historic Preservation (OHP). The criteria for eligibility for the California Register are based upon National Register criteria. Certain resources are determined to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register. To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, State, and/or federal level under one or more of the following four criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
4. Has yielded, or may be likely to yield, information important in prehistory or history.

A resource eligible for the California Register must meet one of the criteria of significance described above, and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and,
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources assigned a California Historical Resource Status Code of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historic districts; and,

- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

California Historical Resource Status Codes

The California State Office of Historic Preservation developed California Historical Resource Status Codes to provide a standardized classifications for properties and districts that have been subject to historical resources evaluation for national, state, or local eligibility. The Status Codes convey the level at which a property or district has been evaluated, its eligibility status, and the process by which the evaluation was made, such as through the regulatory process or as part of a survey evaluation (Office of Historic Preservation 2004). Below, the 7 broad categories of Status Codes are summarized. A detailed list of all individual Status Codes is provided in Appendix F.

Status Code Categories

1. Properties listed in the National Register or the California Register
2. Properties determined eligible for listing in the National Register or the California Register
3. Properties that appear eligible for National Register or California Register through a survey evaluation
4. Properties that appear eligible for National Register (NR) or California Register (CR) through other evaluation, specifically, those that are included on the Master List of State-Owned Properties
5. Properties recognized as historically significant by local government
6. Properties that are not eligible for listing
7. Properties that have were not evaluated for the National Register or California Register or which require re-evaluation

California Health and Safety Code

California Health and Safety Code Sections 7050.5, 7051, and 7054 address the illegality of interference with human burial remains (except as allowed under applicable PRC Sections), and the disposition of Native American burials in archaeological sites. These regulations protect such remains from disturbance, vandalism, or inadvertent destruction, and establish procedures to be implemented if Native American skeletal remains are discovered during construction of a project, including treatment of the remains prior to, during, and after evaluation, and reburial procedures.

California Public Resources Code (PRC)

PRC Sections 5097.5, 5097.9, and 5097.98-99

PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that:

No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.

PRC Section 5097.9 establishes the California Native American Heritage Commission (NAHC) to make recommendations to encourage private property owners to protect and preserve sacred places in a natural state and to allow appropriate access to Native Americans for ceremonial or spiritual activities. NAHC is authorized to assist Native Americans in obtaining appropriate access to sacred places on public lands, and to aid state agencies in any negotiations with federal agencies for the protection of Native American sacred places on federally administered lands in California.

PRC Sections 5097.98-99 require that the NAHC be consulted whenever Native American graves or human remains are found. According to these sections, it is illegal to take or possess remains or artifacts taken from Native American graves; however, it does not apply to materials taken before 1984. California Code of Regulations, Title 14, Section 4307 and Section 1427. Title 14, Section 4307 states that “no person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value.” Section 1427 “recognizes that California’s archaeological resources are endangered by urban development and population growth and by natural forces. Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave.”

California Penal Code Section 622.5

California Penal Code Section 622.5 provides the following: “Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor.”

California Penal Code Section 623

California Penal Code Section 623 provides the following: “Except as otherwise provided in Section 599c, any person who, without the prior written permission of the owner of a cave, intentionally and knowingly does any of the following acts is guilty of a misdemeanor punishable by imprisonment in the county jail not exceeding one year, or by a fine not exceeding one thousand dollars (\$1,000), or by both such fine and imprisonment: (1) breaks, breaks off, cracks, carves upon, paints, writes or otherwise marks upon or in any manner destroys, mutilates, injures, defaces, mars, or harms any natural material found in any cave. (2) disturbs or alters any archaeological evidence of prior occupation in any cave. (3) kills, harms, or removes any animal or plant life found in any cave. (4) burns any material which produces any smoke or gas which is harmful to any plant or animal found in any cave. (5) removes any material found in any cave. (6) breaks, forces, tampers with, removes or otherwise disturbs any lock, gate, door, or any other structure or obstruction designed to prevent entrance to any cave, whether or not entrance is gained.

Assembly Bill (AB) 52

AB 52 specifies that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. AB 52 requires that a lead agency consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a project prior to the determination of whether a negative declaration, mitigated negative declaration, or environmental impact report is required for a project. Furthermore, it provides examples of mitigation measures that may be considered to mitigate any impact. These provisions are applicable to projects that have a notice of preparation (NOP) for an environmental impact or a notice of negative declaration or mitigated negative declaration filed on or after July 1, 2015.

LOCAL

City of Los Angeles General Plan Conservation Element (2001)

The City of Los Angeles General Plan includes a Conservation Element. Section 3 of the Conservation Element, adopted in September 2001, includes policies for the protection of archaeological resources. As stated therein, it is the City’s policy that archaeological resources be protected for research and/or educational purposes. Section 5 of the Conservation Element recognizes the City’s responsibility for identifying and protecting its cultural and historical heritage. The Conservation Element establishes the policy to continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities, with the related objective to protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes (City of Los Angeles 2001).

In addition to the National Register and the California Register, two additional types of historic designations may apply at a local level:

1. Historic-Cultural Monument (HCM)
2. Classification by the City Council as a Historic Preservation Overlay Zone (HPOZ)

Policies from the Conservation Element related to paleontological, archaeological, and historical resources are listed in **Table 4.4-1, Relevant General Plan Cultural Resources Goals, Objectives, and Policies.**

TABLE 4.4-1 RELEVANT GENERAL PLAN CULTURAL RESOURCES OBJECTIVES AND POLICIES	
Objective/Policy	Objective/Policy Description
Conservation Element – Archaeological and Paleontological	
Objective	Protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.
Policy	Continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are identified during land development, demolition or property modification activities.
Conservation Element – Cultural and Historical	
Objective	Protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.
Policy	Continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition or property modification activities.
SOURCE: City of Los Angeles, Conservation Element of the City of Los Angeles General Plan, adopted September 26, 2001.	

City of Los Angeles Cultural Heritage Ordinance

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and most recently amended it in 2018 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission (CHC) and criteria for designating an HCM. The CHC is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture, and architecture. The City of Los Angeles Cultural Heritage Ordinance states that a HCM designation is reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature and meet one of the following criteria. A historical or cultural monument is any site, building, or structure of particular historical or cultural significance to the City of Los Angeles. The four criteria for HCM designation are stated below:

- The proposed HCM reflects the broad cultural, economic, or social history of the nation, state or community is reflected or exemplified; or
- The proposed HCM is identified with historic personages or with important events in the main currents of national, state or local history; or
- The proposed HCM embodies the characteristics of an architectural type specimen inherently valuable for a study of a period, style or method of construction;
- The proposed HCM is the notable work of a master builder, designer, or architect whose individual genius influenced his or her age (Section 22.171 of the Administrative Code).

A proposed resource may be eligible for designation if it meets at least one of the criteria above. When determining historic significance and evaluating a resource against the Cultural Heritage Ordinance criteria above, the CHC and Office of Historic Resources (OHR) staff often ask the following questions:

- Is the site or structure an outstanding example of past architectural styles or craftsmanship?
- Was the site or structure created by a “master” architect, builder, or designer?
- Did the architect, engineer, or owner have historical associations that either influenced architecture in the City or had a role in the development or history of Los Angeles?
- Has the building retained “integrity”? Does it still convey its historic significance through the retention of its original design and materials?
- Is the site or structure associated with important historic events or historic personages that shaped the growth, development, or evolution of Los Angeles or its communities?
- Is the site or structure associated with important movements or trends that shaped the social and cultural history of Los Angeles or its communities?

Unlike the National and California Registers, the Cultural Heritage Ordinance makes no mention of concepts such as physical integrity or period of significance. However, in practice, the seven aspects of integrity from the National Register and California Register are applied similarly and the threshold of integrity for individual eligibility is similar. It is common for the CHC to consider alterations to nominated properties in making its recommendations on designations. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs.

In addition, the LAMC Section 91.106.4.5 states that the Los Angeles Department of Building and Safety “shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated, or has been determined by state or federal action to be eligible for designation, on the National Register of Historic Places, or has been included on the City of Los Angeles list of HCMs, without the department having first determined whether the demolition, alteration or removal may result in the loss of or serious damage to a significant historical or cultural asset. If the department determines that such loss or damage may occur, the applicant shall file an application and pay all fees for the CEQA Initial Study and Check List, as specified in Section 19.05 of the LAMC. If the Initial Study and Check List identifies the historical or cultural asset as significant, the permit shall not be issued without the department first finding that specific economic, social or other considerations make infeasible the preservation of the building or structure” (LAMC Section 91.106.4.5.1). Under Section 91.106.4.5.1 of the LAMC, permits for the demolition of a building or structure that are over 45 years old will not be issued unless abutting properties owners and occupant, and the City Council District Office, and the Certified Neighborhood Council representing the site are notified in writing and a public notice of application for demolition has been posted at the site at least 60 days prior to the date of issuance of the demolition of building or structure permit.

City of Los Angeles Historic Preservation Overlay Zone (HPOZ) Ordinance

The Los Angeles City Council adopted the ordinance enabling the creation of HPOZs in 1979; most recently, this ordinance was amended in 2017. An HPOZ is a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development (LAMC Section 12.20.3). Each HPOZ is established with a Historic Resources Survey, a historic context statement, and a preservation plan. The Historic Resources Survey identifies all Contributing and Non-Contributing features and lots. The context statement identifies the historic context, themes, and subthemes of the HPOZ as well as the period of significance. The preservation plan contains guidelines that inform appropriate methods of maintenance, rehabilitation, restoration, and new construction. Contributing Elements are defined as any building, structure, Landscaping, or Natural Feature identified in the Historic Resources Survey as contributing to the Historic significance of the HPOZ, including a building or structure which has been altered, where the nature and extent of the Alterations are determined reversible by the Historic Resources Survey (LAMC Section 12.20.3). For CEQA purposes, Contributing Elements are treated as contributing features to a historic district, which is the historical resource. Non-Contributing Elements are any building, structure, Landscaping, Natural Feature identified in the Historic Resources Survey as being built outside of the identified period of significance or not containing a sufficient level of integrity. For CEQA purposes, Non-Contributing Elements are not treated as contributing features to a historical resource.

City of Los Angeles Historic Resources Survey (SurveyLA)

SurveyLA is a Citywide survey that identifies and documents potentially significant historical resources representing important themes in the City's history. The survey and resource evaluations were completed by consultant teams under contract to the City and under the supervision of the Department of City Planning's OHR. The program is managed by OHR, which maintains a website for SurveyLA. The field surveys cumulatively cover broad periods of significance, from approximately 1850 to 1980 depending on the location, and include individual resources such as buildings, structures, objects, natural features and cultural landscapes as well as areas and districts (archaeological resources are planned to be included in future survey phases). The survey identifies a wide variety of potentially significant resources that reflect important themes in the City's growth and development in various areas including architecture, city planning, social history, ethnic heritage, politics, industry, transportation, commerce, entertainment, and others. Field surveys, conducted from 2010-2017, were completed in three phases by Community Plan area. However, SurveyLA did not survey areas already designated as HPOZs or areas already surveyed by Community Redevelopment Agencies. All tools, methods, and criteria developed for SurveyLA were created to meet state and federal professional standards for survey work.

Los Angeles' Citywide Historic Context Statement (HCS) was designed for use by SurveyLA field surveyors and by all agencies, organizations, and professionals completing historical resources surveys in the City of Los Angeles. The context statement was organized using the Multiple Property Documentation (MPD) format developed by the National Park Service for use in nominating properties to the National Register. This format provides a consistent framework for evaluating historical resources. It was adapted for local use to evaluate the eligibility of properties for city, state, and federal designation programs. The HCS uses Eligibility Standards to identify the character defining, associative features and integrity aspects a property must retain to be a significant example of a type within a defined theme. Eligibility Standards also indicate the general geographic location, area of significance, applicable criteria, and period of significance associated with that type. These Eligibility Standards are guidelines based on knowledge of known significant examples of property types; properties do not need to meet all of the Eligibility Standards in order to be eligible. Moreover, there are many variables to consider in assessing integrity depending on why a resource is significant under the National Register, California Register or City of Los Angeles HCM eligibility criteria. SurveyLA findings are subject to change over time as properties age, additional

information is uncovered, and more detailed analyses are completed. Resources identified through SurveyLA are not designated resources. Designation by the City of Los Angeles and nominations to the California or National Registers are separate processes that include property owner notification and public hearings.

Redevelopment Project Area Historic Resources Surveys

The Community Redevelopment Agency of the City of Los Angeles (CRA/LA) was established in 1948 to revitalize economically underserved areas within the City of Los Angeles by increasing the supply of low income housing, providing infrastructure for commercial and industrial development, and creating employment opportunities. To carry out these goals, CRA/LA adopts comprehensive plans for each Redevelopment Project Area. Some areas also include a historical resources survey that documents all of the historical resources--individual and districts--within the Redevelopment Project Area. These CRA/LA surveys were done independent of the City's SurveyLA effort, though some of the more recent surveys may have used the same methodology and technology that was used in SurveyLA. SurveyLA did not survey areas already surveyed by CRA/LA. Currently, there are 32 Redevelopment Project Areas throughout Los Angeles. On September 30, 2019, the Los Angeles City Council voted to adopt Ordinance No. 186325 to effectuate the transfer of land use related plans and functions of the CRA/LA to the City of Los Angeles. As a result, the Department of City Planning has jurisdiction over review of properties located within Redevelopment Project Areas as of November 11, 2019.

City of Los Angeles Cultural Heritage Master Plan

The City of Los Angeles Cultural Affairs Department developed a Cultural Heritage Master Plan, adopted by the City Council in 2000. The Master Plan contains numerous important policy recommendations on historic preservation in the City of Los Angeles, many of which have shaped the creation and early work of the Office of Historic Resources.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

The following thresholds of significance were developed based on Appendix G of the CEQA Guidelines. The Proposed Project would have a significant impact to cultural resources if it would:

- Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5 (Threshold 4.4-1)
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 (Threshold 4.4-2)
- Disturb any human remains, including those interred outside of dedicated cemeteries (Threshold 4.4-3)

METHODOLOGY

The cultural resources analysis considers the presence and absence of known cultural resources, as well as the potential for significant cultural resources to occur within the Project Area and considers the potential impacts on such resources from adoption and implementation of the Proposed Project.

The analysis of historical resources examines the likelihood that the Proposed Project could cause a substantial adverse change in the significance of a historical resource. For purposes of the analysis of

impacts to historical resources, historical resources include all resources on the California Register (which include those on the National Register); all HCMs, all HPOZs; all resources identified as eligible for listing or designated on a state or local register in Historic Resources Survey, Cornfield Arroyo Seco Specific Plan Area, completed in 2011 .

Based on CEQA Guidelines Section 15064.5, activities under the Proposed Project would have a significant impact on historical resources if they would cause a substantial adverse change in the significance of a historical resource. Section 15064.5 explains that “[s]ubstantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.” Generally, a project that follows the Secretary of the Interior’s Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior’s Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (1995) is considered to be mitigated to a level of less-than-significant impact on the historical resource.

The analysis of archaeological resources identifies the likelihood of ground disturbing activities to potentially result in a significant impact to unique archaeological resources (non-unique resources do not have to be addressed in an Environmental Impact Report). PRC Section 21083.2 defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
- Has a special and particular quality such as being the oldest of its type or the best example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Similar to archaeological resources, the analysis of human remains considers the likelihood of ground disturbing activities to potentially encounter human remains.

PROJECT IMPACTS

Threshold 4.4-1	Cause a substantial adverse change in the significance of a historical resource as pursuant to § 15064.5
------------------------	--

Impact 4.4-1 **Proposed Project:** Although the existing regulations provide certain protections for significant historical resources, individual reasonably anticipated development from the Project could potentially cause a substantial adverse change in or disturbance of historical resources as defined in CEQA Guidelines Section 15064.5. Impacts to historical resources would be *significant and unavoidable*.

Project Impacts

As described in the Setting, there are 37 historical resources identified within the Project Area, including both designated resources and those found potentially eligible in the 2011 historical resources survey of the Project Area or other surveys.

Within the Project Area, there are eight state- and/or federally designated historical resources, including two historic districts, in addition to nine designated HCMs. The 2011 historic resources survey of the Project Area, which was completed to identify potentially eligible historical resources, identified 19 previously unrecorded properties within the Project Area that could be eligible for federal, state, and/or local designation pending further investigation. **Figures 4.4-1a through 4.4-1d** identify the location of these historical resources and indicates that, although they are located throughout the Project Area, higher concentrations in the north and south ends of the Project Area. Several designated and eligible historical resources are associated with the local and regional transportation networks traverse or are located within the Project Area. Among these are the National Register-listed Arroyo Seco Parkway Historic District, which passes through the north end of the Project Area, and multiple City-owned bridges that cross the Los Angeles River. Historical resources associated with the early development of industry in the Project Area are found throughout the area but are most often found along the historical rail corridor now used as the L Line of the Los Angeles Metro Rail.

The Proposed Project does not introduce any features that would preclude implementation of or alter the regulatory control ordinances that designated historical resources are subject to the Cultural Heritage Ordinance and Building Permit regulations discussed above. There are no historical resources that are called for removal or alteration under the Project. However, development that would occur over the life of the Project has the potential to occur on, or adjacent to, historical resources. Development can impact historical resources either through direct effects (demolition or alteration of a historical resource's physical characteristics that convey its historical significance, such as incompatible façade changes) or through indirect effects to the area surrounding a resource (such as creating a visually incompatible structure adjacent to a historical structure).

Nothing in the Proposed Project alters the current City's practice for any discretionary project, which involves OHR reviewing any project involving a property identified in SurveyLA as potentially eligible for listing, and requiring avoidance measures, unless OHR agrees the resource is not eligible for listing. If OHR disagrees with an applicant that a resource is not eligible for listing, OHR will require the applicant to provide an impact assessment from a qualified preservation consultant and develop mitigation measures or OHR will advise if a significant impact is not avoidable. The Office of Historic Resources typically recommends modifications that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings. Such modifications may include retention of significant character-defining features and adjustments to setbacks, step backs, and height, as well as other project features related to context-sensitive project design. If an impact is not avoidable, the Planning Department will require the applicant to pay fees for the City to prepare an EIR.

Notwithstanding the above, new development could result in an impact to historical resources either through direct effects (demolition or alteration of a historical resource's physical characteristics that convey its historical significance, such as change to the façade inconsistent with the original façade) or through indirect effects to the area surrounding a resource (eliminating or diminishing the historic value of a resource without physically changing the resource, such as creating a visually incompatible structure adjacent to a historical structure).

All discretionary projects that have the potential to impact historical resources must be individually reviewed by the Office of Historic Resources. While the Office of Historic Resources reports that it is extremely uncommon in the City to lose designated historical resources when a property owner has complied with the City's regulations, the Cultural Heritage Ordinance and the Building Code, it cannot prevent a property from being demolished or redeveloped or prevent structures from being altered. Rather these ordinances provide for processes, including environmental review, but they do not prohibit demolition. It is possible that demolition and/or significant alteration to some of the historical resources

within the Project Area would occur during the life of the Proposed Project. Therefore, the Proposed Project's impacts related to historical resources would be potentially *significant and unavoidable*.

Mitigation Measures

No feasible mitigation measures have been identified. As discussed above, historical resources that are designated under HCM may be demolished if an applicant goes through the discretionary review process and prepares necessary environmental review. Resources included in 2011 Project Area Survey are not prohibited from demolition or alteration, provided they go through the appropriate process including environmental review. As a policy matter, the City finds that requiring additional review of projects otherwise undergoing discretionary review is undesirable based on the requirements it would place on City resources and the delay it would result in for projects. Additionally, as a policy matter, the City finds that it is undesirable to put additional regulations or processes on ministerial projects involving historical resources that are designated under the HCM or identified in the 2011 Project Area Survey. Based on the above, there is no feasible mitigation to prevent the demolition or substantial alteration of historical resources. Therefore, impacts to historical resources from the Proposed Plan will be *significant and unavoidable*.

Threshold 4.4-2 Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5

Impact 4.4-2 **Proposed Project:** Implementation of the Proposed Project could result in development that could cause a substantial adverse change in or disturbance of known or unknown archaeological resources as defined in CEQA Guidelines Section 15064.5. Therefore, without mitigation, impacts related to archaeological resources would be potentially significant. With mitigation, the impact would be less than significant.

Project Impacts

Effects on archaeological resources are only known once a specific development has been proposed because the effects are highly dependent on both the individual development site conditions and the characteristics of the proposed ground-disturbing activity. Ground-disturbing activities associated with reasonably anticipated development from the Project, particularly in areas that have not been studied through a cultural resources investigation, or when excavation depths exceed those previously attained, have the potential to damage or destroy previously-unknown historic or prehistoric archaeological resources that may be present on or below the ground surface. Impacts to archaeological resources are especially likely in instances where ground disturbance will occur in native soils, in historic-age fill of unknown origin, and in areas that were developed prior to the implementation of City-wide sewer and trash collection programs. Because of the extensive history of the Los Angeles area throughout the Prehistoric, Spanish, Mexican, and American periods, the entire Project Area is considered sensitive for archaeological resources. Development throughout Los Angeles has encountered subsurface archaeological resources, such as remnants of the Zanja Madre, Tongva sites, and historic archaeological sites such as refuse deposits and privies associated with the early growth of the City. The Zanja Madre, for example, is thought to have run from El Pueblo de Los Angeles in several branches southward, passing through the Project Area and then into Downtown but has not been fully mapped. Consequently, impacts related to damage to or destruction of previously-unknown sub-surface cultural resources could occur as a result of development under the Proposed Project. Such damage or destruction would be *potentially significant*.

Mitigation Measures

The following mitigation measures, in addition to Mitigation Measures 4.15-1(a) and 4.15-1(b) in Section 4.15, Tribal Cultural Resources, apply to discretionary development projects.

4.4-2(a)

For any project that requires a permit for grading or excavation; if a possible archaeological resource is uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a qualified archaeologist has been retained to evaluate the find in accordance with National Register of Historic Places and California Register of Historical Resources criteria. The qualified archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground disturbance activities may continue unimpeded on other portions of the site outside the specified radius.

Any potential archaeological resource or associated materials that are uncovered shall not be moved or collected by anyone other than an archaeological monitor or qualified archaeologist unless the materials have been determined to be non-unique archaeological resources, as defined in Public Resources Code Section 21083.1(h), by the qualified archaeologist. The qualified archaeologist shall determine if the resources are unique archaeological resources as defined in Public Resources Code Section 21083.2(g).

Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows:

- The find should be preserved in place or left in an undisturbed state unless the project would damage the resource.
- When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a qualified archaeologist.

Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a qualified archaeologist. A report that describes the resource(s) and its disposition, as well as the assessment methodology, shall be prepared by the qualified archaeologist according to current professional standards and maintained for a minimum of five years after the Certificate of Occupancy is used. If appropriate, the report should also contain the qualified archaeologist's recommendations for the preservation, conservation, and curation of the resource at a suitable repository, such as the Natural History Museum of Los Angeles County, with which the Applicant or Owner must comply.

4.4-2(b)

Prior to issuance of a permit for grading or excavation all project applicants will receive notice and acknowledge receipt of the following notice:

Several laws regulate the treatment of archaeological, paleontological, and tribal cultural resources and make it a criminal violation to destroy those resources. These regulations include, but are not limited to:

- California Penal Code Section 622.5 provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."
- Public Resources Code Section 5097.5(a) states: "A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints,

inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.”

- California Code of Regulations, Title 14, Section 4307 states: “No person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value.” Section 1427 “recognizes that California’s archaeological resources are endangered by urban development and population growth and by natural forces...Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave.”

The following best practices are recognized by archaeologists and environmental consultants to ensure archaeological resources are not damaged during grading, excavation, or other Ground Disturbance Activities:

- **Records Search.** A cultural resources records search should be requested from and conducted by the California Historical Resources Information System’s (CHRIS) South Central Coastal Information Center (SCCIC) located at California State University, Fullerton to determine whether any cultural resources have been previously identified on or within a 0.5-mile radius of the Project site. The results of this records search shall be used as an indicator of the archaeological sensitivity of the Project site.
- A qualified archaeologist shall be retained and use all reasonable methods, consistent with professional standards and best practices, to determine the potential for archaeological resources to be present on the Project site. If the qualified archaeologist determines there is a medium to high potential that archaeological resources may be located on the Project site and it is possible that such resources will be impacted by the Project, the qualified archaeologist shall advise the Applicant and Owner to retain an Archaeological monitor to observe all Ground Disturbance Activities within those areas identified as having a medium to high potential in order to identify any resources and avoid potential impacts to such resources.
- **Monitoring.** An archaeological monitor should monitor excavation and grading activities in soils that have not been previously disturbed in order to identify and record any potential archaeological finds and avoid potential impacts to such resources. In the event of a possible archaeological discovery, the archaeological monitor shall notify a qualified archaeologist. The Archaeological monitor has the authority to temporarily halt earthwork activities.
- **Handling, Evaluation, and Preservation.** Any archaeological resource materials or associated materials that are uncovered shall not be moved or collected by anyone other than an archaeological monitor or qualified archaeologist unless they have been determined to be nonunique archaeological resources, as defined in Public Resources Code Section 21083.1(h) by a qualified archaeologist. A qualified archaeologist shall determine if the resources are unique archeological resources as defined in Public Resources Code Section 21083.2(g).
- Consistent with Public Resources Code Section 21083.2, the handling, treatment, preservation, and recordation of unique archaeological resources should occur as follows:
 - The find should be preserved in place or left in an undisturbed state unless the Project would damage the resource.
 - When preserving in place or leaving in an undisturbed state is not possible, excavation and recovery of the find for scientific study should occur unless testing or studies already completed

have adequately recovered the scientifically consequential information from and about the resource, and this determination is documented by a qualified archaeologist.

- If recommended by the qualified archaeologist, the resource(s) shall be curated by a public, non-profit institution with a research interest in the material, such as the Natural History Museum of Los Angeles County or another appropriate curatorial facility for educational purposes.
- Ground Disturbance Activities in the area where resource(s) were found may recommence once the identified resources are properly assessed and processed by a qualified archaeologist.

4.4-2(c)

Projects within 500 feet of the currently mapped known segments of the Zanja system (see Appendix F) have increased likelihood of encountering segments of the Zanja system during construction. The Zanja system includes the Zanja Madre and its outbranching secondary Zanja segments. If possible, segments of the Zanja system are uncovered during earthwork or construction, all work shall cease within a minimum distance of 50 feet from the find until a qualified archaeologist has been retained to inspect and evaluate the find. The qualified archaeologist may adjust this avoidance area, ensuring appropriate temporary protection measures of the find are taken while also considering ongoing construction needs in the surrounding area. Temporary staking and delineation of the avoidance area shall be installed around the find in order to avoid any disturbance from construction equipment. Ground Disturbance Activities may continue unimpeded on other portions of the site outside the specified radius.

At a minimum, and even if avoided, should the find be determined to be related to the Zanja system, the qualified archaeologist shall prepare a memo and complete all relevant State of California Department of Parks and Recreation (DPR) DPR 523 forms documenting the find.

If the qualified archaeologist, having evaluated the find, determines that the find retains integrity, documentation consistent with the standards and guidelines established the Historic American Engineering Record (HAER) shall be undertaken and transmitted to the Library of Congress before any alteration, demolition, construction, or removal activity may occur within the determined avoidance area. Documentation shall include narrative records, measured drawings, and photographs in conformance with HAER Guidelines. The found segments shall also be mapped using Geographic Information Systems (GIS) or 3D mapping technology in order to contribute to the existing record of the location and extent of the Zanja system as a whole. At minimum, GIS data shall include the geographic coordinates and depth of all portions of the find. All records, including geographic data, georeferenced photographs, and information about the depth of the find shall be submitted to City Planning. Report documentation and GIS files shall additionally be provided to the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton.

In addition to HAER documentation, if determined appropriate by the qualified archaeologist, one or more of the following specific treatments shall be developed and implemented based on potential California Register eligibility criteria or the significance of the find as a unique archaeological resource:

- Treatment Under Criterion 1: Treatment shall include interpretation of the Zanja system for the public. The interpretive materials may include, but not be limited to, interpretive displays of photographs and drawings produced during the HAER documentation, signage at the Zanja Madre alignment, relocating preserved segments in a publicly accessible display, or other visual representations of Zanja alignments through appropriate means such as a dedicated internet website other online-based material. At a minimum, the interpretive materials shall include photographs and drawings produced during the HAER documentation and signage. These interpretive materials shall be employed as part of Project public outreach efforts that may include various forms of public exhibition and historic image reproduction. Additionally, the results of the historical and

archaeological studies conducted for the Project shall be made available to the public through repositories such as the local main library branch or with identified non-profit historic groups interested in the subject matter. The interpretive materials shall be prepared at the expense of the Project applicant, by professionals meeting the Secretary of the Interior's Professional Qualifications Standards in history or historical archaeology. The development of the interpretive materials shall consider any such materials already available to the public so that the development of new materials would add to the existing body of work on the historical Los Angeles water system, and to this end, shall be coordinated, to the extent feasible and to the satisfaction of the Department of City Planning, in consultation with the Office of Historic Resources. The interpretive materials shall include a consideration of the Zanja segment located on the Project Site in relation to the entire Zanja system. The details of the interpretive materials, including the content and format, and the timing of their preparation, shall be completed to the satisfaction and subject to the approval of the Department of City Planning, in consultation with the Office of Historic Resources.

- Treatment Under Criterion 2: No additional work; archival research about important persons directly associated with the construction and use of the Zanja system would be addressed as part of HAER documentation.
- Treatment Under Criterion 3: No additional work; HAER documentation is sufficient.
- Treatment Under Criterion 4: No additional work; archaeological data recovery and HAER documentation are sufficient.
- Treatment as a unique archaeological resource, as defined by PRC Section 21083.2(g): Same as Criterion 1 treatment.

Significance After Mitigation

Implementation of Mitigation Measures 4.4-2(a), 4.4-2(b), and 4.4-2(c) would avoid significant direct impacts to archaeological resources to the maximum extent feasible and provide for recovery and/or documentation of any significant resources, including any present portions of the Zanja Madre, that cannot be preserved in place. With mitigation, significant archaeological resources would be preserved and impacts to archaeological resources would be *less than significant with mitigation*.

Threshold 4.4-3	Disturb any human remains, including those interred outside of dedicated cemeteries
------------------------	---

Impact 4.4-3 **Proposed Project:** Although human remains are not known to be present in the Project Area, new reasonably anticipated development from the Proposed Project could result in damage to or destruction of as of yet undiscovered human remains. With adherence to existing regulations, impacts would be *less than significant*.

Project Impacts

Human burials outside of formal cemeteries often occur in prehistoric archaeological contexts. Although the Project Area is built out, the potential still exists for these resources to be present. Excavation during future construction activities in the Project Area would have the potential to disturb these resources, including Native American burials.

Human burials, in addition to being potential archaeological resources, have specific provisions for treatment in Section 5097 of the California Public Resources Code. The California Health and Safety Code (Sections 7050.5, 7051, and 7054) has specific provisions for the protection of human burial remains. Existing regulations address the illegality of interfering with human burial remains, and protects them from disturbance, vandalism, or destruction, and established procedures to be implemented if Native American

skeletal remains are discovered. Public Resources Code Section 5097.98 also addresses the disposition of Native American burials, protects such remains, and established the NAHC to resolve any related disputes.

Implementation of the above-described regulations would ensure that development carried out under the Proposed Project would have a *less than significant* impact from potential disturbance of human remains, including those interred outside of formal cemeteries.

Mitigation Measures

None required.

CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable cultural resource impacts includes the entire Project Area and areas comprising portions of historical and archaeological resources that extend outside the Project Area boundaries.

Historical Resources

Cumulative development throughout the Project Area could involve demolition or alteration of historical resources. The nature and magnitude of such impacts would depend on the nature and location of individual future developments so it would be speculative to try to predict the specific level of cumulative impact that may occur as the City continues to develop. Nevertheless, it is conservatively projected that Citywide development could result in the alteration or loss of some historical resources, with potentially significant cumulative impacts.

As discussed under Impact 4.4-1, the Proposed Project could involve the loss of historical resources throughout the Project Area. Although the City policies and programs includes a number of policies aimed at the preservation of historical resources, the loss of such resources remains a possibility. Based on this information, the Project could foreseeably have cumulatively considerable contributions to a significant cumulative impact to historical resources.

The potential for impacts to historical resources from individual developments is site-specific and depends on the location and nature of each individual development proposal. However, potential impacts may reach beyond an individual project site if the project is located within a designated or potential historic district. All future development projects would continue to be subject to existing federal, state, and local requirements and discretionary projects may be subject to project-specific mitigation requirements as outlined herein. It is anticipated that cumulative impacts to historical resources can be avoided through implementation of regulatory compliance measures (existing rules for HCM) and project design features on a project-by-project basis, but alteration or demolition of historical resources remains a possibility throughout the Project Area and Citywide.

Based on the above, the incremental effect of the Project Area on historical resources would be cumulatively considerable and cumulative impacts to historical resources in the Project Area would be *significant and unavoidable*.

Archaeological Resources

Cumulative development could potentially disturb known and currently unknown archaeological resources that could be present throughout the Project Area. The nature and magnitude of such impacts would depend on the nature and location of individual future developments so it would be speculative to try to predict the specific level of cumulative impact that may occur as the City continues to develop. Nevertheless, it is anticipated that development would have the potential to disturb archaeological resources.

As discussed under Impact 4.4-2, implementation of the Proposed Project could potentially disturb archaeological resources that may be present in the Project Area. Although it is anticipated that cumulative impacts to archaeological resources can be avoided or minimized through implementation of mitigation measures on a project-by-project basis, impacts remain a possibility. Based on the above, the incremental effect of the Project on archaeological resources would be cumulatively considerable and cumulative impacts to archaeological resources citywide would be *significant and unavoidable*.

Human Remains

Although unlikely, cumulative development could potentially disturb currently unknown human remains that could be present in the Project Area. However, compliance with applicable regulatory requirements on a case-by-case basis related to the avoidance and treatment of human remains would reduce such impacts to a less than significant level. Based on this information, implementation of the Proposed Project would not substantially contribute to any significant cumulative impact to human remains.

Based on the above, the Proposed Project's incremental effect would not be cumulatively considerable and cumulative impacts would be *less than significant*.

4.5 ENERGY

This section addresses the potential construction and operational impacts on energy resources. The analysis identifies the utility companies that provide electricity and natural gas services in the CASP Area (or Project Area), describes the existing consumption, the nature and location of related infrastructure, and the anticipated demand for electricity and natural gas.

ENVIRONMENTAL SETTING

PETROLEUM

California is one of the top producers of petroleum in the nation, with drilling operations primarily concentrated in Kern and Los Angeles Counties. A network of crude oil pipelines connects production areas to oil refineries in the Los Angeles area, the San Francisco Bay area, and the Central Valley. California oil refineries also process large volumes of Alaskan and foreign crude oil received in ports in Los Angeles, Long Beach, and the San Francisco Bay area. Crude oil production in California and Alaska is in decline, and California refineries have become increasingly dependent on foreign imports. Led by Saudi Arabia, Iraq and Ecuador, foreign suppliers now produce about 56 percent of the crude oil refined in California in 2021 (California Energy Commission [CEC 2021a]CEC 2022a).

According to the United States Energy Information Administration (EIA), transportation accounted for nearly 34 percent of California's energy demand, amounting to approximately 2,355 trillion British thermal units (Btu) in 2020. California's transportation sector, including on-road and rail transportation, consumed roughly 524 million barrels of petroleum fuels in 2020 (EIA 2022a). Furthermore, petroleum-based fuels are used for approximately 99 percent of the State's transportation activity (EIA 2022b). Most gasoline and diesel fuel sold in California for motor vehicles is refined in California to meet state-specific formulations required by the California Air Resources Board (CARB).

Citywide Petroleum Consumption

Southern California is in Petroleum Administration for Defense District 5 (PADD 5). PADDs are geographic groupings of the United States that assists the U.S. Energy Information Administration in assessing regional petroleum product supplies and their movements throughout the nation. Demand in PADD 5 includes in-region consumption, transfers of fuels to other parts of the United States (other PADDs) and to other regional markets within PADD 5, and exports to the global market. Supply in PADD 5 includes in-region refinery production, receipts of fuels produced in other regions and other PADD 5 regional markets, and imports (EIA 2015). There are four petroleum refineries located in the City of Los Angeles, such as Marathon Petroleum, Phillips 66, Valero Energy, and Valero Wilmington Asphalt Refinery. The petroleum refineries in the City consume a total of approximately 593,300 barrels per day (CEC 2021b). As discussed below, the other petroleum refineries near are the Lunday-Thagard Co. Refinery and World Oil Refining Refinery, both located in the City of South Gate, adjacent to the southeastern boundary of the Southeast Los Angeles community.

Project Area Petroleum Consumption

Petroleum fuels are generally purchased by individual users such as residents and employees. There are no petroleum refineries located within the Project Area, and there are five gas stations located at 2001 N Broadway (76 Gas Station), and the intersection of Figueroa Street and Avenue 26th (USA Gasoline, 76,

Hancor, and Chevron) within the Project Area based on Google aerial images (EIA 2022c). The nearest petroleum refineries outside of the Project Area are the Lunday-Thagard Co. Refinery, located at 9301 Garfield Avenue, and the World Oil Refining Refinery, located at 9302 Garfield Avenue in South Gate, Los Angeles, approximately 10 miles southeast of the Project Area.

Petroleum consumption was identified by calculating the direct energy consumption of the Project Area (see *Methodology* in Section 4.5.4, *Environmental Impacts*, for more information). Daily vehicle miles traveled (VMT) within the Project Area were retrieved from the traffic study prepared by Fehr & Peers and were estimated at approximately 328,439 in 2021, as shown in **Table 4.5-1**. Based on this daily VMT, approximately 2,053 million British thermal units (mmBtu) were consumed per day in 2021 by the transportation sector, as shown below in **Table 4.5-2**.

TABLE 4.5-1 CURRENT DAILY AND ANNUAL VMT FOR THE PROJECT AREA		
	Daily VMT	Annual VMT ¹
CASP Area Total	328,439	113,968,333
<p>NOTES: VMT = vehicle miles traveled. ¹ Annual VMT is calculated by multiplying daily VMT by 347 days to account for reduced travel on weekends, in accordance with industry standards. SOURCE: Fehr & Peers 2022.</p>		

TABLE 4.5-2 CURRENT DIRECT TRANSPORTATION ENERGY USE IN THE PROJECT AREA						
	2021 Daily Energy Use (mmBtu)	2021 Annual Energy Use (mmBtu)	2021 Daily Per Capita Energy Use (mmBtu)	2021 Daily Per Service Population Energy Use (mmBtu)	2021 Annual Per Capita Use (mmBtu)	2021 Annual Per Service Population Energy Use (mmBtu)
CASP Area Total	1,925 ²	702,446 ¹	0.32 ³	0.17 ⁴	116.55 ⁵	61.41 ⁶
<p>NOTES: VMT = vehicles miles traveled, mmbtu = millions British thermal units Transportation energy consumption was derived from the CASP Update VMT (see Table 4.5-1), default fleet mix from CalEEMod (see Appendix X), average fuel economy from the United States Department of Transportation – Federal Highway Administration, and energy unit data from EIA. ¹ (4,859,960 gal gasoline x (120,286 btu/gal) + 857,912 gal diesel x (137,381 btu/gal)) / 1,000,000 btu/mmbtu ²Annual energy use mmbtu divided by 365. ³1,925 daily mmbtu divided by existing 2021 population (6,027) ⁴1,925 daily mmbtu divided by existing 2021 population (6,027) and jobs (5,411) ⁵702,446 annual mmbtu divided by 2021 population (6,027) ⁶ 702,446 annual mmbtu divided by 2021 population (6,027) and jobs (5,411). Totals may not add up due to rounding. SOURCE: United States Department of Transportation 2022a; EIA 2022d.</p>						

ELECTRICITY

In 2021, California produced 70 percent of the electricity it used. The remainder was imported from outside the state. In 2021, California used 277,764 gigawatt hours of electricity while a total of 194,127 gigawatt hours was produced in-state (CEC 2022b). Likewise, in 2020, Californians consumed an estimated 11,923 million Therms (CEC 2022c).

The Los Angeles Department of Water and Power (LADWP) provides electrical service throughout Los Angeles. LADWP generates power from a variety of different sources that include approximately 26 percent natural gas, 19 percent coal, 35 percent renewables, 14 percent nuclear, and seven percent hydroelectric (LADWP 2021). LADWP utilizes renewable energy sources and is committed to meeting the requirement of the Renewable Portfolio Standard (RPS) Enforcement Program to use at least 33 percent of

the City's energy from renewables by 2020 (CARB 2016). Eligible renewable resources include biodiesel, biomass, hydroelectricity and small hydro, Los Angeles Aqueduct hydro power plants, digester gas, fuel cells, geothermal, landfill gas, municipal solid waste, ocean thermal, ocean wave, and tidal current technologies, renewable derived biogas, multi-fuel facilities using renewable fuels, solar photovoltaic, solar thermal electric, wind, and other renewables (LADWP 2013).

LADWP provides electricity service to over 4 million residents in its service area, encompassing the City and parts of the Owens Valley (LADWP 2022). LADWP has over 8,009 megawatts of generation capacity from a diverse mix of energy sources. Its distribution network includes 7,148 miles of overhead distribution lines and nearly 3,709 miles of underground distribution cables (LADWP 2022). The LADWP system supplies more than 21 million megawatt-hours (MWh) of electricity per year (CEC 2022d).

2017 Power Strategic Long-Term Plan

The 2017 Power Strategic Long-Term Resource Plan (SLTRP) document serves as a comprehensive 20-year roadmap that guides the LADWP Power System in its efforts to supply reliable electricity in an environmentally responsible and cost-effective manner. Since resource decisions can have significant economic and environmental consequences, it is essential for the planning process to be conducted with transparency, active participation, and collaborative dialog with affected stakeholders and our customers. The 2016 Integrated Resource Plan (IRP) included a public outreach process and Advisory Committee that, along with a series of public outreach workshops, played an integral role in the development of the resource cases that were evaluated and in the final selection of the recommended resource case. Strong interest in the City Council's 100 percent renewable energy Motion was communicated during last year's public outreach process. In response, LADWP formed research partnerships and developed a robust stakeholder process in order to investigate the investments necessary to achieve a 100 percent clean energy future. Future SLTRPs will consider incorporating the findings of this study that are recommended within the 2050 timeframe. This year's 2017 SLTRP re-examines and expands its analysis on the 2016 IRP resource cases with updates in line with latest regulatory framework, and updates to case scenario assumptions that include a 65 percent RPS, advanced energy efficiency, and higher levels of local solar, energy storage, and transportation electrification (LADWP 2017).

Citywide Electricity Consumption

In 2021, the most recent year with available data, LADWP's electricity generation and distribution infrastructure delivered 21.0 million MWh of electricity to its customers. Commercial users consumed the most electricity supplied by the LADWP in 2021 with approximately 11.5 million MWh, or 55 percent of the total electricity provided by the LADWP. Residential customers consumed approximately 7.4 million MWh, or 35 percent, of electricity supplied by the LADWP in 2021. Industrial users consumed approximately 1.7 million MWh, or eight percent, while other LADWP customers consumed approximately 0.39 million MWh, or approximately two percent (CEC 2022d).

CASP Area Electricity Consumption

Electricity consumption in the Project Area for existing conditions was estimated using CalEEMod see Section 4.2, *Air Quality*, for modeling methodology and assumptions, and Appendix X for model results). As shown in **Table 4.5-3**, existing (2021) Project Area residential and non-residential development consumed a combined total of just over 85,989 MWh of electricity. With a Project Area population of approximately 6,027, this equates to approximately 14.3 MWh per capita of electricity consumption in 2021.

TABLE 4.5-3 CURRENT PROJECT AREA ELECTRICITY CONSUMPTION				
	Electricity Consumption (MWh)¹	Proportion of Statewide Consumption	Per Capita Electricity Consumption (MWh)	Per Service Population Electricity Consumption
CASP Area	85,989	0.04%	14.3	7.5
<p>NOTE: The per capita consumption for electricity is determined by dividing electricity consumption data from CalEEMod by the existing CASP Area population, as detailed in Section 4.12, <i>Population, Housing and Employment</i>.</p> <p>SOURCE: CEC 2022d, City of Los Angeles 2018.</p>				

As shown in **Table 4.5-3**, the Project Area accounted for approximately 0.4 percent of the State's electricity consumption in 2021 (CEC 2022d, Appendix E). With a 2021 per capita consumption of 14.3 MWh, the Project Area ranked per capita average is above California's average per capita consumption of approximately 7.1 MWh of electricity in 2021 (CEC 2022b; California Department of Finance [DOF] 2022).

NATURAL GAS

Southern California Gas Company (SoCal Gas) is responsible for providing natural gas supply to the County and City. SoCal Gas is regulated by the California Public Utilities Commission (CPUC) and other state and federal agencies. In 2021, Californians consumed approximately 11,923 million Therms of natural gas or 1,108,529 billion Btu (CEC 2022c). The state population in 2022 was approximately 39.3 million, resulting in an average statewide per capita natural gas demand of 0.03 billion Btu per capita (California Department of Finance 2022).

2022 California Gas Report

The 2022 California Gas Report presents a comprehensive outlook for natural gas requirements and supplies for California through the year 2035. This report is prepared in even-numbered years, followed by a supplemental report in odd-numbered years, in compliance with California PUC Decision D.95-01-039. The below projections in the California Gas Report are for long-term planning and do not necessarily reflect the day-to-day operational plans of the utilities (SoCal Gas 2022a).

Statewide residential gas demand is projected to decrease at an average rate of 2.4 percent each year (SoCalGas 2022a). Aggressive energy efficiency programs are dampening gas demand in these sectors. In addition, the statewide efforts to minimize greenhouse gas (GHG) emissions are reducing electricity generation demand due to increase in demand side and supply side generation resources that produce few or no carbon emissions (SoCal Gas 2022a).

Residential gas demand is expected to decrease at an annual average rate of 2.4 percent. Demand in the commercial market is expected to decline at an annual rate of 1.8 percent, and demand in the industrial market (non-refinery) is expected to grow at an annual rate of 0.2 percent.

For electricity demand within California, SoCalGas relies on the California Energy Commission (CEC)'s California Energy Demand Forecast 2021-2035, dated January 2022. This energy demand forecast was developed as part of the CEC's Integrated Energy Policy Report process. The mid energy demand forecast with Additional Achievable Energy Efficiency Scenario 3 and Additional Achievable Fuel Substitution Scenario 2 was selected as the energy demand forecast (SoCal Gas 2022a). SoCal Gas engages in a number of energy efficiency and conservation programs designed to help customers identify and implement ways to benefit environmentally and financially from energy efficiency investments. Programs administered by SoCal Gas include services that help customers evaluate their energy efficiency options and adopt

recommended solutions, as well as simple equipment retrofit improvements, such as rebates for new hot water heaters.

Southwestern United States Gas Supplies

Traditional Southwestern U.S. sources of natural gas will continue to supply most of Southern California's natural gas demand. This gas is primarily delivered via the El Paso Natural Gas pipeline with some volumes also on Transwestern pipeline. The San Juan Basin's gas supplies peaked in 1999 and have been declining at an annual rate of roughly 2 percent. The Permian Basin has experienced a major increase in gas production as a byproduct of the tremendous amount of oil development in the area. The increase positioned the Permian Basin as a preferred gas supply source of economical gas. Permian gas production increased over 130 percent during the period 2017-2021. Mexican demand for Southwestern U.S. gas along with East of California demand continue to steadily increase and compete for Southwestern supplies. This increased demand, which has been more than offset by the recent increase in Permian gas production, will continue to compete with Southern California for Southwest supplies (SoCal Gas 2022a).

Rocky Mountain Gas Supplies

Rocky Mountain supply supplements traditional South-Western U.S. gas sources for Southern California. This gas is delivered to Southern California primarily on the Kern River Gas Transmission Company's pipeline, although there is also access to Rockies gas through pipelines interconnected to the San Juan Basin. Many pipelines that supplying other markets connect to Rocky Mountain region, which allows these supplies to be redirected from lower to higher value markets as conditions change. Kern River Gas Transmissions volumes to Southern California have surpassed Transwestern pipeline's deliveries of South-western supplies (SoCal Gas 2022a).

Canadian Gas Supplies

Canadian gas only provides a small share of Southern California gas supplies due to the high cost of transport (SoCal Gas 2022a).

Regional Gas Consumption

SoCal Gas is the distributor of natural gas in Southern California, providing retail and wholesale customers with transportation, exchange and storage services and procurement services to most retail core customers. SoCal Gas is a gas-only utility and, in addition to service the residential, commercial, and industrial markets, provides gas for enhanced oil recovery and electric generation customers in Southern California. SoCal Gas' natural gas system is the nation's largest natural gas distribution utility and serves a 24,000-square-mile area in Central and Southern California. The system supplies natural gas to 21.8 million customers through 5.9 million meters in more than 500 communities (SoCal Gas2022b.).

Most of the natural gas used in California comes from out-of-state natural gas basins. In 2017, for example, California utility customers received 38 percent of their natural gas supply from basins located in the Southwestern United States, 27 percent from Canada, 27 percent from the U.S. Rocky Mountain area, and 8 percent from production located in California. Natural gas from out-of-state production basins is delivered into California via the interstate natural gas pipeline system. The major interstate pipelines that deliver out-of-state natural gas to California gas utilities are Gas Transmission Northwest Pipeline, Kern River Pipeline, Transwestern Pipeline, El Paso Pipeline, Ruby Pipeline, Mojave Pipeline, and Tuscarora (CPUC 2022).

SoCalGas serves approximately 21.8 million customers through 5.9 million meters of gas lines within a 24,000-square-mile service area that includes over 500 communities in Central and Southern California. In 2020, a total of approximately 5,100 million therms of natural gas were consumed by SoCalGas' customers.

Of this total, residential, industrial, commercial and miscellaneous other customers consumed 2,261 million, 1,650 million, 844 million, and 347 million therms of natural gas, respectively. In 2021, the total gas consumption for Los Angeles County was 2,881 million therms. Of this total, 1,743 million therms were for non-residential use and 1,138 therms was for residential use (CEC 2022c).. SoCalGas projects total gas demand to decline at an annual rate of 1.5 percent from 2022 to 2035. The core, non-residential markets (comprising core commercial, core industrial and NGV) are expected to decline at an average annual rate of 1.4 percent or from 224 Bcf in 2020 to 170 Bcf by 2035 (SoCalGas 2022a).

CASP Area Natural Gas Consumption

As shown in **Table 4.5-4**, the Project Area accounted for less than <0.1 percent of the State’s natural gas consumption in 2021 (CEC 2022c). With a 2021 Project Area population of approximately 6,027, this equates to natural gas consumption of about 0.019 billion Btu per capita. As noted above, the average statewide per capita natural gas demand in 2017 was 0.03 billion Btu per capita (California Department of Finance 2022). Therefore, per capita natural gas demand in the Project Area is higher than statewide per capita demand.

TABLE 4.5-4 CURRENT PROJECT AREA NATURAL GAS CONSUMPTION			
	Natural Gas Consumption (billion Btu)	Proportion of Statewide Consumption	Per Capita Natural Gas Consumption (billion Btu)
CASP Area	113	<0.1%	0.19
<p>NOTE: The per capita consumption for natural gas is determined by dividing natural gas consumption data from CalEEMod by the existing CASP area population, as detailed in Section 4.12, <i>Population, Housing and Employment</i>.</p> <p>SOURCES: CEC 2022c; City of Los Angeles 2018.</p>			

ALTERNATIVE FUELS

A variety of alternative fuels are used to reduce petroleum-based fuel demand. The use of these fuels is encouraged through various state-wide regulations and plans (e.g., Low Carbon Fuel Standard and SB 32). Conventional gasoline and diesel may be replaced, depending on the capability of the vehicle with transportation fuels including the following:

Hydrogen

Hydrogen is being explored for use in combustion engines and fuel cell electric vehicles. The interest in hydrogen as an alternative transportation fuel stems from its clean-burning qualities, its potential for domestic production, and the fuel cell vehicle’s potential for high efficiency (two to three times more efficient than gasoline vehicles). Currently, 47 hydrogen refueling stations are located in California; however, none are located in the Project Area (United States Department of Energy [DOE 2022a]).

Biodiesel

Biodiesel is a renewable alternative fuel that can be manufactured from vegetable oils, animal fats, or recycled restaurant greases. Biodiesel is biodegradable and cleaner-burning than petroleum-based diesel fuel. Biodiesel can run in any diesel engine generally without alterations but fueling stations have been slow to make it available. There are currently 17 biodiesel refueling stations in California, none of which is located in the Project Area (DOE 2022b).

Electric Vehicles

Electricity can be used to power electric and plug-in hybrid electric vehicles directly from the power grid. Electricity used to power vehicles is generally provided by the electricity grid and stored in the vehicle's batteries. Fuel cells are being explored as a way to use electricity generated onboard the vehicle to power electric motors. There are approximately seven electrical charging stations in the Project Area (DOE 2022c).

Biogas

Biogas is a mixture of methane and carbon dioxide produced by the bacterial degradation of organic matter. There is growing interest regarding biogas production potential in SoCal Gas' service territory from the following activities:

- Non-hazardous-waste landfills,
- Landfill diversion of organic waste material,
- Wastewater treatment,
- Concentrated animal feeding operations, and
- Food and green waste processing.

Biogas is produced from existing waste streams and a variety of renewable and sustainable biomass sources, including animal waste, crop residuals and food waste. Methane can also be produced by the combustion-free thermal conversion of agricultural crop residues, silvicultural residue, wood waste, and municipal sewage sludge or biosolids. The most common source of biogas is the naturally occurring biological breakdown of organic waste at facilities such as wastewater treatment plants and landfills. The abundance of these materials allows for production of substantial quantities of biogas. A study conducted by the University of California, Davis estimates that more than 20 percent of SoCalGas's current residential natural gas use can be provided by biogas derived from our state's existing organic waste alone. In the transportation sector that is enough to replace around 20 percent of the fuel used by heavy-duty trucks in the state. This can help reduce the need for other fossil-based fuels while boosting our supplies with a locally sourced renewable fuel. Looking outside California, the opportunity to produce biogas is vast. According to estimates, the U.S. could produce up to 10 trillion cubic feet of biogas annually by 2030—that is more than five times California's projected natural gas consumption.⁶⁶ (SoCalGas 2022a).

REGULATORY FRAMEWORK

Federal, state and local laws, regulations, plans, and guidelines that are potentially applicable to the Proposed Project or are relevant to the determination of whether the Proposed Project would have a significant impact related to energy are discussed below.

FEDERAL

Energy Policy Conservation Act and Corporate Average Fuel Standards

The Energy Policy Conservation Act of 1975 established nation-wide fuel economy standards in order to conserve oil. Pursuant to this Act, the National Highway Traffic Safety Administration, part of the U.S. Department of Transportation, is responsible for revising existing fuel economy standards and establishing new vehicle fuel economy standards.

The Corporate Average Fuel Economy program was established to determine vehicle manufacturing compliance with the government's fuel economy standards. Compliance with Corporate Average Fuel standards is determined based on each manufacturer's average fuel economy for the proportion of their vehicles produced for sale in the United States.

First established by the U.S. Congress in 1975, the Corporate Average Fuel Economy (CAFE) standards reduce energy consumption by increasing the fuel economy of passenger cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and U.S. Environmental Protection Agency (USEPA) jointly administer CAFE standards. The U.S. Congress has directed NHTSA to set CAFE standards at the "maximum feasible level" with consideration given for: (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) need for the nation to conserve energy.¹ When these standards are raised, automakers respond by creating a more fuel-efficient fleet. The NHTSA has proposed dramatically increasing fuel economy standards to improve the nation's energy security, save consumer's money at the gas pump, and reduce greenhouse gas (GHG) emissions. In 2012, the NHTSA established final passenger car and light truck CAFE standards for model years 2017 through 2021, which the agency projects will require in model year 2021, on average, a combined fleet-wide fuel economy of 40.3 to 41.0 miles per gallons (mpg). In March 2020, the U.S. Department of Transportation (USDOT) and the USEPA issued the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which amends existing CAFE standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establishes new standards covering model years 2021 through 2026.²

Phase 1 and 2 Heavy-Duty Vehicle GHG Standards

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by USEPA and the National Highway Traffic Safety Administration (NHTSA). The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type. The USEPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type.³

Public Utility Regulatory Policies Act of 1978 (PURPA), Public Law 95-617.

PURPA sought to promote conservation of electric energy. Additionally, PURPA created a new class of nonutility generators (small power producers) from which, along with qualified co-generators, utilities are required to buy power.

PURPA was in part intended to augment electric utility generation with more efficiently produced electricity and to provide equitable rates to electric consumers. Utility companies are required to buy all electricity from qualifying facilities at avoided cost (i.e., the incremental savings associated with not having to produce additional units of electricity). PURPA expanded participation of nonutility generators in the electricity market and demonstrated that electricity from nonutility generators could successfully be

¹ Federal Register, 49 U.S.C. 32902, Average Fuel Economy Standards.

² Federal Register, Vol. 85, No. 84, Thursday, April 30, 2020, Rules and Regulations: United States Environmental Protection Agency 40 CFR Parts 86 and 600 and United States Department of Transportation, National Highway Traffic Safety Administration, 49 CFR Parts 523, 531, 533, 536, and 537, The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks, Final Rule, Effective June 29, 2020.

³ Federal Register, Vol. 81, No. 206, Tuesday, October 25, 2016, Rules and Regulations, United States Environmental Protection Agency, 40 CFR Parts 9, 22, 85, 86, 600, 1033, 1036, 1037, 1039, 1042, 1043, 1065, 1066, and 1068, and Department of Transportation, National Highway Traffic Safety Administration, 49 CFR Parts 523, 534, 535, and 538, Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2, Effective December 27, 2016.

integrated with a utility's own supply. In addition, PURPA requires utilities to buy whatever power is produced by qualifying facilities (usually cogeneration or renewable energy). The Fuel Use Act of 1978 (repealed in 1987) also helped qualifying facilities become established. Under Fuel Use Act, utilities were not allowed to use natural gas to fuel new generating technologies, but qualifying facilities, by definition not utilities, were able to take advantage of abundant natural gas and abundant new technologies (such as combined-cycle). The technologies lowered the financial threshold for entrance into the electricity generation business as well as shortened the lead time for constructing new plants.

National Energy Policy Act of 1992 (EPACT92)

EPACT92 calls for programs that promote efficiency and the use of alternative fuels. EPACT92 requires certain federal, state, and local government and private fleets to purchase a percentage of light duty alternative fuel vehicles (AFV) capable of running on alternative fuels each year. In addition, EPACT92 has financial incentives. Federal tax deductions are allowed for businesses and individuals to cover the incremental cost of AFVs. The Act also requires states to consider a variety of incentive programs to help promote AFVs.

Energy Policy Act of 2005

The Energy Policy Act of 2005 provides renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

Clean Air Act (CAA)

Clean Air Act (CAA). CAA Section 211(o), as amended by the Energy Policy Act of 2005, requires the Administrator of the United States Environmental Protection Agency (USEPA) to annually determine a renewable fuel standard which is applicable to refineries, importers, and certain blenders of gasoline, and to publish the standard in the Federal Register by November 30 each year. On the basis of this standard, each obligated party determines the volume of renewable fuel that it must ensure is consumed as motor vehicle fuel. This standard is calculated as a percentage, by dividing the amount of renewable fuel that the Act requires to be blended into gasoline for a given year by the amount of gasoline expected to be used during that year, including certain adjustments specified by the CAA.

Energy Independence and Security Act of 2007

Energy Independence and Security Act of 2007 is designed to improve vehicle fuel economy and help reduce U.S. dependence on oil. It expands the production of renewable fuels, reducing dependence on oil, and confronting global climate change.

Specifically, it:

- Increases the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard that requires fuel producers to use at least 36 billion gallons of biofuel in 2022, which represents a nearly five-fold increase over current levels; and
- Reduces U.S. demand for oil by setting a national fuel economy standard of 35 miles per gallon by 2020 – an increase in fuel economy standards of 40 percent.

Clean Cities Program

The U.S. Department of Energy's (DOE) Clean Cities Program promotes voluntary, locally based government/industry partnerships for the purpose of expanding the use of alternatives to gasoline and diesel fuel by accelerating the deployment of AFVs and building local AFV refueling infrastructure. The mission of the Clean Cities Program is to advance the nation's economic, environmental and energy security by supporting local decisions to adopt practices that contribute to the reduction of petroleum consumption. The Clean Cities Program carries out this mission through a network of more than 80 volunteer coalitions, which develop public/private partnerships to promote alternative fuels and vehicles, fuel blends, fuel economy, hybrid vehicles, and idle reduction.

STATE

Warren-Alquist Act

The 1975 Warren-Alquist Act established the California Energy Resources Conservation and Development Commission, now known as the CEC. The Act established a state policy to reduce wasteful, uneconomical, and unnecessary uses of energy by employing a range of measures. The CPUC regulates privately-owned utilities in the energy, rail, telecommunications, and water fields. Both CEC and CPUC have jurisdiction over Investor-Owned Utilities in California, while the CEC is the primary energy policy and planning agency and CPUC is the primary regulatory agency.

California Energy Plan

CEC is responsible for preparing the California Energy Plan, which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The current (2008) California Energy Plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for zero-emission vehicles and addressing their infrastructure needs; and encouragement of urban designs that reduce VMT and accommodate pedestrian and bicycle access.

Assembly Bill 2076: Reducing Dependence on Petroleum

Pursuant to Assembly Bill (AB) 2076 (Chapter 939, Statutes of 2000), CEC and CARB prepared and adopted in 2003 a joint agency report, *Reducing California's Petroleum Dependence*. This report includes recommendations to increase the use of alternative fuels to 20 percent of on-road transportation fuel use by 2020 and 30 percent by 2030, significantly increase the efficiency of motor vehicles, and reduce per capita VMT. Further, in response to the CEC's 2003 and 2005 *Integrated Energy Policy Reports*, the governor directed CEC to take the lead in developing a long-term plan to increase alternative fuel use.

A performance-based goal of AB 2076 was to reduce petroleum demand to 15 percent below 2003 demand.

Integrated Energy Policy Report (IEPR)

SB 1389 (Chapter 568, Statutes of 2002) required CEC to conduct assessments and forecasts of all aspects of energy industry supply, production, transportation, delivery and distribution, demand, and prices. The CEC shall use these assessments and forecasts to develop energy policies that conserve resources, protect the environment, ensure energy reliability, enhance the state's economy, and protect public health and safety.

CEC adopts an IEPR every two years and an update to the previous IEPR every year between. The 2016 IEPR provides a summary of priority energy issues currently facing the state and outlines strategies and recommendations to further the State's goal of ensuring reliable, affordable, and environmentally responsible energy sources. Energy topics covered in the IEPR include electricity resource and supply plans; electricity and natural gas demand forecasts; natural gas outlooks; transportation energy demand forecasts; energy efficiency savings; integrated resource planning; a barriers study; climate adaptation and resilience; renewable gas; southern California energy reliability; distributed energy resources; strategic transmission investment plans; and existing power plan reliability issues.

Renewable Portfolio Standards (SB 1078, SB 107, SB X 1-2, SB 100, SB 350)

Established in 2002 under SB 1078, and accelerated in 2006 under SB 107, in 2011 under SB X 1-2, in 2015 under SB 350, and most recently in September 2018 under SB 100, California's RPS requires retail sellers of electric services to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 40 percent by 2024, 50 percent by 2026, 60 percent by 2030, and 100 percent by 2045 (Legislative Council of California 2002; Legislative Council of California 2006a). The 33 percent standard is consistent with the RPS goal established in the Scoping Plan (CARB 2008). Initially, the RPS provisions applied to investor-owned utilities, community choice aggregators, and electric service providers. SB X 1-2 (2011) added, for the first time, publicly-owned utilities to the entities subject to RPS.

Assembly Bill 1493: Reduction of Greenhouse Gas Emissions

AB 1493 (Chapter 200, Statutes of 2002), known as the Pavley bill, amended Health and safety Code sections 42823 and 43018.5 requiring CARB to develop and adopt regulations that achieve maximum feasible and cost-effective reduction of GHG emissions from passenger vehicles, light-duty trucks, and other vehicles used for noncommercial personal transportation in California.

Implementation of new regulations prescribed by AB 1493 required that the State of California apply for a waiver under the federal Clean Air Act. Although the USEPA initially denied the waiver in 2008, the USEPA approved a waiver in June 2009, and in September 2009, CARB approved amendments to its initially adopted regulations to apply the Pavley standards that reduce GHG emissions to new passenger vehicles in model years 2009 through 2016. According to CARB, implementation of the Pavley regulations is expected to reduce fuel consumption while also reducing GHG emissions (CARB 2017). In 2018, the USEPA and National Highway Traffic Safety Administration proposed to freeze the clean car standards at the 2020 level through model year 2026 and to revoke California's authority to impose stricter rules (CARB 2018). On September 27, 2019, the U.S. EPA withdrew the waiver it had previously provided to California for the State's GHG and ZEV programs under Section 209 of the CAA. The withdrawal of the waiver was effective November 26, 2019. In response, several states, including California, filed a lawsuit challenging the withdrawal of the U.S. EPA waiver (*State of California vs. Chao*). In March 2022, the U.S. EPA reinstated California's authority under the CAA to implement its own GHG emissions standards and zero emission vehicle sales mandates (USEPA 2022).

Energy Action Plan

The first Energy Action Plan (EAP) emerged in 2003 from a crisis atmosphere in California's energy markets. The state's three major energy policy agencies (CPUC, CEC, and the Consumer Power and Conservation Financing Authority [established under deregulation and now defunct]) came together to develop one high-level, coherent approach to meeting California's electricity and natural gas needs. It was the first time that energy policy agencies formally collaborated to define a common vision and set of strategies to address California's future energy needs and emphasize the importance of the impacts of energy policy on the California environment.

In the October 2005 *Energy Action Plan II*, CEC and CPUC updated their energy policy vision by adding some important dimensions to the policy areas included in the original EAP, such as the emerging importance of climate change, transportation-related energy issues and research and development activities. In February 2008, CEC adopted an update to the EAP II that supplements the earlier EAPs and examines the State's ongoing actions in the context of global climate change.

Assembly Bill 1007: State Alternative Fuel Plans

AB 1007 (Chapter 371, Statutes of 2005) required CEC to prepare a State plan to increase the use of alternative fuels in California. CEC prepared the State Alternative Fuels Plan in partnership with CARB and in consultation with other State, federal, and local agencies. The State Alternative Fuels Plan presents strategies and actions California must take to increase the use of alternative non-petroleum fuels in a manner that minimizes costs to California and maximizes the economic benefits of in-state production. The State Alternative Fuels Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

Bioenergy Action Plan, Executive Order S-06-06

Executive Order (EO) S-06-06, which took effect in 2006, establishes targets for the use and production of biofuels and biopower, and directs state agencies to work together to advance biomass programs in California while providing environmental protection and mitigation. The EO establishes the following targets to produce a minimum of 20 percent of the state's biofuels in California by 2010, 40 percent by 2020, and 75 percent by 2050. EO S-06-06 also calls for the state to meet a target for use of biomass electricity. The 2011 Bioenergy Action Plan identifies those barriers and recommends actions to address them so that the State can meet its clean energy, waste reduction, and climate protection goals. The 2012 Bioenergy Action Plan updates the 2011 Plan and provides a more detailed action plan to achieve the following goals:

- Increase environmentally and economically sustainable energy production from organic waste
- Encourage development of diverse bioenergy technologies that increase local electricity generation, combined heat and power facilities, renewable natural gas, and renewable liquid fuels for transportation and fuel cell applications
- Create jobs and stimulate economic development, especially in rural regions of the state
- Reduce fire danger, improve air and water quality, and reduce waste

Title 24, California Code of Regulations

The California Code of Regulations (CCR) Title 24 is referred to as the California Building Standards Code. It consists of a compilation of several distinct standards and codes related to building construction, including plumbing, electrical, interior acoustics, energy efficiency, and accessibility for persons with physical and sensory disabilities. The California Building Standards Code's energy-efficiency and green building standards are outlined below. These standards are updated every three years and the project will be subject to the 2022 California Building Standards when they go into effect on January 1, 2023.

Part 6 (Building Energy Efficiency Standards)

CCR Title 24, Part 6 is the Building Energy Efficiency Standards or California Energy Code. This code, originally enacted in 1978, establishes energy-efficiency standards for residential and non-residential buildings in order to reduce California's energy demand. New construction and major renovations must

demonstrate their compliance with the current Energy Code through submittal and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission (CEC).

Part 11 (CALGreen)

The California Green Building Standards Code, referred to as CALGreen, was added to Title 24 as Part 11, first in 2009 as a voluntary code, which then became mandatory effective on January 1, 2011 (as part of the 2010 California Building Standards Code). The 2022 CALGreen includes mandatory minimum environmental performance standards for all ground-up new construction of residential and non-residential structures. It also includes voluntary tiers with stricter environmental performance standards for these same categories of residential and non-residential buildings. Local jurisdictions must enforce the minimum mandatory CALGreen standards and may adopt additional amendments for stricter requirements.

The mandatory standards applicable to air quality require:

- Minimum 20 percent reduction in indoor water use relative to specified baseline levels;⁴
- Waste Reduction:
 - Minimum 65 percent non-hazardous construction/demolition waste diverted from landfills;
 - Non-residential and multi-family dwellings with five or more units: Provide readily accessible areas identified for the depositing, storage and collection of nonhazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastic, organic waste, and metals; and/or
 - Non-residential: Reuse and/or recycling of 100 percent of trees, stumps, rocks, and associated vegetation soils resulting from primary land clearing;
- Inspections of energy systems to ensure optimal working efficiency;
- Low-pollutant emitting exterior and interior finish materials such as paints, carpets, vinyl flooring, and particleboards; and
- Electric Vehicle (EV) Charging for New Construction:⁵
 - One- and two-family dwellings and town houses with attached private garages: Dedicated circuitry to facilitate installation of electric vehicle (EV) charging;
 - Multi-family dwellings and hotels/motels with less than 20 units/rooms: Designation of at least 10 percent of the total number of parking spaces shall be EV capable and at least 25 percent of the total number of parking spaces shall be EV-ready;
 - Multi-family dwellings and hotels/motels with greater than 20 units/rooms: Designation of at least 10 percent of the total number of parking spaces shall be EV capable, at least 25 percent of the total number of parking spaces shall be EV-ready, and at least 5 percent of the total number of parking spaces shall be equipped with a Level 2 charging station;

⁴ Similar to the compliance reporting procedure for demonstrating Energy Code compliance in new buildings and major renovations, compliance with the CALGreen water reduction requirements must be demonstrated through completion of water use reporting forms. Buildings must demonstrate a 20 percent reduction in indoor water use by either showing a 20 percent reduction in the overall baseline water use as identified in CALGreen or a reduced per-plumbing-fixture water use rate.

⁵ EV Capable = a vehicle space with electrical panel space and load capacity to support a branch circuit and necessary raceways to support EV charging; EV-ready = a vehicle space which is provided with a branch circuit and any necessary raceways to accommodate EV charging stations, including a receptacle for future installation of a charger (see 2022 California Green Building Standard Code, Title 24 Part 11 for full explanation of mandatory measures, including exceptions).

- Non-residential land uses shall comply with the following EV charging requirements based on the number of passenger vehicle parking spaces:
 - 0-9: no EV capable spaces or charging stations required;
 - 10-25: 4 EV capable spaces but no charging stations required;
 - 26-50: 8 EV capable spaces of which 2 must be equipped with charging stations;
 - 51-75: 13 EV capable spaces of which 3 must be equipped with charging stations;
 - 76-100: 17 EV capable spaces of which 4 must be equipped with charging stations;
 - 101-150: 25 EV capable spaces of which 6 must be equipped with charging stations;
 - 151-200: 35 EV capable spaces of which 9 must be equipped with charging stations; and
 - More than 200: 20 percent of the total available parking spaces of which 25 percent must be equipped with charging stations;
- Non-residential land uses shall comply with the following EV charging requirements for medium- and heavy-duty vehicles: warehouses, grocery stores, and retail stores with planned off-street loading spaces shall install EV supply and distribution equipment, spare raceway(s) or busway(s) and adequate capacity for transformer(s), service panel(s), or subpanel(s) at the time of construction based on the number of off-street loading spaces as indicated in Table 5.106.5.4.1 of the California Green Building Standards;
- Bicycle Parking:
 - Non-residential short-term bicycle parking for projects anticipated to generate visitor traffic: permanently anchored bicycle racks within 200 feet of visitor entrance for 5 percent of new visitor motorized vehicle parking spaces with a minimum of one 2-bike capacity rack; and/or
 - Non-residential buildings with tenant spaces of 10 or more employees/tenant-occupants: secure bicycle parking for 5 percent of the employee/tenant-occupant vehicle parking spaces with a minimum of one bicycle parking facility.
- Shade Trees (Non-Residential):
 - Surface parking: minimum No. 10 container size or equal shall be installed to provide shade over 50 percent of the parking within 15 years (unless parking area covered by appropriate shade structures and/or solar);
 - Landscape areas: minimum No. 10 container size or equal shall be installed to provide shade of 20 percent of the landscape area within 15 years; and/or
 - Hardscape areas: minimum No. 10 container size or equal shall be installed to provide shade of 20 percent of the landscape area within 15 years (unless covered by applicable shade structures and/or solar or the marked area is for organized sports activities).

The voluntary standards include:

- Deconstruct existing buildings and reuse applicable salvaged materials;
- Residential – Cool Roofs: have a thermal mass over the roof membrane, including green roofs weighing a minimum of 25 pounds per square foot or roof areas covered by solar photovoltaic panels and building integrated solar thermal panels;
- Residential – Reduce nonroof heat island for 50 percent of sidewalks, patios, driveways or other paved areas;

- One- and two-family dwelling units and townhouses with attached garages: install a dedicated 208/250-volt branch circuit for EV charging;
- Residential Bicycle Parking:
 - Multi-family/hotel/motel short-term parking: provide permanently anchored bicycle racks within 100 feet of visitor's entrance for 5 percent of visitor motorized vehicle parking capacity (minimum one 2-bike capacity rack);
 - Multi-family buildings long-term parking: provide acceptable on-site bicycle parking for at least one bicycle per every two dwelling units; and/or
 - Hotel/motel long-term parking: provide one acceptable on-site bicycle parking space for every 25,000 square feet but not less than two spaces;
- Tier I:
 - Stricter energy efficiency requirements;
 - Stricter water conservation requirements for specific fixtures;
 - minimum 65 percent reduction in construction waste with third-party verification, Minimum 10 percent recycled content for building materials;
 - Minimum 20 percent permeable paving;
 - Minimum 20 percent cement reduction;
 - Multi-family developments/hotels/motels: minimum 35 percent of total parking spaces shall be EV ready and for projects with 20 or more dwelling units/rooms a minimum of 10 percent of the total number of parking spaces shall be equipped with EV charging stations.
- Tier II:
 - Stricter energy efficiency requirements,
 - Stricter water conservation requirements for specific fixtures;
 - Minimum 75 percent reduction in construction waste with third-party verification,
 - Minimum 15 percent recycled content for building materials;
 - Minimum 30 percent permeable paving;
 - Minimum 25 percent cement reduction; and/or
 - Multi-family developments/hotels/motels: minimum 40 percent of total parking spaces shall be EV ready and for projects with 20 or more dwelling units/rooms, a minimum of 15 percent of the total number of parking spaces shall be equipped with EV charging stations.

Western Electricity Coordinating Council and the North American Electric Reliability Council

The Western Electricity Coordinating Council (WECC) is a voluntary consortium of electrical power providers that is responsible for coordinating and promoting electricity reliability from the Canadian provinces of Alberta and British Columbia in the north of its jurisdiction to the northern Mexican State of Baja California in the south of its jurisdiction, and the 14 western states (WECC 2015). The LADWP is a member of the WECC. The WECC has implemented Standard BAL-STD-002-0 to require reliable operation of the power system while ensuring adequate generating capacity at all times. As a means of ensuring power system reliability, the LADWP maintains an extra reserve margin of power generation resources in the event of a power system disturbance. In order to determine how much extra generation

reserves are needed, the LADWP adheres to the WECC Reliability Standard. WECC Standard BAL-STD-002-0 requires its providers to:

- Supply requirements for load variations
- Replace generating capacity and energy lost due to forced outages of generation or transmission equipment
- Meet on-demand obligations
- Replace energy lost due to curtailment of interruptible imports

Executive Order S-1-07 (California Low Carbon Fuel Standard)

The Low Carbon Fuel Standard (LCFS), established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products, starting with 0.25 percent in 2011 and culminating in a 10-percent total reduction in 2020. Petroleum importers, refiners and wholesalers can either develop their own low carbon fuel products or buy LCFS credits from other California Air Resources Board companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.

Sustainable Communities Strategy (SB 375)

The Sustainable Communities and Climate Protection Act of 2008, or SB 375, coordinates land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction mandates established in AB 32. SB 375 specifically requires each Metropolitan Planning Organization (MPO) to prepare a “sustainable communities strategy” (SCS) as part of its Regional Transportation Plan (RTP), which is required by the state and federal government, that will achieve GHG emission reduction targets set by CARB for the years 2020 and 2035 by reducing vehicle miles travelled (VMT) from light duty vehicles through the development of more compact, complete, and efficient communities. The SCS also contains land use, housing, and transportation strategies that, if implemented, would allow the region to meet its GHG emission reduction targets. The City of Los Angeles and, thus, all projects are located within the MPO area of the Southern California Association of Governments (SCAG). SCAG’s compliance with SB 375, through preparation of a Regional Transportation Plan/Sustainable Communities Strategy, is described below under the regional regulatory setting.

REGIONAL

Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy

SCAG functions as the Metropolitan Planning Organization for six counties, including Los Angeles County, wherein the project Site is located. As the designated Metropolitan Planning Organization, SCAG is required by federal law to prepare and update a long-range regional transportation plan, keep up with CAA requirements, monitor system performance, and develop SCS to achieve GHG reduction targets set by CARB.

On September 1, 2020, SCAG’s Regional Council adopted an updated Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) known as the 2020-2045 RTP/SCS or Connect SoCal.⁶ The 2020-2045 RTP/SCS is a long-range visioning plan that builds upon and expands land use and transportation strategies of the 2016-2040 RTP/SCS to increase mobility options and achieve a more

⁶ SCAG, 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy of the Southern California Association of Governments, Adopted September 3, 2020.

sustainable growth pattern. The 2020-2045 RTP/SCS projects growth in employment, population, and households at the regional, county, city, town and neighborhood levels. These projections take into account economic and demographic trends, as well feedback from SCAG’s jurisdictions. The 2020-2045 RTP/SCS “Core Vision” centers on maintaining and better managing the transportation network for moving people and goods, while expanding mobility choices by locating housing, jobs and transit closer together and increasing investment in transit and complete streets.⁷ The 2020-2045 RTP/SCS continues efforts to better align transportation investments and land use decisions to improve mobility and reduce GHGs by bringing housing, jobs and transit closer together. SCAG has determined that the 2020-2045 RTP/SCS would achieve the applicable GHG emissions reduction target for automobiles and light trucks of 19 percent per capita reduction by 2035, relative to 2005 levels, as established by CARB for the region.⁸

Air Quality Management Plan

As mentioned in Section 4.2, *Air Quality*, under state law, the South Coast Air Quality Management District (SCAQMD) is required to prepare a plan for air quality improvement for pollutants for which the District is in non-compliance. The SCAQMD updates the plan every three years. Each iteration of the SCAQMD’s Air Quality Management Plan (AQMP) is an update of the previous plan and has a 20-year horizon. The 2022 AQMP, adopted on December 2, 2022, incorporates new scientific data and notable regulatory actions that have occurred since adoption of the 2016 AQMP.

The 2022 AQMP addresses several state and federal planning requirements and incorporates new scientific information, primarily in the form of updated emissions inventories, ambient measurements, and updated meteorological air quality models (SCAQMD 2022). This Plan builds upon the approaches taken in the 2016 AQMP for the attainment of federal PM and ozone standards and highlights the significant number of reductions to be achieved. It also includes a variety of additional strategies such as regulation, accelerated deployment of available cleaner technologies (e.g., zero emissions technologies, when cost-effective and feasible, and low NO_x technologies in other applications), best management practices, co-benefits from existing programs (e.g., climate and energy efficiency), incentives, and other CAA measures to achieve the 2015 8-hour ozone standard. Local

City of Los Angeles General Plan

The Air Quality Element of the City’s General Plan includes a goal (Goal 5) that aims to increase energy efficiency through land use and transportation planning; the use of renewable resources and less-polluting fuels; and the implementation of conservation measures including passive methods such as site orientation and tree planting (Los Angeles 2003). Additionally, Section 19: Resource Management (Fossil Fuels) of the Conservation Element of the General Plan includes Policy 1, which aims to continue to encourage energy conservation and petroleum product reuse (Los Angeles 2001).

City of Los Angeles Green Building Code

The following types of projects are subject to the Los Angeles Green Building Code:

- All new buildings (residential and non-residential)
- All additions (residential and non-residential)
- Alterations with building valuations over \$200,000 (residential and non-residential)

⁷ SCAG, A Plan Summary for Connect SoCal, Adopted September 3, 2020.

⁸ CARB, Executive Order G-20-239 Southern California Association of Governments’ 2020 Sustainable Communities Strategy CARB Acceptance of GHG Quantification Determination, October 30, 2020.

The Los Angeles Green Building Code is based on the 2016 CALGreen Standards. The program addresses five key areas: (1) Site: location, site planning, landscaping, storm water management, construction and demolition recycling; (2) Water Efficiency: efficient fixtures, wastewater reuse, and efficient irrigation; (3) Energy & Atmosphere: energy efficiency, and clean/renewable energy; (4) Materials & Resources: materials reuse, efficient building systems, and use of recycled and rapidly renewable materials; and (5) Indoor Environmental Quality: improved indoor air quality, increased natural lighting, and improved thermal comfort/control. Specifically, the Los Angeles Green Building Code requires all non-residential buildings to be constructed such that they're solar ready, while all residential buildings three stories and under must include solar photovoltaic systems. Likewise, all residential buildings greater than three stories must be solar ready.

Los Angeles 2017 Power Strategic Long-Term Resource Plan

The 2017 SLTRP document serves as a comprehensive 20-year roadmap that guides the LADWP Power System in its efforts to supply reliable electricity in an environmentally responsible and cost-effective manner.. This year's 2017 SLTRP re-examines and expands its analysis on the 2016 IRP resource cases with updates in line with latest regulatory framework, and updates to case scenario assumptions that include a 65 percent RPS, advanced energy efficiency, and higher levels of local solar, energy storage, and transportation electrification Starting in 2017, the Power IRP was expanded into the Power SLTRP, which will increase the planning horizon, from 20 years ending in 2037 and extend through 2050, in order to better align with Statewide greenhouse gas emissions goals and align with Los Angeles' 100 percent clean energy initiative. In 2018, the SLTRP will extend through 2050 while a separate, streamlined IRP document will be produced for submission and filing with the California Energy Commission in accordance with Senate Bill 350. The goal of the 2017 SLTRP is to identify a portfolio of generation resources and Power System assets that meets the city's future energy needs at the lowest cost and risk consistent with LADWP's environmental priorities and reliability standards. The SLTRP examines a total of eleven different case scenarios with a combination of strategies, including early coal replacement, accelerated RPS, energy efficiency, local solar, energy storage, and transportation electrification. The recommended SLTRP case scenario balances LADWP's objectives and identifies four key initiatives – greenhouse gas reduction, transportation electrification, dispatchable resources, and Power System reliability (LADWP 2017).

L.A.'s Green New Deal: Sustainable City Plan 2019

The City of Los Angeles adopted its climate action plan, Green LA: An Action Plan to Lead the Nation in Fighting Global Warming (Green LA), in May 2007. Green LA set the goal of reducing the City's GHG emissions to 35 percent below 1990 levels by 2030. The action plan outlines several actions in the fields of energy, water, waste, and transportation. These actions include improved transportation centered around mobility for people rather than cars, increasing recycling to 70 percent diversion, meeting all additional water use through reclaimed water, and increasing renewable energy to 35 percent by 2020. The action plan also outlines goals to help residents become "energy misers" by distributing compact fluorescent lamps (CFL's) and increasing rebates for energy efficient appliances and retrofits.

The City released its first Sustainable City pLAN, which is a roadmap for a Los Angeles that is environmentally healthy, economically prosperous, and equitable in opportunity for all — now and over the next 20 years. The pLAN focuses on both short-term results and long-term goals that will transform our City. L.A.'s Green New Deal is an expanded vision for our pLAN—securing clean air and water and a stable climate, improving community resilience, expanding access to healthy food and open space, and promoting justice for all (Los Angeles 2022).

City of Los Angeles Solid Waste Programs and Ordinances

The recycling of solid waste materials also contributes to reduced energy consumption. Specifically, when products are manufactured using recycled materials, the amount of energy that would have otherwise been consumed to extract and process virgin source materials is reduced. For example, in 2015, 3.61 million tons of aluminum were produced by recycling in the United States, saving enough energy to provide electricity to 7.5 million homes.⁹ In 1989, California enacted AB 939, the California Integrated Waste Management Act which establishes a hierarchy for waste management practices such as source reduction, recycling, and environmentally safe land disposal.¹⁰

The City implements various programs and ordinances related to solid waste. These include: (1) the City of Los Angeles Solid Waste Management Policy Plan, adopted in 1993, which is a long-range policy plan that proposes an approach for the City to achieve a goal of 90-percent diversion by 2025; (2) the RENEW LA Plan, which is a Resource Management Blueprint with the aim to achieve a zero waste goal through reducing, reusing, recycling, or converting the resources now going to disposal so as to achieve an overall diversion level of 90 percent or more by 2025; (3) the Waste Hauler Permit Program (Ordinance No. 181,519), which requires all private waste haulers collecting solid waste, including construction and demolition waste, to obtain AB 939 Compliance Permits and to transport construction and demolition waste to City certified construction and demolition processing facilities;¹¹ and (4) the Exclusive Franchise System Ordinance (Ordinance No. 182,986), which, among other requirements, sets maximum annual disposal levels and specific diversion requirements for franchised waste haulers in the City to promote solid waste diversion from landfills in an effort to meet the City's zero waste goals. These solid waste reduction programs and ordinances not only help to reduce the number of trips to haul solid waste therefore reducing the amount of petroleum-based fuel, but also help to reduce the energy used to process solid waste.

City of Los Angeles Los Angeles 100% Renewable Energy Study (LA100)

The Los Angeles 100% Renewable Energy Study (LA100), published in March 2021, explores possible pathways on how the City could achieve a 100% clean energy future by 2045. The study outlines goals, future scenarios, and implementation pathways but does not present recommendations. All LA100 scenarios include significant deployment of renewable and zero-carbon energy by 2035, accounting for 84%–100% of energy. The study describes how in the future Los Angeles would rely on technologies like wind, solar, and batteries to meet most of the City's everyday needs, and only on combustion turbines—supplied with renewable fuels—for limited periods. The study explores some of the following topics: electricity demand projection, options for local solar and storage, renewable energy investments and operations, as well as the impacts and costs for 100% renewable energy pathways. Results show that a 100% renewable electricity supply is achievable by 2045 or sooner.¹²

In addition to the executive summary, the report makes high-level findings and has 12 chapters, including specific topics such as electricity demand projections, customer-adopted rooftop solar and storage,

renewable energy investments and operations, air quality and public health, environmental justice, and economic impacts and jobs.

City of Los Angeles Residential and Commercial Building Construction / Zero-Carbon Emissions / Climate Equity LA Series / Building Decarbonization

On December 19, 2022, the City of Los Angeles published an ordinance in the City’s Municipal Code, Article 9 of Chapter IX, that requires all new buildings to be all-electric buildings with exceptions. Land use development projects would construct a building that contains no combustion equipment, plumbing for combustion equipment, gas piping, or fuel gas serving any use including, but not limited to, space heating (including fireplaces), water heating (including pools and spas), cooking appliances (including barbeques), and clothes drying, within the building or building property lines, and instead uses electricity as the sole source of energy for all lighting, appliances and/or equipment, including, but not limited to, space heating, water heating, cooking appliances, and drying appliances. Exceptions include: attached accessory dwelling units using existing gas piping systems in conjunction with the primary dwelling, gas-powered emergency life-safety systems, including emergency backup, and cooking equipment contained within kitchens located in a public use area, as defined in the California Building Code Chapter 2, such as restaurants, commissaries, cafeterias, and community kitchens provided the electrical infrastructure is installed in accordance with Section 99.04.106.8.1.Existing Buildings Energy & Water Efficiency Program Ordinance

The City also has an Existing Buildings Energy & Water Efficiency (EBEWE) Program Ordinance that requires owners of buildings over certain sizes to disclose their buildings’ energy and water consumption.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

The following thresholds of significance were developed in accordance with Appendix F and Appendix G of the CEQA Guidelines. Energy-related impacts would be significant if the Proposed Project would:

- Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation (Threshold 4.5-1)
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency (Threshold 4.5-2)

METHODOLOGY

Total energy consumption was calculated for existing (2021), future (2040) without CASP Update, and future (2040) with CASP Update conditions. Future energy use without the CASP Update is provided for informational purposes only and not impact analysis; the determination of significance is based on a comparison of future conditions with the CASP Update to existing conditions. Electricity and natural gas consumption estimates were calculated using CalEEMod. Refer to the Methodology subsection of Section 4.2, *Air Quality*, for modeling assumptions and Appendix E for modeling results. Petroleum consumption was identified by calculating the direct energy consumption of the CASP area using daily VMT, fleet mix, and average fuel economy. Daily VMT within the CASP area were retrieved from the traffic study prepared by Fehr & Peers and fleet mix was derived from CalEEMod. Average fuel economy is forecast to continue to increase, with the most recent automotive trends report for 2021 showing preliminary real-world fuel economy at 25.3 miles per gallon (USEPA 2021). Therefore, applying the 2021-based average fuel economy to future year (2040) with Project VMT provides a conservative evaluation of energy consumption

as the energy use of vehicles in 2040 is likely to be lower than current fuel use. There are no state standards established requiring future decreases in per capita energy use.

Electricity consumption was estimated by calculating the electricity consumption by land use with electricity factors derived from the California Emissions Estimator Model. Electricity factors for the existing and future conditions only account for 2019 energy standards, as a result, the analysis below provides a conservative estimate of the CASP’s future electricity consumption.

PROJECT IMPACTS

Threshold 4.5-1	Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation
------------------------	---

Impact 4.5-1 **Project Impact:** Development accommodated by the Proposed Project would increase demand for energy beyond existing conditions. However, the Project would not conflict with state and/or local plans for renewable energy or energy efficiency. The Project would result in decreases in per capita transportation-related energy use, electricity, and natural gas consumption in the Project Area and neither future construction nor operation of new development would result in energy used in an inefficient, unnecessary or wasteful manner, during construction or operation of reasonably anticipated development. This impact would be *less than significant*.

Project Impacts

Long-term operation of development accommodated by the Proposed Project would require permanent grid connections for electricity and natural gas service to power internal and exterior building lighting, and heating and cooling systems. In addition, the increase in vehicle trips associated with the Proposed Project’s development would increase fuel consumption within the Project Area. Increases in motor vehicle trips are primarily a combined function of population and employment growth. Population growth and growth in VMT would occur in the region regardless of whether the Project is implemented. As a result, energy consumption as it relates to vehicles would increase beyond the 2021 baseline under any scenario.

Table 4.5-5 shows daily VMT and estimated fuel consumption translated into energy use (mmBtu) in the Project Area under existing (2021), future (2040) without Proposed Project conditions, and future (2040) with Proposed Project conditions. The 2040 without Proposed Project was included for informational purposes and was not relied on for impact analysis or conclusions. With respect to transportation energy use, as shown in **Table 4.5-5**, future total daily energy consumption under implementation of the Proposed Project is expected to increase; however, per capita energy consumption is anticipated to decrease from 0.32 to 0.10 mmBtu per capita, a decrease of 69 percent. This change can be attributed to the fact that implementation of the Proposed Project would lower per capita VMT due to the location of jobs and housing in close proximity to each other and creation of substantial opportunities to use such transportation modes as transit, bicycling, and walking.

TABLE 4.5-5 DIRECT TRANSPORTATION ENERGY USE					
Year	Overall Daily VMT	Overall Annual VMT¹	Overall Daily Energy Use (mmBtu)	Overall Annual Energy Use (mmBtu)	Daily Per Capita Energy Use (mmBtu)
Baseline	328,439	113,968,333	1,924	702,446	0.32
Future (2040) without Proposed Project	841,339	291,944,633	4,930	1,799,406	0.14
Future (2040) with Proposed Project	983,961	341,434,467	5,766	2,104,437	0.10
Change from Existing Conditions under Proposed Project	655,522	+227,466,134	+3,814	+1,391,915	-0.22
NOTES:					
Transportation energy consumption was derived from the Project Area VMT (see Table 4.5-1), default fleet mix from CalEEMod (see Appendix X), average fuel economy from the United States Department of Transportation, and energy unit data from EIA.					
1 Annual VMT is calculated by multiplying daily VMT by 347 days, to account for reduced travel on weekends, in accordance with industry standards.					
SOURCE: United States Department of Transportation 2022a; EIA 2022d; Fehr & Peers 2022.					

Table 4.5-6 shows estimated annual electricity consumption in the Project Area under existing (2021), future (2040) without Proposed Project, and future (2040) with Proposed Project conditions. The 2040 without Proposed Project was included for informational purposes and was not relied on for impact analysis or conclusions. Future total annual electricity consumption under implementation of the Proposed Project is expected to increase; however, per capita electricity consumption is anticipated to decrease from 14.3 to 3.8 MWh per capita, a decrease of 73 percent. The Proposed Project buildout would increase the production of affordable, mixed-income, and permanent supportive housing, which consumes less electricity per capita compared to existing conditions. It is important to note that future energy consumption estimates only take into compliance with existing energy efficiency standards (i.e., 2022 Title 24). Similar to current plans, reasonably anticipated future development anticipated to occur with the implementation of the Proposed Project would be subject to Title 24, Part 6 of the California Administrative Code, the Energy Efficiency Standards for Residential and Nonresidential Buildings, which requires local jurisdictions to use energy efficient appliances, weatherization techniques, and efficient cooling and heating systems to reduce energy demand stemming from new development. In addition, future development would also be required to comply with the City of Los Angeles' Green Building Code Energy Efficiency requirements. Although the analysis contained herein does not account for future improvements in energy efficiency, development accommodated by the Proposed Project would be expected to consume less energy than existing developments as building standards become more stringent. Furthermore, while City of Los Angeles Ordinance 187714 would require all new buildings in the Project Area to be all-electric, it is speculative to forecast the Ordinance's effect on energy consumption; and any increase in electricity consumption relating to space heating, water heating, cooking appliances, and clothes drying would be offset by corresponding decreases in natural gas consumption for those uses.

Table 4.5-7 shows estimated annual natural gas consumption in the Project Area under existing (2021), future (2040) without Project, and future (2040) with Project conditions. The 2040 without Proposed Project was included for informational purposes and was not relied on for impact analysis or conclusions. Future total annual natural gas consumption under implementation of the Proposed Project is expected to increase, but the per capita natural gas consumption is anticipated to decrease from 18.7 to 6.0 mmBtu per capita, a decrease of 68percent. It is important to note that future energy consumption estimates, included in **Table 4.5-7**, only take into account compliance with existing energy efficiency standards (i.e., 2022 Title 24). Development accommodated by the Proposed Project would be expected to consume less energy than existing developments as energy conservation standards become more stringent, including the City of Los

Angeles Ordinance 187714, that requires all new buildings to be all-electric and would likely result in a further reduction in natural gas consumption. Therefore, the estimates provided here are conservative.

TABLE 4.5-6 PROJECT AREA ELECTRICITY CONSUMPTION			
Year	Overall Electricity Consumption (MWh)¹	Proportion of Statewide Consumption	Per Capita Electricity Consumption (MWh)
Baseline (2021)	85,989	0.03%	14.3
Future (2040) without Proposed Project	230,320	0.08%	6.39
Future (2040) with Proposed Project	212,296	0.08%	3.8
Change from Existing Conditions under Proposed Project	+126,307		-10.5

NOTE: The per capita consumption for electricity is determined by dividing electricity consumption data from CalEEMod by the existing Project Area population, as detailed in Section 4.12, *Population, Housing and Employment*.

SOURCES: CEC 2022b, City of Los Angeles 2018.

TABLE 4.5-7 PROJECT AREA NATURAL GAS CONSUMPTION			
Year	Overall Natural Gas Consumption (billion Btu)	Proportion of Statewide Consumption	Per Capita Natural Gas Consumption (mmBtu)¹
Baseline (2021)	113	<0.01%	18.7
Future (2040) without Proposed Project	335	0.1%	9.3
Future (2040) with Proposed Project	342	0.1%	6.0
Change from Existing Conditions under Proposed Project	+229		-12.7

NOTE: The per capita consumption for natural gas is determined by dividing natural gas consumption data from CalEEMod by the existing Project Area population, as detailed in Section 4.12, *Population, Housing and Employment*.

¹ Total annual natural gas consumption is expressed in billion Btu, while per capita annual natural gas consumption is expressed in million Btu

SOURCES: CEC 20122f; City of Los Angeles 2018.

Construction and maintenance of reasonably anticipated development from the Proposed Project would result in short-term consumption of energy from the use of construction equipment and processes. Construction energy demand is not calculated because lot acreage, size of buildings, and construction durations for development under the Proposed Project is currently unknown and estimates would be speculative. Although the Proposed Project would increase energy consumption over existing conditions, implementation of the Proposed Project would decrease electricity consumption and increase natural gas consumption modestly compared to the 2040 without Proposed Project scenario. Importantly, the per capita energy consumption would decrease with the Proposed Project. Therefore, the Proposed Project would not foreseeably increase construction and operations energy demand. The California Green Building Standards Code (CalGreen) includes specific requirements related to recycling, construction materials and energy efficiency standards, which would help minimize waste and energy consumptions. All construction and maintenance accommodated by the Proposed Project would be required to comply with relevant provisions of CalGreen.

Consistency with Energy Conservation and Renewable Energy Policies

As previously discussed, the Proposed Project would result in decreases in per capita transportation-related energy use, electricity, and natural gas consumption in the Project Area. Although implementation of the Proposed Project would result in greater net energy consumption than 2021 baseline conditions, the Project would not result in the inefficient, wasteful, or unnecessary consumption of energy if it is consistent with existing relevant energy conservation policies. Accordingly, inconsistencies between the Project and adopted plans and policies related to energy conservation have not been identified. The discussion below further examines consistency with adopted plans and policies related to energy conservation.

SCAG monitors regulations related to fuel efficiency standards and alternative fuel vehicles. The Proposed Project is a land use plan and would not include regulations related to fuel efficiency or alternative fuel vehicles. However, the Proposed Project would reduce per capita VMT and the associated use of fuels, by increasing access to transit and promote the use of active transportation modes by accommodating compact development and mix of land uses in close proximity to transit. Therefore, the plan would not conflict, but would instead support the goals of these regulations. (e.g., *Energy Policy and Conservation Act* and *Corporate Average Fuel Standards, EPCAct, Energy Independence and Security Act of 2007, AB 1493: Reduction of Greenhouse Gas Emissions, AB 1007: State Alternative Fuels Plan*). The 1975 *Warren-Alquist Act* established the California Energy Resource Conservation and Development Commission, now known as the CEC, and established a State policy to reduce wasteful, uneconomical and unnecessary uses of energy. The Proposed Project would be subject to California's Energy Efficiency Standards in the California Code of Regulations, Title 24, Part 6, which requires local jurisdictions to enforce energy efficient appliances, construction materials and building systems for new development. In addition, the City of Los Angeles' Green Building Code would require new development in the Project Area to comply with its Energy Efficiency requirements. As demonstrated in **Table 4.5-5** through **Table 4.5-7** above, the Project would result in lower per capita energy use in comparison to the 2021 baseline conditions. Therefore, the Proposed Project would not result in wasteful, inefficient, or unnecessary use of energy and would not be inconsistent with applicable *Warren-Alquist Act* policies.

SB 1078, as accelerated by SB 350, establishes a renewable portfolio standard for electricity supply, and requires that retail sellers of electricity, including investor-owned utilities and community choice aggregators, provide 33 percent of their supply from renewable sources by 2020. In addition, the 2017 IEPR includes a set of strategies to address California's future energy needs. Key topics covered in the report include electricity resource and supply plans; electricity and natural gas demand forecasts; natural gas outlooks; transportation energy demand forecasts; energy efficiency savings; integrated resource planning; a barriers study; climate adaptation and resilience; renewable gas; distributed energy resources; strategic transmission investment plans; and existing power plan reliability issues. The Proposed Project would not conflict with these policies. Refer to Section 4.7, *Greenhouse Gases*, for a discussion of greenhouse gas emissions reductions related to the Project.

In addition, future development projects accommodated by the Project are expected to promote energy efficiency as they support implementation of the SCAQMD 2022 Air Quality Management Plan transportation control measures, including transportation demand management, transportation system management, commuter and public transit; rail, bike and pedestrian programs, among others (refer to Section 4.2, *Air Quality*).

The Proposed Project would be consistent with the Air Quality and Conservation Elements of the Los Angeles General Plan, which encourages the use of renewable energy, energy conservation and energy efficiency techniques in all new building design, orientation and construction and support of alternative transportation and fuels. The Proposed Project's land use regulations, including its standards related to Building Form, Frontage, Development Standards, and Use, would support mixed use, pedestrian-oriented,

and infill development, thus reducing fuel consumption and enhancing opportunities for the use of transit and other alternative modes of transportation.

In summary, the Proposed Project would not result in wasteful or inefficient energy consumption and is consistent with applicable policies regarding energy conservation and renewable energy. Therefore, the Project would have a *less than significant* impact with respect to energy consumption.

Mitigation Measures

Significant impacts have not been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.5-2	Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.
------------------------	--

Impact 4.5-2 **Project Impact:** The Project would not conflict with applicable federal, state, and local energy conservation policies aimed at decreasing reliance on fossil fuels and increasing reliance on renewable energy sources. This impact would be *less than significant*.

Project Impacts

As discussed under Threshold 4.5-1, above, inconsistencies between the Proposed Project and adopted plans and policies related to decreasing reliance on fossil fuels and increasing reliance on renewable energy sources have not been identified. SB 1078, as accelerated most recently by SB 100, established an RPS for electricity supply, and requires that retail sellers of electricity, including investor-owned utilities and community choice aggregators, provide 33 percent of their supply from renewable sources by 2020, 60 percent by 2030, and 100 percent by 2045. To meet this state requirement, as well as the local desire to achieve 100 percent renewable energy, the LADWP’s 2016 IRP expresses plans to increase the LADWP’s RPS to 55 percent by 2030 and to 65 percent by 2036 along with the sale of LADWP’s 21-percent share in the coal-fired Navajo Generation Station. Many of these strategies are aimed at reducing greenhouse gas emissions, but also result in improved energy efficiency and an increased integration of renewable energy sources. The Project would not conflict with these policies or objectives. Refer to Section 4.7, *Greenhouse Gases*, for a discussion of greenhouse gas emissions reductions related to the Proposed Project.

The Proposed Project would also be consistent with the City of Los Angeles General Plan Air Quality and Conservation Elements, which encourages the use of renewable energy, energy conservation and energy efficiency techniques in all new building design, orientation and construction and support of alternative transportation and fuels. As described under Threshold 4.5-1, above, the Project includes policies intended to improve the efficiency and effectiveness of the transportation system and provide options for alternative transportation. In summary, the Proposed Project would not result in an increased reliance on fossil fuels and a decreased reliance on renewable energy sources and is consistent with applicable policies regarding energy conservation and renewable energy. Therefore, the Proposed Project’s impact with respect to energy source reliance would be *less than significant*.

Mitigation Measures

Significant impacts have not been identified; therefore, mitigation is not required for the Project.

CUMULATIVE IMPACTS

Locally, energy resources are provided by various oil companies, LAWDP, and SoCal Gas, but the issue of energy is global in nature and the state as well as regional and local governments have adopted policies

aimed at energy conservation. The service areas for energy providers are varied, with LADWP primarily serving the Project Area, SoCal Gas serving a 24,000 square mile region covering much of central and southern California, and oil companies serving customers all over the world. No single geographic scope can address the full extent of issues related to energy resources so the cumulative analysis contained herein considers energy demand in the City of Los Angeles and the southern California region served by SoCal Gas in the context of statewide energy demand and state mandates related to energy conservation.

As discussed above, cumulative development in Los Angeles and throughout southern California would continue to increase energy use to meet the Project Area and region's growing population; however, implementation of future community plans is expected to generally improve the efficiency of energy use in the Project Area, while adherence to existing state regulations such as CalGreen and the Low Carbon Fuel Standard would ensure the incorporation of energy efficient measures in the design and operation of future developments throughout the region. Thus, cumulative impacts related to energy use arising from cumulative development in Los Angeles and throughout the region would be less than significant.

As discussed under Impact 4.5-1, above, implementation of the Proposed Project would generally improve the efficiency of energy use in the Project Area on a per capita basis and would not contribute to a cumulative impact related to the wasteful, unnecessary, or inefficient use of energy. Furthermore, development emphasis on compact land use and growth patterns that facilitate transit and non-motorized transportation are anticipated to result in less energy consumption. As mentioned in Section 4.7, *Greenhouse Gases*, SCAG's 2020-2045 RTP/SCS was developed to provide a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system as well as reduce energy use and associated GHG emissions within the region. The Proposed Project would accommodate concentrated, mixed-use development adjacent to transit corridors in order to conserve resources, protect existing residential neighborhoods, and reduce energy use through the increase in active transportation and use of transit. While implementation of the Proposed Project would result in increased demand for energy and natural gas, the impact to the City's and region's energy resources would be less than significant. The Proposed Project would support energy efficient practices and would not result in wasteful or inefficient use of energy.

Based on the above, the incremental effect of the Proposed Project on energy resources would not be cumulatively considerable and cumulative impacts would be *less than significant*.

4.6 GEOLOGY AND SOILS

This section provides an overview of geology and soils and evaluates the impacts associated with the Proposed Project. Topics addressed include suitability of soil for development; geologic faults; and direct and indirect seismic hazards such as floods, erosion, subsidence, liquefaction, and landslides. This section was prepared utilizing documents and maps published by the United States Geological Survey (USGS), California Department of Conservation, California Geological Survey (CGS), and the City of Los Angeles. Generally, this section evaluates whether the Project would substantially increase the exposure of people or structures to adverse effects related to seismic activity, unstable geologic materials, or erosion, or cause impacts to paleontological resources or unique geological features compared to existing conditions.

ENVIRONMENTAL SETTING

GEOLOGY

Project Area Geology

The Project Area is situated on a relatively flat river plain along the east and west sides of the concrete-lined Los Angeles River channel, which bisects the Project Area. Topographically, the area slopes to the south with elevations ranging from approximately 370 feet relative to MSL near the northern boundary of the Project Area to approximately 296 feet MSL near the southern boundary. Relatively steep slopes ascend from the river plain approximately 30 feet or more to Broadway and Elysian Park along the north side of the Project Area (USGS 2017).

A majority of the land surface in the Project Area is urbanized and developed with a mostly industrial uses, the majority of which are paved which limits the extent of exposed surface soils. The Project Area is generally underlain by Quaternary alluvial soils overlying Tertiary age sedimentary deposits. The alluvium is generally comprised of both stream channel and floodplain deposits of the Los Angeles River consisting of unconsolidated silt, sand, and gravel. Older alluvium consisting of river terrace deposits is mapped along the east side of the river. These deposits are described as dissected silt, sand, and gravel. Fill soils may be present, related to previous site development in the Project Area (Ninyo and Moore, 2008).

The sedimentary bedrock exposed in the Elysian hills bordering the northwest boundary of the Project Area has been mapped as the Upper Pliocene Puente Formation, a member of the Monterey Formation. The geologic structure in the area is dominated by a northwest–southeast plunging anticline of the Elysian Park Anticline and the Elysian Park Blind Thrust Fault. The Project Area borders the southwest limb of the anticline where the bedding of the Puente Formation typically dips to the southwest on the order of 30 or more degrees. The anticline is concealed under the alluvium and its approximate location is inferred from nearby bedrock outcrops (Ninyo and Moore, 2008).

Faulting and Seismicity

Project Area Faults

The Project Area is located in a seismically active area, as is the majority of Southern California. No known active faults are located in the Project Area. However, an unnamed Pre-Quaternary fault (older than 1.6 million years) runs east-west through the project area, but it is not considered an active fault. Two potentially active fault lines run near the Project Area. An unnamed Late Quaternary fault identified as

“Unnamed fault west of Monterey Park” by the California Department of Conservation is located approximately 2 miles southeast of the of the Project Area is considered potentially active because it has experienced movement in the past 700,000 years. (DOC 2010). The fault primarily trends east west running from Boyle Heights east toward Montebello, but arcs to the north in City Terrace (DOC 2010). This fault has an expected maximum capability of a magnitude 6.7 earthquake. Though no recent seismic activity has been recorded along this fault, a major earthquake occurring along this fault would be capable of generating seismic hazards and strong groundshaking effects in the Project Area. A Quaternary fault identified as the “Raymond Fault” is located approximately 2 miles north of the Project. The fault primarily trends east west, running from Monrovia in the east, towards Los Feliz where it then trends west toward the Hollywood fault. No recent activity has been recorded on this fault.

Several Pre-Quaternary Faults are also located in the northern sections of the Project Area in and around the vicinity of Elysian Park. However, these faults have not experienced movement within the past 1.6 million years and are considered inactive. Of the local faults, the probability of earthquake activity is considered the highest along the East Montebello Fault, with possible ground rupture. The closest faults that are associated with an Alquist Priolo Earthquake Fault Zone are the Raymond Fault located approximately 2 miles to the north of the CPA and the East Montebello Fault located approximately 6 miles to the east. Thus, no fault rupture hazard is anticipated along the fault traces that pass through the Project Area. (CGS 2017).

Recent Seismic Activity

Historically, earthquakes have caused substantial groundshaking in the Los Angeles region and include the following: the 1933 Long Beach earthquake (magnitude 6.4 on Richter scale), along the Newport-Inglewood Fault Zone; the 1971 San Fernando earthquake (magnitude 6.7), along the San Fernando-Sierra Madre Fault; the 1987 Whittier Narrows earthquake (magnitude 5.9), along the Elysian Park Thrust Fault; the 1988 Pasadena earthquake (magnitude 5.0); the 1990 earthquake north of Pomona (magnitude 5.3); the 1991 Sierra Madre earthquake (magnitude 5.8); the 1992 Landers area earthquake (magnitude 7.4); and the 1994 Northridge earthquake (magnitude 6.7), along the Oakridge Fault. In addition, the 2008 Chino Hills earthquake (magnitude 5.5) was the strongest earthquake felt in the greater Los Angeles region since the 1994 Northridge earthquake.

Seismic Hazards

Hazards associated with earthquakes include primary hazards, such as surface rupture and groundshaking, as well as secondary hazards, such as liquefaction, lateral spreading, ground lurching, tsunamis, and dam inundation. These hazards are described below.

Surface Rupture

Surface rupture represents the breakage of ground along the surface trace of a fault, which is caused by the intersection of the fault surface area ruptured in an earthquake with Earth's surface. Fault displacement occurs when material on one side of a fault moves relative to the material on the other side of the fault. This can have particularly adverse consequences when buildings are located within the rupture zone. It is not feasible, from a structural or economic perspective to design and build structures that can accommodate rapid displacement involved with surface rupture. Amounts of surface displacement can range from a few inches to tens of feet during a rupture event.

The Alquist-Priolo Earthquake Fault Zoning Act regulates development near active faults to mitigate the hazard of surface fault rupture. Essentially, this Act prohibits the location of most structures for human occupancy across the trace of active faults and establishes Earthquake Fault Zones and requires geologic/seismic studies of all proposed developments within a delineated zone. The Earthquake Fault

Zones are delineated and defined by the State Geologist and identify areas where potential surface rupture along a fault could occur.

Project Area Surface Rupture

As previously discussed, no Alquist-Priolo Earthquake Fault Zones are located in the Project Area.

Groundshaking

The major cause of structural damage from earthquakes is groundshaking. The intensity of ground motion expected at a particular site depends upon the magnitude of the earthquake, the distance to the epicenter, and the geology of the area between the epicenter and the property. Greater movement can be expected at sites located on poorly consolidated material, such as alluvium, within close proximity to the causative fault, or in response to a seismic event of great magnitude.

Project Area Groundshaking

Groundshaking levels in the Project Area would be similar to those citywide. Earthquake scenario maps have been developed that depict the expected ground motions and effects of large earthquakes in the City. Ground shaking faults were developed for the Newport-Inglewood Fault, Palos Verde Fault, Puente Hills Fault, San Andreas Fault, and Santa Monica Fault using different scenarios of magnitude, depth, and epicenter locations (City of Los Angeles 2017a). The fault scenarios involved a variation of magnitudes from 6.8 to 7.8. All were expected to produce a range of ground shaking at sites throughout the region from moderate to severe, depending on the distance from the earthquake, rock, and soil conditions.

Liquefaction

Liquefaction is a phenomenon in which the strength and stiffness of a soil is reduced by earthquake shaking or other rapid loading. Liquefaction occurs in saturated soils, in which the water exerts a pressure on the soil particles that influences how tightly the particles themselves are pressed together. This is caused by a sudden temporary increase in pore water pressure due to seismic densification or other displacement of submerged granular soils. Significant factors that affect liquefaction include water level, soil type, particle size and gradation, relative density, confining pressure, and the intensity and duration of shaking.

Liquefaction more often occurs in earthquake-prone areas underlain by young alluvium where the groundwater table is within 30 feet of the ground surface. In addition to the necessary soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

Project Area Liquefaction

The majority of the Project Area is located in a liquification zone and would be subject to earthquake induced liquification.

Lateral Spreading

Lateral spreading involves the lateral displacement of surficial blocks of sediment (e.g., alluvium, terrace sands) as a result of liquefaction in a subsurface layer. The initial gradient of a particular site that fails in lateral spreading can be small since the soil mass usually moves on a liquefied layer of loose, saturated granular material.

Ground Lurching

Certain soils have been observed to move in a wave-like manner in response to intense seismic groundshaking, forming ridges or cracks on the ground surface. Areas underlain by thick accumulations of

colluvium and alluvium appear to be more susceptible to ground lurching than bedrock. Under strong seismic ground motion conditions, lurching can be expected within loose, cohesionless soils, or in clay-rich soils with a high moisture content. Generally, only lightly loaded structures, such as pavement, fences, pipelines, and walkways, are damaged by ground lurching; more heavily loaded structures appear to resist such deformation.

Tsunamis

Tsunamis occur when large areas of the submerged continental shelf or slope are rapidly displaced vertically. Tsunami inundation zones in Los Angeles are limited to areas along the coast in Venice, Marina del Rey, and San Pedro (California Department of Conservation 2020). The Project Area is located approximately 15 miles from the Pacific Ocean and is not located within an Inundation Map for flood risk (CGS 2016). There is no potential for tsunami damage in the Project Area.

Dam Inundation

Project Area Dam Inundation

As discussed in Section 4.9, *Hydrology and Water Quality*, dam failure from three regional dams could potentially create flooding in the majority of the Project Area. These include the Sepulveda Dam on the Los Angeles River, approximately 15 miles northwest of the Project Area, the Hansen Dam on the Tujunga Wash, approximately 15 miles northwest of the Project Area, and the Elysian Reservoir, located just west of the Plan Area on the northwest side of SR-110 (Los Angeles County Enterprise Geographic Information Systems 2017).

Soil Hazards

Hazards associated with soils include erosion, shrink/swell potential (expansive soils), landslides, and subsidence, as described below. Most of the City is urbanized and the majority of the land surface is covered in structures and pavement, which limits the extent of exposed surface soils.

Project Area Soil Hazards

The Project Area is generally underlain by Quaternary alluvial soils overlying Tertiary age sedimentary deposits. The alluvium is generally comprised of both stream channel and floodplain deposits of the Los Angeles River consisting of unconsolidated silt, sand, and gravel. Older alluvium consisting of river terrace deposits is mapped along the east side of the river. These deposits are described as dissected silt, sand, and gravel. Fill soils may also be present in the Project Area.

Soil Erosion

Erosion refers to the removal of soil by water or wind. The effects of erosion are intensified with an increase in slope (as water moves faster, it gains momentum to carry more debris), the narrowing of runoff channels (which increases the velocity of water), and by the removal of groundcover, which leaves the soil exposed.

Project Area Erosion

In the Project Area, there is a low potential for soil erosion as the ground surface is almost entirely paved and the underlying soils are not exposed to the elements. This impermeable surface cover decreases the infiltration of water into the underlying soils, which could increase the amount and velocity of runoff, and potentially erosion, in downstream locations. However, runoff in the Project Area flows to the Los Angeles River which runs through the center of the Project Area, the majority of which is concrete-lined. This existing, concrete-armored stormwater infrastructure minimizes the erosion potential in and downstream of

the Project Area. Although portions of the Los Angeles River within the Project Area have an unconsolidated bottom which contains 25 percent cover of particles smaller than stones, the infiltration of water into the underlying soils is minimal and the potential for soil erosion remains low.

Shrink/Swell (Expansive Soils)

Soils that volumetrically increase (swell) or expand when exposed to water and contract when dry (shrink) are considered expansive soils. A soil's potential to shrink and swell depends on the amount and types of clay in the soil. Montmorillonite and bentonite clays are more responsive to changes in water content than other types of clay. Further, the higher the clay content, the more the soil will swell when wet and shrink when dry. Highly expansive soils can cause structural damage to foundations and roads without proper structural engineering and are generally less suitable or desirable for development than non-expansive soils because of the necessity for detailed geologic investigations and costlier grading applications.

The Los Angeles Building Code (LABC) incorporates California Building Code (CBC) requirements for slab-on-ground building foundations located on expansive soils. If expansive soils are detected based on a preliminary soil report, the CBC requires preparation of a soil investigation prior to construction and incorporation of appropriate corrective actions to prevent structural damage, to be determined on a project-by-project basis. If a building or structure is assigned to a specific seismic design category, a geotechnical investigation will be conducted and a geotechnical report will be submitted prior to construction and incorporation of appropriate corrective actions to prevent structural damage. Whether or not a geotechnical investigation is warranted will be determined on a project-by-project basis.

Project Area Shrink/Swell

The extent of expansive soils in the Project Area is not currently mapped.

Landslides

The geologic character of an area determines its potential for landslides. Steep slopes, the extent of erosion, and the rock composition of a hillside can aid in predicting the probability of slope failure. Common triggering mechanisms of slope failure include undercutting slopes by erosion or grading; saturation of marginally stable slopes by rainfall or irrigation; and shaking of marginally stable slopes during earthquakes.

Project Area Landslides

According to the Los Angeles Seismic Hazard Map, there are no landslide zones in Project Area. However, sections of slope on Elysian Park directly bordering the northern portion of the Plan Areas are relatively steep and may be subjected to instability and are designated as landslide zones.

Subsidence

Subsidence occurs at great depths below the surface when subsurface pressure is reduced by the withdrawal of fluids (e.g., groundwater, natural gas, or oil) resulting in sinking of the ground.

As shown in **Figure 4.6-1** the easternmost portion of the Los Angeles City Oil Field lies along the western edge of the Project Area with a small portion of the oil field located along Spring St in the Project Area.

Figure 4.6-1 Subsidence Risk Areas

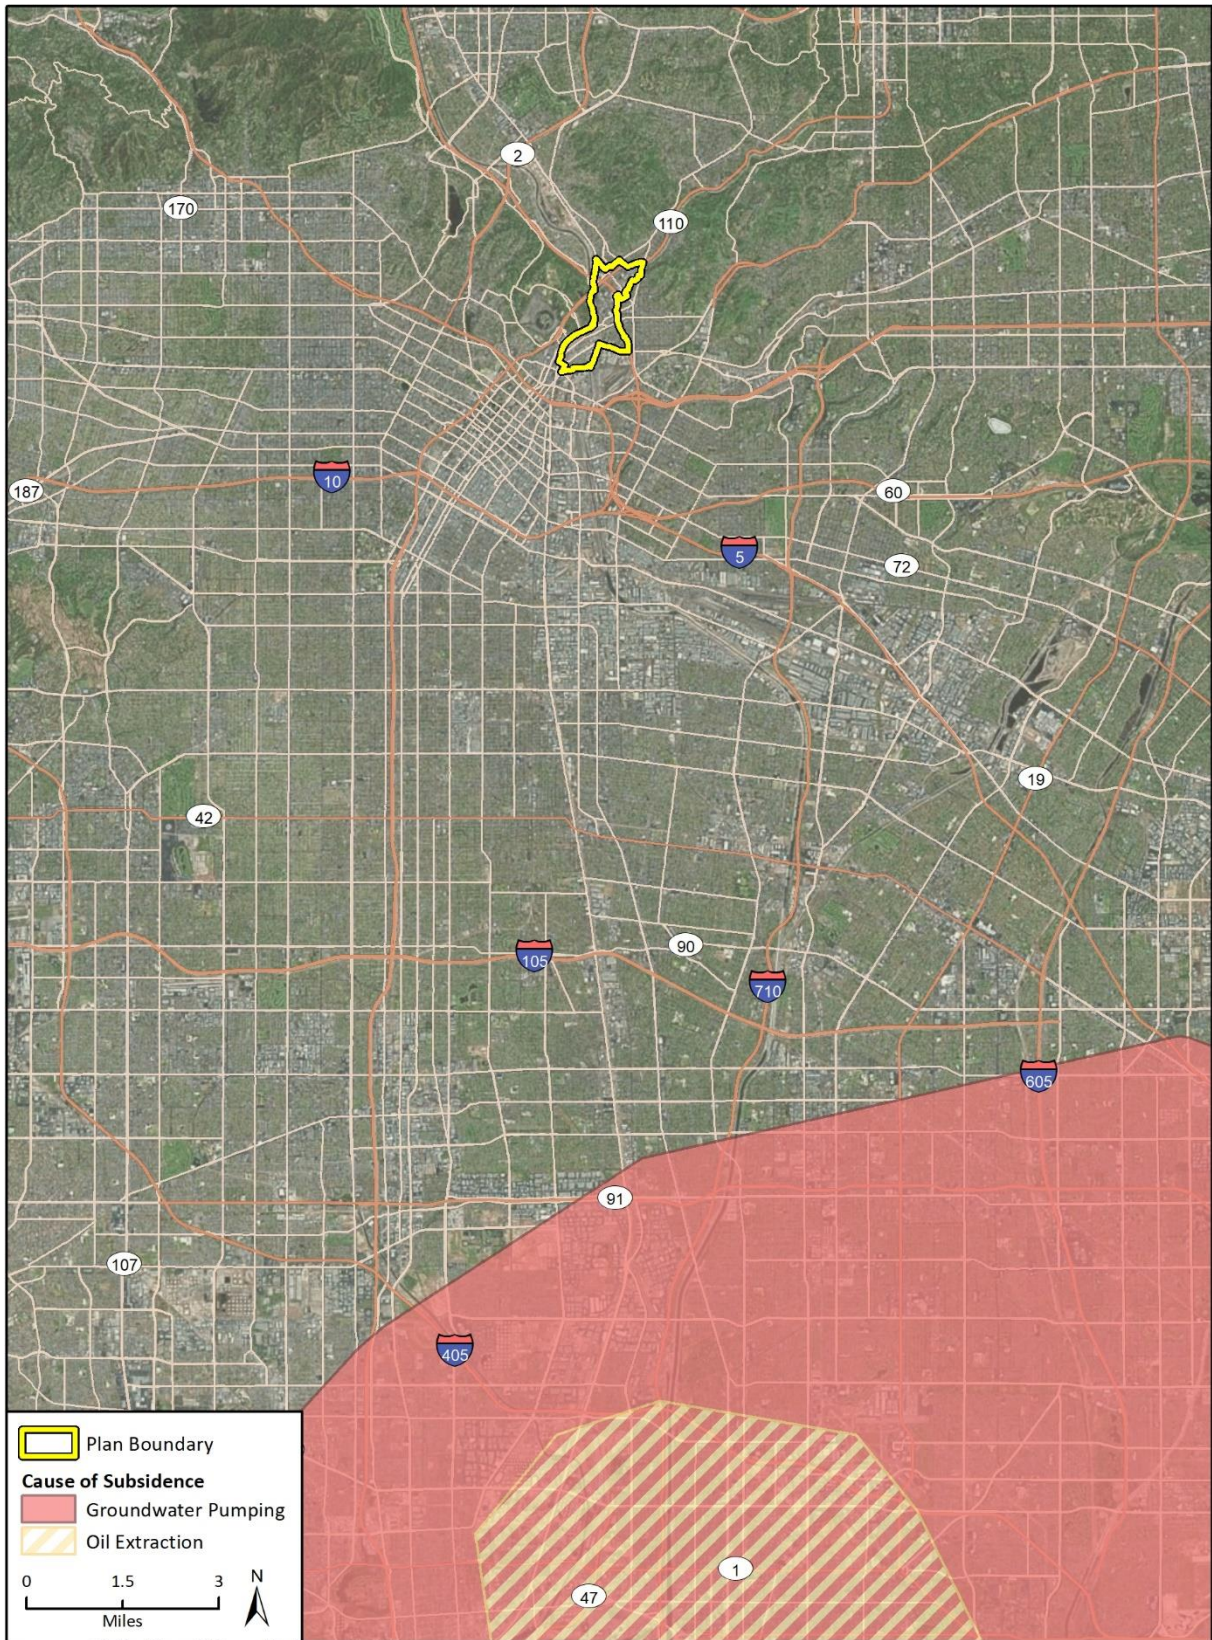

Fig 4.6-5 Subsidence Risk Areas

PALEONTOLOGICAL RESOURCES

Project Area

Project Area Paleontological Geologic Setting

The Cornfield Arroyo Seco Plan Area includes three mapped geologic units as shown in **Figure 4.6-2**: 1) Quaternary alluvial clay and sand (Qg); 2) Quaternary younger alluvium (Qa); and 3) the Monterey Formation (Tm) (Dibblee and Ehrenspeck 1989). The geology and paleontology of these geologic units is discussed below.

Quaternary Alluvium

The majority of the Project Area is underlain by Quaternary alluvium (Qa) of Holocene age locally consisting of unconsolidated sand, silt, and gravel typical of an alluvial floodplain. The Los Angeles River and Arroyo Seco are underlain by Quaternary alluvial clay and sand of valley areas (Qg) that are also of Holocene age. Holocene alluvial deposits are generally considered too young to preserve fossil resources (i.e., < 5,000 years old), but at unknown depths, these sediments may transition to older alluvial sediments or other geologic units like the Monterey Formation, which may contain scientifically significant fossils. Alluvial sediments of early Holocene and Pleistocene age have a well-documented record of abundant and diverse vertebrate fauna throughout California, especially in the Los Angeles Basin. Fossil specimens of whale, sea lion, horse, ground sloth, bison, camel, mammoth, dog, pocket gopher, turtle, ray, bony fish, shark, and bird have been reported (Agenbroad 2003; Bell et al. 2004; Jefferson 1989, 1991, 2010; Maguire and Holroyd 2016; Merriam 1911; Reynolds et al. 1991; Parkman 2005; PBDB 2022; Savage 1951; Savage et al. 1954; Scott and Cox 2008; Springer et al. 2009; Stirton 1951; Tomiya et al. 2011; Wilkerson et al. 2011; Winters 1954; UCMP 2022). Existing information discusses the general range of geologic unit thicknesses in various regions of the Los Angeles Basin; however, specific information on the depth at which Holocene units mapped at the surface become old enough to support paleontological resources is not available (DWR 1961). While the precise depth of these high sensitivity sediments is unknown, it may be as few as five feet (Maguire and Holroyd 2016; Savage 1951). The erosive power of the Los Angeles River and Arroyo Seco likely produce a complex sequence of young Holocene (< 5,000 years old), old Holocene (> 5,000 years old), and Pleistocene alluvial sediments beneath the Project Area. The proximity of these alluvial deposits to exposures of the Monterey Formation means that this unit may also be encountered at shallow depths, particularly in the western part of the Cornfield Arroyo Seco Plan Area.

The Monterey Formation

The Monterey Formation is exposed in the western Project Area. The portion underlying the Project Area consists of tan to light gray, semi-friable arkosic sandstone (Tmss). The Monterey Formation is extensive and outcrops along coastal California from north of San Francisco to south of Los Angeles. It is named after exposures of diatomaceous shale and siltstone in the vicinity of Monterey and is easily recognized by its pale buff to white color (Berndemeyer et al. 2012, Norris and Webb 1990). The Monterey Formation is as much as one mile thick and can span several square miles but is typically a half a mile thick. Its lithology varies greatly but is generally dominated by finely laminated diatomaceous sediments with scarce terrigenous material.

Figure 4.6-2 Geologic Map of the Project Area

Imagery provided by: Dibblee, T.W. and Ehrenspeck, H.E. 1989. Geologic map of the Los Angeles quadrangle, Los Angeles County, California. Dibblee Geological Foundation, Dibblee Foundation Map DF-22, scale 1:24,000

The middle to late Miocene Monterey Formation is well known for producing marine vertebrates, plants, invertebrates, and microfossils from more than 1200 localities in California. Museum collections document dozens of vertebrate localities yielding large sea turtles, dolphins, whales, pinnipeds, sharks, fish, desmostylians, birds, and many other fauna (PBDB 2022; UCMP 2022). In addition, numerous species of scientifically important invertebrates, foraminifera, and plants, such as kelps and other large soft-bodied seaweeds have been recovered from the Monterey Formation. Typically, the fossil specimens within the Monterey Formation have been recovered from its diatomite and shale deposits, but the limestone and sandstone beds have also yielded abundant remains.

Project Area Paleontological Sensitivity

The Society for Vertebrate Paleontology (SVP) broadly defines significant paleontological resources as follows (SVP 2010, page 11):

“fossils and fossiliferous deposits consist of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years).”

Significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, diagnostically important, or are common but have the potential to provide valuable scientific information for evaluating evolutionary patterns and processes, or which could improve our understanding of paleochronology, paleoecology, or depositional histories. New or unique specimens can provide new insights into evolutionary history; however, additional specimens of even well-represented lineages can be equally important for studying evolutionary patterns and processes, and evolutionary rates. Unidentifiable material can also provide useful data for dating geologic units if radiocarbon dating is possible. As such, common fossils (especially vertebrates) may be scientifically important, and therefore considered highly significant.

Project Area Paleontological Resources

The geologic units underlying the Project Area include units with low paleontological resource potential at the surface, and others with a high paleontological resource potential, as defined by the criteria set forth by the SVP (2010). The Monterey Formation (Tmss) has a high paleontological resource potential based on a history of yielding scientifically significant vertebrate fauna. The Holocene-age young alluvial-fan (Qa) and valley (Qg) deposits mapped within the Project Area have been determined to have a low paleontological resource potential at the surface but may overlay older alluvial units and/or the Monterey Formation. At depths below five feet, Quaternary younger alluvial-fan (Qa) and valley (Qg) deposits have a high paleontological resource potential. Sensitivity ratings for the sediments underlying Project Area are shown in **Figure 4.6-3**.

Figure 4.6-3 Paleontological Sensitivity of the Project Area

Imagery provided by: Dibblee, T.W. and Ehrenspeck, H.E. 1989. Geologic map of the Los Angeles quadrangle, Los Angeles County, California. Dibblee Geological Foundation, Dibblee Foundation Map DF-22, scale 1:24,000

REGULATORY FRAMEWORK

FEDERAL STANDARDS

Paleontological Resources Preservation Act

The Paleontological Resources Preservation Act (PRPA) was signed into law in 2009. It directs the Department of Agriculture and the Department of the Interior to implement comprehensive paleontological resource management programs on federal lands. The PRPA protects scientifically significant fossils on federal lands and provides a permitting system where researchers can collect and study scientifically significant fossils which will remain in the public trust. The act also allows for the collection of common plant and invertebrate fossils for personal, non-commercial use on federal lands. The PRPA requires the Secretaries of the Interior and Agriculture to manage and protect paleontological resources on federal land. The PRPA furthers the protection of fossils on federal lands by criminalizing the unauthorized removal of fossils.

Society for Vertebrate Paleontology (SVP) Standard Guidelines

The SVP has established standard guidelines that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. The PRPA of 2009 calls for uniform policies and standards that apply to fossils on all federal public lands. All federal land management agencies are required to develop regulations that satisfy the stipulations of the PRPA. As defined by the SVP, significant nonrenewable paleontological resources are:

Fossils and fossiliferous deposits here are restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments.

As defined by the SVP, significant fossiliferous deposits are:

A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces, and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material and climatic information). Paleontologic resources are considered to be older than recorded history and/or older than 5,000 years BP [before present].

Based on the significance definitions of the SVP, all identifiable vertebrate fossils are considered to have significant scientific value. This position is adhered to because vertebrate fossils are relatively uncommon, and only rarely will a fossil locality yield a statistically significant number of specimens of the same genus. Therefore, every vertebrate fossil found has the potential to provide significant new information on the taxon it represents, its paleoenvironment, and/or its distribution. Furthermore, all geologic units in which vertebrate fossils have previously been found are considered to have high sensitivity. Identifiable plant and invertebrate fossils are considered significant if found in association with vertebrate fossils or if defined as significant by project paleontologists, specialists, or local government agencies.

National Pollutant Discharge Elimination System (NPDES) Construction General Permit

NPDES was created by the Clean Water Act in 1972. Construction activities that disturb one or more acres of land surface are subject to the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (NPDES General Construction Permit) (Order No. 2012-0006-DWQ) adopted by the State Water Resources Control Board (SWRCB). Compliance with the permit requires each qualifying development project to file a Notice of Intent with the SWRCB. Permit conditions require development of a stormwater pollution prevention plan (SWPPP), which must describe the site, the facility, erosion and sediment controls, runoff water quality monitoring, means of waste disposal, implementation of approved local plans, control of construction sediment and erosion control measures, maintenance responsibilities, and non-stormwater management controls. Inspection of construction sites before and after storms is also required to identify stormwater discharge from the construction activity and to identify and implement erosion controls, where necessary.

In the City of Los Angeles, SWPPP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, development project plans are reviewed for compliance with the stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate Best Management Practices (BMPs) are incorporated to address stormwater pollution prevention goals as they relate to erosion and sediment movement on the project site. Sediment and erosion control measures can include both stabilization and structural practices. Stabilization practices, which refer to methods of covering or maintaining existing soil cover, can include seeding, vegetation and tree preservation, and contouring of project design. Such measures prevent initial disturbance of soil that can enable subsequent potential erosion during construction activities. Structural practices involve the use of devices to divert, store, or limit runoff that can transport sediment offsite and can include use of silt fences, earth dikes, sedimentation basins, and sediment traps. These measures obstruct runoff flows to reduce erosion and other soil transport.

Earthquake Hazards Reduction Act

The Earthquake Hazards Reduction Act was enacted in 1977 to “reduce the risks to life and property from future earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards and reduction program.” To accomplish this, the Earthquake Hazards Reduction Act established the National Earthquake Hazards Reduction Program (NEHRP). This program was substantially amended by the NEHRP Reauthorization Act of 2004 (Public Law 108-360).

NEHRP's mission includes improved understanding, characterization, and prediction of hazards and vulnerabilities; improvement of building codes and land use practices; risk reduction through post-earthquake investigations and education; development and improvement of design and construction techniques; improvement of mitigation capacity; and accelerated application of research results. The NEHRP designates the Federal Emergency Management Agency (FEMA) as the lead agency of the program and assigns it several planning, coordinating, and reporting responsibilities. Programs under NEHRP help inform and guide local planning and building code requirements such as emergency evacuation responsibilities and seismic code standards such as those to which a project would be required to adhere.

International Building Code

The International Building Code (IBC) is published by the International Code Council (ICC). The scope of this code covers major aspects of construction and design of structures and buildings. The IBC has replaced the Uniform Building Code as the basis for the California Building Code (CBC) and contains provisions for structural engineering design. The 2021 IBC addresses the design and installation of structures and building systems through requirements that emphasize performance. The IBC includes codes governing

structural as well as fire- and life-safety provisions covering seismic, wind, accessibility, egress, occupancy, and roofs.

STATE STANDARDS

Seismic Safety Act

The California Seismic Safety Commission was established by the Seismic Safety Act in 1975 with the intent of providing oversight, review, and recommendations to the Governor and State Legislature regarding seismic issues. The commission's name was changed to Alfred E. Alquist Seismic Safety Commission in 2006. Since then, the Commission has adopted several documents based on recorded earthquakes, such as the 1994 Northridge earthquake, 1933 Long Beach earthquake, the 1971 Sylmar earthquake, etc. Some of these documents are listed as follows:

- Research and Implementation Plan for Earthquake Risk Reduction in California 1995 to 2000, report dated December 1994;
- Seismic Safety in California's Schools, 2004, "Findings and Recommendations on Seismic Safety Policies and Requirements for Public, Private, and Charter Schools," report dated December 1994;
- Findings and Recommendations on Hospital Seismic Safety, report dated November 2001;
- Commercial Property Owner's Guide to Earthquakes Safety, report dated October 2006; and
- California Earthquake Loss Reduction Plan 2007–2011, report dated July 2007.

California Division of Oil, Gas, and Geothermal Resources (CalGEM)

CalGEM regulates production of oil and gas, as well as geothermal resources, within the State of California. CalGEM requirements in preparation of environmental documents under CEQA are defined in CCR, Title 14, Division 2, Chapter 2. Staff also assists operators in avoiding or reducing environmental impacts from the development of oil, gas, and geothermal resources in California, including subsidence. PRC Sections 3315, et seq. CalGEM regulations, which are defined in CCR, Title 14, Division 2, Chapter 4, include well design and construction standards, surface production equipment and pipeline requirements, and well abandonment procedures and guidelines to ensure effectiveness in preventing migration of oil and gas from a producing zone to shallower zones, including potable groundwater zones, as well as subsidence.

California Penal Code Section 622½

California Penal Code Section 622½ provides the following: "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."

California Penal Code Section 623

California Penal Code Section 623 provides the following: "Except as otherwise provided in Section 599c, any person who, without the prior written permission of the owner of a cave, intentionally and knowingly does any of the following acts is guilty of a misdemeanor punishable by imprisonment in the county jail not exceeding one year, or by a fine not exceeding one thousand dollars (\$1,000), or by both such fine and imprisonment: (1) breaks, breaks off, cracks, carves upon, paints, writes or otherwise marks upon or in any manner destroys, mutilates, injures, defaces, mars, or harms any natural material found in any cave. (2) disturbs or alters any archaeological evidence of prior occupation in any cave. (3) kills, harms, or removes any animal or plant life found in any cave. (4) burns any material which produces any smoke or gas which is harmful to any plant or animal found in any cave. (5) removes any material found in any cave. (6) breaks,

forces, tampers with, removes or otherwise disturbs any lock, gate, door, or any other structure or obstruction designed to prevent entrance to any cave, whether or not entrance is gained.”

California Public Resources Code (PRC) Section 5097.5

PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that:

No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.

California Building Code

The CBC, which is codified in Title 24 of the California Code of Regulations, Part 2, was promulgated to safeguard the public health, safety, and general welfare by establishing minimum standards related to structural strength, means of egress facilities, and general stability of buildings. The purpose of the CBC is to regulate and control the design, construction, quality of materials, use/occupancy, location, and maintenance of all buildings and structures within its jurisdiction. Title 24 is administered by the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Under State law, all building standards must be centralized in Title 24 or those standards are not enforceable. The provisions of the CBC apply to the construction, alteration, movement, replacement, location, and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures throughout California.

The 2019 edition of the CBC is based on the 2018 International Building Code (IBC) published by the International Code Council. The code is updated triennially, and the 2019 edition of the CBC was published by the California Building Standards Commission on July 1, 2019, and became effective January 1, 2020. Every three years, the State adopts new codes (known collectively as the California Building Standards Code) to establish uniform standards for the construction and maintenance of buildings, electrical systems, plumbing systems, mechanical systems, and fire and life safety systems. Sections 17922, 17958 and 18941.5 of the California Health and Safety Code require that the latest edition of the California Building Standards Code apply to local construction 180 days after publication. The significant changes to Title 24 in the 2019 edition can be found at California Department of General Services website.

Appendix J of the CBC applies to grading, excavation, and earthwork construction, and prohibits grading from occurring without first having obtained a permit from the building official. A geotechnical report must be prepared and include the following:

- The nature and distribution of existing soils,
- Conclusions and recommendations for grading procedures,
- Soil design criteria for any structure of embankments required to accomplish the proposed grading, and
- Where necessary, slope stability studies, and recommendations and conclusions regarding site geology.

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act of 1972 was passed into law following the destructive February 9, 1971 Mw 6.6 San Fernando earthquake. The Act provides a mechanism for reducing losses from surface fault rupture on a statewide basis. The intent of the Act is to ensure public safety by prohibiting the siting of most structures for human occupancy across traces of active faults that constitute a potential hazard to structures from surface faulting or fault creep. This Act requires the State Geologist to establish regulatory zones known as “Earthquake Fault Zones” around the surface traces of active faults and to issue appropriate maps. Before a project can be permitted within an Alquist-Priolo Earthquake Fault Zone, the City of Los Angeles requires a geologic investigation to demonstrate that the proposed building(s) will not be constructed across active faults. If an active fault is found, structures for human occupancy must be set back from the fault by approximately 50 feet. This Act groups faults into categories of active, potentially active, and inactive. Historic and Holocene age faults are considered active, Late Quaternary and Quaternary age faults are considered potentially active, and pre-Quaternary age faults are considered inactive.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 was passed into law following the destructive October 17, 1989 Mw 6.9 Loma Prieta earthquake. The Act directs the California Geological Survey (CGS) to delineate Seismic Hazard Zones. The purpose of the Act is to reduce the threat to public health and safety and to minimize the loss of life and property by identifying and mitigating seismic hazards. Cities and counties are directed to use seismic hazard zone maps developed by CGS in their land-use planning and permitting processes. The Act requires Cities and counties to regulate development projects that involve structures for human occupancy, excluding single-family dwellings that are less than two stories and are not part of a development of four or more dwellings. Cities and counties must ensure that geologic and soil conditions are investigated and appropriate mitigation measures, if any, are incorporated into development plans. The State Mining and Geology Board provides additional regulations and policies to assist municipalities in preparing the Safety Element of their General Plan and encourages land use management policies and regulations to reduce and mitigate those hazards to protect public health and safety. Under PRC Section 2697, cities and counties shall require, prior to the approval of a project located in a seismic hazard zone, a geotechnical report defining and delineating any seismic hazard. The requirement for a report may be waived if the city finds that no undue seismic hazard exists, based on information resulting from studies conducted on sites in the immediate vicinity of the project and of similar soil composition to the project site. Each city or county shall submit one copy of each geotechnical report, including mitigation measures, to the State Geologist within 30 days of its approval.

California Code of Regulations, Title 14, Section 4307 and Section 1427

Title 14, Section 4307 states that “no person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value.” Section 1427 “recognizes that California’s archaeological resources are endangered by urban development and population growth and by natural forces....Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave.”

LOCAL STANDARDS

City of Los Angeles Conservation Element

The City's General Plan Conservation Element recognizes paleontological resources in Section 3: "Archeological and Paleontological" (II-3), specifically the La Brea Tar Pits, and identifies protection of paleontological resources as an objective (II-5). The General Plan identifies site protection as important, stating, "Pursuant to CEQA, if a land development project is within a potentially significant paleontological area, the developer is required to contact a bonafide paleontologist to arrange for assessment of the potential impact and mitigation of potential disruption of or damage to the site. Section 3 of the Conservation Element, adopted in September 2001, includes policies for the protection of paleontological resources. As stated therein, it is the City's policy that paleontological resources be protected for historical, cultural research, and/or educational purposes. Section 3 also includes the objective of identifying and protecting of significant paleontological sites and/or resources known to exist or that are identified during "land development, demolition, or property modification activities." Section 5 of the Conservation Element recognizes the City's responsibility for identifying and protecting its cultural and historical heritage. The Conservation Element establishes the policy to continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities, with the related objective to protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes (City of Los Angeles 2001).

City of Los Angeles Safety Element

The City's General Plan Safety Element, which was previously adopted in 1996, addresses public safety risks due to natural disasters, including seismic events and geologic conditions, and sets forth guidance for emergency response during such disasters. The City Council adopted the updated Safety Element on November 24, 2021. The Safety Element offers a high-level overview of how the City plans for disasters and references readers to other implementation documents, including the Local Hazard Mitigation Plan, where more detailed information is available, and also provides maps of designated areas within Los Angeles that are considered susceptible to earthquake-induced hazards, such as fault rupture and liquefaction. The 2021 General Plan Safety Element has three goals and they are associated with various objectives, policies, and implementation programs.

Goal 1: Hazard Mitigations

A city where potential injury, loss of life, property damage and disruption of the social and economic life of the City due to hazards is minimized (City of Los Angeles 2021).

Goal 2: Emergency Response

A city that responds with the maximum feasible speed and efficiency to disaster events so as to minimize injury, loss of life, property damage and disruption of the social and economic life of the City and its immediate environs.

Goal 3: Disaster Recovery

A city where private and public systems, services, activities, physical condition and environment are reestablished as quickly as feasible to a level equal to or better than that which existed prior to the disaster.

Los Angeles Municipal Code (LAMC)

Municipal Code Chapter IX, Article 1, Building Code, (the LABC), incorporates the CBC, to provide geotechnical hazard prevention regulations. In general, the LAMC includes requirements for construction and ground disturbance that could affect geologic risks, as well as standards for building foundations, earthquake/seismic structural designs, and development within landslide susceptible areas. Division 18 of Article 1, in adopting the CBC, provides guidance for development located on expansive soils; Division 70 provides general construction, grading and site excavation requirements and restricts issuance of grading permits for development in landslide areas; and Division 88 establishes standards for structural seismic resistance for existing buildings (LAMC). Division 70 includes provisions for managing and reducing erosion during construction activities, especially as it relates to controlling stormwater pollution from sediments. Specifically, per the LAMC, project applicants are required to incorporate any best management practices necessary to control stormwater pollution in accordance with the “Development Best Management Practices Handbook, Part A Construction Activities” as adopted by the Board of Public Works.

The Los Angeles Department of Building and Safety (LADBS) has the authority to withhold building permit issuance if a project cannot mitigate potential hazards to the project or which are associated with the project. Throughout the permitting, design, and construction phases of a building project, LADBS engineers and inspectors confirm that the requirements of the LAMC pertaining specifically to geoseismic and soils conditions are being implemented by project architects, engineers, and contractors.

The function of the City’s Building Code, which comprises Chapter IX of the LAMC, is to protect life safety and ensure compliance with the LAMC. Chapter IX addresses numerous topics, including earthwork and grading activities, import and export of soils, erosion and drainage control, and general construction requirements that address flood and mudflow protection, landslides, and unstable soils. Additionally, the LAMC includes specific requirements addressing seismic design, grading, foundation design, geologic investigations and reports, soil and rock testing, and groundwater.

Specifically, Chapter IX of LAMC Div. 18, Sec. 91.1803, requires a Final Geotechnical Report with final design recommendations prepared by a California-registered geotechnical engineer and submitted to the LADBS for review prior to issuance of a grading permit. Final foundation design recommendations must be developed during final project design, and other deep foundation systems that may be suitable would be addressed in the Final Geotechnical Report. All earthwork (i.e., excavation, site preparation, any fill backfill placement, etc.) must be conducted with engineering control under observation and testing by the Geotechnical Engineer and in accordance with LADBS.

Hillside Construction Regulation (HCR)

The HCR Supplemental Use District, effective March 2017 and updated in May 2018, was established by Ordinance No. 184827 to provide additional protections that would address the cumulative construction-related impacts of multiple single-family houses in hillside areas. All single-family home development projects within the HCR District shall comply with LAMC Section 13.20. However, if a Haul Route approval by the Board of Building and Safety Commissioners is required for import and/or export of 1,000 cubic yards or more, then the conditions or “Hauling Truck Operations Standards” set by the Board of Building and Safety Commissioners during the Haul Route approval process shall prevail. In addition, the builder of any single-family home development exceeding 17,500 square feet in HCR Districts needs to file for a Site Plan Review discretionary approval.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the State CEQA Guidelines the, a project would have a significant impact related to geology and soils if it would:

- Directly or indirectly cause potential adverse effects, including the risk of loss, injury, or death involving: (Threshold 4.6-1)
 - i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?
 - ii) Strong seismic ground shaking
 - iii) Seismic-related ground failure, including liquefaction
 - iv) Landslides
- Result in substantial soil erosion or the loss of topsoil (Threshold 4.6-2)
- Be located on a geologic unit or soil that is unstable as a result of the project, and potentially result in on or offsite landslide, lateral spreading, subsidence, liquefaction or collapse (Threshold 4.6-3)
- Be located on expansive soil, as defined in **Table 18-1-B** of the Uniform Building Code (1994), creating substantial risks to life or property (Threshold 4.6-4)
- Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater (Threshold 4.6-5)
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature (Threshold 4.6-6)

METHODOLOGY

Baseline information for the analysis was compiled from a review of data and reports published by state agencies, environmental documents for projects in the vicinity, as well as information compiled and evaluated by the City of Los Angeles related to local topography, geologic and soil conditions, and seismic hazards. The result of the effort is a general and qualitative analysis of the types of geologic hazards that could be expected relative to the implementation of the Proposed Project.

Independent of the CEQA process, there is a comprehensive regulatory framework implemented at the State and City levels to mitigate potential hazards associated with geologic and soil conditions. The design-controllable aspects of building foundation support, protection from seismic ground motion, and soil instability are governed by existing regulations. Compliance with these regulations is required, not optional. Project applicants must demonstrate the proposed project complies with these regulations by incorporating these regulations in the project's design before permits for project construction are issued. The analysis presented herein assumes compliance with all applicable laws, regulations, and standards, as part of the initial CEQA baseline and future conditions. In 2015, the California Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District (CBIA v. BAAQMD)*, held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of a project. However, if a project exacerbates a condition in the existing environment, the lead agency is required to analyze the impact of that exacerbated condition on the environment, which

may include future residents and users within the Project Area. The decision from *CBIA v. BAAQMD* will inform the analysis of Appendix G thresholds provided above.

The identification of impacts is based on the potential for reasonably anticipated development from the Proposed Project to create or exacerbate geologic or seismic hazards based on review of available information regarding the types of geologic and seismic hazards present in the Project Area specifically as well as the types of reasonably anticipated development. The analysis focuses on whether or not new development would increase the potential for a particular hazard. Applicable regulations, such as the CBC, LABC, and NPDES General Construction Permit, are considered for the analysis of each potential impact.

The analysis of paleontological resources and unique geological features identifies the likelihood of ground disturbing activities to encounter rock units with potential for containing significant paleontological resources, which is considered high in quaternary alluvial fan deposits exhibiting a composition conducive to the preservation of fossil resources. Paleontological resources in the Project Area were evaluated qualitatively based on general information about Project Area conditions. In the absence of an inventory of unique geological resources, the potential for such resources to be present and impacted is generally assessed.

PROJECT IMPACTS

Threshold 4.6-1	<p>Directly or indirectly cause potential adverse effects, including the risk of loss, injury, or death involving:</p> <ul style="list-style-type: none"> i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42 ii) Strong seismic ground shaking iii) Seismic-related ground failure, including liquefaction iv) Landslides
------------------------	--

Impact 4.6-1 **Proposed Project:** Because the Project would not exacerbate exposure to geologic hazards and reasonably anticipated development from the Project would comply with currently applicable seismic regulations and building standards, the Project would not increase exposure to seismic hazards. Reasonably anticipated development may result in exposure of people or structures to geologic hazards.. However, development in the Project Area would likely replace older structures with new seismic safety compliant structures and may actually improve seismic safety. Thus, although new development would be exposed to existing geologic hazards, it would not increase the potential for such hazards or create new hazards and; as a result, there would be *no impact* related to increased exposure to seismic hazards.

Project Impacts

In light of the California Supreme Court ruling in *CBIA v. BAAQMD*, which held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of a project, the potential for substantial adverse effects on people or structures from the rupture of a known earthquake, strong seismic ground shaking, seismic-related ground failure (including liquefaction) or landslides, which would result from an existing environmental condition, would not be an impact under CEQA unless the Proposed Project exacerbated the existing environmental condition.

The type of development that would occur under the Project is typical of urban environments and would not involve mining operations, deep excavation into the Earth, or boring of large areas creating unstable seismic conditions or stresses in the Earth's crust that would result in the rupture of a fault. The Proposed Project would increase development potential, thereby potentially increasing the number of people and structures exposed to seismic ground shaking or seismic related ground failure (including liquefaction or landslides); however, it would not cause or accelerate existing geologic hazards, including altering the underlying soil or groundwater characteristics that govern liquefaction or landslide potential and replacement of older structures with new structures that comply with current seismic standards would generally improve seismic safety. While the future development would not increase the risk of an earthquake, construction can have the effect of changing soil conditions that may increase the potential for landslide or liquefaction. However, with compliance with existing regulatory standards, including Chapter 18 of the CBC and all other excavation and grading requirements in the CBC and LABC, future development under the Proposed Project would not change the soil conditions that would increase the risk to structures or persons from future seismic related ground failure, including landslides or liquefaction. Therefore, the Proposed Project would have *no impact* with respect to the rupture of a known earthquake fault, strong seismic ground shaking or seismic-related ground failure (including liquefaction) or landslides.

The following information about the risk of rupture of known earthquake fault, strong seismic ground shaking, and seismic-related ground failure (including liquefaction) or landslides from existing conditions and that risk to existing or future residents in the Project Area is for informational purposes.

No Earthquake Fault Zones or identified active faults cross through the Project Area; therefore, neither residents nor future structures would be exposed to increased risk from potential fault rupture, and the Project Area development would not be subject to buffering requirements of the Alquist-Priolo Earthquake Fault Zoning Act.

The Project Area is located in a region of high potential for seismic activity, similar to most of Southern California. Several potentially active fault systems could generate substantial damage to Project Area structures. All of Los Angeles is generally subject to large magnitude earthquakes and is located within Seismic Zone 4, designated as having the highest national seismic potential (UBC 1997). However, relative to other areas in Southern California, the Project Area is currently designated as having an average expected ground shaking potential from earthquakes, according to the California Department of Conservation's (DOC) California Earthquake Shaking Potential Map (DOC 2016). Reasonably anticipated development from the Proposed Project would involve new construction, including larger, taller buildings, more dense development. This could increase the Project Area's population as well as work and leisure visitors to the Project Area from current conditions. As such, additional structures and people could be exposed to the potential effects of seismic ground shaking from regionally generated earthquakes upon implementation of the Project. However, reasonably anticipated development from the Project would not increase the potential for earthquakes or otherwise exacerbate ground shaking potential in Project Area. Moreover, in many cases, new development would replace older buildings subject to seismic damage with structures built to current seismic standards, which would decrease the risk of damage to people and structures.

Continued implementation of City regulations and requirements on all new development would minimize ground shaking hazards through requiring implementation of current geotechnical practices and compliance with CBC requirements, which include specific structural seismic safety provisions. As required by CBC Chapter 16 for the construction of new buildings or structures, specific engineering design and construction measures would be implemented to minimize the potential for adverse impacts to human life and property caused by seismically induced ground shaking. Chapter 33 of the CBC requires all new development to comply with specific geologic design parameters and geotechnical recommendations, which would be incorporated into individual development projects to minimize the potential for adverse impacts. In addition, Policy 1.1.6 of the Safety Element of the City General Plan encourages development to comply with applicable state and federal planning and development regulations, including the Alquist-Priolo

Earthquake Fault Zoning Act and the Seismic Hazards Mapping Act. Compliance with applicable regulations and policies would minimize the risk of exposure to hazards associated with seismic ground shaking.

Development in the Project Area could be susceptible to liquefaction risk, especially given that the Project would allow for increased density of development throughout the Project Area. However, construction in liquefaction zones would not increase liquefaction potential and new structures would be built to current/improved future building, structural and seismic codes per the requirements of the CBC. Construction would comply with existing regulations, as included in Chapter 18 of the CBC, to ensure that building foundations are properly anchored and stabilized to withstand damage from potential liquefaction. All new construction in liquefaction-prone areas would be required to prepare a geotechnical report. Additionally, for properties with mapped maximum considered earthquake spectral response, as determined by Section 1613 of the CBC, a liquefaction potential study of the property is required. Required compliance with the recommendations identified in the project-specific geotechnical evaluation, the LABC, and any specific requirements established by Los Angeles Department of Public Works (LADPW) and/or the City's Engineer would ensure that future development would not be exposed to substantial risks associated with liquefaction.

Strong ground motion can worsen existing unstable slope conditions, particularly if improper construction has already destabilized the underlying soil structure on hillslopes. Seismically-induced landslides can overrun structures, people or property, sever utility lines, and block roads, thereby hindering rescue operations after an earthquake. Slope stability depends on many factors and their interrelationships. Rock type and pore water pressure are arguably the most important factors, as well as slope steepness due to natural or human-made undercutting. Where slopes have failed before, they may fail again. According to the Los Angeles Seismic Hazard Map, there are no landslide zones in Project Area. However, sections of slope on Elysian Park directly bordering the northern portion of the Project Area are relatively steep and may be subjected to instability and are designated as landslide zones. The Project would accommodate development of high density residential, and mixed use development projects in the Project Area. However, these developments would not be subject to potential landslide risk. Furthermore, compliance with CBC standards would require an assessment of landslide hazards and the incorporation of design measures into structures to mitigate these hazards. Also, any development on steep terrain would require site-specific slope stability design to ensure adherence to the standards contained in Appendix Chapter A33, Excavation and Grading, of the CBC, as well as California Division of Occupational Safety and Health (DOSH, CAL/OSHA) requirements for shoring and stabilization. Any development in areas susceptible to landslides would be required to implement site-specific measures that would generally reduce landslide potential and, as such, would not increase landslide hazards on adjacent properties.

Implementation of the Proposed Project would not exacerbate existing geologic hazards. Moreover, compliance with applicable regulations, as described above, for all new Project Area development would achieve applicable seismic safety standards and thus reduce risks to future Proposed Project residents, tenants and other users. In addition, future Project Area development would not increase the potential for seismic related geological hazards and, in some cases, may reduce the potential for property damage and/or safety concerns by replacing older structures with new structures built to current seismic standards. Thus, impacts would be *less than significant*.

Mitigation Measures

Significant impacts have not been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.6-2	Result in substantial soil erosion or the loss of topsoil
------------------------	---

Impact 4.6-2 **Proposed Project:** Reasonably anticipated development from the Project would not result in substantial soil erosion and loss of topsoil because it would be required to comply with state and local applicable regulations and standards. The impact would be *less than significant*.

Project Impacts

Soil erosion is the result of actions of water and wind. The likelihood of erosion is higher with an increase in slope, narrowing of runoff channels, and removal of groundcover. As discussed in the Environmental Setting above, most of the Project Area's topography is relatively flat, with relatively steep slopes ascending towards Broadway and Elysian Park along the north side of the Project Area. Loose and disturbed soils are more prone to erosion by water and wind. There is a low potential for soil erosion as the ground surface is almost entirely paved and the underlying soils are not exposed to the elements. This impermeable surface cover decreases the infiltration of water into the underlying soils, which could increase the amount and velocity of runoff, and potentially erosion, in downstream locations. Reasonably anticipated development from the Project would involve construction activities such as stockpiling, grading, excavation, paving, and other earth-disturbing activities.

As discussed under federal, state and local requirements, construction activities that disturb one or more acres of land surface are subject to the NPDES General Construction Permit process, which would require development of a SWPPP that outlines project-specific BMPs to control erosion, sediment release, and otherwise reduce the potential for discharge of pollutants from construction into stormwater. Typical BMPs include, but are not limited to, installation of silt fences, erosion control blankets, and anti-tracking pads at site exits to prevent off-site transport of soil material.

Because the Project Area is almost entirely built out, the potential for erosion is primarily limited to temporary effects of possible topsoil loss at project construction sites. For construction activities, Section D of LAMC Article 4.4, *Stormwater and Urban Runoff Pollution Control*, requires owners or developers to implement stormwater pollution control requirements for construction activities depicted in the project plans, which are subject to approval by the Department of Building and Safety. The Director of the Department may require additional and/or alternative site-specific BMPs or conditions, if needed. The BMPs would be in accordance with the provisions contained in the "Planning and Land Development Handbook For Low Impact Development (LID), Part B Planning Activities" and would be designed to capture and treat runoff from construction sites such as through stabilization of construction entrance roadways and on-site retention of eroded sediments and pollutants. The City and PRC Section 2697 require the preparation of a site-specific geotechnical report to evaluate soils issues. For sites where grading activities would occur on one or more acre, construction activities would be subject to the statewide General Construction Permit required by the State Water Resources Control Board in compliance with the federal NPDES program, which would require preparation and implementation of a SWPPP that includes additional site-specific BMPs to reduce potential stormwater pollution from onsite erosion. Construction activities would also be required to comply with CBC Chapter 70 standards, which are designed to ensure implementation of appropriate measures during grading and construction to control erosion and storm water pollution. Therefore, erosion from demolition and construction activities associated with future development within the Project Area would be controlled through implementation of the requirements and BMPs contained in existing regulations, including the NPDES Construction General Permit and LAMC.

While new reasonably expected construction activities from the Proposed Project may slightly increase the potential for construction related soil erosion, consistent enforcement of CBC requirements and NPDES permit conditions, enacted through the LAMC requirements, would minimize runoff and pollution from construction sites, and ensure compliance with the Regional Water Quality Control Board (RWQCB) Water

Quality Control Plan and its regulations. Further, BMPs for post-construction erosion and sediment control would remain in effect, which would improve future erosion conditions. Compliance with the regulations discussed above would reduce the risk of soil erosion from construction activities such that there would be no substantial change in risk compared to current conditions with existing development. Impacts related to soil loss would be *less than significant*.

Mitigation Measures

Significant impacts have not been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.6-3	Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse
------------------------	--

Impact 4.6-3 **Proposed Project:** Reasonably anticipated development from the Proposed Project would be subject to existing requirements, regulations and policies provided in the LABC, which would ensure that reasonably anticipated development from the Project would not increase or otherwise alter the potential for impacts related to on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse compared to existing conditions. Impacts would be *less than significant*.

Project Impacts

See also discussion of landslides and liquefaction in Impact 4.6-1. Lateral spreading occurs as a result of liquefaction; accordingly, liquefaction-prone areas would also be susceptible to lateral spreading. Thus, the entire Project Area would therefore be susceptible to lateral spreading.

The Project would guide the transition of a vehicular-oriented industrial and public facility area into a cluster of mixed-use, pedestrian-oriented neighborhoods. These new developments would be located in areas susceptible to liquefaction risk. However, new reasonably anticipated development from the Proposed Project would not increase the potential for liquefaction or otherwise increase the potential for exposure to liquefaction-related damage because, as discussed below, future development under the Project would be required to comply with building standards and be designed to withstand potential liquefaction and lateral spreading hazards. In addition, by replacing older structures with new structures built to current standards, future projects involving redevelopment of properties would reduce the potential for liquefaction-related damage. Under the provisions of LABC, all new construction would be required to first assess the potential for liquefaction at the building site, and then provide design recommendations to mitigate the site's liquefaction potential. Construction in liquefaction zones would be built to current/improved future building, structural and seismic codes per the requirements of the CBC. Construction would comply with existing regulations, as included in Chapter 18 of the CBC, to ensure that building foundations are properly anchored and stabilized to withstand damage from potential liquefaction.

Although new developments would be susceptible to potential liquefaction, as mentioned previously, the Project Area does not include areas designated as landslide or subsidence zones. Furthermore, construction would primarily involve infill development of uses that already exist in those areas and future development would be required to comply with Division 18, *Soils and Foundations*, of the LABC, which adopted Chapter 18 of the CBC by reference. Therefore, future development would be required to comply with the CBC regarding the minimum standards for structural design and site development. The CBC, which is based on the UBC, has been modified for California conditions with more detailed and/or more stringent regulations. The CBC requires that "classification of the soil at each building site shall be determined when required by the building official" and that "the classification shall be based on observation and any necessary test of the

materials disclosed by borings or excavations.” Section 91.1803 and Section 91.1804 of the LAMC reference the CBC standards for excavation, grading, and earthwork construction; fills and embankments; expansive soils; foundation investigations; and liquefaction potential and soils strength loss. Thus, an acceptable degree of soil stability can be achieved for soil materials by the CBC-required incorporation of soil treatment programs (replacement, grouting, compaction, drainage control, etc.) in the excavation and construction plans to address site-specific soil conditions. In addition to the CBC regulations, State oil and gas laws (including but not limited to, Public Resources Code Sections 3315, et seq.), extensively regulate the operation of oil and gas wells to ensure that subsidence does not occur to threaten people or property. Adherence to these requirements would achieve accepted safety standards relative to unstable geologic units or soils. In addition, although reasonably anticipated development from the Proposed Project would potentially be subject to these hazards, it would not increase the potential for landslides (non-seismic related), liquefaction (non-seismic related) lateral spreading, subsidence, or collapse. Therefore, impacts would be *less than significant*.

Mitigation Measures

Significant impacts have not been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.6-4	Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.
------------------------	--

Impact 4.6-4 **Proposed Project:** Reasonably anticipated development from the Proposed Project may involve new development in areas with expansive soils but would not create substantial risk to people or structures as all future development would be subject to applicable standards of the CBC. Impacts would be *less than significant*.

Project Impacts

As discussed in Section 4.6.2, *Environmental Setting*, a majority of the land surface in the Project Area is covered in structures and pavement, which limits the extent of exposed surface soils. The Project Area is generally underlain by Quaternary alluvial soils overlying Tertiary age sedimentary deposits. The alluvium is generally comprised of both stream channel and floodplain deposits of the Los Angeles River consisting of unconsolidated silt, sand, and gravel. Older alluvium consisting of river terrace deposits is mapped along the east side of the river. These deposits are described as dissected silt, sand, and gravel, which are generally considered to have high potential to be expansive. However, LABC regulations would require underlying soils for each new individual development site in the Project Area to be evaluated for the presence of expansive soils and remediated as necessary to reduce potential damage risk.

Reasonably anticipated development from the Project may be exposed to risks associated with expansive soils but would not increase soil expansiveness or increase exposure of existing development in the Project Area to such hazards. All future development would be required to comply with applicable provisions of the CBC with regard to soil hazard-related design and in adherence to Policy 1.1.6 of the Safety Element of the City General Plan, which assures compliance with applicable local, state, and federal planning and development regulations to minimize risks from natural hazards. The CBC requires a site-specific soil investigation for any new development that identifies potentially unsuitable soil conditions in a preliminary soil report. Because development under the Proposed Project would not increase the potential for soil expansion and would comply with applicable LABC regulations, there would be no change in the exposure of people or existing structures to risks associated with expansive soils. Impacts would be *less than significant*.

Mitigation Measures

Significant impacts have not been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.6.5	Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater
------------------------	--

Impact 4.6-5 **Proposed Project:** The entire Project Area is served by the City’s sewer system. Use of septic systems or other alternative wastewater disposal systems would not be needed in the Project Area. *No impact* would occur.

Project Impacts

The Project Area is currently almost entirely built out with established utility infrastructure and associated services. Sewer services are provided by the Los Angeles Sanitation Department. Reasonably anticipated development from the Project would be required to connect to the existing sewer system. Therefore, development under the Proposed Project would not require the use of septic tanks and *no impact* would occur.

Mitigation Measures

Significant impacts have not been identified; therefore, mitigation is not required for the Proposed Project.

Threshold 4.6-6	Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature
------------------------	---

Impact 4.6-6 **Proposed Project:** Implementation of the Project could significantly impact unique paleontological or a unique geologic feature. Mitigation Measures 4.6-6(a) and 4.6-6(b) would minimize potential impacts during excavation activities. Impacts to paleontological resources would be *less than significant with mitigation*.

Project Impacts

As described under Existing Conditions, the majority of the Project Area is underlain by Quaternary alluvium (Qa) of Holocene age locally consisting of unconsolidated sand, silt, and gravel typical of an alluvial floodplain which is defined as low paleontological sensitivity at the surface. However, these sediments increase in age with depth, and subsurface sediments may have high paleontological sensitivity as few as five feet below ground surface. Therefore, paleontological resources may be present in fossil-bearing sediments in relatively shallow depths below much of the Project Area. Ground disturbing activities that include excavation greater than five feet below ground surface have the potential to damage or destroy an unknown quantity of paleontological resources in this area. In addition, the Monterey Formation (Tmss) along the western edge of the Project Area bordering Broadway and Elysian Park has high paleontological sensitivity based on a history of yielding scientifically significant vertebrate fauna. Ground-disturbing activities in geologic units in the Project Area, thus, have the potential to damage or destroy an unknown quantity of paleontological resources.

In general, the potential for a specific development to result in negative impacts to paleontological resources is directly proportional to the amount of ground disturbance associated with the development; thus, the higher the amount of ground disturbances within geological units with a known paleontological sensitivity, the greater the potential for adverse impacts to paleontological resources. Development involving major

building foundation construction (i.e., high rises) and subsurface parking would have a high potential for major excavation that could impact subsurface resources. The area of high sensitivity along the western edge of Project Area is primarily confined to a landscaped hillside area. Because development in or immediately adjacent to this hillside area would not occur, development in this portion of the Project Area has low potential to disturb resources. Nevertheless, there is potential for ground disturbing activities for future development throughout the Project Area. Therefore, activities resulting from any reasonably anticipated development from the Proposed Project, which includes construction-related and earth-disturbing actions, could damage or destroy fossils in these geologic units, resulting in a *potentially significant* impact.

Mitigation Measures

For all discretionary projects that are excavating at least two subterranean levels below the ground surface, the following measures shall be conducted to identify and avoid potential impacts to such resources:

4.6-6(a) Paleontological Resources

- **Retention of Qualified Paleontologist.** The project applicant shall retain a Qualified Paleontologist prior to excavations. The Qualified Paleontologist shall direct all mitigation measures related to paleontological resources. A qualified professional paleontologist is defined by the Society of Vertebrate Paleontology (SVP) standards (SVP 2010) as an individual preferably with an M.S. or Ph.D. in paleontology or geology who is experienced with paleontological procedures and techniques, who is knowledgeable in the geology of California, and who has worked as a paleontological mitigation project supervisor for a least two years (SVP 2010).
- **Paleontological Worker Environmental Awareness Program.** Prior to the start of construction, the Qualified Paleontologist or their designee shall conduct a paleontological Worker Environmental Awareness Program (WEAP) training for construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered by construction staff.
- **Paleontological Monitoring.** Full-time paleontological monitoring shall be conducted during the initial phases of ground disturbing construction activities (i.e., grading, trenching, foundation work) within sediments with a high paleontological sensitivity. Paleontological monitoring shall be conducted by a qualified paleontological monitor, who is defined as an individual who has experience with collection and salvage of paleontological resources and meets the minimum standards of the SVP (2010) for a Paleontological Resources Monitor. The duration and timing of the monitoring shall be determined by the Qualified Paleontologist based on the observation of the geologic setting from initial ground disturbance, and subject to the review and approval by the City of Los Angeles. If the Qualified Paleontologist determines that full-time monitoring is no longer warranted, based on the specific geologic conditions once the full depth of excavations has been reached, they may recommend that monitoring be reduced to periodic spot-checking or ceased entirely. Monitoring shall be reinstated if any new ground disturbances are required, and reduction or suspension shall be reconsidered by the Qualified Paleontologist at that time. In the event of a fossil discovery by the paleontological monitor or construction personnel, all work in the immediate vicinity of the find shall cease. A Qualified Paleontologist shall evaluate the find before restarting construction activity in the area. If it is determined that the fossil(s) is (are) scientifically significant, the Qualified Paleontologist shall complete the following conditions to mitigate impacts to significant fossil resources:
 - **Salvage of Fossils.** If fossils are discovered, the paleontological monitor shall have the authority to halt or temporarily divert construction equipment within 50 feet of the find until the monitor and/or lead paleontologist evaluate the discovery and determine if the fossil may

be considered significant. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. Bulk matrix sampling may be necessary to recover small invertebrates or microvertebrates from within paleontologically sensitive deposits.

- **Treatment of Paleontological Resources.** Once salvaged, significant fossils shall be identified to the lowest possible taxonomic level, prepared to a curation-ready condition, and curated in a scientific institution with a permanent paleontological collection (such as the Natural History Museum of Los Angeles County), along with all pertinent field notes, photos, data, and maps. Fossils of undetermined significance at the time of collection may also warrant curation at the discretion of the Qualified Paleontologist.
- **Final Paleontological Mitigation Report.** Upon completion of ground disturbing activity (and curation of fossils if necessary) the Qualified Paleontologist shall prepare a final report describing the results of the paleontological monitoring efforts associated with the project. The report shall include a summary of the field and laboratory methods, an overview of the project geology and paleontology, a list of taxa recovered (if any), an analysis of fossils recovered (if any) including their scientific significance, and recommendations. The report shall be submitted to the City of Los Angeles. If the monitoring efforts produced fossils, a copy of the report shall also be submitted to the designated museum repository.

4.6-6(b) Treatment of Paleontological Resources

For discretionary projects, the City shall require that all paleontological resources identified on a project site be assessed and treated. A report shall be prepared according to current professional standards that describes the resource, how it was assessed, and disposition.

4.6-6(c) Notification of Intent to Excavate Language

For all projects not subject to 4.6-6(a) that are seeking excavation or grading permits, the Department of Building and Safety shall issue the following notice and obtain an acknowledgement of receipt of the notice from applicants:

- California Penal Code Section 622-1/2 provides the following: “Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor.”
- California Penal Code Section 623 provides the following: “Except as otherwise provided in Section 599c, any person who, without the prior written permission of the owner of a cave, intentionally and knowingly does any of the following acts is guilty of a misdemeanor punishable by imprisonment in the county jail not exceeding one year, or by a fine not exceeding one thousand dollars (\$1,000), or by both such fine and imprisonment: (1) breaks, breaks off, cracks, carves upon, paints, writes or otherwise marks upon or in any manner destroys, mutilates, injures, defaces, mars, or harms any natural material found in any cave. (2) disturbs or alters any archaeological evidence of prior occupation in any cave. (3) kills, harms, or removes any animal or plant life found in any cave. (4) burns any material which produces any smoke or gas which is harmful to any plant or animal found in any cave. (5) removes any material found in any cave. (6) breaks, forces, tampers with, removes or otherwise disturbs any lock, gate, door, or any other structure or obstruction designed to prevent entrance to any cave, whether or not entrance is gained.”

- PRC Section 5097.5 provides protection for cultural and paleontological resources, where Section 5097.5(a) states, in part, that: “No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.”
- California Code of Regulations, Title 14, Section 4307 states that “no person shall remove, injure, deface or destroy any object of paleontological, archaeological, or historical interest or value.” Section 1427 “recognizes that California’s archaeological resources are endangered by urban development and population growth and by natural forces....Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archaeological or historical interest or value, whether situated on private lands or within any public park of place, is guilty of a misdemeanor. It is a misdemeanor to alter any archaeological evidence found in any cave, or to remove any materials from a cave.”
- Best practices to ensure unique geological and paleontological resources are not damaged include but are not limited to the following steps:
 - Prior to excavation and grading activities, a qualified paleontologist prepares a resource assessment using records from the Natural History Museum of Los Angeles County.
 - If in the assessment, the soil is identified as potentially containing paleontological resources, a qualified paleontologist monitors excavation and grading activities in soils that have not been previously disturbed, to identify, record, and evaluate the significance of any paleontological finds during construction.
 - If paleontological resources are uncovered (in either a previously disturbed or undisturbed area), all work ceases in the area of the find until a qualified paleontologist has evaluated the find in accordance with federal, state, and local guidelines.
 - If fossils are discovered, a qualified paleontologist shall recover them. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. In this case, the paleontologist would have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner. Handline and disposition of fossils is done at the direction and guidance of a qualified paleontologist.
 - Personnel of the project would not collect or move any paleontological materials or associated materials.
 - If cleared by the qualified paleontologist, construction activity would continue unimpeded on other portions of the project site.
 - Construction activities in the area where resources were found would commence once the identified resources are properly assessed and processed by a qualified paleontologist and if construction activities were cleared by the qualified paleontologist.

Significance After Mitigation

Implementation of Mitigation Measures 4.6-1(a), 4.6-1(b) and 4.6-1(c) would reduce impacts to paleontological resources to a *less than significant level* by ensuring that potential resources are identified and either further avoided or recovered. Therefore, impacts to paleontological resource would be **less than significant with mitigation**.

CUMULATIVE IMPACTS

Exposure to Seismic Hazards

Continued growth throughout Los Angeles would cumulatively expose more people to existing seismic hazards. However, new development in the Project Area would not increase the potential for earthquakes or associated hazards (surface rupture, liquefaction, landsliding). Compliance with applicable CBC requirements would ensure that new development conforms to current seismic standards and that it would not expose current residents or existing property to increased hazards (such as from an increase in landslide potential). As discussed under Impact 4.6-1, Future development under the Proposed Project would not exacerbate any seismic hazards and, as a result, would not cumulatively contribute to seismic hazards. All new development throughout the Project Area would continue to comply with applicable provisions of the CBC and other applicable regulations. By replacing older development with new structures built to current safety standards, implementation of the Project would cumulatively reduce the potential for seismic hazards to affect people or property.

The Proposed Project would not have cumulatively considerable impact and cumulative impacts would be **less than significant** related to seismic hazards.

Soil Erosion

Continued growth in the Project Area would involve grading and excavation that could temporarily, but cumulatively, indirectly increase the potential for soil erosion. However, new development in the Project Area would be subject to applicable requirements of the NPDES General Construction Permit and Section D of LAMC Article 4.4, Stormwater and Urban Runoff Pollution Control. Compliance with these requirements would generally address potential cumulative impacts related to soil erosion. Also, reasonably anticipated development in the Project Area would be subject to the same federal and local requirements as other projects in the City. As discussed under Impact 4.6-2, above, these requirements would help reduce potential impacts related to Project Area soil disturbance to a less than significant level. and potential impacts would not be anticipated to have a cumulatively considerable impact.

The Proposed Project would not have cumulatively considerable impact and cumulative impacts would be **less than significant** related to soil erosion.

Unstable geologic units

Continued growth throughout Los Angeles would cumulatively expose more people to existing hazards associated with unstable geologic units (e.g., liquefaction, landsliding). However, new development would not increase the potential for geologic instability. Soil and geologic conditions are site-specific and do not have additive effects. As such, changes to geologic conditions from development at one site would not affect geologic conditions at another development site. Compliance with applicable CBC requirements would ensure that new development conforms to current standards related to geologic stability and that it would not expose current residents or existing property to increased hazards. As discussed under Impact 4.6-3, reasonably anticipated development in the Project Area similarly would not increase the potential for geologic hazards. All new development throughout the Project Area and the City would continue to comply with applicable provisions of the CBC and other applicable regulations. By replacing older development with new structures built to current standards, implementation of the Project would cumulatively reduce the potential for hazards related to geologic instability to affect people or property.

The Proposed Project would have **less than significant** related to unstable geologic units.

Expansive Soils

Continued development throughout Los Angeles would cumulatively increase the potential for exposure to expansive soil-related issues. However, neither citywide development nor, as discussed under Impact 4.6-4, development in the Project Area specifically would increase the potential for soil expansion or otherwise increase exposure of existing people or property to hazards associated with expansive soils.

The Proposed Project would have *less than significant cumulative impacts* related to expansive soils.

Septic tanks/alternative wastewater treatment

Most of Los Angeles is served by sewer systems, though certain areas continue to utilize alternative wastewater treatment systems. Continued growth in the City could incrementally increase the number of residences using such wastewater treatment systems; however, because the Project Area is completely served by sewers, reasonably anticipated Project Area development would not contribute to any cumulative impacts related to alternative wastewater treatment.

The Proposed Project would have *no cumulatively considerable impact and no cumulative impact* related to septic tanks/alternative wastewater treatment.

Paleontological Resources

Cumulative development throughout Los Angeles could potentially disturb known and currently unknown paleontological resources that could be present throughout the City. The nature and magnitude of such impacts would depend on the nature and location of individual future developments; however,, it is anticipated that citywide development would have the potential to disturb paleontological resources. Potentially significant cumulative paleontological resource impacts could, however, be mitigated to below a level of significance through resource avoidance or recovery on a case-by-case basis.

As discussed under Impact 4.6-6, above, the Project could potentially disturb paleontological resources that may be present in the Project Area. However, mitigation measure 4.6-1(a), (b), (c) is expected to reduce to a less than significant level.

The Proposed Project's cumulative impacts would not be cumulatively considerable related to paleontological resources and cumulative impacts would have be *less than significant with mitigation*.

4.7 GREENHOUSE GAS EMISSIONS

This section evaluates potential impacts related to greenhouse gas (GHG) emissions. GHGs are emitted by both natural processes and human activities. The accumulation of GHGs in the atmosphere regulates Earth's temperature. The State of California has undertaken initiatives designed to address the effects of GHGs, and to establish targets and emission reduction strategies for GHG emissions in California. The GHG data supporting this section is included as Appendix E to this Draft Environmental Impact Report (EIR). The analysis of GHG emissions and climate change is unique under California Environmental Quality Act (CEQA), largely because of the global nature of climate change. Typical CEQA analyses address local actions that have local – or regional – impacts, whereas climate change analyzes the relationship between local activities and the resulting potential, if any, for global environmental impacts. Based on this, the focus of GHG emission analysis is on cumulative impacts. As provided by the State Natural Resources Agency in the latest update to the CEQA Guidelines: “In determining the significance of a project's greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable *incremental contribution* of the project's emissions to the effect of climate change.” (15064.4(b).)

ENVIRONMENTAL SETTING

GLOBAL CLIMATE CHANGE

Earth's natural warming process is known as the “greenhouse effect.” Certain atmospheric gases act as an insulating blanket for solar energy to keep the global average temperature in a suitable range for life support. These greenhouse gases (GHGs) keep the average surface temperature of the Earth close to 60 degrees Fahrenheit (°F). Without the natural greenhouse effect, the Earth's surface would be about 61°F cooler (California Environmental Protection Agency [CalEPA] 2006). It is normal for Earth's temperature to fluctuate over extended periods of time. Over the past one hundred years, Earth's average global temperature has generally increased by one degree Fahrenheit. In some regions of the world, the increase has been as much as four degrees Fahrenheit.

Scientists studying the particularly rapid rise in global temperatures during the late twentieth century believe that natural variability alone does not account for that rise. Rather, human activity spawned by the industrial revolution has likely resulted in increased emissions of carbon dioxide and other forms of GHGs, primarily from the burning of fossil fuels (i.e., during motorized transport, electricity generation, consumption of natural gas, industrial activity, manufacturing, etc.) and deforestation, as well as agricultural activity and the decomposition of solid waste (C2ES 2011).

GHG Components and Effects

The California Global Warming Solutions Act of 2006 (discussed in the following pages) defined GHGs to include carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), sulfur hexafluoride (SF₆), and nitrogen trifluoride. Black carbon also contributes to global warming, but it is a solid particle or aerosol, not a gas. A general description of each GHG discussed in this report is provided in **Table 4.7-1** (Description of Identified Greenhouse Gases). CO₂ is the most abundant GHG. Other GHGs are less abundant but have higher global warming potential (discussed below) than CO₂. Thus, emissions of other GHGs are frequently expressed in the equivalent mass of CO₂, denoted as CO₂e. Forest fires, decomposition, industrial processes, landfills, and consumption of fossil fuels for power generation, transportation, heating, and cooking are the primary sources of GHG emissions.

TABLE 4.7-1 DESCRIPTION OF GREENHOUSE GASES

GHG	General Description
CO₂	Carbon Dioxide. CO ₂ is an odorless, colorless GHG, which has both natural and man-made sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing; manmade sources of CO ₂ are burning coal, oil, natural gas, and wood.
CH₄	Methane. CH ₄ is a flammable gas and is the main component of natural gas. When one molecule of CH ₄ is burned in the presence of oxygen, one molecule of CO ₂ and two molecules of water are released. There are no ill health effects from CH ₄ . A natural source of CH ₄ is the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain CH ₄ , which is extracted for fuel. Other sources are from landfills, fermentation of manure, and cattle.
N₂O	Nitrous Oxide. N ₂ O is a colorless GHG. High concentrations can cause dizziness, euphoria, and sometimes slight hallucinations. N ₂ O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used in rocket engines, race cars, and as an aerosol spray propellant.
HFCs	Hydrofluorocarbons. HFCs are synthetic man-made chemicals that are used as a substitute for chlorofluorocarbons (CFCs) for automobile air conditioners and refrigerants. CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at Earth's surface). CFCs were first synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. Because they destroy stratospheric ozone, the production of CFCs was stopped as required by the Montreal Protocol in 1987.
PFCs	Perfluorocarbons. PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth's surface are able to destroy the compounds. PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane and hexafluoroethane. The two main sources of PFCs are primary aluminum production and semiconductor manufacture.
SF₆	Sulfur Hexafluoride. SF ₆ is an inorganic, odorless, colorless, non-toxic, and nonflammable gas. SF ₆ is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.
Black Carbon¹	Black Carbon. Black carbon is the most strongly light-absorbing component of particulate matter emitted from burning fuels such as coal, diesel, and biomass.
SOURCE: Association of Environment Professionals (AEP). 2007. <i>Alternative Approaches to Analyze Greenhouse Gas Emissions and Global Climate Change in CEQA Documents</i> . June, 2007.	
¹ Black carbon contributes to global warming, but it is a solid particle or aerosol, not a gas.	

Global Warming Potential

Global Warming Potential (GWP) is one type of simplified index based upon radiative properties that is used to estimate the potential future impacts of emissions of different gases upon the climate system in a relative sense. GWP is based on a number of factors, including the radiative efficiency (heat-absorbing ability) of each gas relative to that of CO₂, as well as the decay rate of each gas (the amount removed from the atmosphere over a given number of years) relative to that of CO₂. A summary of the atmospheric lifetime and GWP of selected gases is presented in **Table 4.7-2**.

TABLE 4.7-2 ATMOSPHERIC LIFETIMES AND GLOBAL WARMING POTENTIALS			
GHG	Lifetime (Years)	Global Warming Potential (20-Year)	Global Warming Potential (100-Year)
Carbon Dioxide	100	1	1
Nitrous Oxide	121	264	273
Nitrogen Trifluoride	500	12,800	16,100
Sulfur Hexafluoride	3,200	17,500	23,500
Perfluorocarbons	3,000-50,000	5,000-8,000	7,000-11,000
Black Carbon	days to weeks	270-6,200	100-1,700
Methane	12	84	30
Hydrofluorocarbons	Uncertain	100-11,000	100-12,000

SOURCE: CARB, 2013. *Climate Change Scoping Plan First Update*, October 2013. USEPA 2022
 "Global Warming Potential" is a relative measure of how much heat a greenhouse gas traps in the atmosphere, as compared to carbon dioxide.

Statewide Climate Change

The California Environmental Protection Agency (CalEPA) published a report titled *Scenarios of Climate Change in California: An Overview, Climate Scenarios report*, in February 2006 that, while not adequate for a California Environmental Quality Act (CEQA) project-specific or cumulative analysis, is generally instructive about the future impacts of global warming on California.

In addition, on December 2, 2009, the California Natural Resources Agency released its California Climate Adaptation Strategy report that details many vulnerabilities arising from climate change with respect to matters such as temperature extremes, sea level rise, wildfires, floods and droughts and precipitation changes. This report responds to the Governor's Executive Order S-13-2008 that called on State agencies to develop California's strategy to identify and prepare for expected climate impacts.

According to these reports, substantial temperature increases arising from increased GHG emissions potentially could result in a variety of impacts to the people, economy, and environment of California. This includes an associated projected increase in extreme conditions, with the severity of the impacts depending upon actual future emissions of GHGs and associated warming. Under the emissions scenarios of the Climate Scenarios report, the impacts of global climate change in California have the potential to include, but are not limited to, the areas of public health, water resources, agriculture, forests and landscapes, and rising sea levels. The potential effects of climate change are detailed in the section below.

The California Air Resources Board (CARB) has prepared a state-wide emissions inventory covering 2000 to 2020, which demonstrates that GHG emissions have decreased by 30 percent over that period (CARB 2022a). However, the 2019 to 2020 decrease in emissions is likely due in large part to the impacts of the COVID-19 pandemic. Economic recovery from the pandemic may result in emissions increases over the next few years. As such, the total 2020 reported emissions are likely an anomaly, and any near-term increases in annual emissions should be considered in the context of the pandemic. **Table 4.7-3** shows GHG emissions from 20010 to 2020 in California. The transportation sector represents California's largest source of GHG emissions and contributed nearly 37 percent of total annual emissions. Over the last three years, emissions from the transportation sector have decreased, and has dropped 17 percent drop over the past ten years.

TABLE 4.7-3 CALIFORNIA GREENHOUSE GAS EMISSIONS INVENTORY

Sector	Annual CO ₂ e Emissions (Million Metric Tons)										
	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
Transportation	163	157	157	157	158	162	165	167	165	162	136

Emissions Total	443	435	435	431	429	427	414	412	411	404	370

SOURCE: CARB 2022a

Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources though potential impacts related to future air temperatures and precipitation patterns. Scientific modelling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. The year 2022 was the sixth warmest year since global records began in 1880 at 0.86°C (1.55°F) above the 20th century average of 13.9°C (57.0°F). This value is 0.13°C (0.23°F) less than the record set in 2016 and it is only 0.02°C (0.04°F) higher than the last year's (2021) value, which now ranks as the seventh highest. The 10 warmest years in the 143-year record have all occurred since 2010, with the last nine years (2014–2022) ranking as the nine warmest years on record. Furthermore, several independently analyzed data records of global and regional Land-Surface Air Temperature obtained from station observations are in agreement that Land-Surface Air Temperature as well as sea surface temperatures have increased. The annual global surface temperature has increased at an average rate of +0.14°F (+0.08°C) per decade since 1880; however, since 1981 the average rate of increase is more than twice that rate (+0.32°F / +0.18°C). (National Oceanic and Atmospheric Administration 2023). In addition to these findings, there are identifiable signs that global warming is currently taking place, including substantial ice loss in the Arctic over the past two decades (Intergovernmental Panel on Climate Change [IPCC] 2014 and 2018).

According to California's Fourth Climate Change Assessment, state-wide temperatures from 1986 to 2016 were approximately 1°F to 2°F higher than those recorded from 1901 to 1960. Potential impacts of climate change in California may include loss in water supply from snowpack, sea level rise, more extreme heat days per year, more large forest fires, and more drought years (California Natural Resource Agency [CNRA]2018). While there is growing scientific consensus about the possible effects of climate change at a global and state-wide level, current scientific modelling tools are unable to predict what local impacts may occur with a similar degree of accuracy. In addition to state-wide projections, California's Fourth Climate Change Assessment includes regional reports that summarize climate impacts and adaptation solutions for nine regions of the state as well as regionally specific climate change case studies (CNRA2018). Below is a summary of some of the potential effects that could be experienced in California as a result of climate change.

Air Quality

Higher temperatures, which are conducive to air pollution formation, could worsen air quality in California. Climate change may increase the concentration of ground-level ozone, but the magnitude of the effect, and

therefore its indirect effects, are uncertain. As temperatures have increased in recent years, the area burned by wildfires throughout the state has increased, and wildfires have been occurring at higher elevations in the Sierra Nevada Mountains (CNRA 2018). If higher temperatures continue to be accompanied by an increase in the incidence and extent of large wildfires, air quality could worsen. Severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state. With increasing temperatures, shifting weather patterns, longer dry seasons, and more dry fuel loads, the frequency of large wildfires and area burned is expected to increase. (CNRA 2021).

Water Supply

Analysis of paleoclimatic data (such as tree-ring reconstructions of stream flow and precipitation) indicates a history of naturally and widely varying hydrologic conditions in California and the west, including a pattern of recurring and extended droughts. Year-to-year variability in state-wide precipitation levels has increased since 1980, meaning that wet and dry precipitation extremes have become more common (California Department of Water Resources 2018). This uncertainty regarding future precipitation trends complicates the analysis of future water demand, especially where the relationship between climate change and its potential effect on water demand is not well understood. However, the average early spring snowpack in the western United States, including the Sierra Nevada Mountains, decreased by about 10 percent during the last century. During the same period, sea level rose over 5.9 inches along the central and southern California coast (CNRA2018). The Sierra snowpack provides the majority of California's water supply by accumulating snow during the state's wet winters and releasing it slowly during the state's dry springs and summers. A warmer climate is predicted to reduce the fraction of precipitation falling as snow and result in less snowfall at lower elevations, thereby reducing the total snowpack (California Department of Water Resource 2008; CNRA 2018). The State of California projects that average spring snowpack in the Sierra Nevada and other mountain catchments in central and northern California will decline by approximately 66 percent from its historical average by 2050 (CNRA2018).

Hydrology and Sea Level Rise

Climate change could affect the intensity and frequency of storms and flooding (CNRA 2018). Furthermore, climate change could induce substantial sea level rise in the coming century. Rising sea level increases the likelihood of and risk from flooding. The rate of increase of global mean sea levels between 1993 to 2022, observed by satellites, is approximately 3.4 millimeters per year, double the twentieth century trend of 1.6 millimeters per year (World Meteorological Organization 2013; National Aeronautics and Space Administration 2023). Global mean sea levels in 2013 were about 0.23 meter higher than those of 1880 (National Oceanic and Atmospheric Administration 2022). Sea levels are rising faster now than in the previous two millennia, and the rise will probably accelerate, even with robust GHG emission control measures. The most recent Intergovernmental Panel on Climate Change (IPCC) report predicts a mean sea level rise ranging between 0.25 to 0 1.01 meters by 2100 with the sea level ranges dependent on a low, intermediate, or high GHG emissions scenario (IPCC 2021). A rise in sea levels could erode 31 to 67 percent of southern California beaches and cause flooding of approximately 370 miles of coastal highways during 100-year storm events. This would also jeopardize California's water supply due to saltwater intrusion and induce groundwater flooding and/or exposure of buried infrastructure (CNRA 2018). Furthermore, increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to manage impacts from storm events.

Agriculture

California has a \$50 billion annual agricultural industry that produces over a third of the country's vegetables and two-thirds of the country's fruits and nuts (California Department of Food and Agriculture 2020). Higher CO₂ levels can stimulate plant production and increase plant water-use efficiency. However,

if temperatures rise and drier conditions prevail, certain regions of agricultural production could experience water shortages of up to 16 percent; water demand could increase as hotter conditions lead to the loss of soil moisture; crop-yield could be threatened by water-induced stress and extreme heat waves; and plants may be susceptible to new and changing pest and disease outbreaks (CNRA2018). In addition, temperature increases could change the time of year certain crops, such as wine grapes, bloom or ripen, and thereby affect their quality (California Climate Change Center 2006).

Ecosystems and Wildlife

Climate change and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increasing concentrations of GHGs are likely to accelerate the rate of climate change. Scientists project that the annual average maximum daily temperatures in California could rise by 4.4 to 5.8°F in the next 50 years and by 5.6 to 8.8°F in the next century (CNRA 2018). Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. Rising temperatures could have four major impacts on plants and animals related to (1) timing of ecological events; (2) geographic distribution and range; (3) species' composition and the incidence of non-native species within communities; and (4) ecosystem processes, such as carbon cycling and storage (Parmesan 2006; CNRA2018).

Citywide Climate Change

According to Los Angeles' Green New Deal 2019 Sustainable City Plan, the city has reduced GHG emissions to 25 percent below 1990 levels as of 2017 (City of Los Angeles 2019). The city is currently striving to supply 55 percent renewable energy by 2025; 80 percent by 2036; and 100 percent by 2045. The *Sustainable City pLAN* is described in more detail below under, *Regulatory Framework*.

REGULATORY FRAMEWORK

Climate change and GHG emissions are governed by an evolving body of laws, regulations, and case law. Below are summaries of key regulations; however, the discussion below should not be considered exhaustive of this growing body of regulation.

INTERNATIONAL

Intergovernmental Panel on Climate Change

The World Meteorological Organization (WMO) and United Nations Environmental Program (UNEP) established the IPCC in 1988. The goal of the IPCC is to evaluate the risk of climate change caused by human activities. Rather than performing research or monitoring climate, the IPCC relies on peer-reviewed and published scientific literature to make its assessment. While not a regulatory body, the IPCC assesses information (i.e., scientific literature) regarding human-induced climate change and the impacts of human-induced climate change and recommends options to policy makers for the adaptation and mitigation of climate change. The IPCC reports its evaluations in special reports called assessment reports. The latest assessment report (i.e., Fifth Assessment Report, consisting of three working group reports and a synthesis report based on the first three reports) was published in 2013. In its 2013 report, the IPCC stated that global temperature increases since 1951 were extremely likely attributable to man-made activities (greater than 95 percent certainty).¹ The IPCC anticipates the release of the Sixth Assessment Report in 2022.²

¹ IPCC, Climate Change 2013 The Physical Science Basis, 2013.

² IPCC, AR6 Synthesis Report: Climate Change 2022. Available online at: <https://www.ipcc.ch/report/sixth->

U.S.-China Climate Agreement

In November 2014, the United States and China made a joint announcement to cooperate on combatting climate change and promoting clean energy. In the U.S., then President Obama announced a climate target to reduce GHG emissions by 26 to 28 percent below 2005 levels by 2025. In China, then President Xi Jinping announced a climate target to reduce peak CO₂ emissions by 2030 and to increase the renewable energy share across all sectors to 20 percent by 2030. China will need to build an additional 800 to 1,000 gigawatts of nuclear, wind, solar, and other zero emission generation capacity by 2030 to reach this target. Together, the United States and China have agreed to: expand joint clean energy research and development at the U.S.-China Clean Energy Research Center, advance major carbon capture, use and storage demonstrations, enhance cooperation on HFCs, launch a climate- smart/low-carbon cities initiative, promote trade in green goods, and demonstrate clean energy on the ground.

Paris United Nations Framework Convention on Climate Change

A new international climate change agreement was adopted at the Paris United Nations Framework Convention on Climate Change Conference in December 2015. The prior two climate conferences in Warsaw (2013) and Lima (2014) decided that countries were to submit their proposed emissions reduction targets for the 2015 conference as “intended nationally determined contributions” prior to the Paris conference. The European Union has committed to an economy wide, domestic GHG reduction target of 40 percent below 1990 levels by 2030. The United States set its intended nationally determined contribution to reduce its GHG emissions by 26 to 28 percent below its 2005 level by 2025 and to make best efforts to reduce emissions by 28 percent. These targets are set with the goal of limited global temperature rise to well below 2 degrees Celsius and getting to an 80 percent emission reduction by 2050. As of 2017, however, the United States withdrew from the Paris agreement.

North American Climate, Clean Energy, and Environment Partnership Action Plan

The North American Climate, Clean Energy, and Environment Partnership Action Plan was announced by Prime Minister Justin Trudeau, President Barack Obama, and President Enrique Peña Nieto on June 29, 2016, at the North American Leaders Summit in Ottawa, Canada. This Action Plan identifies the deliverables to be achieved and activities to be pursued by the three countries as part of this enduring Partnership. The three leaders declared their common vision in a historic North American Climate, Clean Energy, and Environment Partnership, described in a Leaders’ Statement and Action Plan that details the actions our leaders will pursue. These actions include:

- Setting a target to increase clean power to 50 percent of the electricity generated across North America by 2025
- Reducing methane emissions from the oil and gas sector by 40 to 45 percent by 2025
- Strengthening standards for energy efficiency and vehicle emissions, including aligning energy efficiency standards that will amount to over \$4 billion per year in annual savings for United States businesses and consumers by 2025.
- Strengthening vehicle efficiency, improving fuel quality, and reducing tailpipe pollutants.
- Affirming their support for joining and implementing the Paris Agreement this year and committing to work together to address climate issues through the Montreal Protocol, International Civil Aviation Organization, G-20, and other forums.

assessment-report-cycle/, 2022.

- Celebrating our strong environmental cooperation, including expanding cooperation on early warning systems for natural disasters, supporting habitat for migratory species including Monarchs and birds, and developing action plans to combat wildlife trafficking.

FEDERAL

Clean Air Act

The U.S. Supreme Court ruled in *Massachusetts v. Environmental Protection Agency*, 127 S. Ct. 1438 (2007), that CO₂ and other GHGs are pollutants under the Clean Air Act (CAA), which the U.S. Environmental Protection Agency (USEPA) must regulate if it determines they pose an endangerment to public health or welfare. On December 7, 2009, the USEPA issued an “endangerment finding” under the Clean Air Act, concluding that current and projected GHG emissions threaten the public health and welfare of current and future generations and that motor vehicles contribute to GHG pollution (USEPA 2017). These findings provide the basis for adopting new national regulations to mandate GHG emission reductions under the federal Clean Air Act. The USEPA’s endangerment finding paves the way for federal regulation of GHGs.

Under the Consolidated Appropriations Act of 2008 (HR 2764), Congress established mandatory GHG reporting requirements for some emitters of GHGs. In addition, on September 22, 2009, the USEPA issued the Final Mandatory Reporting of Greenhouse Gases Rule. The rule requires annual reporting to the USEPA of GHG emissions from large sources and suppliers of GHGs, including facilities that emit 25,000 metric tons (MT) or more a year of GHGs.

Corporate Average Fuel Economy (CAFE) Standards

In response to the *Massachusetts v. Environmental Protection Agency* ruling, President George W. Bush issued Executive Order 13432 in 2007, directing the USEPA, the United States Department of Transportation (USDOT), and the United States Department of Energy (USDOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. The National Highway Traffic Safety Administration (NHTSA) subsequently issued multiple final rules regulating fuel efficiency for and GHG emissions from cars and light-duty trucks for model year 2011 and later for model years 2012-2016, and 2017-2021. In March 2020, the USDOT and the USEPA issued the final Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which amends existing CAFE standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establishes new standards covering model years 2021 through 2026.³ These standards set a combined fleet wide average of 36.9 to 37 for the model years affected.⁴

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011 the USEPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO₂ emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the USEPA, this regulatory program would reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baselines. Building on the first phase of standards, in August 2016, the EPA and NHTSA finalized Phase 2 standards for medium and heavy-duty vehicles through model

³ U.S. Environmental Protection Agency, Final Rule for Model Year 2021 - 2026 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards, published April 30, 2020.

⁴ National Highway Traffic Safety Administration (NHTSA), Corporate Average Fuel Economy standards.

year 2027 that will improve fuel efficiency and cut carbon pollution. The Phase 2 standards are expected to lower CO₂ emissions by approximately 1.1 billion metric tons.⁵

Global Change Research Act (1990)

In 1990, Congress passed—and the President signed—Public Law 101-606, the Global Change Research Act.⁶ The purpose of the legislation was: “...to require the establishment of a United States Global Change Research Program aimed at understanding and responding to global change, including the cumulative effects of human activities and natural processes on the environment, to promote discussions towards international protocols in global change research, and for other purposes.” To that end, the Global Change Research Information Office was established in 1991 to serve as a clearinghouse of information. The Act requires a report to Congress every four years on the environmental, economic, health and safety consequences of climate change; however, the first and only one of these reports to date, the National Assessment on Climate Change, was not published until 2000. In February 2004, operational responsibility for GCRIO shifted to the U.S. Climate Change Science Program.

National Fuel Efficiency Policy

On May 19, 2009, the president announced a new National Fuel Efficiency Policy aimed at increasing fuel economy and reducing GHG pollution. This policy is expected to increase fuel economy by more than five percent by requiring a fleet-wide average of 35.5 miles per gallon by 2016 starting with model year 2012.

Federal Vehicle Standards

In response to the *Massachusetts v. Environmental Protection Agency* ruling discussed above, the Bush Administration issued an Executive Order on May 14, 2007, directing the USEPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008.

On October 10, 2008, the National Highway Traffic Safety Administration (NHTSA) released a final environmental impact statement analyzing proposed interim standards for passenger cars and light trucks in model years 2011 through 2015. The NHTSA issued a final rule for model year 2011 on March 30, 2009 (NHTSA 2009).

On May 7, 2010, the USEPA and the NHTSA issued a final rule regulating fuel efficiency and GHGs from motor vehicles for cars and light-duty trucks for model years 2012–2016 (USEPA and NHTSA 2010). On May 21, 2010, the President issued a memorandum to the Secretaries of Transportation and Energy, and the Administrators of the USEPA and the NHTSA calling for the establishment of additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure (GPO 2010). In response to this directive, USEPA and NHTSA issued a Supplemental Notice of Intent announcing plans to propose stringent, coordinated federal GHG and fuel economy standards for model year 2017-2025 light-duty vehicles (GPO 2011). The agencies proposed standards projected to achieve 163 grams/mile of CO₂ in model year 2025, on an average industry fleet wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. California has announced its support of this national program (CARB 2011a). The final rule was adopted in October 2012 and NHTSA intends to set standards for model years 2022-2025 in future rulemaking (USEPA and NHTSA 2012; NHTSA 2012).

⁵ U.S. EPA, EPA and NHTSA Adopt Standards to Reduce GHG and Improve Fuel Efficiency of Medium- and Heavy-Duty Vehicles for Model Year 2018 and Beyond, August 2016.

⁶ Global Change Research Act (Public Law 101-606, 104 Stat. 3096-3104). 1990. Available online at: <https://www.govinfo.gov/content/pkg/STATUTE-104/pdf/STATUTE-104-Pg3096.pdf>

Heavy-Duty Engines and Vehicles Fuel Efficiency Standards

In addition to the regulations applicable to cars and light-duty trucks, on August 9, 2011, the USEPA and the NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks, which apply to vehicles from model years 2014 through 2018 (USEPA and NHTSA 2016). The USEPA and the NHTSA adopted standards for CO₂ emissions and fuel consumption, respectively, tailored to each of three main vehicle categories: (1) combination tractors, (2) heavy-duty pickup trucks and vans, and (3) vocational vehicles. According to the USEPA, this program will reduce GHG emissions and fuel consumption for affected vehicles by six percent to 23 percent.

Energy Independence and Security Act

On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law (GPO 2007). Among other key measures, the EISA would do the following, which would aid in the reduction of national GHG emissions, both mobile and non-mobile:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.⁷
- Prescribe or revise standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labelling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.
- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and
- While superseded by the USEPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of the EISA address energy savings in government and public institutions, promoting research for alternative energy, additional research in carbon capture, international energy programs, and the creation of “green jobs.”

National Fuel Efficiency Policy

On May 19, 2009, the president announced a new National Fuel Efficiency Policy aimed at increasing fuel economy and reducing GHG pollution. This policy is expected to increase fuel economy by more than five percent by requiring a fleet-wide average of 35.5 miles per gallon by 2016 starting with model year 2012.

Fuel Economy Standards

On September 15, 2009, the USEPA and the Department of Transportation’s National Highway Traffic Safety Administration (NHTSA) issued a joint proposal to establish a national program consisting of new standards for model year 2012 through 2016 light-duty vehicles that will reduce GHG emissions and improve fuel economy. The proposed standards were to be phased in and require passenger cars and light-duty trucks to comply with a declining emissions standard. In 2012, passenger cars and light-duty trucks were required to meet an average emissions standard of 295 grams of CO₂ per mile and 30.1 miles per gallon. By 2016, the vehicles were required to meet an average standard of 250 grams of CO₂ per mile and

⁷ According to the United States Energy Information Administration, 36 billion gallons of fuel represents approximately 26 percent of current gasoline consumption.

35.5 miles per gallon. The final standards were adopted by the USEPA and Department of Transportation on April 1, 2010.

On December 7, 2009, the USEPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA (42 United States Code Section 7521):

Endangerment Finding: The Administrator found that the current and projected concentrations of the six key well-mixed GHGs (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) in the atmosphere threaten the public health and welfare of current and future generations.

Cause or Contribute Finding: The Administrator found that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

While these findings do not impose additional requirements on industry or other entities, this action is a prerequisite to finalizing the USEPA's proposed GHG emissions standards for light-duty vehicles, which were jointly proposed by the USEPA and the NHTSA. On April 1, 2010, the USEPA and NHTSA issued final rules requiring that by the 2016 model-year, manufacturers must achieve a combined average vehicle emission level of 250 grams CO₂ per mile, which is equivalent to 35.5 miles per gallon as measured by USEPA standards. According to Midterm Evaluation of Light-Duty Vehicle GHG Emission Standards and Corporate Average Fuel Economy Standards for Model Years 2022-2025, issued by the NHTSA, USEPA and ARB on July 18, 2016, CAFE standards for passenger cars and light trucks increased from an average fuel economy of 34.1 miles per gallon (mpg) by model year 2016 to 38.3 mpg by model year 2021 and 46.3 mpg by model year 2025 (NHTSA et al 2016). Executive Order 13693

Issued on June 10, 2015, Executive Order 13693 — Planning for Federal Sustainability in the Next Decade — revokes multiple prior Executive Orders and memoranda including Executive Order 13514. The goal of Executive Order 13693 is to maintain federal leadership in sustainability and GHG emission reductions. This Executive Order outlines forward-looking goals for federal agencies in the area of energy, climate change, water use, vehicle fleets, construction, and acquisition. Federal agencies shall, where life-cycle cost-effective, beginning in 2016:

- Reduce agency building energy intensity as measured in British Thermal Units per square foot by 2.5 percent annually through 2025.
- Improve data center energy efficiency at agency buildings.
- Ensure a minimum percentage of total building electric and thermal energy shall be from clean energy sources.
- Improve agency water use efficiency and management (including storm water management); and
- Improve agency fleet and vehicle efficiency and management by achieving minimum percentage GHG emission reductions.

Executive Order 13783

Issued on March 28, 2017, Executive Order 13783 — Promoting Energy Independence and Economic Growth — revokes multiple prior Executive Orders and memoranda including Executive Order 13653, the Power Sector Carbon Pollution Standards, Presidential Memorandum – Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment, and Presidential Memorandum – Climate Change and National Security, as well as other federal reports and provisions. Executive Order 13783 represents a reversal on federal climate policy relative to the work of previous administrations and

its objective is to reduce the regulatory framework applicable to GHG emissions to spur fossil fuel production. This Executive Order “established a national policy to promote the clean and safe development of our energy resources while reducing unnecessary regulatory burdens” (Federal Register 2017). The order also “directs the USEPA to review existing regulations, orders, guidance documents and policies that potentially burden the development or use of domestically produced energy resources.” As of April 2020, the Council on Environmental Quality (CEQ) is considering updating its National Environmental Policy (NEPA) implementing regulations and has issued a Notice of Proposed Rulemaking that incorporates Executive Order 13783 (Council on Environmental Quality 202). How these proposed rule changes will affect GHG emissions cannot be predicted at this time.

Executive Order 13795

Issued on April 28, 2017, Executive Order 13795 — Implementing an America-First Offshore Energy Strategy — directs the “policy of the United States to encourage energy exploration and production, including on the Outer Continental Shelf, in order to maintain the Nation’s position as a global energy leader and foster energy security and resilience for the benefit of the American people, while ensuring that any such activity is safe and environmental responsible” (Federal Register 2017). The objective of the order is to expand the opportunity for offshore energy development by removing restrictions on resource exploration and extraction. This Executive Order prioritizes the development of offshore energy resources over the protection of National Marine Sanctuaries and authorizes the review and potential revision or withdrawal of the Bureau of Ocean Energy Management’s Proposed Rule entitled “Air Quality Control, Reporting, and Compliance,” 81 Federal Register 19718 and any other related rules and guidance. The implications of implementing Executive Order 13795 with regards to the national GHG emissions inventory cannot be reasonably determined at this time.

Presidential Executive Order 13990

President Biden signed Executive Order 13990 – Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis — on January 20, 2021. The order directs all executive departments and agencies to immediately review and, as appropriate and consistent with applicable law, take action to address the promulgation of Federal regulations and other actions during the 2017–2021 executive tenure that conflict with the following national objectives: to improve public health and protect the environment; to ensure access to clean air and water; to limit exposure to dangerous chemicals and pesticides; to hold polluters accountable, including those who disproportionately harm communities of color and low-income communities; to reduce GHG emissions; to bolster resilience to the impacts of climate change; to restore and expand our national treasures and monuments; and to prioritize both environmental justice and the creation of the well-paying union jobs necessary to deliver these goals.⁸

Presidential Executive Order 14008

President Biden signed Executive Order 14008 – Tackling the Climate Crisis At Home and Abroad — on January 27, 2021. The order affirmed the United States as rejoining the Paris Agreement and expressed its commitment to exercising leadership in promoting global climate ambition to meet the climate challenge.⁹

⁸ Federal Register, Executive Order 13990 of January 20, 2021: Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis, Vol. 86, No. 14, January 25, 2021.

⁹ Federal Register, Executive Order 14008 of January 27, 2021: Tackling the Climate Crisis at Home and Abroad, Vol. 86, No. 19, February 1, 2021.

STATE

California Air Resources Board

The California Air Resources Board (CARB), a part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California's State Implementation Plan (SIP), for which it works closely with the Federal Government and the local air districts. The SIP is required for the State to take over implementation of the Federal Clean Air Act. CARB also has primary responsibility for adopting regulations to meet the State's goal of reducing GHG emissions. The State has met its goals to reduce GHG emissions to 1990 levels by 2020. Subsequent State goals include reducing GHG emissions to 40 percent below 1990 levels by 2030 and to 85 percent below 1990 levels by 2045.

Statewide GHG Reduction Targets and Scoping Plans

Executive Order S-3-05, Assembly Bill 32, Senate Bill 32, 2017 Scoping Plan (CARB), Executive Order B-55-18, Cap-and-Trade Program, Senate Bill 350, Senate Bill 1383, Senate Bill 97, Senate Bill 375, Emission Performance Standards, Renewable Portfolio Standards (SB 1078, SB 107, SB X 1-2, and SB 100), Assembly Bill 1493, Low Carbon Fuel Standard (Executive Order S-01-07), Advanced Clean Cars Program, Senate Bill 743, California Integrated Waste Management Act (AB 341), California Appliance Efficiency Regulations, California Green Building Code (California Code of Regulations Title 24)

Executive Order S-3-05

Executive Order S-3-05, issued in June 2005, established GHG emissions targets for the State, as well as a process to ensure the targets are met. The order directed the Secretary for California EPA to report every two years on the State's progress toward meeting the Governor's GHG emission reduction targets. As a result of this executive order, the California Climate Action Team (CCAT), led by the Secretary of the California Environmental Protection Agency (CalEPA), was formed. The CCAT is made up of representatives from a number of State agencies and was formed to implement global warming emission reduction programs and reporting on the progress made toward meeting state-wide targets established under the Executive Order. The CCAT reported several recommendations and strategies for reducing GHG emissions and reaching the targets established in the Executive Order (CalEPA 2006). The state-wide GHG targets are as follows:

- By 2010, reduce to 2000 emission levels.
- By 2020, reduce to 1990 emission levels: and
- By 2050, reduce to 80 percent below 1990 levels.

However, with the adoption of the California Global Warming Solutions Act of 2006, also known as Assembly Bill (AB) 32, discussed below, the Legislature did not adopt the 2050 horizon-year goal from Executive Order No. S-3-05. In the last legislative session, the Legislature rejected legislation to enact the Executive Order's 2050 goal.¹⁰

¹⁰ The original version of SB 32 as introduced in the Legislature contained a commitment to the 2050 goal, but this commitment was not included in the final version of the bill. See:

The original mandate for the CCAT was to develop proposed measures to meet the emission reduction targets set forth in E.O. S-3-05. The CCAT has since expanded and currently has members from 18 state agencies and departments. The CCAT also has ten working groups, which coordinate policies among their members. The working groups and their major areas of focus are:

- Agriculture: Focusing on opportunities for agriculture to reduce GHG emissions through efficiency improvements and alternative energy projects, while adapting agricultural systems to climate change.
- Biodiversity: Designing policies to protect species and natural habitats from the effects of climate change.
- Energy: Reducing GHG emissions through extensive energy efficiency policies and renewable energy generation.
- Forestry: Coupling GHG mitigation efforts with climate change adaptation related to forest preservation and resilience, waste to energy programs and forest offset protocols.
- Land Use and Infrastructure: Linking land use and infrastructure planning to efforts to reduce GHG from vehicles and adaptation to changing climatic conditions.
- Oceans and Coastal: Evaluating the effects of sea level rise and changes in coastal storm patterns on human and natural systems in California.
- Public Health: Evaluating the effects of GHG mitigation policies on public health and adapting public health systems to cope with changing climatic conditions.
- Research: Coordinating research concerning impacts of and responses to climate change in California.
- State Government: Evaluating and implementing strategies to reduce GHG emissions resulting from state government operations; and
- Water: Reducing GHG impacts associated with the state's water systems and exploring strategies to protect water distribution and flood protection infrastructure.

The CCAT is responsible for preparing reports that summarize the state's progress in reducing GHG emissions. The CCAT Report was published in December 2010. The CCAT Report discusses mitigation and adaptation strategies, state research programs, policy development, and future efforts.

Assembly Bill 32 (State-wide GHG Reductions)

The California Global Warming Solutions Act of 2006 (AB 32) was signed into law in September 2006 after considerable study and expert testimony before the Legislature. The law instructs the CARB to develop and enforce regulations for the reporting and verifying of state-wide GHG emissions. AB 32 directed CARB to set a GHG emission limit based on 1990 levels, to be achieved by 2020. AB 32 set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner (Legislative Council of California 2006a).

https://leginfo.legislature.ca.gov/faces/billVersionsCompareClient.xhtml?bill_id=201520160SB32&cversion=20150SB3299IN
 T. In addition, the Supreme Court recently held in *Cleveland National Forest Foundation et al. v San Diego Association of Governments (SANDAG)* (S223603, July 13, 2017) that SANDAG did not abuse its discretion in declining to adopt the 2050 goal as a measure of significance in an analysis of the consistency of projected 2050 greenhouse gas emissions with the goals in Executive Order S-3-05. Although it stated that “we do not hold that the analysis of greenhouse gas impacts employed by SANDAG in this case will necessarily be sufficient going forward. CEQA requires public agencies like SANDAG to ensure that such analysis stay in step with evolving scientific knowledge and state regulatory schemes.”

The heart of AB 32 is the requirement to reduce state-wide GHG emissions to 1990 levels by 2020. AB 32 required CARB to adopt rules and regulations in an open public process to achieve the maximum technologically feasible and cost-effective GHG reductions. CARB accomplished the key milestones set forth in AB 32, including the following:

June 30, 2007. Identification of discrete early action GHG emissions reduction measures. On June 21, 2007, CARB satisfied this requirement by approving three early action measures (CARB 2007a). These were later supplemented by adding six other discrete early action measures (CARB 2007b).

January 1, 2008. Identification of the 1990 baseline GHG emissions level and approval of a state-wide limit equivalent to that level and adoption of reporting and verification requirements concerning GHG emissions. On December 6, 2007, CARB approved a state-wide limit on GHG emissions levels for the year 2020 consistent with the determined 1990 baseline (CARB 2007c).

January 1, 2009. Adoption of a scoping plan for achieving GHG emission reductions. On December 11, 2008, CARB adopted *Climate Change Scoping Plan: A Framework for Change* (Scoping Plan), discussed in more detail below (CARB 2008).

January 1, 2010. Adoption and enforcement of regulations to implement the “discrete” actions. Several early action measures have been adopted and became effective on January 1, 2010 (CARB 2007a; CARB 2007b).

January 1, 2011. Adoption of GHG emissions limits and reduction measures by regulation. On October 28, 2010, CARB released its proposed cap-and-trade regulations, which would cover sources of approximately 85 percent of California's GHG emissions (CARB 2011b). CARB's Board ordered its Executive Director to prepare a final regulatory package for cap-and-trade on December 16, 2010 (CARB 2010).

January 1, 2012. GHG emissions limits and reduction measures adopted in 2011 became enforceable.

As noted above, CARB adopted the Scoping Plan in 2008 to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions for various categories of emissions. CARB determined that achieving the 1990 emission level by 2020 would require an approximately 28.5 percent reduction of GHG emissions in the absence of new laws and regulations (referred to as “business as usual” or “No Action Taken”). The Scoping Plan evaluates opportunities for sector-specific reductions, integrates all CARB and Climate Action Team early actions and additional GHG reduction measures by both entities, and identifies additional measures to be pursued as regulations, and outlines the role of a cap-and-trade program. Key elements of the Scoping Plan include the following (CARB 2008):

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards.
- Achieving a state-wide renewable energy mix of 33 percent.
- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions.
- Establishing targets for transportation related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets.
- Adopting and implementing measures pursuant to existing state laws and policies, such as California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and

- Creating targeted fees, including a public goods charge on water use, fees on high global warming potential gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.

In connection with preparation of the supplement to the Functional Equivalent Document, CARB released revised estimates in 2011 of the expected 2020 emission reductions in consideration of the economic recession and the availability of updated information from development of measure specific regulations. Incorporation of revised estimates in consideration of the economic recession reduced the projected 2020 emissions from 596 metric tons of CO₂ equivalent (MT CO₂e) to 545 million MT CO₂e (MMT CO₂e) (CARB 2011c). Under this scenario, achieving the 1990 emissions level in 2020 would require a reduction of GHG emissions of 118 MMT CO₂e, or 21.7 percent. This revised reduction represents a 6.8 percentage point reduction from the 28.5 percent level determined in CARB's 2008 Scoping Plan. The 2020 AB 32 baseline was also updated to account for measures incorporated into the inventory, including Pavley (vehicle model-years 2009 to 2016) and the renewable portfolio standard (12 percent to 20 percent). Inclusion of these measures further reduced the 2020 baseline to 507 MMT CO₂e. As a result, based on both the 2007-09 economic recession and the availability of updated information from development of measure-specific regulations, achieving the 1990 emission level would now require a reduction of GHG emissions of 80 MMT CO₂e or a reduction by approximately 16 percent (down from the 28.5 percent level determined in CARB's 2008 Scoping Plan) by 2020 in the "business as usual" or No Action Taken condition (CARB 2011c; CARB 2011d).

On October 1, 2013, CARB released a discussion draft first update to the Scoping Plan. The discussion draft recalculates 1990 GHG emissions using *Intergovernmental Panel on Climate Change Fourth Assessment Report* released in 2007. Using the AR4 global warming potentials (ratio of time integrated or GWP), the 427 MMT CO₂e 1990 emissions level and 2020 GHG emissions limit would be slightly higher, at 431 MMT CO₂e (CARB 2013). Based on the revised estimates of expected 2020 emissions identified in the 2011 supplement to the Functional Environmental Document and updated 1990 emissions levels identified in the draft first update to the Scoping Plan, achieving the 1990 emission level would require a reduction of 76 MMT CO₂e (down from 507 MMT CO₂e) or a reduction by approximately 15 percent (down from 28.5 percent) to achieve in 2020 emissions levels in the "business as usual" or No Action Taken condition (CARB 2011c; CARB 2011d; CARB 2013). Two updates to the Scoping Plan have occurred since 2008. The latest update was adopted in December 2017 and is discussed below as it relates to Executive Order B-30-15 and Senate Bill 32.

Senate Bill 1 (SB 1) and Senate Bill 1017 (SB 1017) (Million Solar Roofs)

SB 1 and SB 1017, enacted in August 2006, set a goal to install 3,000 megawatts of new solar capacity by 2017 – with a stated intent to move the state toward a cleaner energy future and help lower the cost of solar systems for consumers. The Million Solar Roofs Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time. It provides up to \$3.3 billion in financial incentives that decline over time.

Executive Order B-30-15 and Senate Bill 32

CARB also aims to reduce GHG emissions substantially by 2030. As California moves closer to reaching the 2020 GHG emission reduction goal, state legislation has focused on furthering GHG emission reduction targets. Executive Order B-30-15 was issued on April 2015, establishing a mid-term GHG reduction target for California of 40 percent below 1990 levels by 2030 (discussed in further detail below). In 2016, the Legislature passed SB 32 with the companion bill AB 197, which further mandates the 2030 target and provides additional direction to CARB on strategies to reduce GHG emissions. The bill targets reductions from the leading GHG emitters in the state. Transportation is the largest sector of GHG emissions in the state and will be a primary subject for reductions. Through advances in technology and improved public

transportation, the state plans to reduce GHG emissions from transportation sources to assist in meeting the 2030 reduction goal.

CARB adopted the 2017 Scoping Plan on December 14, 2017 in response to Executive Order B-30-15 and SB 32, which provides a framework for achieving the 2030 target. To meet reduction targets, the 2017 Scoping Plan relies on the continuation and expansion of existing policies and regulations, such as the Cap-and-Trade Program, as well as implementation of recently adopted policies, such as SB 350 and SB 1383 (see below). The 2017 Scoping Plan also puts an increased emphasis on innovation, adoption of existing technology, and strategic investment to support its strategies. As with the 2013 Scoping Plan Update, the 2017 Scoping Plan does not provide project-level thresholds for land use development. Instead, it recommends that local governments adopt policies and locally-appropriate quantitative thresholds consistent with a statewide per capita goal of six MT CO_{2e} by 2030 and two MT CO_{2e} by 2050 (CARB 2017a). The 2017 Scoping Plan in particular emphasized the importance in the role of local agencies in setting policies to reduce Vehicle Miles Traveled (VMT) through land use planning:

Local land use decisions play a particularly critical role in reducing GHG emissions associated with the transportation sector, both at the project level, and in long-term plans, including general plans, local and regional climate action plans, specific plans, transportation plans, and supporting sustainable community strategies developed under SB 375.

While the State can do more to accelerate and incentivize these local decisions, local actions that reduce VMT are also necessary to meet transportation sector-specific goals and achieve the 2030 target under SB 32. Through developing the Scoping Plan, CARB staff is more convinced than ever that, in addition to achieving GHG reductions from cleaner fuels and vehicles, California must also reduce VMT. Stronger SB 375 GHG reduction targets will enable the State to make significant progress toward needed reductions, but alone will not provide the VMT growth reductions needed; there is a gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals. In its evaluation of the role of the transportation system in meeting the statewide emissions targets, CARB determined that VMT reductions of 7 percent below projected VMT levels in 2030 (which includes currently adopted SB 375 SCSs) are necessary. In 2050, reductions of 15 percent below projected VMT levels are needed. A seven percent VMT reduction translates to a reduction, on average, of 1.5 miles/person/day from projected levels in 2030. It is recommended that local governments consider policies to reduce VMT to help achieve these reductions, including land use and community design that reduces VMT; transit oriented development; street design policies that prioritize transit, biking, and walking; and increasing low carbon mobility choices, including improved access to viable and affordable public transportation and active transportation opportunities. It is important that VMT reducing strategies are implemented early because more time is necessary to achieve the full climate, health, social, equity, and economic benefits from these strategies (CARB 2017a).

California's future climate strategy will require increased focus on integrated land use planning to support livable, transit-connected communities, and conservation of agricultural and other lands. Accommodating population and economic growth through travel- and energy-efficient land use provides GHG-efficient growth, reducing GHGs from both transportation and building energy use be further reduced at the project level through implementing energy-efficient cost of transportation impacts continues to evolve. The CEQA Guidelines are being updated to focus the analysis of transportation impacts on VMT. Office of Planning and Research (OPR)'s Technical Advisory includes methods of analysis of transportation impacts, approaches to setting significance thresholds, and includes examples of VMT mitigation under CEQA (CARB 2017a).

2022 Update to the Climate Change Scoping Plan

In response to the passage of AB 1279 and the identification of the 2045 GHG reduction target, CARB published the Final 2022 Climate Change Scoping Plan in November 2022 (CARB 2022a). The 2022 Update builds upon the framework established by the 2008 Climate Change Scoping Plan and previous updates while identifying new, technologically feasible, cost-effective, and equity-focused path to achieve California's climate target. The 2022 Update includes policies to achieve a significant reduction in fossil fuel combustion, further reductions in short-lived climate pollutants, support for sustainable development, increased action on natural and working lands (NWL) to reduce emissions and sequester carbon, and the capture and storage of carbon.

The 2022 Update assesses the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan, addresses recent legislation and direction from Governor Newsom, extends and expands upon these earlier plans, and implements a target of reducing anthropogenic emissions to 85 percent below 1990 levels by 2045, as well as taking an additional step of adding carbon neutrality as a science-based guide for California's climate work. As stated in the 2022 Update, "The plan outlines how carbon neutrality can be achieved by taking bold steps to reduce GHGs to meet the anthropogenic emissions target and by expanding actions to capture and store carbon through the state's NWL and using a variety of mechanical approaches" (CARB 2022a). Specifically, the 2022 Update:

- Identifies a path to keep California on track to meet its SB 32 GHG reduction target of at least 40 percent below 1990 emissions by 2030.
- Identifies a technologically feasible, cost-effective path to achieve carbon neutrality by 2045 and a reduction in anthropogenic emissions by 85 percent below 1990 levels.
- Recognizes that the technology and regulations do not exist yet to reach the targets.
- Focuses on strategies for reducing California's dependency on petroleum to provide consumers with clean energy options that address climate change, improve air quality, and support economic growth and clean sector jobs.
- Integrates equity and protecting California's most impacted communities as driving principles throughout the document.
- Incorporates the contribution of NWL to the State's GHG emissions, as well as their role in achieving carbon neutrality.
- Relies on the most up-to-date science, including the need to deploy all viable tools to address the existential threat that climate change presents, including carbon capture and sequestration, as well as direct air capture.
- Evaluates the substantial health and economic benefits of taking action.
- Identifies key implementation actions to ensure success.

In addition to reducing emissions from transportation, energy, and industrial sectors, the 2022 Update includes emissions and carbon sequestration in NWL and explores how NWL contribute to long-term climate goals. Under the Scoping Plan Scenario, California's 2030 emissions are anticipated to be 48 percent below 1990 levels, representing an acceleration of the current SB 32 target. Cap-and-Trade regulation continues to play a large factor in the reduction of near-term emissions for meeting the accelerated 2030 reduction target. Every sector of the economy will need to begin to transition in this decade to meet our GHG reduction goals and achieve carbon neutrality no later than 2045. The 2022 Update approaches decarbonization from two perspectives, managing a phasedown of existing energy sources and

technologies, as well as increasing, developing, and deploying alternative clean energy sources and technology.

The Scoping Plan also identifies the strategies local agencies can take to help the State meet its goals. Specifically, the Scoping Plan identifies the following priority GHG reduction strategies for local agencies: VMT reduction, Transportation Electrification, and Building Decarbonization.

Senate Bill 350

Adopted on October 7, 2015, SB 350 supports the reduction of GHG emissions from the electricity sector through a number of measures, including requiring electricity providers to achieve a 50 percent renewables portfolio standard by 2030, a cumulative doubling of statewide energy efficiency savings in electricity and natural gas by retail customers by 2030.

Senate Bill 1383

Approved by the governor in September 2016, SB 1383 requires the CARB to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants. SB 1383 requires the strategy to achieve the following reduction targets by 2030:

- Methane – 40 percent below 2013 levels
- Hydrofluorocarbons – 40 percent below 2013 levels
- Anthropogenic black carbon – 50 percent below 2013 levels

SB 1383 also requires CalRecycle, in consultation with the state board, to adopt regulations that achieve specified targets for reducing organic waste in landfills.

Senate Bill 97

Per SB 97, which was signed into law on August 24, 2007, the California Natural Resources Agency adopted amendments to the State CEQA Guidelines, which address the specific obligations of public agencies when analyzing GHG emissions under CEQA to determine a project's effects on the environment (codified as Public Resources Code [PRC] 21083.05). Specifically, PRC 21083.05 states, “[t]he Office of Planning and Research and the Natural Resources Agency shall periodically update the guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions.”

Renewable Portfolio Standards (SB 1078, SB 107, SB X 1-2, and SB 100)

Established in 2002 under SB 1078, and accelerated in 2006 under SB 107, again in 2011 under SB X 1-2, and most recently in September 2018 under SB 100, California's Renewable Portfolio Standards (RPS) requires retail sellers of electric services to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 40 percent by 2024, 50 percent by 2026, 60 percent by 2030, and 100 percent by 2045 (Legislative Council of California 2002; Legislative Council of California 2006b). The 33 percent standard is consistent with the RPS goal established in the Scoping Plan (CARB 2008). As interim measures, the RPS requires 20 percent of retail sales to be sourced from renewable energy by 2013, and 25 percent by 2016. Initially, the RPS provisions applied to investor-owned utilities, community choice aggregators, and electric service providers. SB X 1-2 added, for the first time, publicly owned utilities to the entities subject to RPS. The expected growth in RPS to meet the standards in effect in 2008 is not reflected in the “business as usual” calculation in the AB 32 Scoping Plan, discussed below. In other words, the Scoping Plan's “business as usual” 2020 does not take credit for implementation of RPS that occurred after its adoption (CARB 2008).

GHG Emissions Standards for Baseload Generation

SB 1368, which was signed into law on September 29, 2006, prohibits any retail seller of electricity in California from entering into a long-term financial commitment for baseload generation if the GHG emissions are higher than those from a combined-cycle natural gas power plant. This performance standard (i.e., reducing long-term GHG emissions as a result of electrical baseload generation) applies to electricity generated both within and outside of California, and to publicly owned as well as investor-owned electric utilities.

Mobile Source Reductions

AB 1493 (Chapter 200, Statutes of 2002), enacted on July 22, 2002, required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles whose primary use is non-commercial personal transportation manufactured in and after 2009. In 2004, CARB approved the Pavley regulation to require automakers to control GHG emissions from new passenger vehicles for the 2009 through 2016 model years. Upon adoption of subsequent federal GHG standards by the U.S. EPA that preserved the benefits of the Pavley regulations, the Pavley regulations were revised to accept compliance with the federal standards as compliance with California's standards in the 2012 through 2016 model years. This is referred to as the "deemed to comply" option.

In January 2012, CARB approved GHG emission regulations which require further reductions in passenger vehicle GHG emissions for 2017 and subsequent vehicle model years. As noted above, in August 2012, the U.S. EPA and U.S. DOT adopted GHG emission standards for model year 2017 through 2025 vehicles. On November 15, 2012, CARB approved an amendment that allows manufacturers to comply with the 2017-2025 national standards to meet State law. Automobile manufacturers generally comply with these standards through a combination of improved energy efficiency in vehicle equipment (e.g., air conditioning systems) and engines, as well as sleeker aerodynamics, use of strong but lightweight materials, and lower-rolling resistance tires (CARB 2017b).

In 2018, the U.S. EPA proposed the Safer Affordable Fuel-Efficient Vehicles Rule (SAFE) which would roll back fuel economy standards and revoke California's waiver. The rule amended certain average fuel economy and GHG standards for passenger cars covering model years 2021 through 2026. On March 30, 2020, the SAFE Rule was finalized and published in the Federal Register, commencing a review period. Subsequent legal challenges from a coalition of states, including California, and private industry groups were issued. In August 2021, U.S. EPA proposed to revise and strengthen the emissions standards for passenger cars and light trucks for model years 2023-2026.

On September 27, 2019, the U.S. EPA withdrew the waiver it had previously provided to California for the State's GHG and ZEV programs under Section 209 of the CAA. The withdrawal of the waiver was effective November 26, 2019. In response, several states, including California, filed a lawsuit challenging the withdrawal of the U.S. EPA waiver (*State of California vs. Chao*). In March 2022, the U.S. EPA reinstated California's authority under the CAA to implement its own GHG emissions standards and zero emission vehicle sales mandates (U.S. EPA 2022d).

Low Carbon Fuel Standard

Executive Order S-01-07 (January 18, 2007) requires a 10 percent or greater reduction in the average fuel carbon intensity for transportation fuels in California regulated by CARB. CARB identified the Low Carbon Fuel Standard (LCFS) as a Discrete Early Action item under AB 32, and the final resolution (09-31) was issued on April 23, 2009 (CARB 2009). In 2009, CARB approved for adoption the LCFS regulation, which became fully effective in April 2010 and is codified at Title 17, California Code of Regulations (CCR),

Sections 95480-95490. The LCFS will reduce GHG emissions by reducing the carbon intensity of transportation fuels used in California by at least 10 percent by 2020.

Advanced Clean Cars Program

In January 2012, CARB approved the Advanced Clean Cars Program, a new emissions-control program for model year 2017 through 2025. The program combines the control of smog, soot, and GHGs with requirements for greater numbers of zero-emission vehicles. By 2025, when the rules will be fully implemented, the new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.

CEQA Guidelines Section 15064.3.

CEQA Guidelines Section 15064.3 describes specific considerations for evaluating a project's transportation impacts and states that, generally, vehicle miles traveled is the most appropriate measure of transportation impacts. The section also states provides some guidance for evaluating land use projects stating that generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact and projects that decrease vehicle miles traveled in the project area compared to existing conditions should be presumed to have a less than significant transportation impact.

CEQA Guidelines Section 15064.4.

CEQA Guidelines Section 15064.4 requires that, in performing environmental review under CEQA, an agency shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. The lead agency has discretion to determine whether to quantify GHG emissions, and/or rely on a qualitative analysis or performance-based standards.

In determining the significance of a project's GHG emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. The lead agency should consider the following factors, among others, when determining the significance of impacts from GHG emissions on the environment.

- The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting.
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (see, e.g., section 15183.5(b)). Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of GHG emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project. In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or

strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable.

Lastly, a lead agency may use a model or methodology to estimate GHG resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

Senate Bill 743

SB 743, adopted September 27, 2013, encourages land use and transportation planning decisions and investments that reduce VMT, which contribute to GHG emissions, as required by AB 32. Key provisions of SB 743 include reforming aesthetics and parking CEQA analysis for certain urban infill projects and eliminating the measurement of auto delay, including Level of Service (LOS), as a metric that can be used for measuring traffic impacts in transit priority areas. SB 743 requires the Governor's (OPR) to develop revisions to the CEQA Guidelines establishing criteria for determining the significance of transportation impacts of projects within transit priority areas that promote the "...reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." It also allows OPR to develop alternative metrics outside of transit priority areas.

Title 24 Building Energy Efficiency Standards

The California Code of Regulations (CCR) Title 24 is referred to as the California Building Standards Code. It consists of a compilation of several distinct standards and codes related to building construction, including plumbing, electrical, interior acoustics, energy efficiency, and accessibility for persons with physical and sensory disabilities. The California Building Standards Code's energy-efficiency and green building standards are outlined below. The 2022 California Buildings Standards Code (the most recent iteration of the code) was adopted by reference with applicable local amendments in City of Los Angeles Municipal Code (Ordinance No. 186,488) in August 2022. These standards are updated every three years and the project will be subject to the 2022 California Building Standards when they go into effect on January 1, 2023.

CCR Title 24, Part 6 is the Building Energy Efficiency Standards or California Energy Code. This code, originally enacted in 1978, establishes energy-efficiency standards for residential and non-residential buildings in order to reduce California's energy demand. New construction and major renovations must demonstrate their compliance with the current Energy Code through submittal and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission (CEC).

California Green Building Standards Code

The California Green Building Standards Code, referred to as CALGreen, was added to Title 24 as Part 11, first in 2009 as a voluntary code, which then became mandatory effective on January 1, 2011 (as part of the 2010 California Building Standards Code). The 2022 CALGreen includes mandatory minimum environmental performance standards for all ground-up new construction of residential and non-residential structures. It also includes voluntary tiers with stricter environmental performance standards for these same categories of residential and non-residential buildings. Local jurisdictions must enforce the minimum mandatory CALGreen standards and may adopt additional amendments for stricter requirements.

The mandatory standards applicable to air quality require:

- Minimum 20 percent reduction in indoor water use relative to specified baseline levels;¹¹
- Waste Reduction:
 - Minimum 65 percent non-hazardous construction/demolition waste diverted from landfills;
 - Non-residential and multi-family dwellings with five or more units: Provide readily accessible areas identified for the depositing, storage and collection of nonhazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastic, organic waste, and metals; and/or
 - Non-residential: Reuse and/or recycling of 100 percent of trees, stumps, rocks, and associated vegetation soils resulting from primary land clearing;
- Inspections of energy systems to ensure optimal working efficiency;
- Low-pollutant emitting exterior and interior finish materials such as paints, carpets, vinyl flooring, and particleboards; and
- Electric Vehicle (EV) Charging for New Construction:¹²
 - One- and two-family dwellings and town houses with attached private garages: Dedicated circuitry to facilitate installation of electric vehicle (EV) charging;
 - Multi-family dwellings and hotels/motels with less than 20 units/rooms: Designation of at least 10 percent of the total number of parking spaces shall be EV capable and at least 25 percent of the total number of parking spaces shall be EV-ready;
 - Multi-family dwellings and hotels/motels with greater than 20 units/rooms: Designation of at least 10 percent of the total number of parking spaces shall be EV capable, at least 25 percent of the total number of parking spaces shall be EV-ready, and at least 5 percent of the total number of parking spaces shall be equipped with a Level 2 charging station;
 - Non-residential land uses shall comply with the following EV charging requirements based on the number of passenger vehicle parking spaces:
 - 0-9: no EV capable spaces or charging stations required;
 - 10-25: 4 EV capable spaces but no charging stations required;
 - 26-50: 8 EV capable spaces of which 2 must be equipped with charging stations;
 - 51-75: 13 EV capable spaces of which 3 must be equipped with charging stations;
 - 76-100: 17 EV capable spaces of which 4 must be equipped with charging stations;
 - 101-150: 25 EV capable spaces of which 6 must be equipped with charging stations;
 - 151-200: 35 EV capable spaces of which 9 must be equipped with charging stations; and
 - More than 200: 20 percent of the total available parking spaces of which 25 percent must be equipped with charging stations;

¹¹ Similar to the compliance reporting procedure for demonstrating Energy Code compliance in new buildings and major renovations, compliance with the CALGreen water reduction requirements must be demonstrated through completion of water use reporting forms. Buildings must demonstrate a 20 percent reduction in indoor water use by either showing a 20 percent reduction in the overall baseline water use as identified in CALGreen or a reduced per-plumbing-fixture water use rate.

¹² EV Capable = a vehicle space with electrical panel space and load capacity to support a branch circuit and necessary raceways to support EV charging; EV-ready = a vehicle space which is provided with a branch circuit and any necessary raceways to accommodate EV charging stations, including a receptacle for future installation of a charger (see 2022 California Green Building Standard Code, Title 24 Part 11 for full explanation of mandatory measures, including exceptions).

- Non-residential land uses shall comply with the following EV charging requirements for medium- and heavy-duty vehicles: warehouses, grocery stores, and retail stores with planned off-street loading spaces shall install EV supply and distribution equipment, spare raceway(s) or busway(s) and adequate capacity for transformer(s), service panel(s), or subpanel(s) at the time of construction based on the number of off-street loading spaces as indicated in Table 5.106.5.4.1 of the California Green Building Standards;
- Bicycle Parking:
 - Non-residential short-term bicycle parking for projects anticipated to generate visitor traffic: permanently anchored bicycle racks within 200 feet of visitor entrance for 5 percent of new visitor motorized vehicle parking spaces with a minimum of one 2-bike capacity rack; and/or
 - Non-residential buildings with tenant spaces of 10 or more employees/tenant-occupants: secure bicycle parking for 5 percent of the employee/tenant-occupant vehicle parking spaces with a minimum of one bicycle parking facility.
- Shade Trees (Non-Residential):
 - Surface parking: minimum No. 10 container size or equal shall be installed to provide shade over 50 percent of the parking within 15 years (unless parking area covered by appropriate shade structures and/or solar);
 - Landscape areas: minimum No. 10 container size or equal shall be installed to provide shade of 20 percent of the landscape area within 15 years; and/or
 - Hardscape areas: minimum No. 10 container size or equal shall be installed to provide shade of 20 percent of the landscape area within 15 years (unless covered by applicable shade structures and/or solar or the marked area is for organized sports activities).

The voluntary standards include:

- Deconstruct existing buildings and reuse applicable salvaged materials;
- Residential – Cool Roofs: have a thermal mass over the roof membrane, including green roofs weighing a minimum of 25 pounds per square foot or roof areas covered by solar photovoltaic panels and building integrated solar thermal panels;
- Residential – Reduce nonroof heat island for 50 percent of sidewalks, patios, driveways or other paved areas;
- One- and two-family dwelling units and townhouses with attached garages: install a dedicated 208/250-volt branch circuit for EV charging;
- Residential Bicycle Parking:
 - Multi-family/hotel/motel short-term parking: provide permanently anchored bicycle racks within 100 feet of visitor’s entrance for 5 percent of visitor motorized vehicle parking capacity (minimum one 2-bike capacity rack);
 - Multi-family buildings long-term parking: provide acceptable on-site bicycle parking for at least one bicycle per every two dwelling units; and/or
 - Hotel/motel long-term parking: provide one acceptable on-site bicycle parking space for every 25,000 square feet but not less than two spaces;
- Tier I:
 - Stricter energy efficiency requirements;

- Stricter water conservation requirements for specific fixtures;
 - minimum 65 percent reduction in construction waste with third-party verification, Minimum 10 percent recycled content for building materials;
 - Minimum 20 percent permeable paving;
 - Minimum 20 percent cement reduction;
 - Multi-family developments/hotels/motels: minimum 35 percent of total parking spaces shall be EV ready and for projects with 20 or more dwelling units/rooms a minimum of 10 percent of the total number of parking spaces shall be equipped with EV charging stations.
- Tier II:
 - Stricter energy efficiency requirements,
 - Stricter water conservation requirements for specific fixtures;
 - Minimum 75 percent reduction in construction waste with third-party verification,
 - Minimum 15 percent recycled content for building materials;
 - Minimum 30 percent permeable paving;
 - Minimum 25 percent cement reduction; and/or
 - Multi-family developments/hotels/motels: minimum 40 percent of total parking spaces shall be EV ready and for projects with 20 or more dwelling units/rooms, a minimum of 15 percent of the total number of parking spaces shall be equipped with EV charging stations.

Cap-and-Trade Program

As mentioned above, the Scoping Plan identifies a cap-and-trade program as one of the strategies the State will employ to reduce GHG emissions that cause climate change. The cap-and-trade program is implemented by CARB and “caps” GHG emissions from the industrial, utility, and transportation fuels sections, which account for roughly 85 percent of the State’s GHG emissions. The program works by establishing a hard cap on about 85 percent of total state-wide GHG emissions. The cap starts at expected business-as-usual emissions levels in 2012 and declines two to three percent per year. Originally with a planning horizon of 2020, the recent approval of AB 398 in July 2017 extended the program until 2030. Fewer and fewer GHG emissions allowances are available each year, requiring covered sources to reduce their emissions or pay increasingly higher prices for those allowances. The cap level is set in 2030 to ensure California complies with SB 32’s emission reduction target of 40 percent below 1990 GHG emission levels.

The scope of GHG emission sources subject to cap-and-trade in the first compliance period (2013-2014) includes all electricity generated and imported into California (the first deliverer of electricity into the State in the “capped” entity and that one that will have to purchase allowances as appropriate), and large industrial facilities emitting more than 25,000 MT CO_{2e} per year (e.g., oil refineries and cement manufacturers). The scope of GHG emission sources subjected to cap-and-trade during the second compliance period (2015-2017) expands to include distributors of transportation fuels (including gasoline and diesel), natural gas, and other fuels. The regulated entity will be the fuel provider that distributes the fuel upstream (not the gas station). In total, the cap-and-trade program is expected to include roughly 350 large businesses, representing about 600 facilities. Individuals and small businesses will not be regulated.

Under the program, companies do not have individual or facility-specific reduction requirements. Rather, all companies covered by the regulation are required to turn in allowances¹³ in an amount equal to their

¹³ “Allowance” means a limited tradable authorization to emit up to one metric ton of carbon dioxide equivalent.

total GHG emissions during each phase of the program. The program gives companies the flexibility to either trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more will have to turn in more allowances. Companies that can cut their emissions will have to turn in fewer allowances. Furthermore, as the cap declines, total GHG emissions are reduced. On October 20, 2011, CARB's Board adopted the final cap-and-trade regulation. The cap-and-trade program began on January 1, 2012, with an enforceable compliance obligation beginning with the 2013 GHG emissions (CARB 2018b). In July 2017, the State Legislature passed legislation to extend the cap-and-trade program to 2030 (Office of the Governor 2017).

Sustainable Communities and Climate Protection Act (Senate Bill 375)

The Sustainable Communities and Climate Protection Act of 2008, or SB 375 (Chapter 728, Statutes of 2008), establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions, was adopted by the State on September 30, 2008. SB 375 finds that the "transportation sector is the single largest contributor of greenhouse gases of any sector."¹⁴ Under SB 375, CARB is required, in consultation with the Metropolitan Planning Organizations, to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035. SCAG is the Metropolitan Planning Organization in which the City of Los Angeles is located in. CARB set targets for 2020 and 2035 for each of the 18 metropolitan planning organization regions in 2010, and updated them in 2018.¹⁵ In March 2018, the CARB updated the SB 375 targets for the SCAG region to require an 8 percent reduction by 2020 and a 19 percent reduction by 2035 in per capita passenger vehicle GHG emissions.¹⁶ As discussed further below, SCAG has adopted an updated Regional Transportation Plan / Sustainable Community Strategies (RTP/SCS) subsequent to the update of the emission targets. The 2020–2045 RTP/SCS is expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State's GHG emission reduction goals.¹⁷

Under SB 375, the target must be incorporated within that region's Regional Transportation Plan (RTP), which is used for long-term transportation planning, in a Sustainable Communities Strategy (SCS). Certain transportation planning and programming activities would then need to be consistent with the SCS; however, SB 375 expressly provides that the SCS does not regulate the use of land, and further provides that local land use plans and policies (e.g., general plans) are not required to be consistent with either the RTP or SCS.

The California Climate Crisis Act (Assembly Bill 1279)

AB 1279 was passed on September 16, 2022 and declares the State would achieve net zero greenhouse gas emissions as soon as possible, but no later than 2045. In addition, achieve and maintain net negative greenhouse gas emissions and ensure that by 2045, statewide anthropogenic greenhouse gas emissions are reduced to at least 85% below the 1990 levels. The bill would require updates to the scoping plan (once every five years) to implement various policies and strategies that enable carbon dioxide removal solutions and carbon capture, utilization, and storage technologies.

Clean Energy, Jobs, and Affordability Act of 2022 (Senate Bill 1020)

Adopted on September 16, 2022, SB 1020 creates clean electricity targets for eligible renewable energy resources and zero-carbon resources to supply 90 percent of retail sale electricity by 2035, 95 percent by 2040, 100 percent by 2045, and 100 percent of electricity procured to serve all state agencies by 2035. This bill shall not increase carbon emissions elsewhere in the western grid and shall not allow resource shuffling.

REGIONAL

South Coast Air Quality Management District (SCAQMD) Policies

SCAQMD adopted a “Policy on Global Warming and Stratospheric Ozone Depletion” on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the AQMP. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy.

SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds. SCAQMD proposed the use of a percent emission reduction target (e.g., 30 percent) to determine significance for commercial/residential projects that emit greater than 3,000 metric tons per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where SCAQMD is the lead agency. However, SCAQMD has yet to adopt a GHG significance threshold for land use development or transportation projects and has formed a GHG CEQA Significance Threshold Working Group to further evaluate potential GHG significance thresholds.

The GHG CEQA Significance Threshold Working Group is tasked with providing guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. Members of the working group included government agencies implementing CEQA and representatives from various stakeholder groups that will provide input to the SCAQMD staff on developing CEQA GHG significance thresholds. The Working Group discussed multiple methodologies for determining project significance. These methodologies included categorical exemptions, consistency with regional GHG budgets in approved plans, a numerical threshold, performance standards, and emissions offsets. The GHG CEQA Significance Threshold Working Group has not convened since 2008.

Southern California Association of Governments (SCAG) – 2020-2045 RTP/SCS

SCAG functions as the Metropolitan Planning Organization (MPO) for six counties, including Los Angeles County, wherein the project site is located. As the designated MPO, SCAG is required by federal law to prepare and update a long-range regional transportation plan, keep up with CAA requirements, monitor system performance, and develop SCS to achieve GHG reduction targets set by the CARB.

On September 1, 2020, SCAG’s Regional Council adopted an updated Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) known as the 2020-2045 RTP/SCS or Connect SoCal.¹⁸ The 2020-2045 RTP/SCS is a long-range visioning plan that builds upon and expands land use and transportation strategies of the 2016-2040 RTP/SCS to increase mobility options and achieve a more sustainable growth pattern. The 2020-2045 RTP/SCS projects growth in employment, population, and households at the regional, county, city, town and neighborhood levels. These projections take into account economic and demographic trends, as well feedback from SCAG’s jurisdictions. The 2020-2045 RTP/SCS “Core Vision” centers on maintaining and better managing the transportation network for moving people

¹⁸ SCAG, 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy of the Southern California Association of Governments, Adopted September 3, 2020.

and goods, while expanding mobility choices by locating housing, jobs and transit closer together and increasing investment in transit and complete streets.¹⁹ The 2020-2045 RTP/SCS continues efforts to better align transportation investments and land use decisions to improve mobility and reduce GHGs by bringing housing, jobs and transit closer together. SCAG has determined that the 2020-2045 RTP/SCS would achieve the applicable GHG emissions reduction target for automobiles and light trucks of 19 percent per capita reduction by 2035, relative to 2005 levels, as established by CARB for the region.²⁰

LOCAL

GreenLA Climate Action Plan

The City of Los Angeles has issued guidance promoting sustainable development to reduce GHG emissions citywide in the form of a Climate Action Plan (CAP). The objective of GreenLA is to reduce GHG emissions 35 percent below 1990 levels by 2030 (Los Angeles 2007). GreenLA identifies goals and actions designed to make the City a leader in confronting global climate change. The measures would reduce emissions directly from municipal facilities and operations and create a framework to address citywide GHG emissions. GreenLA lists various focus areas in which to implement GHG reduction strategies. Focus areas include energy, water, transportation, land use, waste, port, airport, and ensuring that changes to the local climate are incorporated into planning and building decisions. City goals for each focus area are identified as follows:

Energy

- Increase the generation of renewable energy.
- Encourage the use of mass transit.
- Develop sustainable construction guidelines.
- Increase citywide energy efficiency; and
- Promote energy conservation.

Water

- Decrease per capita water use to reduce electricity demand associated with water pumping and treatment.

Transportation

- Power the city vehicle fleet with alternative fuels; and
- Promote alternative transportation (e.g., mass transit and rideshare).

Other Goals

- Create a more livable City through land use regulations.
- Increase recycling.
- Reduce emissions generated by activity associated with the Port of Los Angeles and regional airports.

¹⁹ SCAG, A Plan Summary for Connect SoCal, Adopted September 3, 2020.

²⁰ CARB, Executive Order G-20-239 Southern California Association of Governments' 2020 Sustainable Communities Strategy CARB Acceptance of GHG Quantification Determination, October 30, 2020.

- Create more city parks, promoting the environmental economic sector; and
- Adapt planning and building policies to incorporate climate change policy.

In order to provide detailed information on action items discussed in GreenLA, the City published an implementation document titled ClimateLA (Los Angeles 2008). ClimateLA presents the existing GHG inventory for the City, describes enforceable GHG reduction requirements, provides mechanisms to monitor and evaluate progress, and includes mechanisms that allow the plan to be revised in order to meet targets. By 2030, the plan aims to reduce GHG emissions by 35 percent from 1990 levels, which were estimated to be approximately 54.1 million metric tons.

Therefore, the City will need to lower annual GHG emissions to approximately 35.1 million metric tons per year by 2030. To achieve these reductions the City has developed strategies that focus on energy, water use, transportation, land use, waste, open space and greening, and economic factors. To reduce emissions from energy usage, ClimateLA proposes the following goals: increase the amount of renewable energy provided by the Los Angeles Department of Water and Power (LADWP); present a comprehensive set of green building policies to guide and support private sector development; reduce energy consumed by City facilities and utilize solar heating where applicable; and help citizens to use less energy. With regard to waste, ClimateLA sets the goal of reducing or recycling 70 percent of trash by 2015. With regard to open space and greening, ClimateLA includes the following goals: create 35 new parks; revitalize the Los Angeles River to create open space opportunities; plant one million trees throughout the City; identify opportunities to “daylight” streams; identify promising locations for stormwater infiltration to recharge groundwater aquifers; and collaborate with schools to create more parks in neighborhoods.

Sustainable City pLAN (pLAN)

In addition to GreenLA, Mayor Eric Garcetti released Los Angeles’s first-ever pLAN on April 8, 2015 (Los Angeles 2015). The pLAN is a roadmap to achieving short-term results and sets a path to strengthen and transform the City in future decades. Recognizing the risks posed by climate change, Mayor Garcetti set time-bound outcomes on climate action, most notably to reduce GHG emissions by 45percent by 2025, 60 percent by 2035, and 80 percent by 2050, all against a 1990 baseline. Through the completion and verification of the GHG inventory update, the City concluded that:

- The City accounted for approximately 36.2 million metric tons of CO₂e in 1990.
- The City's most recent inventory shows that emissions fell to 29 million metric tons of CO₂e in 2013: and
- Los Angeles’ emissions are 20 percent below the 1990 baseline as of 2013, putting Los Angeles nearly halfway to the 2025 pLAN reduction target of 45 percent. In addition, the 20 percent reduction exceeds the 15 percent statewide goal listed in the First Update to the AB 32 Scoping Plan.

L.A.’s Green New Deal

The City of Los Angeles addressed the issue of global climate change in Green LA, An Action Plan to Lead the Nation in Fighting Global Warming (“LA Green Plan/ClimateLA”) in 2007. This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities.

In April 2019, the Green New Deal (Sustainable City Plan 2019), was released, consisting of a program of actions designed to create sustainability-based performance targets through 2050 designed to advance

economic, environmental, and equity objectives.²¹ L.A.'s Green New Deal is the first four-year update to the City's first Sustainable City pLAn that was released in 2015.²² It augments, expands, and elaborates L.A.'s vision for a sustainable future and tackles the climate emergency with accelerated targets and new aggressive goals.

While not a plan adopted solely to reduce GHG emissions, within the Green New Deal, "Climate Mitigation," or reduction of GHG is one of eight explicit benefits that help define its strategies and goals. These include reducing GHG emissions through near-term outcomes:

- Reduce potable water use per capita by 22.5 percent by 2025; 25 percent by 2035; and maintain or reduce 2035 per capita water use through 2050.
- Reduce building energy use per square feet for all building types 22 percent by 2025; 34 percent by 2035; and 44 percent by 2050 (from a baseline of 68 mBTU/sq.ft in 2015).
- All new buildings will be net zero carbon by 2030 and 100 percent of buildings will be net zero carbon by 2050.
- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.
- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025; and 75 percent by 2035.
- Increase the percentage of all trips made by walking, biking, micro-mobility/matched rides, or transit to at least 35 percent by 2025, 50 percent by 2035, and maintain at least 50 percent by 2050.
- Reduce VMT per capita by at least 13 percent by 2025; 39 percent by 2035; and 45 percent by 2050.
- Increase the percentage of electric and zero emission vehicles in the city to 25 percent by 2025; 80 percent by 2035; and 100 percent by 2050.
- Increase landfill diversion rate to 90 percent by 2025; 95 percent by 2035 and 100 percent by 2050.
- Reduce municipal solid waste generation per capita by at least 15 percent by 2030, including phasing out single-use plastics by 2028 (from a baseline of 17.85 lbs. of waste generated per capita per day in 2011).
- Eliminate organic waste going to landfill by 2028.
- Reduce urban/rural temperature differential by at least 1.7 degrees by 2025; and 3 degrees by 2035.

Ensure the proportion of Angelenos living within 1/2 mile of a park or open space is at least 65 percent by 2025; 75 percent by 2035; and 100 percent by 2050.

Green Building Program

The purpose of the City's 'Green Building Program is to reduce the use of natural resources, create healthier living environments and minimize the negative impacts of development on local, regional, and global ecosystems. The program consists of a Standard of Sustainability and Standard of Sustainable Excellence. The program addresses five key areas:

- Site: location, site planning, landscaping, storm water management, construction and demolition recycling.

²¹ City of Los Angeles. LA's Green New Deal, 2019.

²² City of Los Angeles, Sustainable City pLAn, April 2015.

- Water Efficiency: efficient fixtures, wastewater reuse, and efficient irrigation.
- Energy & Atmosphere: energy efficiency, and clean/renewable energy.
- Materials & Resources: materials reuse, efficient building systems, and use of recycled and rapidly renewable materials; and
- Indoor Environmental Quality: improved indoor air quality, increased natural lighting, and improved thermal comfort/control.

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the U.S. Green Building Council's 'Leadership in Energy and Environmental Design (LEED) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50 percent of the existing building's replacement cost.

The voluntary Standard of Sustainable Excellence establishes an incentive program for projects that register with the LEED program, contract with a certified LEED professional, and can demonstrate how the project will achieve LEED certification at a Silver or higher level. These projects are eligible for priority processing services within the Department of City Planning and expedited services within the Bureau of Engineering. The Department of Building and Safety provides priority plan check processing and Priority Service Planning is offered by the LADWP.

Los Angeles Green Building Code

The City has adopted the Green Building Code to reduce the City's 'Carbon footprint. The Green Building Code is applicable to new buildings and alterations with building valuations over \$200,000 (residential and non-residential). The Green Building Code is based on the 2013 California Green Building Standards Code, commonly known as CalGreen that was developed and mandated by the state to attain consistency among the various jurisdictions within the state; reduce the building's 'energy and water use; and reduce waste (see discussion of CalGreen, above).

Existing Buildings Energy and Water Efficiency (EBEWE) Ordinance

Effective in 2017, the EBEWE Ordinance makes public the annual energy and water consumption of all buildings over 20,000 square feet in the City. Beginning in 2017, privately owned buildings that are 20,000 square feet or more and buildings owned by the City that are 7,500 or more are required to be benchmarked, and owners must disclose annual energy and water consumption. Privately owned buildings that are 100,000 square feet or more must begin benchmarking reporting by December 1, 2017, and smaller buildings must begin reporting over the following two years. This Ordinance is designed to facilitate the comparison of buildings' energy and water consumption, and reduce building operating costs, leading to reduced GHG emissions.

Building Decarbonization Ordinance

Effective in January 23, 2023, the Building Decarbonization Ordinance is an ordinance amending Divisions 2, 4, and 5 of Article 9 of Chapter IX of the Los Angeles Municipal Code (LAMC) to require all new buildings to be all-electric buildings. This is a critical first step to take action to reduce carbon emissions in new building constructions by ensuring newly constructed buildings rely on electricity than on fossil fuels. Exceptions to the ordinance apply to

- 1) Projects with approval from the Department of Building and Safety with paid application fees prior to April 1, 2023.
- 2) Cooking equipment contained within kitchens located in a public use area, as defined in the California Building Code Chapter 2, such as restaurants, commissaries, and cafeterias provided the electrical infrastructure is installed in accordance with Section 99.05.106.14.1.
- 3) Gas-powered emergency life-safety systems, including emergency backup.
- 4) Gas-powered process equipment in I-2, F and L Occupancy Groups provided the electrical infrastructure is installed in accordance with Section 99.05.106.14.1.

City of Los Angeles General Plan

The City of Los Angeles does not have a General Plan Element specific to Global Warming and GHG emissions. However, the following goals and objectives from the Air Quality Element of the City of Los Angeles General Plan would also serve to reduce GHG emissions:

Goal 2 Less reliance on single-occupant vehicles with fewer commute and non-work trips.

Objective 2.1 Reduce work trips as a step towards attaining trip reduction objectives necessary to achieve regional air quality goals.

Objective 2.2 Increase vehicle occupancy for non-work trips by creating disincentives for single passenger vehicles, and incentives for high occupancy vehicles.

Goal 4 Minimal impact of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality.

Objective 4.2 Reduce vehicle trips and vehicle miles traveled associated with land use patterns.

Goal 5 Energy Efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels, and the implementation of conservation measures including passive methods such as site orientation and tree planting.

***Objective 5.1* Increase energy efficiency of City facilities and private developments. Mobility Plan 2035**

Mobility Plan 2035, updated in September 2016, serves as the Mobility Element of the General Plan. Mobility Plan 2035 establishes new street designations, classifies each of the City's arterial streets and incorporates a "complete street" policy framework (i.e., the idea that transportation facilities should be designed for all types of users, including pedestrians, cyclists, and trucks, as well as passenger vehicles), thus providing a foundation for future policies and principles promoting residents' interaction with their streets. Discussed in detail in Section 4.10, *Land Use and Planning*, Mobility Plan 2035 also promotes equitable land use decisions that result in fewer vehicle trips by providing greater proximity and access to jobs, destinations, and other neighborhood services. The Mobility Element sets a goal to reduce VMT 20% by plan horizon.

City of Los Angeles Solid Waste Programs and Ordinances

The recycling of solid waste materials also contributes to reduced energy consumption. Specifically, when products are manufactured using recycled materials, the amount of energy that would have otherwise been consumed to extract and process virgin source materials is reduced as well as disposal energy averted. In 1989, California enacted AB 939, the California Integrated Waste Management Act, which establishes a

hierarchy for waste management practices such as source reduction, recycling, and environmentally safe land disposal.

The City has developed and is in the process of implementing the Solid Waste Integrated Resources Plan, also referred to as the Zero Waste Plan, whose goal is to lead the City towards being a “zero waste” City by 2030. These waste reduction plans, policies, and regulations, along with Mayoral and City Council directives, have increased the level of waste diversion for the City to 76 percent as of 2013. The RENEW LA Plan aims to achieve a zero waste goal through reducing, reusing, recycling, or converting the resources not going to disposal and achieving a diversion rate of 90 percent or more by 2025. The City has also approved the Waste Hauler Permit Program (Ordinance No. 181,519, LAMC Chapter VI, Article 6, Section 66.32-66.32.5), which requires private waste haulers to obtain AB 939 Compliance Permits to transport construction and demolition waste to City-certified construction and demolition waste processors. The City’s Exclusive Franchise System Ordinance (Ordinance No. 182,986), among other requirements, sets a maximum annual disposal level and diversion requirements for franchised waste haulers to promote waste diversion from landfills and support the City’s zero waste goals. These programs reduce the number of trips to haul solid waste and therefore reduce the number of petroleum-based fuels and energy used to process solid waste.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines, impacts related to GHG emissions from the project would be significant if the project would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; and/or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

To answer the Appendix G questions above for the Project, the City of Los Angeles will rely on the following project-specific threshold of significance to assess the environmental impacts associated with GHG emissions for the Proposed Project:

- Consistency with AB 32, SB 32, and AB 1279 (through demonstration of conformance with the 2022 Scoping Plan), the Sustainable City pLAn, GreenLA, and relevant components of the City’s General Plan.

The basis for a project specific threshold is provided as follows. The City has not adopted specific GHG significance thresholds. SCAQMD has not adopted a GHG significance threshold for land use development projects, although it has adopted significance thresholds for industrial-type projects for which it is the lead agency (SCAQMD 2010). Those industrial thresholds are not relevant to the Proposed Project, as the only projects for which the SCAQMD serves as the lead agency are those involving the adoption of air quality rules or regulations, or projects that have not gone through CEQA environmental review via another lead agency. No such projects would occur under implementation of the Proposed Project. In the absence of adopted thresholds for land use development projects based on SCAQMD guidance, the City has the discretion to use a significance threshold relevant to the Proposed Project.

On November 30, 2015, the California Supreme Court issued an opinion on GHG significance thresholds for CEQA in the case *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife*.

The following discussion is paraphrased from that case, which assessed the use of GHG significance thresholds.

The Court stated that California air pollution control officials and air quality districts have made several proposals for numerical thresholds. Multiple agencies' efforts at framing GHG significance issues have not yet coalesced into any widely accepted set of numerical thresholds but have produced a certain level of consensus on the value of AB 32 consistency as a criterion. Neither AB 32 nor that CARB Scoping Plan set out a mandate or method for CEQA analysis of GHG emissions from a proposed project. A 2007 CEQA amendment, however, required the preparation, adoption, and periodic update of guidelines for mitigation of GHG impacts. The resulting state direction was that a lead agency should attempt to describe, calculate or estimate the amount of GHG emissions a project will emit, but recognized that agencies have discretion in how to do so. It goes on to provide that when assessing the significance of GHG emissions, the agency should consider these factors among others: (1) the extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

The Court also acknowledged that the scope of global climate change and the fact that GHGs, once released into the atmosphere, are not contained in the local area of their emission means that the impacts to be evaluated are global rather than local. For many air pollutants, the significance of their environmental impact may depend greatly on where they are emitted; for GHG, it does not. For projects that are designed to accommodate long-term growth in California's population and economic activity in a sustainable manner, such as the Proposed Project, this fact gives rise to an argument that a certain amount of GHG emissions is as inevitable as population growth. Under this view, a significance criterion framed in terms of efficiency and conservation in land use (as compared to a business-as-usual [BAU] pattern of growth) is superior to a simple numerical threshold because CEQA is not intended as a population control measure.

This consideration favors consistency with AB 32's statewide goals as a permissible significance criterion for project GHG emissions. Meeting statewide reduction goals does not preclude all new development. Rather, the Scoping Plan, the State's roadmap for meeting AB 32's target, assumes continued growth and depends on increased efficiency and conservation in land use and transportation from all Californians. To the extent a project incorporates efficiency and conservation measures sufficient to contribute its portion of the overall GHG reductions necessary for the entire State, one can reasonably argue that its impact is not cumulatively considerable, because it would be helping to solve the cumulative problem of GHG emissions as envisioned by California law. Given the reality of growth, some GHG emissions from new housing and commercial developments are inevitable. The critical CEQA question is the cumulative significance of a project's GHG emissions and, as discussed previously, from a climate change point of view it does not matter where in the State those emissions are produced. Under these circumstances, evaluating the significance of a project's GHG emissions with respect to their effect on the State's efforts to meet its long-term goals is a reasonable threshold.

The Court found there are potential options for analyzing cumulative significance of a project's GHG emissions, including:

- Business-as-usual (BAU) Model. BAU comparison based on the Scoping Plan methodology if supported by substantial evidence that the metric used supports what level of reduction from

business as usual a new land use development at the proposed location must contribute to comply with state goals.

- Consistency with AB 32's goal in whole or in part by looking at compliance with regulatory programs designed to reduce GHG; provided the project complies with or exceeds the regulations that were adopted by CARB, or state agencies to comply with Scoping Plan; and provided, the significance analysis only relates to impacts within the area governed by the regulation – e.g., reliance on Title 24 energy efficiency rules that are intended to reduce GHG from building would not address GHG impacts from transportation. And/or showing consistency with local GHG reduction plans, (e.g., climate action plan), to provide a basis for the tiering or streamlining of project-level CEQA analysis, including as consistent with CEQA Guidelines Section 15183.3.
- Relying on numerical thresholds for significance for GHG.

As discussed in the Regulatory Setting above, Section 15064.4 was amended in 2019 to incorporate the holding in Center for Biological Diversity case as well as others. That section now directs lead agencies as follows:

Section 15064.4. Determining the Significance of Impacts from Greenhouse Gas Emissions.

(a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency shall make a good- faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:

- (1) Quantify greenhouse gas emissions resulting from a project; and/or
- (2) Rely on a qualitative analysis or performance based standards.

(b) In determining the significance of a project's greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. A lead agency should consider the following factors, among others, when determining the significance of impacts from greenhouse gas emissions on the environment:

- (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.
- (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- (3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions (see, e.g., section 15183.5(b)). Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's 'incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project. In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the

project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable.

(c) A lead agency may use a model or methodology to estimate greenhouse gas emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

Based on the above legal standards, the City finds analyzing the Project's GHG emissions through consistency with the state's laws and programs to address climate change, including AB 32, SB 32, SB 375, 2022 Scoping Plan, regional plans to address climate change consistent with state laws and plans, including the 2020-2045 SCS/RTP, and local plans, ordinances and policies to address climate change, including GreenLA, Sustainable City pLAn, and L.A.'s Green New Deal is the appropriate threshold. Calculating and analyzing per-capita GHG emissions, while not a threshold of significance, is a useful indicator as to whether regional GHG impacts are consistent with the 2022 Scoping Plan, AB 32 and SB 32. Per-capita GHG emissions reflects on average GHG emissions taking into account population density. The 2020-2045 RTP/SCS indicates that the SCAG region will achieve a 19 percent reduction in per-capita passenger vehicle GHG emissions by 2035 relative to 2005 levels. With that said, there is no adopted City or CAP per-capita GHG emission target or other numerical criteria adopted as a threshold of significance that would be applicable to the Proposed Project. Using consistency with AB 32's statewide goal for GHG reduction, among the other regulations, standards and policies, rather than a numerical threshold, as a significance criterion is also consistent with the broad guidance provided by Section 15064.4 of the CEQA Guidelines. Section 15064.4, to reflect that there is no iron-clad definition of significance. Section 15064.4 was not intended to restrict agency discretion in choosing a method for assessing GHG emissions, but rather to assist lead agencies in investigating and disclosing all that they reasonably can, regarding a project's GHG emissions impact.

METHODOLOGY

Calculating GHG Emission

GHG emissions result from both direct and indirect sources. Direct emissions include emissions from fuel combustion in vehicles and natural gas combustion from stationary sources. Indirect sources include off-site emissions occurring as a result of electricity and water consumption and solid waste. In addition, construction activities would result in direct and indirect emissions.

As GHGs are evaluated on a regional basis, the following analysis addresses the Project as it pertains to the region. Mobile source emissions were estimated using VMT data presented in Section 4.15, *Transportation and Traffic*.

Area source emissions related to existing and future demand for water, wastewater treatment and conveyance, solid waste disposal, and energy were obtained using the California Emissions Estimator Model (CalEEMod). GHG emissions result from the energy use to supply, distribute, and treat water and wastewater, as well as from solid waste disposal by landfilling, recycling, or composting as methane and CO₂ gas is emitted in the process.

The energy use estimates generated in the 2022.1v CalEEMod utilizes the 2019 Building Energy Efficiency Standards (Title 24). This is a conservative assumption since the energy use estimates do not account for potential energy efficiency measures required by subsequent Title 24 updates in 2022, 2025, and 2028. In addition, energy emissions estimates take into account California's Renewable Portfolio Standards (RPS)

requiring retail sellers of electric services to increase procurement from eligible renewable energy resources to 60 percent by 2030 per SB 100. The analysis uses a carbon intensity factor for Los Angeles Department of Water and Power (LADWP) from reporting year 2019 (California Air Pollution Control Officer Association 2022)) and does not take into account utility compliance with RPS standards over time. As of 2010, LADWP achieved its RPS goal of 20 percent of retail sales generated by carbon neutral sources and in 2017 LADWP achieved its RPS goal of 25 percent (LADWP 2013; 2017).

It is anticipated that future conservation (as a result of increased pressure to conserve and increased prices) will result in more efficient energy use by all sectors resulting in reduced energy demand. As energy providers and water suppliers respond to SB 32 and the 2022 Scoping Plan, emission rates associated with power and water delivery are anticipated to decrease. It is anticipated that the state and region will comply with SB 32, but at the present time sector-specific improvements, beyond those associated with RPS identified above, cannot be quantified for this analysis.

GHG emissions would also be generated by construction activity. No specific development projects have been proposed as part of the Proposed Project, and an annualized quantification of construction emissions would be speculative. In addition, construction-related GHG emissions would be a negligible percentage of total regional emissions when considering the emissions generated by mobile sources. As stated by the 2016-2040 SCAG RTP/SCS Programmatic Environmental Impact Report (PEIR), construction related emissions presented for 2040 account for less than 0.3 percent of annual mobile source emissions (SCAG 2020). A similar percentage is expected for construction emissions related to the Proposed Project. Construction emissions are discussed below based on this assumption and amortized over 30 years in accordance with SCAQMD recommendations.

Consistency Evaluation With 2022 Scoping Plan Update

Appendix D, Local Actions, of the 2022 Scoping Plan Update includes “recommendations intended to build momentum for local government actions that align with the State’s climate goals, with a focus on local GHG reduction strategies (commonly referred to as climate action planning) and approval of new land use development projects, including through environmental review under the California Environmental Quality Act (CEQA).” (Page 4 of Appendix D.)

The State encourages local governments to adopt a CEQA-qualified Climate Action Plan (CAP) addressing the three priority areas (transportation electrification, VMT reduction, and building decarbonization). However, the State recognizes that almost 50% of jurisdictions do not have an adopted CAP, among other reasons because they are costly, requiring technical expertise, staffing, funding. Additionally, CAPs need to be monitored and updated as State targets change and new data is available. Jurisdictions that wish to take meaningful climate action (such as preparing a non-CEQA-qualified CAP or as individual measures) aligned with the State’s climate goals in the absence of a CEQA-qualified CAP are advised to look to the three priority areas when developing local climate plans, measures, policies, and actions: (transportation electrification, VMT reduction, and building decarbonization). “By prioritizing climate action in these three priority areas, local governments can address the largest sources of GHGs within their jurisdiction.” (Page 9 of Appendix D.)

The State also recognizes in Appendix D, Local Actions, of the Scoping Plan that each community or local area has distinctive situations and local jurisdictions must balance the urgent need for housing while demonstrating that a Project is in alignment with the State’s Climate Goals. The State calls for the climate crisis and the housing crisis to be confronted simultaneously. Jurisdictions should avoid creating targets that are impossible to meet as a basis to determine significance. Ultimately, targets that make it more difficult to achieve statewide goals by prohibiting or complicating projects that are needed to support the State’s climate goals, like infill development, low-income housing or solar arrays, are not consistent with the State’s goals. The State also recognizes the lead agencies’ discretion to develop evidence-based

approaches for determining whether a project would have a potentially significant impact on GHG emissions.

PROJECT IMPACTS

Threshold 4.7-1	Whether the Project is consistent with SB 32, SB 375 (through demonstration of conformance with the 2016–2040 RTP/SCS), the 2022 Scoping Plan, the Sustainable City pLAN and GreenLA?
------------------------	---

Impact 4.7-1 **Proposed Project:** Implementation of the Project would be consistent with the applicable GHG emission reduction goals, policies, and objectives found in the City’s General Plan, SCAG’s 2020-2045 RTP/SCS, the 2022 Scoping Plan, and regional and local plans. This impact would be *less than significant*.

Project Impacts

GHG Emissions Generation

Reasonably anticipated development from the Proposed Project would generate GHG emissions through individual project construction and operation during the twenty plus year planning horizon of the Proposed Project. GHG emissions would specifically arise from direct sources such as motor vehicles, natural gas consumption, solid waste handling/treatment, and indirect sources such as electricity generation.

Table 4.7-4 compares current annual GHG emissions for the Project Area to 2040 emissions without and with the Project. Total emissions and per capita emissions are shown. The 2040 without Proposed Project was included for informational purposes and was not relied on for impact analysis or conclusions. The emissions estimates include some known emission control requirements (such as Pavley regulations and RPS) but does not take into account anticipated laws (such as increasingly stringent Title 24 standards, refinery regulations, and the Cap-and-Trade program) that will further reduce future GHG emissions.

Total annual GHG emissions generated in the Project Area, based on the 2040 reasonably anticipated development under the Proposed Project, would be greater than existing emissions by approximately 123,821 MT CO_{2e}. This represents an increase of about 147 percent as compared to existing conditions, whereas the population of the Project Area is projected to grow more than ninefold and the number of Project Area jobs is projected to grow by about 52 percent. The Proposed Project would increase emissions by approximately 9,821 MT CO_{2e}, or approximately five percent as compared to future (2040) without Proposed Project scenario. In addition, the Proposed Project would increase the population of the Project Area by 58 percent and would decrease the number of Project Area jobs by 20 percent as compared to future (2040) without Proposed Project. Consequently, despite the overall increase in GHG emissions generated in the Project Area, per capita GHG emissions would decrease. As illustrated in **Table 4.7-4**, per capita GHG emissions are estimated at 14 MT CO_{2e} in 2021, 5.4 MT CO_{2e} in future (2040) without Proposed Project, and 3.6 MT CO_{2e} in future (2040) with implementation of the Proposed Project.

The existing to future (2040) with Proposed Project change represents a 74 percent drop in per capita emissions, which can be attributed to a combination of state-mandated GHG emission reduction strategies and the fact that implementation of the Proposed Project would lower per capita VMT due to the location of jobs and housing in close proximity to each other and creation of substantial opportunities to use such transportation modes as transit, bicycling, and walking. In addition, the Proposed Project would comply with each iteration of the Title 24 requirements, which would increase the amount of electric vehicle spaces and solar panels. On December 19, 2022, the City of Los Angeles published Ordinance 187714 in Article 9 of Chapter IX of the Los Angeles Municipal Code would require all new buildings to be constructed all-electric. By guiding development near transit corridors and encouraging creative mixed land uses, the

Proposed Project creates an efficient strategy for reasonably foreseeable development in the region, consistent with AB 32, SB 32 and the 2020-2045 RTP/SCS. This reduction in per capita emissions would also contribute to meeting the statewide 2050 goal of 2 MT CO₂e per capita. The per capita reduction in GHG emissions demonstrates compliance with regional, state, and federal efforts to reduce climate impacts from development and transportation. Finally, it should be recognized that although total GHG emissions in the Project Area would incrementally increase due to the relatively large amount of growth anticipated, the growth projection for the Proposed Project is within the overall growth projection for the City. Thus, the population growth and associated GHG emissions associated with implementation of the Proposed Project would not add to overall citywide emissions, but rather would concentrate development in the Project Area rather than in other parts of the City. Because of the proximity of jobs and housing and enhanced opportunities for transit use in the Project Area, it is anticipated that focusing growth in the Project Area would reduce citywide emissions as compared to accommodating more of the projected growth in other parts of the City.

TABLE 4.7-4 PROJECT AREA GREENHOUSE GAS EMISSIONS						
	Annual GHG Emissions (MT CO₂e)					
	Existing (2021)		2040 Without Project		2040 With Project	
Source Type	Total	Per Capita²	Total	Per Capita²	Total	Per Capita²
Transportation ¹	44,666	7.4	86,529	2.4	101,422	1.8
Area	576	0.1	4,801	0.1	4,873	0.1
Energy	33,081	5.5	90,283	2.5	85,625	1.5
Waste	2,435	0.4	7,674	0.2	8,463	0.1
Water	3,384	0.6	8,850	0.2	7,574	0.1
Construction Emissions ³	4	<0.1	8.7	<0.1	10.1	<0.1
Total	84,146	14.0	198,146	5.4	207,967	3.6

NOTES: ¹Transportation emissions are based on GHG emission rates from EMFAC2017 that include implementation of the Pavley regulations. All other values were identified for the associated source activity as calculated by CalEEMod Version 2020.4.0

² Per capita values equal emissions divided by population estimates from Section 4.12, *Population and Housing*.

³ Construction related emissions are estimated at 0.3 percent of annual mobile source emissions amortized over 30 years (SCAG 2016).

Regional Perspective

To assess future GHG emission reductions resulting from a development project, the future condition is often compared to a BAU condition – typically the proposed development without the various GHG reduction measures. For a Specific Plan project, BAU is much more difficult to determine and would be entirely speculative to quantify. While the future conditions with the existing community plan identifies what is reasonably foreseeable to occur in the Project Area if the Proposed Project were not to proceed, it is not a complete picture of BAU for the region. The Proposed Project is a planned response to forecast growth, so if growth does not occur in the Project Area, it could occur elsewhere in the City or SCAG region. The Proposed Project combines sustainable strategies (e.g., proximity to transit, mixed-use, increased density) to respond to state, regional and local policies aimed at reducing GHG emissions. If development were to occur elsewhere in a less sustainable fashion (BAU), regional emissions would be greater. However, for land use plans such as the Proposed Project, full quantification of BAU is not possible because, at this scale, it is not possible to anticipate where growth would go and how different it would be as compared to the project in terms of proximity to transit, mix of uses and density. Therefore, a comparison of the Proposed Project's emissions in the future to emissions under BAU is not possible.

In consideration of the objectives of SB 375 and the goals of the 2020–2045 RTP/SCS, per-capita CO₂ emissions from passenger and light duty vehicles were analyzed. By integrating the Forecasted

Development Pattern with a suite of financially constrained transportation investments, the 2020–2045 RTP/SCS can reach its regional per-capita GHG emissions reduction goal from passenger and light duty vehicles by 19 percent relative to 2005 levels by 2035. The 2016–2040 RTP/SCS determined that the 2005 per-capita CO₂ emissions from passenger and light duty vehicles within the SCAG region were 23.8 pounds per day.

Table 4.7-5 presents the forecast population, total Project Area daily CO₂ emissions from passenger and light-duty vehicles, and per-capita CO₂ emissions within the Project Area under existing conditions (2021), future (2040) without Proposed Project, and the future (2040) with Proposed Project.

TABLE 4.7-5 PROJECT AREA SB 375 PASSENGER VEHICLE PER-CAPITA CO₂ EMISSIONS			
	Existing Conditions (2021)	2040 Without Project	2040 With Project
Resident Population	6,027	36,021	56,501
Daily CO ₂ Emissions (Pounds)	278,961	538,389	630,992
Per Capita Emissions (Pounds)	46.3	14.9	11.2
Comparison to 2005 SCAG Regional Per Capita Emissions Level (Percent Increase or Decrease)	95%	-37%	-53%
NOTES: Transportation emissions are based on GHG emission rates for passenger and light duty vehicles from EMFAC2017 and include implementation of the Pavley regulations.			
¹ Per capita value equal emission divided by population estimates from Section 4.12, <i>Population and Housing</i> .			

As shown in **Table 4.7-5**, implementation of the future (2040) with Proposed Project would reduce per-capita CO₂ emissions from passenger and light duty vehicles by approximately 35.1 pounds per day relative to Existing Conditions. Under the Proposed Project, per-capita CO₂ emissions would be reduced by approximately 53 percent relative to the 2005 SCAG Regional baseline levels examined under SB 375. The 53 percent reduction by 2040 as compared to 2005 levels resulting from the Proposed Project exceeds the 19 percent reduction target of the 2020–2045 RTP/SCS by 2035. Therefore, the Proposed Project is consistent with SB 375.

Based on the plan-level analysis, the Project would decrease per-capita emissions in the Project Area compared to existing conditions and, therefore, considered in isolation, would contribute to reducing emissions in California below existing emissions and would contribute to AB 32 and SB 32 GHG reduction goals. The Proposed Project is not occurring in isolation; it is part of a regional strategy (contained in the 2020–2045 RTP/SCS) to direct growth to urban areas in order to achieve the following:

- Undertake modern, efficient construction techniques that result in using less energy and less water as compared to less dense development.
- Create a mix of uses that encourages pedestrian and bicycle activity, reducing vehicle trips; and
- Develop areas in close proximity to transit in order to reduce vehicular trips.

The Proposed Project would also be consistent with the City’s Sustainable City pLAN and Green New Deal by accommodating growth while providing transportation options. This strategy would result in lower per capita emissions than less dense growth and would contribute to the City reaching the 2025 Sustainable City pLAN reduction target of 45 percent.

Finally, it should be recognized that although total GHG emissions in the Project Area would incrementally increase due to the relatively large amount of growth anticipated in this area of the City, the growth projection for the Proposed Project is within the overall growth projection for the City. Thus, the population

growth and associated GHG emissions associated with implementation of the Proposed Project would not add to overall citywide emissions but would concentrate development in the Project Area rather than in other parts of the City. Because of the proximity of jobs and housing and enhanced opportunities for transit use in the Proposed Project, it is anticipated that focusing growth in the Project Area would reduce citywide emissions as compared to accommodating more of the projected growth in other parts of the City.

Consistency with State and Regional Plans, Policies, and Regulations

Consistency with AB 32, SB 32, and AB 1279 and 2022 Scoping Plan

The Proposed Project is consistent with the goals of AB 32, SB 32, AB 1279, and the associated CARB Scoping Plans, which call for strategies to reduce Statewide GHG emissions. As discussed previously, jurisdictions that want to take meaningful climate action aligned with the State's climate goals should look to the following three priority areas:

- transportation electrification,
- VMT reduction, and
- building decarbonization.

To assist local jurisdictions, the 2022 Scoping Plan Update presents a non-exhaustive list of impactful GHG reduction strategies that can be implemented by local governments within the three priority areas (Priority GHG Reduction Strategies for Local Government Climate Action Priority Areas).

As there are currently no specific development projects associated with the Proposed Project, the following discussion generally illustrates how the City will ensure GHG emissions from these priority areas are reduced to the maximum extent feasible.

Transportation Electrification. The priority GHG reduction strategies for local government climate action related to transportation electrification are discussed below and would support the Scoping Plan action to have 100 percent of all new passenger vehicles to be zero-emission by 2035 (see Table 2-1 of the Scoping Plan).

- *Convert local government fleets to zero-emission vehicles (ZEV)*

The CARB approved the Advanced Clean Cars II rule which codifies Executive Order N-79-20 and requires 100 percent of new cars and light trucks sold in California be zero-emission vehicles by 2035. The State has also adopted AB 2127, which requires the CEC to analyze and examine charging needs to support California's EVs in 2030. This report would help decision-makers allocate resources to install new EV chargers where they are needed most.

The City of LA Green New Deal (Sustainable City pLAn 2019) identifies a number of measures to reduce VMT and associated GHG emissions. Such measures that would support the local reduction strategy include converting all city fleet vehicles to zero emission where technically feasible by 2028. Starting in 2021, all vehicle procurement followed a "zero emission first" policy for City fleets. The Green New Deal also establishes a target to increase the percentage of zero emission vehicles to 25 percent by 2025, 80 percent by 2035 and 100 percent by 2050. In order to achieve this goal, the City would build 20 Fast Charging Plazas throughout the City. The City would also install 28,000 publicly available chargers by 2028 to encourage adoption of ZEVs.

The City's goals of converting the municipal fleet to zero emissions and installation of EV chargers throughout the City would be consistent with the Scoping Plan goals of transitioning to EVs. Although this measure mainly applies to City fleets, the Proposed Project would not conflict with these goals. Furthermore, as individual development projects are proposed within the Project Area, each project would be evaluated on a case-by-case basis to determine the appropriate number of EV chargers to be installed. Installation of additional EV chargers would encourage adoption of EVs.

- *Create a jurisdiction-specific ZEV ecosystem to support deployment of ZEVs statewide (such as building standards that exceed state building codes, permit streamlining, infrastructure siting, consumer education, preferential parking policies, and ZEV readiness plans)*

The State has adopted AB 1236 and AB 970, which require cities to adopt streamline permitting procedures for EV charging stations. As a result, the City updated Section IX of the LAMC, which requires most new construction to designate 30 percent of new parking spaces as capable of supporting future electric vehicle supply equipment (EVSE). This would exceed the CALGreen 2022 requirements of 20 percent of new parking spaces as EV capable. The ordinance also requires new construction to install EVSE at 10 percent of total parking spaces. This requirement also exceeds the CALGreen 2022 requirements of installing EVSE for 25 percent of EV capable parking spaces which is approximately five percent of total parking spaces. The City has also implemented programs to increase the amount of EV charging on city streets, EV carshare, and incentive programs for apartments to be retrofitted with EV chargers.

The City's goals of installing EV chargers throughout the City would be consistent with the Scoping Plan goals of transitioning to EVs. As individual development projects are proposed within the Project Area, each project would be evaluated on a case-by-case basis to determine the appropriate number of EV chargers to be installed. Based on the City's updates to Section IX of the LAMC, many of the future development projects within the Project Area would exceed the CALGreen 2022 requirement.

VMT Reduction. The priority GHG reduction strategies for local government climate action related to VMT reduction are discussed below and would support the Scoping Plan action to reduce VMT per capita 25 percent below 2019 levels by 2030 and 30 percent below 2019 levels by 2045.

- *Reduce or eliminate minimum parking standards in new developments*
- *Implement parking pricing or transportation demand management pricing strategies*

The City of Los Angeles Mobility Plan 2035 contains measures and programs related to VMT reduction throughout the City. With regard to parking standards, the Proposed Project does not include minimum automobile parking requirements in new developments. These reduction strategies and TDM programs would serve to reduce minimum parking standards and reduce vehicle trips. Individual discretionary projects, including those within the area of the Proposed Project, currently are reviewed, and would continue to be reviewed, using the City's VMT trip calculator. As part of that review, if individual projects have the potential to significantly impact VMT, the calculator allows the applicant to identify project design features that reduce VMT and if such PDFs are not available it identifies suggested mitigation measures. See **Section 4.15, Transportation & Traffic**.

- *Implement Complete Streets policies and investments, consistent with general plan circulation element requirements*

The City of Los Angeles Mobility Plan 2035 established a "Complete Streets" planning framework which resulted in the City of Los Angeles Complete Streets Design Guide in 2015, consistent with California's

Complete Streets Act of 2008. A supplemental update to the Complete Streets Design Guide was adopted in 2020.

The Complete Streets Design Guide provides a number of measures to increase public access to electric shuttles, car sharing and walking. The Design Guide establishes guidelines for establishing on-street parking for car sharing. The City has also established BlueLA which is a car sharing network consisting of more than 100 electric vehicles located throughout the City. In addition, under the Green New Deal, the City would install 28,000 publicly available chargers by 2028 and introduce 135 new electric DASH buses. While this reduction strategy mainly applies to City traffic circulation, the Proposed Project would not conflict with the strategy. See also below for consistency analysis with the City's Mobility Plan 2035.

- *Increase access to public transit by increasing density of development near transit, improving transit service by increasing service frequency, creating bus priority lanes, reducing or eliminating fares, microtransit, etc.*
- *Increase public access to clean mobility options by planning for and investing in electric shuttles, bike share, car share, and walking*
- *Amend zoning or development codes to enable mixed-use, walkable, transit-oriented, and compact infill development (such as increasing the allowable density of a neighborhood)*
- *Preserve natural and working lands by implementing land use policies that guide development toward infill areas and do not convert "greenfield" land to urban uses (e.g., green belts, strategic conservation easements)*

These reduction strategies are supported through implementation of SB 375 which requires integration of planning processes for transportation, land-use and housing and generally encourages jobs/housing proximity, promote transit-oriented development (TOD), and encourages high-density residential/commercial development along transit corridors. To implement SB 375 and reduce GHG emissions by correlating land use and transportation planning, SCAG adopted the 2020–2045 RTP/SCS, also referred to as Connect SoCal. The 2020–2045 RTP/SCS' "Core Vision" prioritizes the maintenance and management of the region's transportation network, expanding mobility choices by co-locating housing, jobs, and transit, and increasing investment in transit and complete streets. See above for a detailed discussion of consistency with SB 375 and the 2020-2045 RTP/SCS.

On a local level, the City has developed the Complete Streets Design Guide which provides a number of reduction strategies to increase public access to electric shuttles, car sharing and walking, continues to build out networks in the Mobility Plan for pedestrians, bicyclists, and transit users, has implemented an EV car sharing network, and is working towards increasing publicly available chargers, and introducing new electric DASH buses. See also below for consistency analysis with the City's Mobility Plan 2035.

The Proposed Project would provide for infill development within existing urbanized areas that would concentrate new development consistent with the overall growth pattern encouraged in the RTP/SCS. The Proposed Project would provide for increasing jobs in proximity to housing.

- *VMT reduction through affordable housing*

As California continues to experience a severe housing shortage, the State must plan for more than 2.5 million residential units over the next eight years, and no less than one million of those residential units must be affordable to lower-income households (California Department of Housing and Community Development 2022). This represents more than double the housing planned for during the last eight years.

The housing crisis and the climate crisis must be confronted simultaneously, and it is possible to address the housing crisis in a manner that supports the State's climate and regional air quality goals.²³ CAPCOA's Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (CAPCOA's Handbook) provides a VMT reduction measurement for incorporation of low-income housing. Measure T-4 (Integrate Affordable and Below Market Rate Housing) shows a 28.6 percent reduction in VMT for low-income units in comparison to market rate units.

The Scoping Plan references two studies related to housing affordability/income and VMT. One study indicates (Table 5 of the referenced study) that as compared to moderate-income units, VMT is reduced by 10.2% for low-income households, 25.2% for very low-income households and 32.5% for extremely low-income (ELI) households in Metro areas. The other study indicates that the difference in daily VMT for ELI and very low-income households in Department of Housing and Community Development TOD areas vs. non-TOD is -20.9 VMT and -17.6 VMT per day respectively.

A study commissioned by Caltrans based on Los Angeles area survey data, shows VMT reductions by income level as compared to a base case, with lower income units, especially ELI units, showing a substantial reduction in VMT as compared to other income levels (Caltrans 2018).

The Caltrans study indicates that ELI housing generates a fraction of the VMT of other types of affordable housing no matter where they are located. If a low-income multi-family unit (7.65 VMT in an urban neighborhood according to the Caltrans study) is generically representative of an affordable unit an ELI unit (with 0.45 VMT) would have just 6% of the VMT of a low-income unit (94% reduction) or 3% of a median-income unit in a suburban neighborhood (97% reduction).

The City's Housing Element of the General Plan provides planning guidance in meeting housing needs identified in the SCAG Regional Housing Needs Assessment (RHNA). The current RHNA goal for affordable housing within the City is approximately forty percent of new construction. However, the City's projections show affordable housing comprising twenty percent of new construction, which falls short of the forty percent RHNA goal. In order to address this shortfall, the Housing Element identifies measures to encourage development of affordable housing such as revising density bonuses for affordable housing; identify locations which are ideal for funding programs to meet low-income housing goals; and rezone areas to encourage low-income housing. The Housing Element estimates that implementation of these measures would increase housing production at all income ranges compared to previous cycles.

The City's 20-percent goal of low-income housing for new construction is applicable on a citywide basis and not applicable to an individual project. The Planning Department Housing Division found, based on market studies and experiences of other agencies, that mandating 20-percent affordable housing on individual projects is likely to reduce overall housing production, including low-income housing, in the City and would be contrary to City and State policies. Pushing more housing outside of the City would be contrary to the Scoping Plan, as infill housing production in the City, which is a highly urbanized city with billions of dollars invested in transit infrastructure, lower average VMT than the SCAG region, is called for in the 2022 Scoping Plan. The City has implemented a highly successful Transit Oriented Communities (TOC) program as well as other City programs that facilitate the production of low-income (LI), very-low-income (VLI) and extremely-low-income (ELI) housing in proximity to transit. In general, development in proximity to transit has much lower trip generation and vehicle trip lengths than development not adjacent to transit.

As further detailed in **Section 4.13, Population and Housing**, the Proposed Project, while focused mostly on job growth, does accommodate current and anticipated housing demand in the Project Area, including

affordable housing. In addition to the City's affordable housing regulations and policies, the Proposed Project also includes affordable housing incentives through community benefit systems. This program will allow developers to provide or otherwise cause the creation of specific community benefits in return for access to above-baseline density and other property development standards. Maximum FAR may be achieved through participation in the various incentive systems. Development exceeding development rights may be permitted by producing a range of public benefits including affordable housing.

For purposes of evaluating consistency with affordable housing targets relative to GHG reduction goals, the City of Los Angeles considers citywide housing production and does not require individual projects to meet specific targets as all levels of housing affordability are needed in the City particularly in proximity to transit.

Building Decarbonization. The priority GHG reduction strategies for local government climate action related to electrification are discussed below and would support the Scoping Plan actions regarding meeting increased demand for electrification without new fossil gas-fire resources and all electric appliances beginning in 2026 (residential) and 2029 (commercial) (see Table 2-1 of the Scoping Plan).

- *Adopt all-electric new construction reach codes for residential and commercial uses*

California's transition away from fossil fuel-based energy sources will bring the Proposed Project's GHG emissions associated with building energy use down to zero as the City's electric supply becomes 100 percent carbon free. California has committed to achieving this goal by 2045 through SB 100, the 100 Percent Clean Energy Act of 2018. SB 100 strengthened the State's RPS by requiring that 60 percent of all electricity provided to retail users in California come from renewable sources by 2030 and that 100 percent come from carbon-free sources by 2045. The land use sector will benefit from RPS because the electricity used in buildings will be increasingly carbon-free, but implementation does not depend (directly, at least) on how buildings are designed and built.

The City has updated the LAMC with requirements for all new buildings, with some exceptions to be all-electric, which will reduce GHG emissions related to natural gas combustion. Space heating, water heating and cooking for non-restaurant uses would be required to be powered by electricity. In future years, the LADWP will be required to increase the amount of renewable energy in the power mix to comply with SB 100 requirements. The combination of the all-electric LAMC regulations and increasing availability of renewable energy will serve to reduce GHG emissions from sources traditionally powered by natural gas. Unless exempt, all new buildings proposed and constructed through the Proposed Project horizon year will be subject to this section of the LAMC.

- *Adopt policies and incentive programs to implement energy efficiency retrofits for existing buildings, such as weatherization, lighting upgrades, and replacing energy-intensive appliances and equipment with more efficient systems (such as Energy Star-rated equipment and equipment controllers)*

This reduction strategy would support the Scoping Plan action regarding electrification of appliances in existing residential buildings (see Table 2-1 of the Scoping Plan). The City and Los Angeles Department of Water and Power has established rebate programs to promote use of energy-efficient products and home upgrades. Under the LADWP's Consumer Rebate Program (CRP), residential customers would receive rebates for energy-efficient upgrades such as Cool Roofs, Energy Star Windows, HVAC upgrades, pool pumps and insulation upgrades. Such upgrades would serve to reduce wasteful energy and water usage and associated GHG emissions. While it is unknown at this time if future development projects within the Project Area would involve retrofit of existing buildings, each project would be reviewed on a case-by-case basis to determine if these strategies are relevant and applicable.

Consistency With SB 375 and SCAG RTP/SCS

The State of California has adopted plans and policies designed to reduce regional and local GHG emissions. SB 375 requires that each MPO prepare an SCS in the RTP that demonstrates how the region will meet greenhouse gas emissions targets. SB 375 establishes a collaborative relationship between MPOs and CARB to establish GHG emissions targets for each region in the state. Under the guidance of the goals and objectives adopted by SCAG's Regional Council, the 2020–2045 RTP/SCS was developed to provide a blueprint to integrate land use and transportation strategies to help achieve a coordinated and balanced regional transportation system. The 2020–2045 RTP/SCS represents the culmination of several years of work involving dozens of public agencies, 191 cities, hundreds of local, county, regional and state officials, the business community, environmental groups, as well as various nonprofit organizations. Adoption of the 2020–2045 RTP/SCS substantiated that the growth forecasts for the SCAG region, taking into account efforts to reduce climate change impacts from GHG emissions, were consistent with the goals of SB 375.

The 2020–2045 RTP includes an SCS, as required by SB 375. The primary goal of the SCS is to provide a vision for future growth in southern California that will decrease per capita GHG emissions from passenger vehicles. However, the strategies contained in the 2020–2045 RTP/SCS will produce benefits for the region far beyond simply reducing GHG emissions. The SCS integrates the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas on existing main streets, in downtowns, and on commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. The underlying purpose of the Proposed Project is to plan for and accommodate foreseeable growth in the Project Area, consistent with the growth strategies of the City as provided in the City's General Plan Framework Element, as well as the policies of SB 375 and the SCS. The Proposed Project would allow for concentrated, mixed-use development adjacent to transit corridors in order to conserve resources, protect existing residential neighborhoods, and improve air quality by reducing the reliance on cars. The Project is expected to contribute to reductions in per capita GHG emissions when viewed at the regional level, as detailed above. Thus, the Proposed Project would be entirely consistent with the SCS and SB 375 goals. As illustrated in **Table 4.7-5**, the Proposed Project would contribute to reductions in per capita GHG vehicle emissions. As a result, and as illustrated in **Table 4.7-6**, the Proposed Project would be consistent with SCS and SB 375 goals.

TABLE 4.7-6 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE SCAG 2020-2045 RTP/SCS	
Objective	Project Consistency
<p>Focus Growth Near Destinations & Mobility. Emphasize land use patterns that facilitate multimodal access to work, educational and other destinations Focus on a regional jobs/housing balance to reduce commute times and distances and expand job opportunities near transit and along center-focused main streets Prioritize infill and redevelopment of underutilized land to accommodate new growth, increase amenities and connectivity in existing neighborhoods Encourage design and transportation options that reduce the reliance on and number of solo car trips (this could include mixed uses or locating and orienting close to existing destinations) Identify ways to “right size” parking requirements and promote alternative parking strategies (e.g., shared parking or smart parking)</p>	<p>Consistent The Project would increase approximately 18,024 affordable mixed-income housing units in the Project Area through the 2040. The additional housing would be prioritized in locations near existing and anticipated jobs, amenities, services and transit resources. In addition, the Project intent is to transition the Project Area into a cluster of mixed-used, pedestrian-oriented neighborhoods. This would support opportunities for walking, bicycling, and connectivity to neighboring communities. Therefore, the Proposed Project would be consistent with 2020 RTP/SCS focus growth near destinations & mobility strategy.</p>
<p>Promote Diverse Housing Choices Preserve and rehabilitate affordable housing and prevent displacement. Create incentives and reduce regulatory barriers for building context-sensitive accessory dwelling units to increase housing supply.</p>	<p>Consistent The Proposed Project would accommodate additional housing in the Project Area by expanding the residential Urban Village zoning designation to more parcels within the Project Area and allowing 100 percent affordable housing developments in the Urban Innovation and Urban Center zones. The Project’s affordable housing zoning incentives would be recalibrated and updated to require more affordable housing for those development projects seeking additional FAR rights. Therefore, the Project would be consistent with the 2020 RTP/SCS promote diverse housing choices strategy.</p>
<p>Support Implementation of Sustainability Policies Continue to support long range planning efforts by local jurisdiction</p>	<p>Consistent The project would be consistent with the City of Los Angeles’ Green LA and Sustainable City pLAN/Green New Deal. In addition, it would be constructed in accordance with Building Energy Efficiency Standards and the Green Building Code for Los Angeles. Therefore, the Proposed Project would support long-range planning efforts by the local jurisdiction.</p>
<p>Promote a Green Region Promote more resource efficient development focused on conservation, recycling, and reclamation</p>	<p>Consistent The Proposed Project would update the environmental conservation and performance standards of the existing Specific Plan to reflect current regulatory conditions. The conservation standards are intended to reduce energy demand, recycle water and decrease demand for potable water, reduce waste and use of new materials, and reduce demand on natural resources. Therefore, the Proposed Project would promote environmental conservations with the Project Area.</p>

Consistency with Local Plans, Policies, and Regulations

The City of Los Angeles GreenLA Climate Action Plan

The City of Los Angeles enacted its GreenLA CAP in 2007 to outline strategies for reducing the City’s emissions of GHG and consequent effects on climate change. The CAP’s primary long-term objective is to establish a framework for implementing GHG emissions reduction efforts that would achieve a goal of reducing citywide emissions to 35 percent below 1990 levels by 2030. With regard to planning, elements of the CAP designed to aid in regional GHG reductions include promotion of high-density housing close to major transportation arteries, implementation of transit-oriented development, and expanding availability of City land for housing, mixed-use development, parks, and open space. The Proposed Project would add substantial multi-family housing to the Project Area and incorporate transit-oriented development. Furthermore, implementation of the Proposed Project would encourage pedestrian-friendly, mixed-use neighborhoods that would require less use of passenger vehicles. The Proposed Project promotes a sustainable Project Area and would allow for a more dense, integrated land use and transportation environment that would encourage the use of active transportation. The Proposed Project encourages sustainable and transit oriented development with form regulations that prioritize pedestrian walkability, with no minimum parking requirements. Together, these regulations encourage increased use of transit resources and support a shift in travel mode. The combination of these strategies is consistent with the goals of GreenLA. **Table 4.7-7** illustrates the Proposed Project’s consistency with the City’s GreenLA CAP.

TABLE 4.7-7 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY’S GREENLA CAP	
Objective	Project Consistency
Energy Transform Los Angeles into the model of an energy efficient city.	Consistent As shown in Table 4.7-4 , Proposed Project per capita GHG emissions would be within state targets. In addition, the Project’s developments would be designed and operated to meet the applicable requirements of CalGreen and the City’s Green Building Code. Therefore, the Proposed Project would support local energy efficiency policies.
Transportation Lower the environmental impact and carbon intensity of transportation.	Consistent As illustrated in Table 4.7-4 , implementation of the Project would result in a reduction in per capita GHG emissions by 2040.
Transportation Focus on mobility for people, not cars.	Consistent As discussed in Section 4.15, <i>Transportation and Traffic</i> , the Project area provides access to a range of transportation options. The Proposed Project also includes policies that support reductions in vehicle miles traveled and ultimately GHG emissions, such as policies promoting active transport through the development of walkable streets and the expansion of bicycle and pedestrian facilities. While total daily VMT would increase from existing conditions to 2040 with Project conditions, per capita VMT would decrease from 55 to 17 VMT per capita daily (based on population values summarized in Section 4.12, <i>Population, Housing and Employment</i>). Moreover, a number of policies contained in the Project support the development of pedestrian-oriented development with universal accessibility.
Transportation Create a more livable city.	Consistent The entire Project Area is well-served by existing and planned transit and many of the mixed-use residences permitted would occur in high activity areas, such as in proximity to transit corridors and along major arterials.

The City of Los Angeles Sustainable City pLAN/Green New Deal

The City’s Sustainability City pLAN is the City’s sustainability planning document that embraces both short- and long-term goals to improve equity, the City’s economy, and the environment. Focus areas for the environmental aspect of the City’s Sustainability City pLAN includes improving local water supply, increasing local electricity supply from solar, incentivizing energy efficient buildings, reducing atmospheric carbon, reducing waste destined for landfills, and embracing climate leadership. **Table 4.7-8** below compares the goals and objectives of the Proposed Project with those of the City’s Sustainability City pLAN.

TABLE 4.7-8 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY’S SUSTAINABLE CITY PLAN/ GREEN NEW DEAL	
Objective	Project Consistency
<p>Renewable Energy LADWP will supply 55 percent renewable energy by 2025; 80 percent by 2036; and 100 percent by 2045. Increase cumulative megawatts by 2025; 2035; and 2050 of: Local solar to 900-1,500 MW; 1,500-1,800 MW; and 1,950 MW. Energy storage capacity to 1,654-1,750 MW; 3,000 MW; and 4,000 MW. Demand response (DR) programs to 234 MW (2025) and 600 MW (2035).</p>	<p>Consistent. While this action primarily applies to the City and LADWP, LADWP is required to generate electricity that would increase renewable energy resources to 33 percent by 2020, 44 percent by 2024, 60 percent by 2030, and 100 percent by 2045 under SB 100. Because LADWP would provide electricity service to the Project Area, the Project would use electricity consistent with the requirements of SB 100 and City goals.</p>
<p>Local Water Lead by example through reduced energy consumption in municipal buildings. Source 70 percent of L.A.’s water locally and capture 150,000 acre-feet per year of stormwater by 2035. Recycle 100 percent of all wastewaters for beneficial reuse by 2035. Build at least 10 new multi-benefit stormwater capture projects by 2025; 100 by 2035; and 200 by 2050. Reduce potable water use per capita by 22.5 percent by 2025; and 25 percent by 2035; and maintain or reduce 2035 per capita water use through 2050 Install or refurbish hydration stations at 200 sites, prioritizing municipally-owned buildings and public properties such as parks, by 2035</p>	<p>Consistent As discussed in Section 4.17, <i>Utilities and Service Systems</i>, the Project would increase the water demand but minimize per capita water use through water efficient design. In addition, the Proposed Project would be required to comply with the City’s water use restrictions on timing, area, frequency, and duration of specified allowable water usage. The Project would also be required to comply with the Title 24 standards for Water Efficiency and Conservation that are in effect at the time of development. These standards include actions such as separate water submeters for subsystems, prescriptive reduced flow rates for water and fixtures, and plumbing fixtures and fittings.</p>
<p>Clean and Healthy Buildings All new buildings will be net zero carbon by 2030; and 100 percent of buildings will be net zero carbon by 2050. Reduce building energy use per sf for all building types 22 percent by 2025; 34 percent by 2035; and 44 percent by 2050.</p>	<p>Consistent The project would be constructed in accordance with the applicable requirements of CalGreen and the City’s Green Building Code.</p>
<p>Waste and Resource Recovery Increase landfill diversion rate to 90 percent by 2025; 95 percent by 2035; and 100 percent by 2050. Reduce municipal solid waste generation per capita by at least 15 percent by 2030, including phasing out single-use plastics by 2028. Eliminate organic waste going to landfill by 2028 Increase proportion of waste products and recyclables</p>	<p>Consistent As discussed in Section 4.17, <i>Utilities and Service Systems</i>, future Project Area development would participate in City recycling and waste diversion programs. The Proposed Project would comply with existing City and state programs would achieve consistency with this measure.</p>

TABLE 4.7-8 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY'S SUSTAINABLE CITY PLAN/ GREEN NEW DEAL	
Objective	Project Consistency
productively reused and/or repurposed within Los Angeles County to at least 25 percent by 2025; and 50 percent by 2035.	
<p>Mobility and Transit</p> <p>Increase the percentage of all trips made by walking, biking, micro-mobility/matched rides or transit to at least 35 percent by 2025; 50 percent by 2035; and maintain at least 50 percent by 2050.</p> <p>Reduce vehicle miles traveled per capita by at least 13 percent by 2025; 39 percent by 2035; and 45 percent by 2050.</p> <p>Ensure Los Angeles is prepared for Autonomous Vehicles (AV) by the 2028 Olympic and Paralympic Games.</p>	<p>Consistent</p> <p>As discussed in Section 4.15, <i>Transportation and Traffic</i>, the Project would minimize per capita vehicle trips and vehicle miles traveled by enhancing access to walking, bicycling, and transit. Therefore, the Project would be consistent in reducing per capita daily trips and VMT.</p>

In addition, individual development projects constructed within the Project Area would be required to comply with the Los Angeles Green Building Code. The City's Green Building Code includes energy and water saving measures that reduce GHG emissions below 2013 Title 24 requirements. It promotes sustainable building practices by creating a series of requirements and incentives for developers to meet the U.S. Building Council's Energy and Design standards. The Green Building Code includes the following key mandatory measures for non-residential and high-rise residential buildings related to GHG reduction:

- **Short-Term Bicycle Parking:** If a development project is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passersby, for five percent of visitor motorized vehicle parking capacity, with a minimum of one two-bike capacity rack.
- **Long-Term Bicycle Parking:** For buildings with over 10 occupants, provide secure bicycle parking for five percent of motorized vehicle parking capacity, with a minimum of one space. Acceptable parking facilities shall be convenient from the street and may include:
 - Covered, lockable enclosures with permanently anchored racks for bicycles.
 - Lockable bicycle rooms with permanently anchored racks.
 - Lockable, permanently anchored bicycle lockers.
- **Designated Parking:** Provide designated parking, by means of permanent marking or a sign, for any combination of low-emitting, fuel-efficient, and carpool/van pool vehicles as described in Table 5.106.5.2 of the Green Building Code.
- **Energy Conservation:** Provide electric vehicle supply wiring for a minimum of five percent of the total number of parking spaces.
- **Energy Conservation:** A project must exceed the California Energy Code requirements, based on the 2008 Energy Efficiency Standards, by 15 percent using an Alternative Calculation Method approved by the California Energy Commission.
- **Energy Conservation:** Each appliance provided and installed shall meet Energy Star requirements if an Energy Star designation is applicable for that appliance.
- **Renewable Energy:** Provide future access, off-grid pre-wiring, and space for electrical solar systems.

Because the Project would be consistent with the goals of GreenLA and the Sustainable City pLAn/Green New Deal, and future development projects within the Project Area would be required to comply with the City’s Green Building Code, the Proposed Project would be consistent with the City’s strategies for reducing GHG.

The City of Los Angeles General Plan Framework Element

The General Plan’s guiding document for the City of Los Angeles is the Framework Element, which provides a strategy for long-range growth and development. The Proposed Project focuses on providing 100 percent affordable, mixed-income housing, and permanent supportive housing that has access to public transit through the 2040 buildout year. **Table 4.7-9** discusses consistency of the Proposed Project with the City of Los Angeles’ General Plan Framework Element.

The City of Los Angeles General Plan Air Quality Element

The City’s General Plan Air Quality Element, adopted in 2003, sets forth goals, objectives, and policies that aim to guide the City in implementing its air quality improvement programs and strategies. The Air Quality Element recognizes that air quality strategies must be integrated into land use and transportation decisions and aims to facilitate consistency with regional Air Quality, Growth Management, Mobility, and Congestion Management Plans. **Table 4.7-10** shows objectives contained in the City’s Air Quality Element applicable to reducing GHG emissions and how the Proposed Project’s goals and objectives satisfy these objectives.

The City of Los Angeles General Plan Mobility Element

As discussed in Section 4.15, *Transportation and Traffic*, the citywide Ordinance on Transportation Demand Measures (TDM) and Trip Reduction Measures (Ordinance No. 168,700) would continue to be implemented within the Project Area. This Ordinance calls for several measures to be taken by non-residential developments in an effort to reduce single-occupancy vehicle trips. As illustrated in **Table 4.7-11**, the Proposed Project would be consistent with the City’s Mobility Plan 2035.

As discussed below, the Proposed Project would concentrate development around transit, comprise a wide mix of uses, and better accommodate pedestrians and bicyclists. By accommodating new residential and non-residential development in an urbanized area with good access to transit, the Proposed Project would encourage a transportation mode shift from private vehicles to public transit. These characteristics are anticipated to reduce per capita GHG emissions associated with cars and light trucks. The Project would be consistent with AB 32, SB 375, the 2020-2045 RTP/SCS, regional and local strategies to reduce GHG, and can be expected to contribute to reductions in per capita GHG emissions when viewed at the regional level. Therefore, impacts related to GHG emissions under the Proposed Project would be *less than significant*.

TABLE 4.7-9 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY OF LOS ANGELES GENERAL PLAN FRAMEWORK ELEMENT (1995)	
Objective	Project Consistency
<p>3.15 Focus mixed commercial/ residential uses, neighborhood-oriented retail, employment opportunities, and civic and quasi-public uses around urban transit stations, while protecting and preserving surrounding low-density neighborhoods from the encroachment of incompatible land uses.</p>	<p>Consistent As discussed in Section 4.15, <i>Transportation and Traffic</i>, the Project Area is well served by public transit, including regional rail service, many local and rapid bus lines, and the Metro. Metro, the primary transit provider in the region, also maintains the Gold (L) Line light rail route that intersects the Project Area as it runs east-west between East Los Angeles and Azusa via Downtown. Pedestrian facilities primarily consist of sidewalks adjacent to roadways, and a limited bicycle network is provided. The transportation network in the Project Area is primarily auto- and bus transit-oriented.</p>

TABLE 4.7-9 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY OF LOS ANGELES GENERAL PLAN FRAMEWORK ELEMENT (1995)	
Objective	Project Consistency
<p>3.16 Accommodate land uses, locate and design buildings, and implement streetscape amenities that enhance pedestrian activity.</p>	<p>Consistent The Project includes policies that support reductions in vehicle miles traveled and ultimately GHG emissions, such as policies promoting active transport through the development of walkable streets and the expansion of bicycle and pedestrian facilities. While total daily VMT would increase from existing conditions to 2040 with Project conditions, total daily VMT per service population would decrease from 28.7 to 15.2 (based on population values summarized in Section 4.12, <i>Population, Housing and Employment</i>).</p>
<p>4.2 Encourage the location of new multi-family housing development to occur in proximity to transit stations, along some transit corridors, and within some high activity areas with adequate transitions and buffers between higher-density developments and surrounding lower-density residential neighborhoods.</p>	<p>Consistent The Project would update and recalibrate incentives to deliver more affordable units, while being simpler to understand and implement. The current incentive system would be replaced with a new base and bonus system (Community Benefits Program), similar to that found in the proposed new Zoning Code for the Downtown Plan, intended to establish a clearer set of objective standards for projects that wish to build beyond their base zoning. The main incentive used to garner public benefits under the Proposed Project is through floor area rights (depicted as Floor Area Ratio, or FAR).</p>
<p>9.40 Ensure efficient and effective energy management in providing appropriate levels of lighting for private outdoor lighting for private streets, parking areas, pedestrian areas, security lighting, and other forms of outdoor lighting and minimize or eliminate the adverse impact of lighting due to light pollution, light trespass, and glare.</p>	<p>Consistent As discussed in Section 4.5.2, <i>Regulatory Setting</i>, of the Energy Section of this EIR, future development in the Project Area would be required to comply with energy efficiency lighting and light pollution reduction requirements included in the 2019 California Building Code, including the CalGreen Code, and the Los Angeles Building Code and Los Angeles Green Building Code (LAMC Chapter IX); the Los Angeles Building Code and Green Building Code largely incorporate and amend the 2013 California Building Code and CalGreen Code, respectively. For example, Subsection 99.05.106.8 of the Los Angeles Green Building Code sets restrictions on residential outdoor lighting, and Section 99.04.211.4 requires residences to be constructed with solar-ready features as specified in the California Energy Code. Lighting requirements and potential light pollution and glare impacts would be less than significant, as discussed in Section 4.1, <i>Aesthetics</i>.</p>

TABLE 4.7-10 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY OF LOS ANGELES GENERAL PLAN AIR QUALITY ELEMENT (1992)	
Objective	Project Consistency
<p>Objective 1.1 Reduce air pollutants consistent with the Regional Air Quality Management Plan (AQMP), increase traffic mobility, and sustain economic growth citywide.</p>	<p>Consistent As discussed in Section 4.2, <i>Air Quality</i>, Project development would generate emissions exceeding SCAQMD significance thresholds. However, growth under the Proposed Project would be consistent with SCAG forecasts upon which the AQMP is based. In addition, the Project Area includes a wide range of transportation options and consequently, as discussed in Section 4.15, <i>Transportation and Traffic</i>, per capita vehicle miles traveled (VMT) in the Project Area are forecast to remain well below City and regional averages.</p>
<p>Objective 2.1 Reduce work trips as a step towards attaining trip reduction objectives necessary to achieve</p>	<p>Consistent The Proposed Project would reduce work trips by promoting development near major transit hubs, promoting development of residences near employment, improving and expanding pedestrian, bicycle, and transit facilities, and supporting complete communities with a mix of residences</p>

TABLE 4.7-10 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY OF LOS ANGELES GENERAL PLAN AIR QUALITY ELEMENT (1992)	
Objective	Project Consistency
regional air quality goals.	and community-serving uses. While total daily VMT would increase from existing conditions to 2040 with Proposed Project conditions, per capita VMT would decrease from 55 to 17 VMT per capita daily (based on population values summarized in Section 4.12, <i>Population, Housing and Employment</i>).
Objective 2.2 Increase vehicle occupancy for non-work trips by creating disincentives for single passenger vehicles and incentives for high occupancy vehicles.	Consistent The Project Area is well served by public transit and a variety of enhancements to public transit are proposed. While total daily VMT would increase from existing conditions to 2040 with Project conditions, total daily VMT per service population would decrease from 28 to 15.2 (based on population values summarized in Section 4.12, <i>Population, Housing and Employment</i>). In addition, the Project promotes higher vehicle occupancy.
Objective 5.1 Increase energy efficiency of City facilities and private developments.	Consistent. As discussed in Section 4.5.2, <i>Regulatory Setting</i> , of the Energy Section of this EIR, the City’s Green Building Code would enforce the application of the 2019 CalGreen standards and would apply to all new buildings, all additions, and any alterations with building valuations over \$200,000. In addition, the Proposed Project contains the following passive energy efficiency policies relating to City facilities and private developments that would result in reductions of per capita GHG emissions: This is a conservative assumption since potential energy efficiency measures required by subsequent Title 24 updates in 2022, 2025, and 2028 are not included.
3.1 Increase the portion of work trips made by transit to levels that are consistent with the goals of the AQMP and Congestion Management Plan	Consistent See response to General Plan Air Quality Element Objective 2.1.
3.2 Reduce vehicular traffic during peak periods.	Consistent See response to General Plan Air Quality Element Objective 2.1. The overall reduction in per capita vehicle trips and vehicle miles traveled would also reduce peak period traffic.
4.2 Reduce vehicle trips and vehicle miles traveled associated with land use patterns.	Consistent See response to General Plan Air Quality Element Objective 2.1. Reasonably anticipated development from the Project would include a mix of residential, service-oriented, and job-generating uses that would encourage transit use, walking, and bicycling while minimizing travel distances and vehicle miles traveled.
5.2 Have a portion of the City’s service fleet be comprised of alternative fuel powered vehicles, subject to availability of funding, and practical feasibility.	Consistent The Project does not contain any policies specifically aimed at improving City’s service fleet’s efficiency or alternative fuel use. However, the Project does not involve management of the City’s service fleet and would not obstruct the City’s ambition in implementing the City’s General Plan Air Quality Element Objective 5.2.
5.3 Reduce the use of polluting fuels in stationary sources.	Consistent The Proposed Project does not contain any policies specifically aimed at reducing polluting fuels in stationary sources. However, the Proposed Project does not include construction industrial uses that could become a stationary source; therefore, implementation of the Project would not create any obstructions to implement the City’s General Plan Air Quality Element Objective 5.3.

TABLE 4.7-11 CONSISTENCY ANALYSIS OF THE PROPOSED PROJECT WITH THE CITY OF LOS ANGELES MOBILITY ELEMENT – MOBILITY PLAN 2035 (2016)	
Objective	Project Consistency
4.2 Meet a 9 percent per capita GHG reduction for 2020 and a 16 percent per capita reduction for 2035.	Consistent As illustrated in Table 4.7-4 , implementation of the Proposed Project would result in a 66 percent reduction in per capita GHG emissions by 2040 in comparison to existing conditions, which substantially exceeds the Mobility Element's reduction goals for 2020 and 2035.
4.3 Convert 100 percent of City General Services Division vehicle fleet to alternative fuels and/or zero emission vehicles by 2035.	Consistent See the response to General Plan Air Quality Element Objective 5.2. Although the Project does not include specific policies to implement this objective, it would not preclude conversion of the City's vehicle fleet.
4.4 Convert 100 percent of City refuse collection trucks and street sweepers to alternative fuels by 2020.	Consistent See response to General Plan Air Quality Element Objective 5.2. Although the Project does not include specific policies to implement this objective, it would not preclude conversion of the City's vehicle fleet.
4.5 Reduce transportation-related energy use by 95 percent and reduce maintenance requirements of City vehicle fleet.	Consistent See response to General Plan Air Quality Element Objective 5.2. Additionally, although implementation of the Proposed Project would result in an increase in net transportation energy consumption by 2040, as discussed in Section 4.5, <i>Energy</i> , the Project Area would have a 69 percent decrease in per capita transportation energy consumption by 2040.

CUMULATIVE IMPACTS

GHG and climate change are, by definition, cumulative impacts. The geographic scope for considering cumulative impacts related to GHG emissions is the state of California. Although GHG emissions have worldwide repercussions, the contribution of the project to the impact is addressed in light of the goals for reducing statewide emissions.

Statewide GHG emissions are an existing significant cumulative impact. As such, the state has established the following statewide emissions reductions targets:

- By 2020, reduce GHG emissions to 1990 levels
- By 2030, reduce GHG emissions to 40 percent below 1990 levels
- By 2050, reduce GHG emissions to 80 percent below 1990 levels

GHG impacts are assessed in a cumulative context since no single project can cause a discernible change to the climate. Therefore, cumulative significance is based on the same thresholds as the Proposed Project. In the absence of any adopted numeric threshold, the significance of the Project's GHG emissions is evaluated consistent with *CEQA Guidelines* Section 15064.4(b) by considering whether the Proposed Project complies with applicable plans, policies, regulations, and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. For the Project, the most directly applicable adopted regulatory plans to reduce GHG emissions are the 2022 Scoping Plan, 2020-2045 SCS/RTP, the LA Green Plan/Climate LA, the Sustainable City pLAn/Green New Deal, and the City of Los Angeles General Plan's Framework, Air Quality, and Mobility Element. The Proposed Project's GHG emissions were evaluated based on per capita CO₂e emissions, and the 2020-2045 RTP/SCS regional per-capita GHG emissions target from passenger and light duty vehicles from 2005 levels. The Proposed Project would provide affordable, market rate, and mixed-income residential units accessible to

public transit and parks. The buildout of the project would decrease 74 percent per capita GHG emissions and decrease passenger per capita GHG emissions from existing conditions by 53 percent below the 2005 emissions target. The Proposed Project would comply with the 2022 California Building Code, including the CalGreen Code, and the Los Angeles Building Code and Los Angeles Green Building Code. This is a conservative assumption since the energy use estimates do not account for potential energy efficiency measures required by subsequent Title 24 updates in 2025 and 2028. In addition, the Proposed Project would apply conservation standards that are intended to reduce energy demand, recycle water and decrease demand for potable water, reduce waste and use of new materials, and reduce demand on natural resources.

Therefore, the Project would be consistent with the 2022 Scoping Plan, 2020-2045 RTP/SCS, regional and local strategies to reduce GHG, and can be expected to contribute to reductions in per capita GHG emissions when viewed at the regional level. Thus, based on the *CEQA Guidelines* for determining the significance of GHG emissions, while cumulative impacts are significant, the Proposed Project's contribution would not be considerable.

4.8 HAZARDS AND HAZARDOUS MATERIALS

This section addresses potential impacts associated with risk of upset related to hazardous materials, airports, wildfires, emergency access, and hazards to schools from implementation of the updated Cornfield Arroyo Seco Plan (CASP) Plan (or “Proposed Project” or “Project”) in the existing CASP area of Los Angeles (or “Project Area”).

ENVIRONMENTAL SETTING

HAZARDOUS MATERIALS

The term “hazardous material” can have varying definitions for different regulatory programs. For the purpose of this EIR, the term “hazardous materials” refers to both hazardous materials and hazardous waste. The California Health and Safety Code Section 25501(n)(1) defines hazardous materials as any material that “because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment.” Hazardous materials include but are not limited to hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or environment.

A material is hazardous if it exhibits one or more of the following characteristics: toxicity, ignitability, corrosivity, and reactivity (Code of Regulations, Title 22). These types of hazardous materials are defined below:

- **Toxic Substances.** Toxic substances may cause short-term or long-lasting health effects, ranging from temporary effects to permanent disability, or even death. For example, such substances can cause disorientation, acute allergic reactions, asphyxiation, skin irritation, or other adverse health effects if human exposure exceeds certain levels. (The level depends on the substances involved and is chemical-specific.) Carcinogens (substances that can cause cancer) are a special class of toxic substances. Examples of toxic substances include benzene (a component of gasoline and suspected carcinogen) and methylene chloride (a common laboratory solvent and a suspected carcinogen).
- **Ignitable Substances.** Ignitable substances are hazardous because of their ability to burn. Gasoline, hexane, and natural gas are examples of ignitable substances.
- **Corrosive Materials.** Corrosive materials can cause severe burns. Corrosives include strong acids and bases such as sodium hydroxide (lye) or sulfuric acid (battery acid).
- **Reactive Materials.** Reactive materials may cause explosions or generate toxic gases. Explosives, pure sodium or potassium metals (which react violently with water), and cyanides are examples of reactive materials.

Soil and groundwater can become contaminated by hazardous material releases in a variety of ways, including permitted or illicit use and accidental or intentional disposal or spillage. Before the 1980s, most land disposal of chemicals was unregulated, with the result that numerous industrial properties and public landfills became dumping grounds for unwanted chemicals. The largest and most contaminated of these sites became Superfund sites, so named for their eligibility to receive cleanup money from a federal fund

established under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA; see Section 4.8.3, *Regulatory Framework*, for more details about CERCLA). The National Priorities List (NPL) is the list of national priorities among the known releases or threatened releases of hazardous substances, pollutants, or contaminants throughout the United States and its territories. The NPL is intended primarily to guide the United States Environmental Protection Agency (USEPA) in determining which sites warrant further investigation. Sites are added to the NPL following a hazard ranking system.

In addition to soil and groundwater contamination, the following substances may occur throughout the City in older buildings or products. The effects of these substances and where they are commonly present are explained below.

Asbestos Containing Materials (ACMs)

Asbestos is a naturally occurring fibrous material that was widely used in structures built between 1945 and 1989 for its fireproofing and insulating properties. ACMs were banned by USEPA between the early 1970s and 1991 under the authority of the federal Clean Air Act (CAA) and the Toxic Substances Control Act (TSCA) due to their harmful health effects. Exposure to asbestos increases risk of developing lung disease, such as lung cancer, mesothelioma (a type of cancer), or asbestosis (a type of chronic, non-cancer lung disease) (USEPA 2021a). Common ACMs include vinyl flooring and associated mastic, wallboard and associate joint compound, plaster, stucco, acoustic ceiling spray, ceiling tiles, heating system components, and roofing materials. Commercial/industrial structures are affected by asbestos regulations if damage occurs or if remodeling, renovation, or demolition activities disturb ACMs. Since many of the structures in the Project Area were constructed before 1989, there is a potential for the presence of ACMs to exist in a wide variety of building materials in the Project Area.

Lead and Lead-Based Paint (LBP)

Lead is a naturally occurring metallic element. Because of its toxic properties, lead is regulated as a hazardous material. Excessive exposure to lead can result in the accumulation of lead in the blood, soft tissues, and bones. Children are particularly susceptible to potential lead-related health problems because it is easily absorbed into developing systems and organs. Lead can affect almost every organ and system in the body and can result in behavior and learning problems, lower IQ and hyperactivity, hearing problems, and anemia in children, and cardiovascular effects, decreased kidney function, and reproductive problems in adults (USEPA 2021b). Among its numerous uses and sources, lead can be found in paint, water pipes, solder in plumbing systems, and in soils around buildings and structures painted with LBP. LBP was primarily used during the same time period as ACMs. Commercial/industrial structures are affected by lead-based paint regulations if the paint is in a deteriorated condition or if remodeling, renovation, or demolition activities disturb LBP surfaces. Since many of the residential structures within the Project Area were constructed before 1978, there is potential for structures to contain paints and coatings with detectable or elevated concentrations of lead.

Polychlorinated Biphenyls (PCBs)

PCBs are mixtures of up to 209 individual chlorinated compounds. There are no known natural sources of PCBs. PCBs have been used as coolants and lubricants in transformers, capacitors, and other electrical equipment because they do not burn easily and are good insulators. The manufacture of PCBs was banned in the United States in 1979 by the TSCA because of evidence that they build up in the environment and can cause a variety of harmful health effects. Health risks include cancer as well as non-cancer effects on the immune system, reproductive system, nervous system, endocrine system, such as a decrease in the size of the thymus gland, decreased birth weight and gestational age for children born to women exposed to PCBs, and decreased thyroid hormone levels (USEPA 2021c). Products made before 1979 that may contain

PCBs include old fluorescent lighting fixtures and electrical devices containing PCB capacitors, and old microscope and hydraulic oils.

EXISTING ENVIRONMENTAL SETTING

Hazardous Materials Sites

The locations where hazardous materials are used, stored, treated and/or disposed of comes to the attention of regulatory agencies through various means, including licensing and permitting, enforcement actions, and anonymous tips. To the extent possible, the locations of these businesses and operations are recorded in several database lists maintained by various State, federal, and local regulatory agencies. In some cases, businesses that use hazardous materials in quantities greater than certain established thresholds are required to file business plans with the Los Angeles County Fire Department (LAFD). Other businesses that engage in the transport, storage, treatment, or disposal of hazardous materials are required to maintain detailed records of all their hazardous materials-related activities. Federal, State, and local agencies enforce regulations applicable to hazardous waste generators and users, and the LAFD Health Hazardous Materials Division tracks and inspect hazardous materials handlers to ensure appropriate reporting and compliance.

Permitted uses of hazardous materials include those facilities that use hazardous materials or handle hazardous wastes in accordance with current hazardous materials and hazardous waste regulations. The use and handling of hazardous materials from these sites is considered low risk, although there can be instances of unintentional chemical releases. In such cases, the site would be tracked in the environmental databases as an environmental case. Permitted sites without documented releases are, nevertheless, potential sources of hazardous materials in the soil and/or groundwater (compared to sites where there are no hazardous materials used or stored) because of accidental spills, incidental leakage, or spillage that may have gone undetected. Many of the facilities are permitted for more than one hazardous material use, and therefore could appear in more than one database.

The potential to encounter hazardous materials in soil and groundwater in the Project Area was based on a search of federal, State, and local regulatory databases that identify permitted hazardous materials uses, environmental cases, and spill sites.

The following databases were searched for hazardous sites:

- California Department of Toxic Substance Control (DTSC) EnviroStor Database
- State Water Resources Control Board (SWRCB) GeoTracker Database
- USEPA Superfund Enterprise Management System (SEMS) Database in Envirofacts

The EnviroStor database contains information on properties in California where hazardous substances have been released or where the potential for a release exists. The GeoTracker database contains information on properties in California for sites that require cleanup, such as leaking underground storage tank (LUST) sites, which may impact, or have potential impacts, to water quality, with emphasis on groundwater. The SEMS database lists Superfund sites that are found on the NPL.

Hazardous Material Sites

Hazardous materials sites in the Project Area identified in applicable databases are discussed below.

DTSC EnviroStor Database

A search of this database was conducted on February 4, 2022 and identified eight “Active” sites in the Project Area. An “Active” site identifies that an investigation and/or remediation is currently in progress and that DTSC is actively involved, either in a lead or support capacity. **Table 4.8-1** lists the “Active” EnviroStor-listed cleanup sites in the Project Area. **Figure 4.8-1** and **Table 4.8-3** present the EnviroStor-listed (and GeoTracker-listed) cleanup sites in the Project Area, including the aforementioned nine active sites as well as a number of sites that are inactive or do not require further action (a full table is included as Appendix G).

TABLE 4.8-1 “ACTIVE” ENVIROSTOR SITES IN THE PROJECT AREA					
Label	Site Name	Address	City	Site Type	Status
1	140-154 N Avenue 21	140-154 N Avenue 21	Los Angeles	Voluntary Cleanup	Active
6	Avenue 34	West Avenue 34 and Pasadena Avenue	Los Angeles	Voluntary Cleanup	Active
18	Cornfield Site	1245 N. Spring Street	Los Angeles	Voluntary Cleanup	Active
27	Jaybee Site at Lincoln Heights - LADWP	301 West Avenue 26	Los Angeles	Voluntary Cleanup	Active
29	Kennington	3209 Humboldt Street	Los Angeles	Voluntary Cleanup	Active
33	LADWP Main Street Center	1630 N Main St Ste 16	Los Angeles	Corrective Action	Active
71	Welch's Uniform Facility (Former)	3505 Pasadena Avenue	Los Angeles	Voluntary Cleanup	Active
75	William Mead Homes	1300 Cardinal Street	Los Angeles	State Response or NPL	Active

The following is a discussion of the eight “Active” sites in the Project Area as listed in the DTSC EnviroStor Database:

1. **140-154 N Avenue 21** – 140-154 North Avenue 21: The Site is currently developed with a 14,400 square-foot industrial building. The Site is currently owned by the Los Angeles Department of Water and Power (LADWP). Previous occupants include U.P.A., which leased the site from 2013 to 2017 and used it as a warehouse, and prior to that, Veolia Transportation, which used the Site as a garage and service area for bus and trolley maintenance. The Site’s past uses that caused contamination include a railroad maintenance shop and vehicle maintenance. This led to potential contaminated soil, soil vapor, and “other” groundwater (uses other than drinking water). The potential contaminants of concern include dichloroethane (EDC), tetrachloroethylene (PCE), toluene, and trichloroethylene (TCE). The DTSC is overseeing the evaluation and cleanup of contamination on the Site, including a Remedial Investigation Workplan approved October 30, 2019.
2. **Avenue 34** – West Avenue 34 and Pasadena Avenue: The Site is approximately 5.03 acres in size and has been historically developed with industrial uses. By 1920, the Site was developed and occupied by the Los Angeles Sand & Gravel Company, which occupied the property until at least 1928, and terminated by 1938. By 1948, areas of the Site were redeveloped with six industrial structures, occupied by Steel Framing & Building Corporation in 1951, and ITT Cannon Industries, Inc. from at least 1964 to 1970. The Site was occupied by American Caster Co. from 1977 until the property was purchased by Mr. Eric Ortiz in 1999. The current owners of the Site are R Cap Avenue 34, LLC and R Cap Avenue Two, LLC. The Site is currently unoccupied. The owners demolished the unoccupied buildings on the Site to construct a 400+ unit apartment complex with underground parking and ground floor retail development. The development project (Project) was approved on October 8, 2020, by the Los Angeles City Planning Commission, which found that the Project was

assessed in Mitigated Negative Declaration, No. ENV-2016-273-MND adopted on August 22, 2017, and the addendum dated December 2019.

The Site has been subject to a prior enforcement action and cleanup in 1984, when the City of Los Angeles filed 12 criminal charges against American Caster Co., after the joint city-county Hazardous Waste Strike Force discovered 252, 52-gallon drums of organic solvents buried throughout the property, as well as toxic chemicals discharged into the City's sewer system, as part of a 2½-month investigation.¹ Additionally, the Site's past uses that caused contamination include a machine shop, manufacturing - electronic, and manufacturing - metal. The activities on the Site led to potential contaminated soil, soil vapor, and "other" groundwater (uses other than drinking water). Site assessments conducted between 2019 and 2021 identified the presence of chemicals of concerns (COCs) at the site including tetrachloroethylene (PCE), trichloroethene (TCE), and total petroleum hydrocarbons (TPH) in soil gas and soil; lead, arsenic, and hexavalent chromium in isolated occurrences in soil; and generally low concentrations of PCE, TCE, TPH, and dichloroethane (cis,1,2-DCE) in groundwater.

The DTSC and the Site owners have entered into a Standard Voluntary Agreement (Agreement) to review a Phase 1 and a Soils Management Plan, and DTSC's review determined that additional investigation is required prior to redevelopment. DTSC and the Site owners entered into an amendment of the Agreement and continue characterizing the Site under DTSC oversight. DTSC accepted the Phase 2 investigation results, and a transmittal of supplemental soil and groundwater data, and approved the Site Characterization Work Plan that proposes additional investigations at the Site. Subsequently, a Site Characterization Report and Draft Removal Action Workplan, which proposes excavation and implementation of a soil vapor extraction system, was reviewed and approved by DTSC for public comment. The Site Characterization Report and Draft Removal Action Workplan concludes that the nature and extent of chemical releases on the Site has been generally characterized and recommended cleanup of these chemical releases to protect future users of the site; DTSC concurred with this conclusion. A public comment period was held from November 10, 2021 through December 20, 2021, and a public meeting was held on December 1, 2021. Responses to the received public comments were provided on March 18, 2022. The Removal Action Workplan (RAW) approval, dated March 18, 2022, required minor revisions be corrected and a revised RAW submitted to DTSC and that the community update and response to public comments also be attached. As Responsible Agency under the California Environmental Quality Act (CEQA), DTSC filed a Notice of Determination for the approved the RAW on April 1, 2022, including an Addendum dated April 2022 to the Avenue 34 Project Mitigated Negative Declaration, and the determination that the RAW will not have a significant effect on the environment. Lastly, the RAW approval also required that a remedial design implementation plan (RDIP) be submitted for DTSC that details procedures for sampling and analytical testing, details of ongoing groundwater monitoring, transportation procedures, an operation and maintenance plan for soil vapor extraction, a health and safety plan, and an air monitoring plan. The RDIP was approved on July 22, 2022, with implementation of the RAW and RDIP beginning on August 3, 2022. Separate from the DTSC action, on May 4, 2022, the Los Angeles City Council passed a motion to direct the Los Angeles Bureau of Sanitation to lead off-site testing of wastewater, stormwater, and soil relative to the Site.

3. **Cornfield Site** – 1245 North Spring Street: The Site is a 32-acre abandoned railyard located near downtown Los Angeles. The Site was acquired by the State of California Department of Parks and Recreation to turn the Site into a State Park. The Site's past uses that caused contamination include vehicle storage/refueling, railroad maintenance shop, and railroad right of way. This led to potential contaminated soil and "other" groundwater (uses other than drinking water). The potential

¹ <https://www.latimes.com/environment/story/2022-04-30/an-old-toxic-dump-brings-new-worries-for-lincoln-heights>

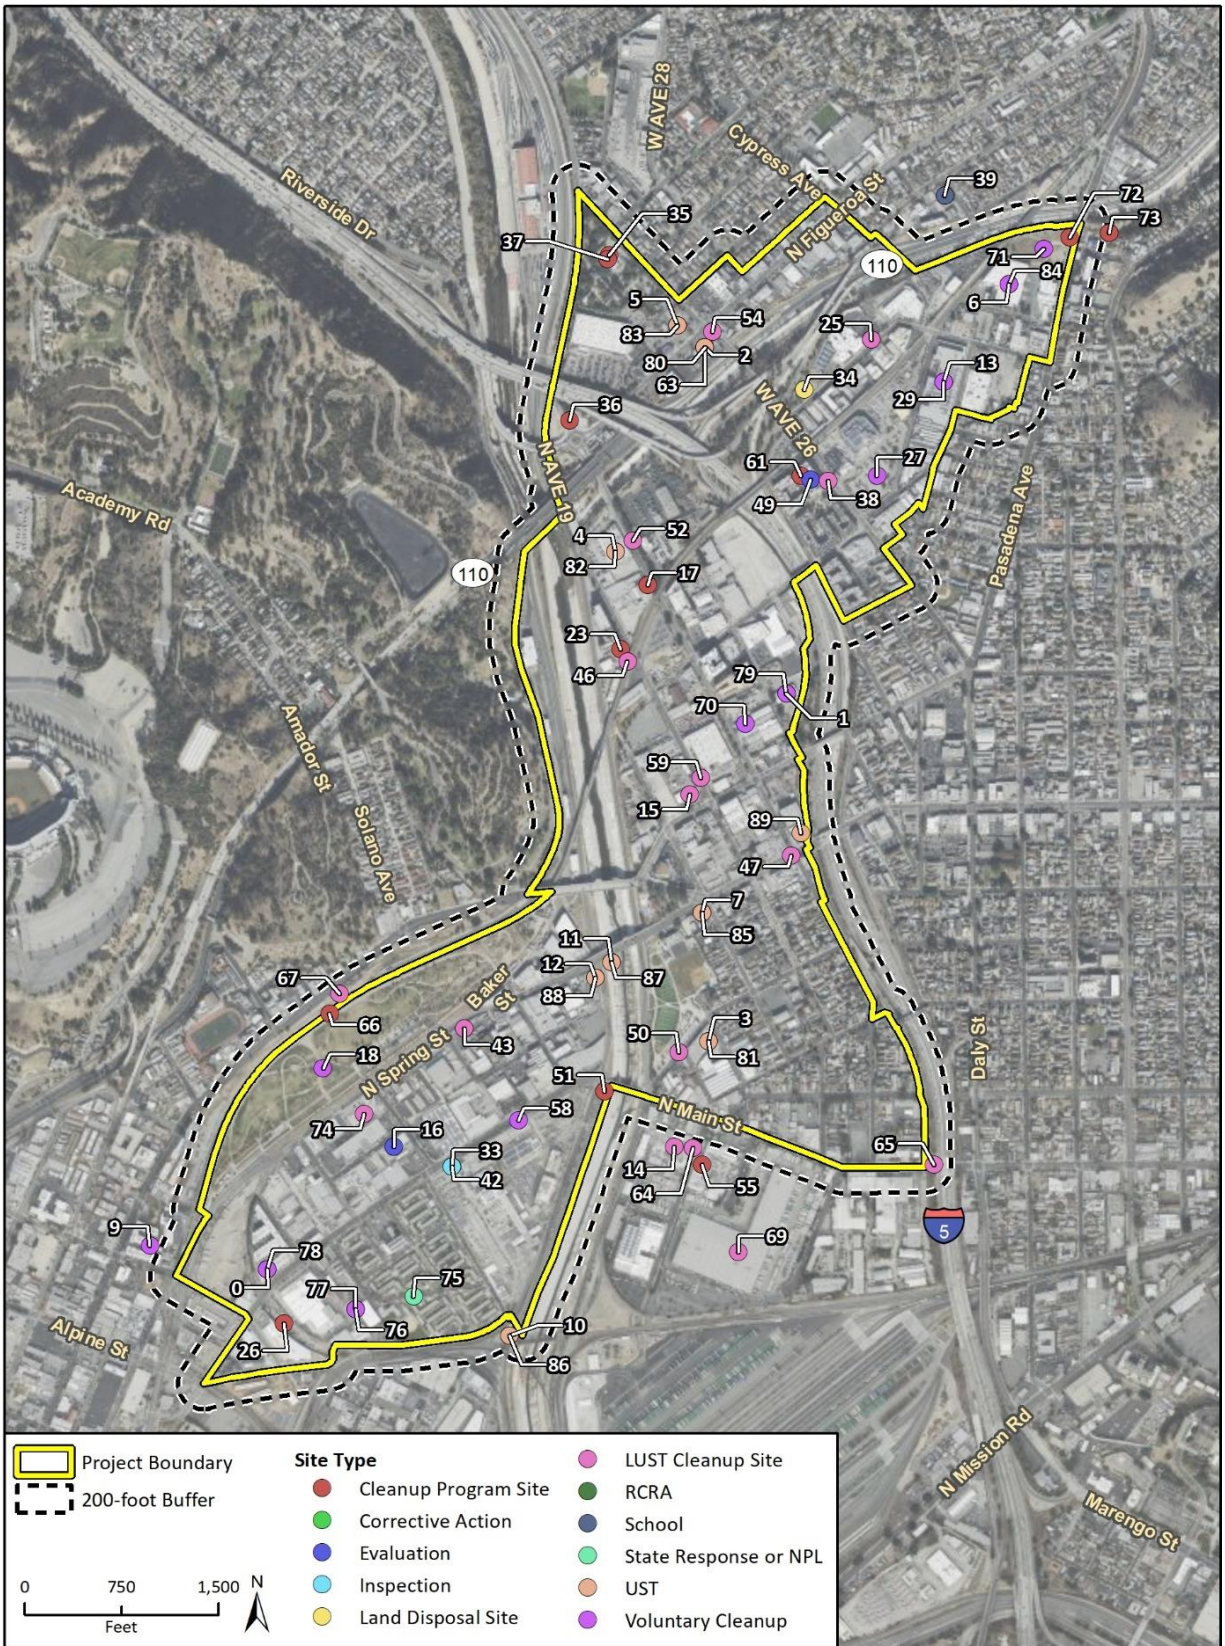

contaminants of concern include arsenic, lead, and TPH-motor oil. Several investigations have been conducted over the years with the most recent ones being conducted under the oversight of DTSC. The DTSC is overseeing the evaluation and cleanup of contamination on the Site, with the majority of the Site having been remediated.

4. **Jaybee Site at Lincoln Heights - LADWP** – 301 West Avenue 26: The Site is owned by the Los Angeles Department of Water and Power. A major part of the Site has been paved and that has been used as an employee parking lot since its purchase in 1989. The rest of the Site is vacant and has not been developed. Jaybee Manufacturing Corporation, a hardware manufacturer operated at the Site from 1970 to 1989. Other operators at this Site include Rod Forge Shop, D&B Pump and Supply, and Peerless Pump. The Site's previous owner performed the removal of an underground storage tank and contaminated soil in 1990. Previous investigation reports which contain the results of environmental media sampling conducted at the Site indicate that the soils are contaminated with Total Petroleum Hydrocarbons, Lead, Trichloroethylene, Tetrachloroethylene, Napthalene, Toluene and Xylenes. Groundwater is impacted by PCE, TCE, cis- and trans-1,2-Dichloroethene, and 1,1-dichloroethene. The DTSC is overseeing the evaluation and cleanup of contamination on the Site, including a Removal Action Workplan approved February 14, 2023.
5. **Kennington** – 3209 Humboldt Street: The Site is currently a large warehouse-type building with cement flooring and an adjoining parking lot that is also paved. The Site's past uses that caused contamination include battery manufacturing and electronic manufacturing. This led to potential contaminated soil and "other" groundwater (uses other than drinking water). The potential contaminants of concern include lead, polychlorinated biphenyls (PCBs), tetrachloroethylene (PCE), and trichloroethylene (TCE). A land use covenant was recorded on the property which set forth land use restrictions and site management requirements, including prohibiting activities that disturb the remedy and monitoring systems without approval.
6. **LADWP Main Street Center** – 1630 North Main Street, Suite 16: A hazardous waste facility permit, issued to LADWP on August 10, 1983, allowed the facility to store up to 60 55-gallon drums of hazardous waste. LADWP did not renew the permit and requested the closure of the hazardous waste storage unit. A closure plan was implemented and investigation detected concentrations of hazardous waste exceeding the cleanup criteria, as well as VOCs in soil gas samples. LADWP entered into a Corrective Action Consent Agreement in August 1999 with the DTSC for its Main Street Center. The Consent Agreement requires LADWP to identify and further investigate all solid waste management units (SWMUs) and areas of concern (AOCs) at the site as part of a Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) process. Cleanup is ongoing with a cleanup complete due date of 2028.
7. **Welch's Uniform Facility (Former)** – 3505 Pasadena Avenue: The Site was formerly a commercial linen and apparel laundering and delivery service facility that was established circa 1920 and operated until approximately 1988. All buildings associated with the previous operation were removed in 1993, and the Site is now a vacant parcel. The development of a proposed warehouse building is anticipated for the Site. The Site is currently enrolled in a Voluntary Cleanup Agreement executed on June 17, 2007, between the DTSC and AmeriPride, now owned by ARAMARK. A soil vapor extraction (SVE) system, which extracted volatile organic compound (VOC) impacted vapors from eleven SVE wells, operated at the site from December 2013 until July 2015 when it was shut down for rebound testing. The soil vapor rebound testing indicated that all concentrations were below the respective soil vapor cleanup goals, and the cumulative soil vapor risk was evaluated and determined to be below the established risk levels. This information was presented to DTSC in the Request for NFA of the SVE system and Site Closure letter, dated April 20, 2016. DTSC subsequently approved the no further action (NFA) and decommissioning of the SVE system in their letter dated August 17, 2016. The SVE system was decommissioned and removed from the Site, and the eleven SVE wells and eight soil vapor monitoring points were

decommissioned in December 2016. The Site continues monitoring activities. The primary constituent of concern in groundwater at the site is PCE. Groundwater monitoring continues at the site on a semi-annual basis. During the most recent groundwater monitoring event, in October 2020, the highest PCE concentration at the Site was 24 micrograms per liter (ug/L), observed in monitoring well MW-3. In 2021, groundwater monitoring transitioned to monitoring on an annual basis. On August 3, 2022, a land use covenant was recorded prohibiting activities which disturb the remedy and monitoring systems without approval, as well as any residential, hospital, school, and day care center uses. On April 12, 2023, Phase I and Phase II Environmental Site Assessments were reviewed pursuant to the Voluntary Cleanup Agreement, Docket No. HSA-FY22/23090 entered between DTSC and Pasadena XC LLC, on March 22, 2023, relative to the proposed warehouse building on the Site.

8. **William Mead Homes** – 1300 Cardinal Street: The Site is currently developed with a 415-unit public housing developed owned by the Housing Authority of the City of Los Angeles (HACLA). The Site's past uses that caused contamination include an oil field. This led to potential contaminated soil and "other" groundwater (uses other than drinking water). The potential contaminants of concern include aqueous solution with metals, oil/water separation sludge, unspecified oil containing waste, and waste oil and mixed oil. HACLA entered into a Consent Order with DTSC to perform required remedial actions. Contaminated soils were excavated and replaced with clean soil from August 2004 to June 2005. On December 3, 2013, a deed restriction was recorded on the property prohibiting excavation of contaminated soils without DTSC review and approval, as well as a prohibition on activities which disturb the soil below a specified depth without DTSC review and approval of a Soils Management Plan. In November 2021, HACLA received a Choice Neighborhoods Planning Grant from the U.S. Department of Housing and Urban Development (US HUD) to support the development of a comprehensive neighborhood Transformation Plan that will outline a strategy for the replacement of the existing public housing units at William Mead Homes. The Transformation Plan is an approximately two-year process that will include the development of a master plan that will allow HACLA to move forward with the preferred redevelopment plan for William Mead. At this time, the timeline and details associated with the future William Mead master plan and any future development on the Site is unknown.

 Additional data provided by GeoTracker and EnviroStor, 2022.

Fig 4.8-1 GeoTracker and EnviroStor Sites

SWRCB GeoTracker Database

A search of this database was conducted on February 4, 2022 and identified six “Open” cleanup sites in the Project Area and 32 cases that were completed and closed. A completed and closed site indicates that a closure letter or other formal decision document has been issued for the site. Open sites are categorized as “Assessment and Interim Remedial Action,” “Remediation,” “Site Assessment,” “Verification Monitoring,” “Reopen Case,” “Eligible for Closure,” or “Inactive” for sites where no regulatory oversight activities are being conducted by the Lead Agency. **Table 4.8-2** lists the “Open” GeoTracker-listed cleanup sites in the Project Area. **Figure 4.8-1** and **Table 4.8-3** present the GeoTracker-listed (and EnviroStor-listed) sites in the Project Area (a full table is included as Appendix G).

TABLE 4.8-2 “OPEN” GEOTRACKER SITES IN THE PROJECT AREA					
Label	Site Name	Address	City	Site Type	Status
11	Bortz Oil	1746 Spring St N	Los Angeles	Cleanup Program Site	Open - Inactive
13	Cannon Electrical	3209 Humboldt St	Los Angeles	Cleanup Program Site	Open - Inactive
17	Commercial/Industrial Property	405 N San Fernando Rd	Los Angeles	Cleanup Program Site	Open - Site Assessment
23	Former Lincoln Heights Jail	401 N Ave 19	Los Angeles	Cleanup Program Site	Open - Site Assessment
66	Union Pacific Railroad - Cornfield Yard	1245 N Spring St	Los Angeles	Cleanup Program Site	Open - Verification Monitoring
72, 73	Welch's Uniform Rental (former)	3505 Pasadena Ave	Los Angeles	Cleanup Program Site	Open - Inactive

The following is a discussion of the six “Active” sites in the Project Area as listed in the SWRCB GeoTracker Database:

1. **Bortz Oil** – 1746 North Spring Street: The Site was formerly used to manufacture and distribute various petroleum products. This led to potential contaminated soil and “other” groundwater (uses other than drinking water). The potential contaminants of concern include volatile organics (8260B VOCs). Soils closure was granted by DTSC in August 2002, after a Covenant to Restrict Land Use (Covenant) for the Spring Street parcel was finalized and notarized with the Los Angeles County Recorder’s office. The Covenant specifies the implementation of land use restrictions for the property to provide acceptable protection of human safety and the environment. The Covenant specifies that Site use will be restricted to commercial and industrial activities and prohibits drilling for drinking water without prior written consent of DTSC. The Site currently has a Cleanup Program Site status under the State Water Resources Control Board’s Site Cleanup Program.
2. **Cannon Electrical** – 3209 Humboldt Street: See “Kennington” above.
3. **Commercial/Industrial Property** – 405 North San Fernando Road: The Site is developed with a vacant industrial building that was formerly used for food processing. No potential contaminants of concern have been identified and no cleanup actions exist on this site per GeoTracker. The Site has an “Open - Site Assessment” status on GeoTracker as the owner of the property entered into an assessment/remedial action agreement with the Site Mitigation Unit of the County of Los Angeles Fire Department.
4. **Former Lincoln Heights Jail** – 401 North Avenue 19: The Site is developed with a City-owned structure that was the former Lincoln Heights Jail. On December 20, 2018, the Site Mitigation Unit of the County of Los Angeles Fire Department referred the site to the California Regional Water

Quality Control Board for regulatory oversight, including review of the soil sampling and analysis plan. The Site has an “Open - Site Assessment” status on GeoTracker as Site assessment is ongoing.

5. **Union Pacific Railroad – Cornfield Yard** – 1245 North Spring Street: See “Cornfield Site” above.
6. **Welch’s Uniform Rental (former)** – 3505 Pasadena Avenue: See “Welch’s Uniform Facility (Former)” above.

Sites outside of the Project Area not identified above could also have releases that may affect the Project Area. In addition to hazardous materials used and generated in the Project Area, there is potential for uncontrolled release of hazardous materials from vehicular accidents on U.S. Highway 101, Interstate 10, and Interstate 110.

USEPA Superfund Enterprise Management System (SEMS) Database in Envirofacts

A search of the USEPA database of Superfund sites revealed no Superfund sites or NPL sites in the Project Area (USEPA 2021d). However, the DTSC EnviroStor database, discussed above, lists one “State Response or NPL” site in the Project Area. This site is not listed on the SEMS database, and therefore is interpreted to be a “State Response” site. According to EnviroStor, DTSC is listed as the lead cleanup oversight agency for this site.

Use, Transport, and Abatement of Hazardous Materials

The use of hazardous materials is typically associated with industrial land uses. Activities such as manufacturing, plating, cleaning, refining, and finishing, frequently involve chemicals that are considered hazardous when accidentally released into the environment. There are several clusters of industrial uses scattered throughout the Project Area, including the area generally east of the Los Angeles River and south of the Arroyo Seco Parkway (SR-110).

To a lesser extent, hazardous materials may also be used by various commercial enterprises, as well as residential uses. Dry cleaners, in particular, use cleaning agents considered to be hazardous materials. Hardware stores typically stock paints and solvents, as well as fertilizers, herbicides, and pesticides. Swimming pool supply stores stock acids, algacides, and caustic agents. In fact, most commercial businesses occasionally use commonly available cleaning supplies which, when used in accordance with manufacturers’ recommendations, are considered safe by the state of California, but when handled improperly can be considered hazardous. Private residences also use and store commonly available cleaning materials, paints, solvents, swimming pool and spa chemicals, as well as fertilizers, herbicides, and pesticides.

If improperly handled, hazardous materials can result in public health hazards through human contact with contaminated soil or groundwater, or through airborne releases of vapors, fumes, or dust. There is also the potential for accidental or unauthorized releases of hazardous materials that would pose a public health concern. The use, transport, and disposal of hazardous materials and wastes are required to occur in accordance with federal, State, and local regulations. In accordance with such regulations, the transport of hazardous materials and wastes can only occur with transporters who have received training and appropriate licensing. Additionally, hazardous waste transporters are required to complete and carry a hazardous waste manifest, which is a set of forms, reports, and procedures designed to seamlessly track hazardous waste.

TABLE 4.8-3 GEOTRACKER AND ENVIROSTOR SITES IN THE PROJECT AREA					
Label	Site Name	Address	City	Site Type	Status
0	1101 N Main	1101 N Main St	Los Angeles	Voluntary Cleanup	No Further Action
1	140-154 N Avenue 21	140-154 N Ave 21	Los Angeles	Voluntary Cleanup	Active

Use, Transport, and Abatement of Hazardous Materials

Hazardous materials use is primarily concentrated in the industrial and manufacturing areas of the western, central, and eastern portions of the Project Area where light and heavy industry are present. Most transportation of hazardous materials through and within the Project Area consists of trucks that travel along freeways and major thoroughfares in the Project Area.

OIL FIELDS AND WELLS

Oil fields and oil production activities present a variety of hazards in urbanized areas, including toxic air contaminants and dust from oil production, and the potential of contaminant release into an aquatic environment. Unconstrained oil seepage from oil fields and wells can contaminate the soil and groundwater aquifers.

The Project Area does not contain any active oil or gas wells (Department of Conservation [DOC] 2022a). The easternmost portion of the Los Angeles City Oil Field lies along the western edge of the Project Area, with a small portion (approximately two acres) of the oil field located along North Spring Street in the Project Area. However, one plugged core hole well is located in the Project Area: API Number 0403719045, which is an exploratory core hole drilled for geological information (DOC 2022a). **Figure 4.8-2** includes the location of the sole oil well (now plugged) in the Project Area.

METHANE GAS

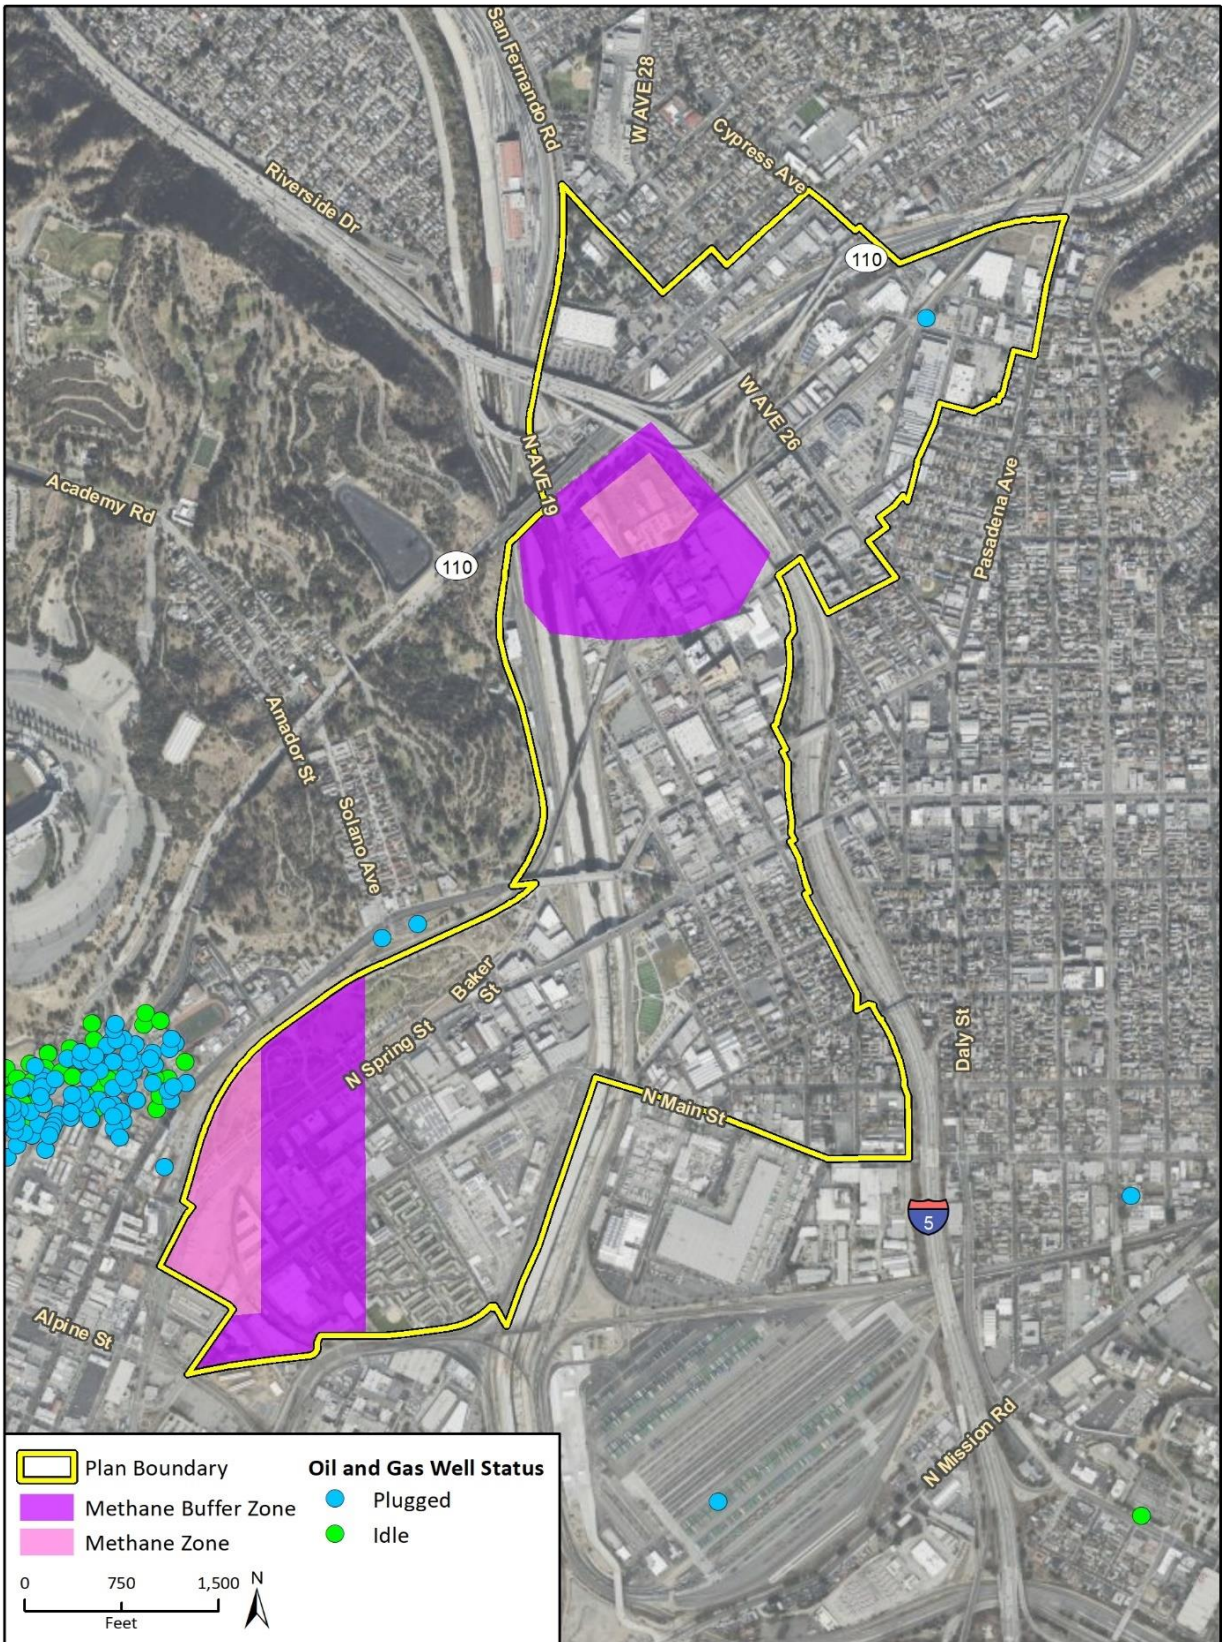

Methane gas is produced by anaerobic decay of organic matter deep under the Earth's surface and is the major component of natural gas, about 87 percent by volume. In common usage, deposits rich in natural gas (i.e., methane) are called natural gas fields. At room temperature and standard pressure, methane is a colorless, odorless gas. While not toxic, it is highly flammable and may form explosive mixtures with air. Methane is also an asphyxiant and may displace oxygen in an enclosed space; however, the concentrations at which flammable or explosive mixtures form are much lower than the concentration at which asphyxiation risk is significant. Thus, the main concern with methane gas is the risk of explosion if methane seeps and accumulates in an enclosed space with air (County of Los Angeles 2020).

The easternmost portion of the Los Angeles City Oil Field lies along the western edge of the Project Area, with a small portion (approximately two acres) of the oil field located along North Spring Street in the Project Area. As shown in **Figure 4.8-2**, the Project Area includes two areas designated by the City as Methane Zones or Methane Buffer Zones. Properties within these zones require methane testing and/or mitigation for construction projects (City of Los Angeles 2004).

AIRPORTS

The Project Area is not located within two miles of a public airport or public use airport and therefore is not subject to airport-related hazards. The airports nearest to the Project Area are Hollywood Burbank Airport, located approximately 10 miles northwest of the Project Area, and San Gabriel Valley Airport, located approximately 10 miles east of the Project Area; both of these airports are located in Los Angeles County (not within the City of Los Angeles). Los Angeles International Airport is located approximately 12 miles southwest of the Project Area.

Additional data provided by California Department of Conservation, 2019.

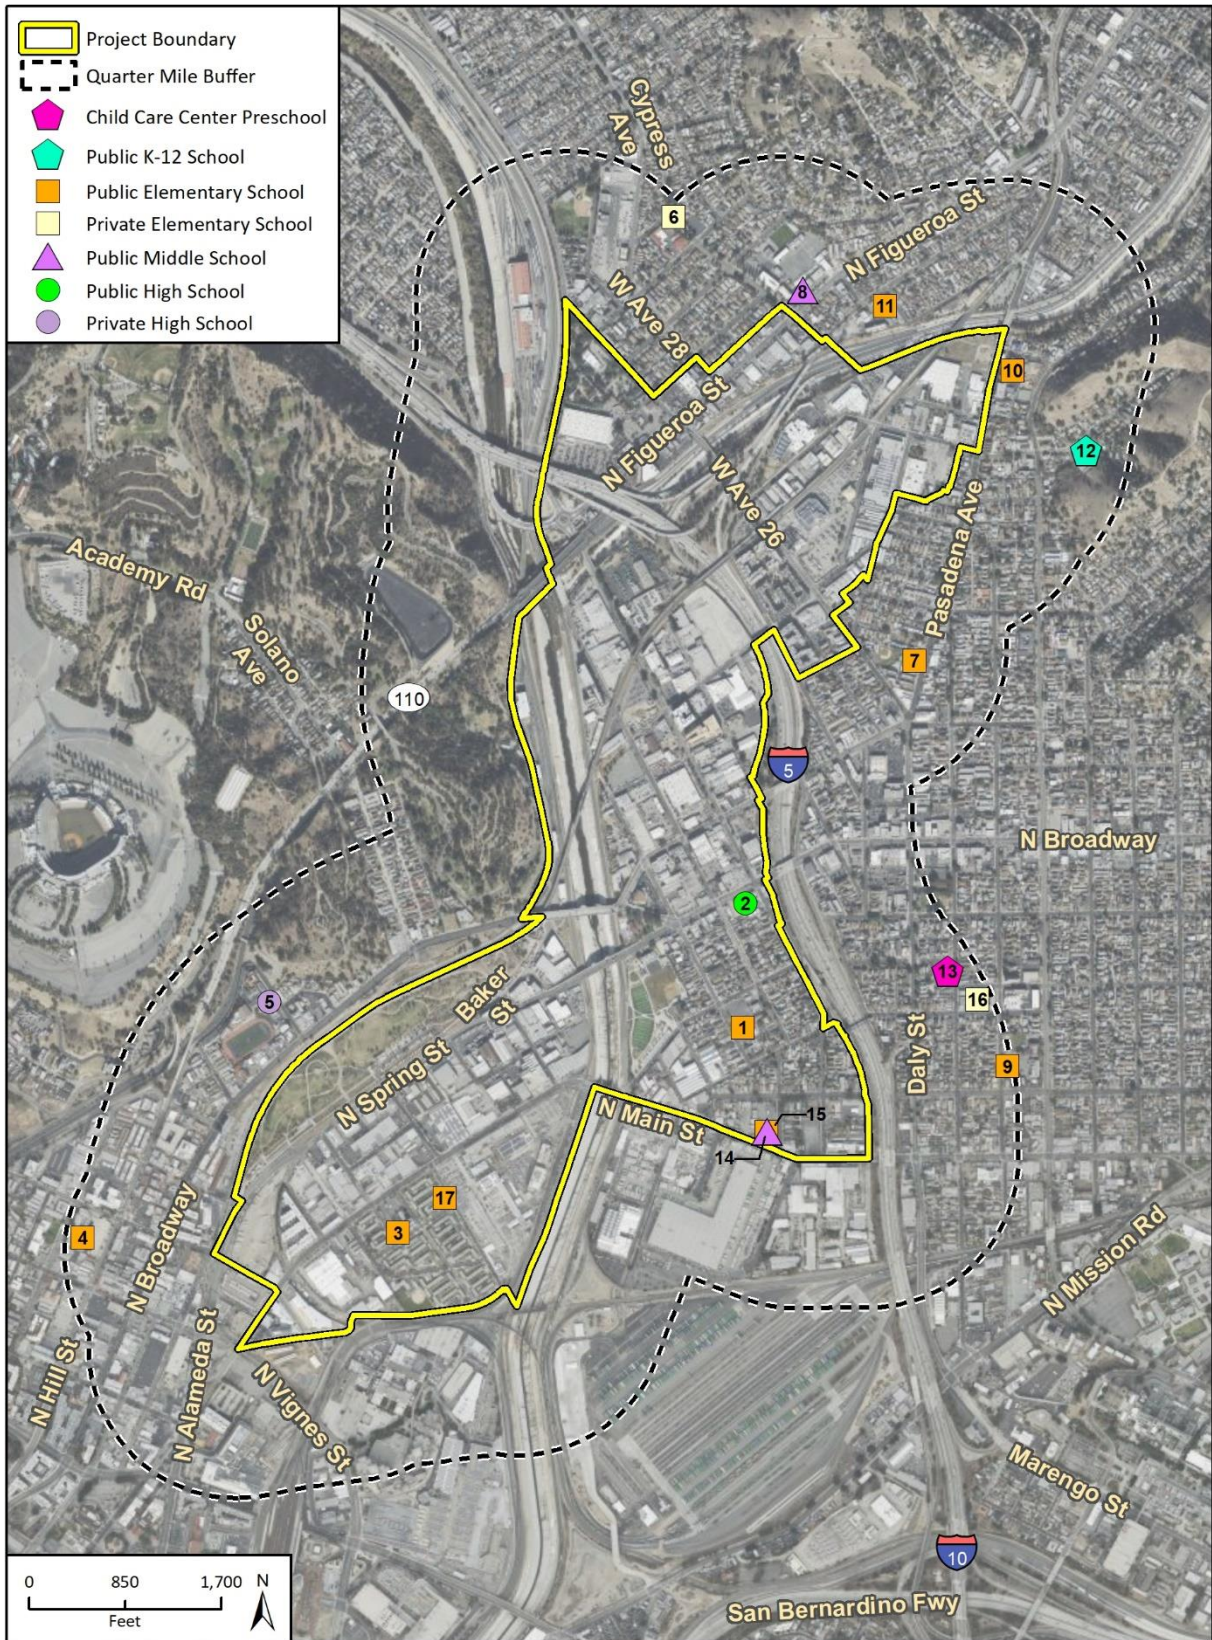

SCHOOLS

School locations require consideration because individuals particularly sensitive to hazardous materials exposure use these facilities. Additional protective regulations apply to projects that could use or disturb potentially hazardous products near or at schools. The California Public Resources Code requires projects that would be located within 0.25 mile of a school and might reasonably be expected to emit or handle hazardous materials to consult with the school district regarding potential hazards.

There are 17 educational facilities (defined as colleges, high schools, elementary schools, preschools, or nursery schools) within the Project Area or 0.25 mile of the Project Area, including six within the Project Area and 11 within 0.25 mile of the Project Area. **Table 4.8-4** and **Figure 4.8-3** identify the following facilities: 10 elementary schools (four in the Project Area and six within 0.25 mile of the Project Area), two middle schools (one in the Project Area and one within 0.25 mile of the Project Area), two high schools (one in the Project Area and one within 0.25 mile of the Project Area), and one public K-12 school within 0.25 mile of the Project Area.

TABLE 4.8-4 EDUCATIONAL FACILITIES IN OR WITHIN 0.25 MILE OF THE PROJECT AREA			
Facility No.	Facility Name	Address	Type of School
1	Albion Street Elementary School	322 South Avenue 18	Public Elementary School
2	Alliance Susan and Eric Smidt Technology High School	211 South Avenue 20	Public High School
3	Ann Street Elementary School	126 East Bloom Street	Public Elementary School
4	Castelar Street Elementary School	840 Yale Street	Public Elementary School
5	Cathedral High School	1253 Bishops Road	Private High School
6	Divine Saviour School	624 Cypress Avenue	Private Elementary School
7	El Rio Community School	2635 Pasadena Avenue	Public Elementary School
8	Florence Nightingale Middle School	3311 North Figueroa St	Public Middle School
9	Griffin Avenue Elementary School	2025 Griffin Avenue	Public Elementary School
10	Hillside Elementary School	120 East Avenue 35	Public Elementary School
11	Loreto Street Elementary School	3408 Arroyo Seco Ave	Public Elementary School
12	Los Angeles Leadership Academy	234 East Avenue 33	Public K-12 School
13	Plaza de la Raza Head Start	2141 Workman Street	Child Care Center Preschool
14	PUC Excel Charter Academy	1855 North Main Street	Public Middle School
15	PUC Milagro Charter	1855 North Main Street	Public Elementary School
16	Sacred Heart Elementary School	2109 Sichel Street	Private Elementary School
17	William Mead Head Start/State Preschool	120 Leroy Street	Child Care Center Preschool

WILDLAND FIRE HAZARDS

The California Department of Forestry and Fire Protection (CAL FIRE) identifies fire hazard areas and fire-threatened communities at the wildland urban interface. CAL FIRE maps identify fire hazard severity zones in the State and local responsibility areas. Wildland fire protection in California is the responsibility of either the State, local government, or the federal government. A designated State Responsibility Area (SRA) is the area "in which the financial responsibility of preventing and suppressing fires is primarily the responsibility of the state" (Public Resources Code Section 4125). Local responsibility areas (LRA) include incorporated cities, cultivated agricultural lands, and portions of the desert. LRA fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government.

Classification of a zone as moderate, high, or very high fire hazard is based on a combination of how a fire will behave and the probability of flames and embers threatening buildings.

CAL FIRE has identified the entire Project Area as being located within the "Non-Very High Fire Hazard Severity Zone" in the Local Responsibility Area for incorporated cities (CAL FIRE 2011). This indicates that the Project Area is not subject to wildfire hazards.

EMERGENCY RESPONSE PLANS

The City of Los Angeles Emergency Management Department (EMD) is comprised of five divisions: administrative services, community preparedness and engagement, operational readiness, planning, and training and exercise. The EMD works with City departments, municipalities and with community-based organizations to ensure that the City and its residents have the resources and information they need to prepare, respond, and recover from emergencies, disasters, and significant events (City of Los Angeles 2022). Within the EMD, the Emergency Operations Organization (EOO) is the operational department responsible for the City's emergency preparations (planning, training, and mitigation), response and recovery operations. The EOO centralizes command and information coordination to enable its unified chain-of-command to operate efficiently and effectively in managing the City's resources. The Emergency Operation Center (EOC) is the focal point for coordination of the City's emergency planning, training, response, and recovery efforts. EOC processes follow the National All-Hazards approach to major disasters such as fires, floods, earthquakes, acts of terrorism and large-scale events in the City that require involvement by multiple City departments.

The Los Angeles Fire Department (LAFD) is responsible for rescue and provision of medical care to victims of fires and other emergencies. Key to a successful rapid response is LAFD's goal of maintaining adequate response distances from any given fire outbreak to the closest fire station. See Section 4.13, *Public Services*, of this Draft EIR, for further details about the LAFD.

Emergency Response in the City of Los Angeles

Emergency response throughout the City is managed by the Emergency Management Department (EMD) which is comprised of five divisions, including the administrative services division, community preparedness and engagement division, operational readiness division, planning division, and training and exercise division (City of Los Angeles 2022). The Emergency Operations Organization (EOO) is the centralized operational department of the EMD, which implements the Safety Element of the General Plan. The EOO is a "department without walls" as it works with all of the City's departments to prepare for, respond to, and recover from emergencies, disasters, and significant events (City of Los Angeles 1996). The EOO also coordinates emergency response planning with other jurisdictions' emergency service organizations (City of Los Angeles 2017a). The Emergency Operations Center (EOC) is the operations

center which is the focal point for the coordination of the City's emergency planning, training, response, and recovery efforts. The EOC is a state-of-the-art facility comprised of a Main Coordination Room (MCR), Media Center, Training Room, Management Section Room, Public Information Officer Room, Executive Conference Room, six flexible-use Break Out Rooms (includes Business Operations Center), Amateur Radio Operations Room and two storage rooms (City of Los Angeles 2022).

Project Area Emergency Response

The City's General Plan Safety Element specifies several disaster routes in the Project Area. Disaster routes typically parallel major north-south and east-west traffic corridors. Disaster routes within and adjacent to the Project Area include U.S. 101, I-110, I-10, W. 1st Street, W. Cesar Chavez Avenue, E. 4th Street east of Alameda Street, S. Figueroa Street, Alameda Street, and S. San Pedro Street south of Temple Street (County of Los Angeles 2018).

REGULATORY FRAMEWORK

Hazardous materials and waste can pose a potential hazard to human health and the environment when improperly treated, stored, transported, disposed of, or otherwise managed. Federal, State, and local programs that regulate the use, storage, and transportation of hazardous materials and hazardous waste are in place to prevent unwanted consequences. These regulatory programs are designed to reduce the risk that hazardous substances may pose to people and businesses under normal daily circumstances and as a result emergencies and disasters.

FEDERAL

Primary federal agencies with responsibility for hazardous materials management include the USEPA, U.S. Department of Labor's Occupational Safety and Health Administration (OSHA), and U.S. Department of Transportation (USDOT).

U.S. Environmental Protection Agency

The USEPA's mission is to protect human health and the environment. USEPA takes action to reduce risks associated with exposure to chemicals in commerce, indoor and outdoor environments, and products and food. USEPA continues to oversee the introduction and use of pesticides, improve their Integrated Risk Information System (IRIS) program, reduce radon risks, identify and address children's health risks in schools and homes, and improve chemical management practices. Oversight of chemical storage and manufacturing in coordination with their interagency partners remains a key focus of USEPA, as well as efforts to reduce urban air toxins.

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as "Superfund," was enacted by Congress on December 11, 1980. This law provided broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA establishes requirements concerning closed and abandoned hazardous waste sites, providing for liability of persons responsible for releases of hazardous waste at these sites, and established a trust fund to provide for cleanup when no responsible party could be identified. CERCLA also enabled the revision of the National Contingency Plan. The National Contingency Plan provided the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, or contaminants. The National Contingency Plan also establishes the National

Priorities List, which is a list of contaminated sites warranting further investigation by the EPA. CERCLA was amended by the Superfund Amendments and Reauthorization Act on October 17, 1986 (USEPA 2022).

Resource Conservation and Recovery Act

The 1976 federal Resource Conservation and Recovery Act (RCRA) (42 United States Code [USC] secs. 6901-6992k), amended and revised the Solid Waste Disposal Act to give USEPA authority to regulate hazardous waste from “cradle to grave.” This includes regulating the generation, transportation, treatment, storage, and disposal of hazardous waste. Under RCRA regulations, generators of hazardous waste must register and obtain a hazardous waste activity identification number. RCRA allows individual states to develop their own programs for the regulation of hazardous waste as long as they are at least as stringent as RCRA.

The 1986 amendments to RCRA enabled USEPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. STs are regulated under Subtitle I of RCRA and its regulations, which establish construction standards for USTs installed after December 22, 1988, as well as standards for upgrading existing USTs and associated piping. Since 1998, all non-conforming tanks were required to be either upgraded or closed.

Toxic Substances Control Act (TSCA)

In 1976, TSCA (15 USC Sections 2601–2671) established a system of evaluation in order to identify chemicals which may pose hazards. TSCA is enforced by the USEPA through inspections of places in which ACMs are manufactured, processed, and stored and through the assessment of administrative and civil penalties and fines, as well as injunctions against violators. TSCA establishes a process by which public exposure to hazards may be reduced through manufacturing, distribution, use and disposal restrictions or labeling of products. PCBs are hazardous materials regulated by the USEPA under the TSCA. These regulations ban the manufacture of PCBs (as of 1979), although the continued use of existing PCB-containing equipment is allowed. PCBs were formerly used in such applications as hydraulic fluids, plasticizers, adhesives, fire retardants, and electrical transformers, among others. TSCA also contains provisions controlling the continued use and disposal of existing PCB-containing equipment. The disposal of PCB wastes is also regulated by TSCA (40 CFR 761), which contains life cycle provisions similar to those in RCRA. In addition to TSCA, provisions relating to PCBs are contained in the Hazardous Waste Control Law (HWCL), which lists PCBs as hazardous waste.

Under TSCA, the USEPA has enacted strict requirements on the use, handling, and disposal of ACMs. These regulations included the phasing out of friable asbestos and ACMs in new construction materials beginning in the early 1970s. In 1989, the USEPA banned most uses of asbestos in the country. Although most of the ban was overturned in 1991, the current banned product categories include corrugated paper, rollboard, commercial paper, specialty paper, flooring felt, and any new uses. TSCA also establishes USEPA’s Lead Abatement Program regulations, which provide a framework for lead abatement, risk assessment, and inspections. Those performing these services are required to be trained and certified by USEPA (USEPA 1996).

Hazardous Materials Transportation Act (HMTA)

The USDOT prescribes strict regulations for the safe transportation of hazardous materials, including requirements for hazardous waste containers and licensed haulers who transport hazardous waste on public roads. The Secretary of the USDOT receives the authority to regulate the transportation of hazardous materials from the Hazardous Materials Transportation Act (HMTA), as amended and codified in 49 USC Section 5101 et seq. The Secretary of Transportation is authorized to issue regulations to implement the requirements of 49 USC. The Pipeline and Hazardous Materials Safety Administration (PHMSA), formerly

the Research and Special Provisions Administration, was delegated the responsibility to write the hazardous materials regulations, which are contained in Title 49 of the CFR Parts 100-185. Title 49 of the CFR, which contains the regulations set forth by the HMTA, specifies requirements and regulations with respect to the transport of hazardous materials. It requires that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Under the HMTA, the Secretary of Transportation “may authorize any officer, employee, or agent to enter upon, inspect, and examine, at reasonable times and in a reasonable manner, the records and properties of persons to the extent such records and properties relate to: (1) the manufacture, fabrication, marking, maintenance, reconditioning, repair, testing, or distribution of packages or containers for use by any "person" in the transportation of hazardous materials in commerce; or (2) the transportation or shipment by any "person" of hazardous materials in commerce.”

Occupational Safety and Health Act of 1970

The Occupational Safety and Health Act of 1970, which is implemented by the federal OSHA, contains provisions with respect to hazardous materials handling. OSHA was created to assure safe and healthful working conditions by setting and enforcing standards and by providing training, outreach, education, and assistance. OSHA provides standards for general industry and construction industry on hazardous waste operations and emergency response. OSHA requirements, as set forth in 29 CFR Section 1910, et. seq., are designed to promote worker safety, worker training, and a worker’s right-to-know. The U.S. Department of Labor has delegated the authority to administer OSHA regulations to the state of California. The California OSHA program (Cal/OSHA) (codified in the California Code of Regulations [CCR], Title 8, or 8 CCR generally and in the Labor Code secs. 6300-6719) is administered and enforced by the Division of Occupational Safety and Health (DOSH). Cal/OSHA is very similar to the OSHA program. Among other provisions, Cal/OSHA requires employers to implement a comprehensive, written Injury and Illness Prevention Program (IIPP) for potential workplace hazards, including those associated with hazardous materials.

In addition, pursuant to OSHA, a developer that undertakes a construction project that involves the handling of contaminated site conditions must prepare and implement a Health and Safety Plan (HASP) that sets forth the measures that would be undertaken to protect those that may be affected by the construction project. While a HASP is prepared and implemented pursuant to OSHA, the HASP is not subject to regulatory review and approval, although a HASP is typically appended to a Soil Management Plan if this document is required by the Certified Unified Program Agency (CUPA), which is the LAFD with regard to the Project Area. The HASP, if required, would be prepared in accordance with the most current OSHA regulations, including 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response and 29 CFR 1926, Construction Industry Standards, as well as other applicable federal, State, and local laws and regulations.

Research and Special Programs Administration (RSPA)

The RSPA regulations cover definition and classification of hazardous materials, communication of hazards to workers and the public, packaging and labeling requirements, operational rules for shippers, and training. They apply to interstate, intrastate, and foreign commerce by air, rail, ships, and motor vehicles, and also cover hazardous waste shipments. The RSPA’s Federal Highway Administration (FHWA) is responsible for highway routing of hazardous materials and highway safety permits. The U.S. Coast Guard regulates bulk transport by vessel. The hazardous material regulations include emergency response provisions, including incident reporting requirements. Reports of major incidents go to the National Response Center, which in turn is linked with CHEMTREC, a service of the chemical manufacturing industry that provides details on most chemicals shipped in the United States.

Federal Emergency Management Act (FEMA)

FEMA was established in 1979 via executive order and is an independent agency of the federal government. In March 2003, FEMA became part of the U.S. Department of Homeland Security with the mission to lead the effort in preparing the nation for all hazards and effectively manage federal response and recovery efforts following any national incident. FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration.

Disaster Mitigation Act of 2000

Disaster Mitigation Act (42 U.S.C. §5121) provides the legal basis for FEMA mitigation planning requirements for state, local, and Indian Tribal governments as a condition of mitigation grant assistance. It amends the Robert T. Stafford Disaster Relief Act of 1988 (42 U.S.C. §5121-5207) by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need and creates incentives for state, Tribal, and local agencies to closely coordinate mitigation planning and implementation efforts. This Act reinforces the importance of pre-disaster infrastructure mitigation planning to reduce disaster losses nationwide and the streamlining of the administration of federal disaster relief and programs to promote mitigation activities. Some of the major provisions of this Act include:

- Funding pre-disaster mitigation activities;
- Developing experimental multi-hazard maps to better understand risk;
- Establishing state and local government infrastructure mitigation planning requirements;
- Defining how states can assume more responsibility in managing the Hazard Mitigation Grant Program (HMGP); and
- Adjusting ways in which management costs for projects are funded.

The mitigation planning provisions outlined in Section 322 of this Act establish performance-based standards for mitigation plans and require states to have a public assistance program (Advance Infrastructure Mitigation [AIM]) to develop county government plans. The consequence for counties that fail to develop an infrastructure mitigation plan is the chance of a reduced federal share of damage assistance from 75 percent to 25 percent if the damaged facility has been damaged on more than one occasion in the preceding 10-year period by the same type of event.

Other Hazardous Materials Regulations

In addition to the USDOT regulations for the safe transportation of hazardous materials, other applicable federal laws also address hazardous materials. These include:

- Community Environmental Response Facilitation Act (CERFA) of 1992;
- Clean Water Act;
- Clean Air Act;
- Safe Drinking Water Act;
- Atomic Energy Act;
- Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)

Federal Fire Safety Act (FFSA)

The FFSA of 1992 is different from other laws affecting fire safety as the law applies to federal operations, and there is no requirement for local action unless a private building owner leases space to the federal government. The FFSA requires federal agencies to provide sprinkler protection in any building, whether owned or leased by the federal government that houses at least 25 federal employees during their employment.

Title 40 Code of Federal Regulations

Title 40 of the CFR Part 264 “Standards for Owners of Hazardous Waste Treatment, Storage and Disposal Facilities,” establishes minimum national standards which define the acceptable management of hazardous waste. This standard applies to owners and operators of all facilities which treat, store, or dispose of hazardous waste.

STATE POLICIES AND REGULATIONS

The primary state agencies with jurisdiction over hazardous chemical materials management are the California Environmental Protection Agency (CalEPA) DTSC and the SWRCB. Other state agencies involved in hazardous materials management include California OSHA (Cal/OSHA) and the State Office of Emergency Services (Cal OES).

Authority for the statewide administration and enforcement of RCRA rests with Cal/EPA DTSC. While DTSC has primary state responsibility in regulating the generation, storage, and disposal of hazardous materials, DTSC may further delegate enforcement authority to local jurisdictions. In addition, DTSC is responsible and/or provides oversight for contamination cleanup and administers statewide hazardous waste reduction programs. DTSC operates programs to accomplish the following: (1) manage the aftermath of improper hazardous waste management by overseeing site cleanups; (2) prevent releases of hazardous waste by ensuring that those who generate, handle, transport, store, and dispose of wastes do so properly; and (3) evaluate soil, water, and air samples taken at sites.

The storage of hazardous materials in USTs is regulated by the SWRCB, which delegates authority to the Regional Water Quality Control Boards (RWQCBs) on the regional level, and typically to the local oversight agency or fire department on the local level.

The Cal/OSHA program is administered and enforced by the Division of Occupational Safety and Health (DOSH). Cal/OSHA is very similar to the federal OSHA program. For example, both programs contain rules and procedures related to exposure to hazardous materials during demolition and construction activities. In addition, Cal/OSHA requires employers to implement a comprehensive, written IIPP. An IIPP is an employee safety program for potential workplace hazards, including those associated with hazardous materials.

The Cal OES Hazardous Materials (HazMat) section under the Fire and Rescue Division coordinates statewide implementation of hazardous materials accident prevention and emergency response programs for all types of hazardous materials incidents and threats. In response to any hazardous materials emergency, the HazMat section staff is called upon to provide state and local emergency managers with emergency coordination and technical assistance.

California Hazardous Materials Release Response Plans and Inventory Law of 1985, Hazardous Waste and Substance Sites

The Business Plan Act requires preparation of Hazardous Materials Business Plans and disclosure of hazardous materials inventories, including an inventory of hazardous materials handled, plans showing where hazardous materials are stored, an emergency response plan, and provisions for employee training in safety and emergency response procedures for businesses that handle, store, or transport hazardous materials in amounts exceeding specified minimums (California Health and Safety Code [HSC], Division 20, Chapter 6.95, Article 1). Statewide, DTSC has primary regulatory responsibility for management of hazardous materials, with delegation of authority to local jurisdictions that enter into agreements with the state. Local agencies are responsible for administering these regulations.

Several state agencies regulate the transportation and use of hazardous materials to minimize potential risks to public health and safety, including CalEPA and the California Emergency Management Agency. The California Highway Patrol and Caltrans enforce regulations specifically related to the transport of hazardous materials. Together, these agencies determine container types used and license hazardous waste haulers for hazardous waste transportation on public roadways.

Hazardous Waste and Substances Sites (Cortese List)

Government Code Section 65962.5, amended in 1992, requires the CalEPA to develop and update annually the Hazardous Waste and Substances Sites (Cortese List), which is a list of hazardous waste sites and other contaminated sites. The Cortese List is a planning document used by the State, local agencies, and developers to comply with California Environmental Quality Act (CEQA) requirements pertaining to providing information about the location of hazardous materials release sites. While the Cortese List is no longer maintained as a single list, the following databases provide information that meet the Cortese List requirements:

- List of Hazardous Waste and Substances sites from the (DTSC EnviroStor database (HSC Sections 25220, 25242, 25356, and 116395);
- List of open and active LUST sites by County and Fiscal Year from the SWRCB GeoTracker database (HSC Section 25295);
- List of solid waste disposal sites identified by the SWRCB with waste constituents above hazardous waste levels outside the waste management unit (California Water Code [CWC] Section 13273[e] and 14 CCR Section 18051);
- List of “active” Cease and Desist Orders and Cleanup and Abatement Orders from the SWRCB (CWC Sections 13301 and 13304); and
- List of hazardous waste facilities subject to corrective action pursuant to HSC Section 25187.5, identified by the DTSC.

California Health and Safety Code, Division 20, Chapter 6.5, Hazardous Waste Control Law

The California Health and Safety Code, Division 20, Chapter 6.5, Hazardous Waste Control Law empowers DTSC to administer the state’s hazardous waste program and implement the federal program in California. CCR Titles 22 and 23 address hazardous materials and wastes. Title 22 defines, categorizes, and lists hazardous materials and wastes. Title 23 addresses public health and safety issues related to hazardous materials and wastes and specifies disposal options.

License to Transport Hazardous Materials – California Vehicle Code, Section 32000.5 et seq.

The California Department of Transportation (Caltrans) regulates hazardous materials transportation on all interstate roads. Within California, the State agencies with primary responsibility for enforcing federal and State regulations and for responding to transportation emergencies are the California Highway Patrol and Caltrans. Together, federal and State agencies determine driver-training requirements, load labeling procedures, and container specifications for vehicles transporting hazardous materials.

Underground Storage Tanks Program

The State regulates USTs through a program pursuant to HSC Division 20, Chapter 6.7, and CCR Title 23, Division 3, Chapter 16 and Chapter 18. The State's UST program regulations include among others, permitting USTs, installation of leak detection systems and/or monitoring of USTs for leakage, UST closure requirements, release reporting/corrective action, and enforcement. Oversight of the statewide UST program is assigned to the SWRCB which has delegated authority to the RWQCB and typically on the local level to the local oversight agency or fire department. The LAFD administers and enforces federal and state laws and local ordinances for USTs at the Project Area. Plans for the construction/installation, modification, upgrade, and removal of USTs are reviewed by LAFD Inspectors. If a release affecting groundwater is documented, the project file is transferred to the appropriate RWQCB for oversight.

Aboveground Petroleum Storage Act

In 1989, California established the Aboveground Petroleum Storage Act instituting a regulatory program covering ASTs containing specified petroleum products (HSC Sections 25270–25270.13). The Aboveground Petroleum Storage Act applies to facilities with storage capacities of 10,000 gallons or more or are subject to oil pollution prevention and response requirements under 40 CFR Part 112. Under the Aboveground Petroleum Storage Act, each owner or operator of a regulated aboveground storage tank (AST) facility must file biennially a storage statement with the SWRCB disclosing the name and address of the AST facility; the contact person for the facility; and the location, size, age, and contents of each AST that exceeds 10,000 gallons in capacity and that holds materials that are at least five percent petroleum. In addition, each owner or operator of a regulated AST must prepare a Spill Prevention Control and Countermeasure (SPCC) Plan in accordance with federal and State requirements (40 CFR Part 112 and HSC Section 25270.5[c]). The responsibility for inspecting ASTs and ensuring that Spill Prevention Control and Countermeasure Plans have been prepared lies with the RWQCBs.

Lead-Based Paint Regulations

Lead-based paint (LBP) is defined as any paint, varnish, stain, or other applied coating that has a one milligram per square centimeter (mg/cm^2) (5,000 microgram per gram [$\mu\text{g}/\text{g}$] or 0.5% by weight) or more of lead. The U.S. Consumer Product Safety Commission (16 CFR 1303) banned paint containing more than 0.06 percent lead for residential use in 1978. Therefore, residential buildings built before 1978 are much more likely to have LBP.

The demolition of buildings containing LBPs is subject to a comprehensive set of California regulatory requirements that are designed to assure the safe handling and disposal of these materials. Cal/OSHA has established limits of exposure to lead contained in dusts and fumes, which provides for exposure limits, exposure monitoring, and respiratory protection, and mandates good working practices by workers exposed to lead, particularly since demolition workers are at greatest risk of adverse exposure. Lead-contaminated debris and other wastes must also be managed and disposed of in accordance with applicable provisions of the California HSC.

California Occupational Safety and Health Act (Cal/OSHA) – California Labor Code, Section 6300 et seq.

Cal/OSHA is responsible for developing and enforcing workplace safety standards and ensuring worker safety in the handling and use of hazardous materials (8 CCR, Section 1529). Among other requirements, Cal/OSHA requires entities handling specified amounts of certain hazardous chemicals to prepare injury and illness prevention plans and chemical hygiene plans and provides specific regulations to limit exposure of construction workers to lead.

The California Occupational Safety and Health Act of 1973 addresses California employee working conditions, enables the enforcement of workplace standards, and provides for advancements in the field of occupational health and safety. The Act also created Cal/OSHA, the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. Cal/OSHA's standards are generally more stringent than federal regulations. Under the former, the employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure. The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and hazardous substance exposure warnings. At sites known or suspected to be contaminated by hazardous materials, workers must have training in hazardous materials operations and a HASP must be prepared. The HASP establishes policies and procedures to protect workers and the public from exposure to potential hazards at the contaminated site.

The Safe Drinking Water and Toxic Enforcement Act

The Safe Drinking Water and Toxic Enforcement Act (HSC Section 25249.5, et seq.), Proposition 65, lists chemicals and substances believed to have the potential to cause cancer or deleterious reproductive effects in humans. It also restricts the discharges of listed chemicals into known drinking water sources above the regulatory levels of concern, requires public notification of any unauthorized discharge of hazardous waste, and requires that a clear and understandable warning be given prior to a known and intentional exposure to a listed substance.

California Water Code

The CWC authorizes the SWRCB to implement provisions of the Clean Water Act, including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants. In regard to construction dewatering discharge analysis and treatment, groundwater may be encountered during deeper excavations for the subterranean parking structure, building foundations, or other subterranean building components. Under the CWC, discharges of any such groundwater to surface waters, or any point sources hydrologically connected to surface waters, such as storm drains, is prohibited unless conducted in compliance with a Waste Discharge Requirement (WDR) permit. In addition to the CWC, these permits implement and are in compliance with the federal Clean Water Act's National Pollutant Discharge Elimination System (NPDES) program. In accordance with these legal requirements, dewatering, treatment, and disposal of groundwater encountered during construction activities would be conducted in accordance with the Los Angeles RWQCB's Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, pursuant to adopted Order No. R4-2013-0095, or any other appropriate WDR permit identified by the Los Angeles RWQCB. Compliance with an appropriate WDR permit would include monitoring, treatment if appropriate, and proper disposal of any encountered groundwater in accordance with applicable water quality standards. If, for example, extracted groundwater contains total petroleum hydrocarbons (TPH) or other petroleum breakdown compounds in concentrations exceeding water quality standards, compliance with legal requirements would mandate treatment to meet published State water quality standards prior to discharge into a storm drain system.

Government Code Section 3229, Division 3 (California Geologic Energy Management Division [CalGEM])

In compliance with Section 3229, Division 3 of the California Public Resources Code, before commencing any work to abandon any well, the owner or operator shall request approval from CalGEM, formerly the Division of Oil, Gas, and Geothermal Resources (DOGGR), via a written notice of intention to abandon the well.

California Fire Code, Title 24, Part 9, Chapters 33, 50 and 57

The 2019 California Fire Code (CFC), written by the California Building Standards Commission, is based on the 2018 International Fire Code (IFC). The IFC is a model code that regulates minimum fire safety requirements for new and existing buildings, facilities, storage, and processes. The IFC addresses fire prevention, fire protection, life safety, and safe storage and use of hazardous materials in new and existing buildings, facilities, and processes.

The CFC, Chapter 9 of Title 24 of the CCR, was created by the California Building Standards Commission based on the International Fire code and is updated every three years. The overall purpose of the CFC is to establish the minimum requirements to safeguard the public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises, and to provide safety and assistance to firefighters and emergency responders during emergency operations. Chapter 49 of the CFC contains minimum standards for development in the wildland–urban interface and fire hazard areas. The CFC also provides regulations and guidance for local agencies in the development and enforcement of fire safety standards.

Uniform Fire Code

The Uniform Fire Code, Article 80 (Section 80.103 of the Uniform Fire Code as adopted by the State Fire Marshal pursuant to Health and Safety Code Section 13143.9), includes specific requirements for the safe storage and handling of hazardous materials. These requirements are intended to reduce the potential for a release of hazardous materials and for mixing of incompatible chemicals, and specify the following specific design features to reduce the potential for a release of hazardous materials that could affect public health or the environment:

- Separation of incompatible materials with a noncombustible partition;
- Spill control in all storage, handling, and dispensing areas; and
- Separate secondary containment for each chemical storage system. The secondary containment must hold the entire contents of the tank, plus the volume of water needed to supply the fire suppression system for a period of 20 minutes in the event of catastrophic spill.

California Governor’s Office of Emergency Services (Cal OES)

In 2009, the State of California passed legislation creating the Cal OES and authorized it to prepare a Standard Emergency Management System program (Title 19 CCR Section 2401 *et seq.*), which sets forth measures by which a jurisdiction should handle emergency disasters. In California, the Standard Emergency Management System provides the mechanism by which local government requests assistance. Non-compliance with the Standard Emergency Management System could result in the state withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster. Cal OES coordinates the state’s preparation for, prevention of, and response to major disasters, such as fires, floods, earthquakes, and terrorist attacks. During an emergency, Cal OES serves as the lead state agency for emergency management in the state. It also serves as the lead agency for mobilizing the state’s resources and obtaining

federal resources. Cal OES coordinates the state response to major emergencies in support of local government. The primary responsibility for emergency management resides with local government. Local jurisdictions first use their own resources, and as they are exhausted, obtain more from neighboring cities and special districts, the county in which they are located, and other counties throughout the state through the statewide mutual aid system (see discussion of Mutual Aid Agreements, below). California Emergency Management Agency (Cal-EMA) maintains oversight of the state's mutual aid system.

Emergency Managed Mutual Aid (EMMA) System

Cal OES developed the Emergency Managed Mutual Aid System in response to the 1994 Northridge Earthquake. The EMMA System coordinates emergency response and recovery efforts along the coastal, inland, and southern regions of California. The purpose of EMMA is to provide emergency management personnel and technical specialist to afflicted jurisdictions in support of disaster operations during emergency events. Objectives of the EMMA Plan is to provide a system to coordinate and mobilize assigned personnel, formal requests, assignment, training, and demobilization of assigned personnel; establish structure to maintain the EMMA Plan and its procedures; provide the coordination of training for EMMA resources, including Standard Emergency Management System training, coursework, exercises, and disaster response procedures; and to promote professionalism in emergency management and response. The EMMA Plan was updated in November 2012 and supersedes the 1997 EMMA Plan and November 2001 EMMA Guidance.

California Health and Safety Code, Title 22, Chapter 20 Hazardous Waste Permit Program

Title 22, Chapter 20 Hazardous Waste Permit Program, establishes provisions for the issuance and administration of hazardous waste permits pursuant to the Health and Safety Code. Regulations cover basic permitting requirements, such as application requirements, standard permit conditions, and monitoring and reporting requirements. Hazardous Waste Permits are required for the transfer, treatment, storage, and disposal of any waste which is hazardous waste pursuant to section 66261.3. Owners and operators of certain facilities require hazardous waste facility permits as well as permits under other programs for certain aspects of the facility operation.

California Code of Regulations, Division 4.5, Title 22

California Health and Safety Code and Title 22 regulates processes that produce hazardous waste. The Regulation requires an ID number, regulates accumulation of onsite hazardous materials, shipping and transport, emergency procedures, and worker training.

California Code of Regulations Title 23, Chapter 15 Discharges of Hazardous Waste to Land Section 2511(b)

California Code of Regulations Title 23, Chapter 15 Discharges of Hazardous Waste to Land Section 2511(b) pertains to water quality aspects of waste discharge to land. The regulation establishes waste and site classifications and waste management requirements for waste treatment, storage, or disposal in landfills, surface impoundments, waste piles, and land treatment facilities. Requirements are minimum standards for proper management of each waste category, which allow regional water boards to impose more stringent requirements to accommodate regional and site-specific conditions. In addition, the requirements of California Code of Regulations Title 23, Chapter 15 applies to cleanup and abatement actions for unregulated discharges to land of hazardous waste (e.g., spills).

California Fire Code, Title 24, Part 9, Chapters 33, 50 and 57

The 2022 California Fire Code, written by the California Building Standards Commission, is based on the 2021 International Fire Code. The International Fire Code (IFC) is a model code that regulates minimum fire safety requirements for new and existing buildings, facilities, storage, and processes. The IFC addresses fire prevention, fire protection, life safety, and safe storage and use of hazardous materials in new and existing buildings, facilities, and processes.

California Constitution Article XIII Section 35.

Section 35 of Article III of the California Constitution at subdivision (a)(2) provides: “The protection of the public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services.” Section 35 of Article XIII of the California Constitution was adopted by the voters in 1993 under Proposition 172. Proposition 172 directed the proceeds of a 0.50 percent sales tax to be used exclusively for local public safety services. California Government Code Sections 30051-30056 provide rules to implement Proposition 172. Public safety services include fire protection. Section 30056 provides that cities are not allowed to spend less of their own financial resources on their combined public safety services in any given year compared to the 1992-93 fiscal year. Therefore, an agency is required to use Proposition 172 to supplement its local funds used on fire protection, as well as other public safety services. In *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, the court found that, Section 35 of Article XIII of the California Constitution requires local agencies to provide fire services and that it is reasonable to conclude that a lead agency will comply with that provision and ensure that public services are provided. (See *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, 847, stating “the city has a constitutional obligation to provide adequate fire protection services”.)

Title 8 California Code of Regulations (CCR) Sections 1270 and 6773

In accordance with CCR, Title 8 Sections 1270 “Fire Prevention” and 6773 “Fire Protection and Fire Equipment,” the Cal/OSHA has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hosing sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

California Health and Safety Code Section 13100-13135

California Health Safety Code Section 13100-13135 codifies regulations known as the “Regulations of the State Fire Marshal” and constitutes the Basic Building Design and Construction Standards of the State Fire Marshal. The regulations establish minimum standards for the preservation and protection of life and property against fire, explosion, and panic through requirements for fire protection and notification systems, fire protection devices, and fire suppression training.

REGIONAL**South Coast Air Quality Management District (SCAQMD) Rule 1113**

SCAQMD Rule 1133, Architectural Coatings, requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce volatile organic compound (VOC) emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

South Coast Air Quality Management District Rule 1166

SCAQMD Rule 1166, Volatile Organic Compound Emissions from Decontamination of Soil, requires that an approved mitigation plan be obtained from SCAQMD prior to commencing any of the following activities: 1) The excavation of a UST or piping which has stored VOCs; 2) The excavation or grading of soil containing VOC material including gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOCs; 3) The handling or storage of VOC-contaminated soil [soil which registers >50 parts per million or greater using an organic vapor analyzer calibrated with hexane] at or from an excavation or grading site; and 4) The treatment of VOC-contaminated soil at a facility. This rule sets requirements to control the emission of VOCs from excavating, grading, handling, and treating VOC-contaminated soil as a result of leakage from storage or transfer operations, accidental spillage, or other deposition.

South Coast Air Quality Management District Rule 1403

SCAQMD Rule 1403, Asbestos Emissions from Renovation/Demolition Activities, regulates asbestos as a toxic material and controls the emissions of asbestos from demolition and renovation activities by specifying agency notifications, appropriate removal procedures, and handling and clean up procedures. Rule 1403 applies to owners and operators involved in the demolition or renovation of structures with ACMs, asbestos storage facilities, and waste disposal sites.

Waste Discharge Requirements

Effective on December 28, 2012, the Los Angeles RWQCB adopted Order No. R4-2012-0175, NPDES Permit No. CAS004001, Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges into the Coastal Watersheds of Los Angeles County. The permit establishes new performance criteria for new development and redevelopment projects in the coastal watersheds of Los Angeles County (with the exception of the city of Long Beach). Storm water and non-storm water discharges consist of surface runoff generated from various land uses, which are conveyed via the municipal separate storm sewer system and ultimately discharged into surface waters throughout the region (“storm water” discharges are those that originate from precipitation events, while “non-storm water” discharges are all those that are transmitted through an MS4 Storm Water Permit and originate from precipitation events). Discharges of stormwater and non-storm water from the MS4s, or storm drain systems, in the Coastal Watersheds of Los Angeles County convey pollutants to surface waters throughout the Los Angeles Region. Non-storm water discharges through an MS4 in the Los Angeles Region are prohibited unless authorized under an individual or general NPDES permit; these discharges are regulated by the Los Angeles County NPDES Permit, issued pursuant to CWA Section 402. Coverage under a general NPDES permit such as the Los Angeles County permit can be achieved through development and implementation of a project-specific SWPPP (CARB 2022).

Los Angeles County Airport Land Use Commission Comprehensive Land Use Plan (ALUC)

In Los Angeles County, the Regional Planning Commission has the responsibility for acting as the ALUC and for coordinating the airport planning of public agencies within the county. ALUC coordinates planning for the areas surrounding public use airports. The Los Angeles County Airport Land Use Plan (dually titled Comprehensive Land Use Plan) provides for the orderly expansion of Los Angeles County's public use airports and the area surrounding them. It is intended to provide for the adoption of land use measures that will minimize the public's exposure to excessive noise and safety hazards. In formulating this plan, the Los Angeles County ALUC has established provisions for safety, noise insulation, and the regulation of building height within areas adjacent to each of the public airports in the County.

Los Angeles County Operational Area Emergency Response Plan (ERP)

The County of Los Angeles developed the ERP to ensure the most effective allocation of resources for the maximum benefit and protection of the public in time of emergency. The ERP does not address normal day-to-day emergencies, or the well-established and routine procedures used in coping with them. Instead, the operational concepts reflected in this plan focus on potential large-scale disasters like extraordinary emergency situations associated with natural and man-made disasters and technological incidents which can generate unique situations requiring an unusual or extraordinary emergency response. The purpose of the plan is to incorporate and coordinate all facilities and personnel of County government, along with the jurisdictional resources of the cities and special districts within the County, into an efficient Operational Area organization capable of responding to any emergency using a Standard Emergency Management System, mutual aid, and other appropriate response procedures. The goal of the plan is to take effective life-safety measures and reduce property loss, provide for the rapid resumption of impacted businesses and community services, and provide accurate documentation and records required for cost-recovery.

LOCAL

The primary local agency with responsibility for implementing federal and state laws and regulations pertaining to hazardous materials management is the LAFD. The LAFD is the CUPA for the County of Los Angeles. A CUPA is a local agency that has been certified by CalEPA to implement the six state environmental programs within the local agency's jurisdiction. This program was established under the amendments to the California Health and Safety Code made by Senate Bill 1082 in 1994. The six consolidated programs are:

- Aboveground Storage Tanks SPCC requirements)
- California Accidental Release Prevention (CalARP)
- Hazardous Materials Release Response Plan and Inventory (Business Plans)
- Hazardous Waste (including Tiered Permitting)
- Underground Storage Tanks (USTs)
- Uniform Fire Code (UFC) Article 80 Hazardous Material Management Program (HMMP) and Hazardous Material Identification System (HMIS)

As the CUPA for County of Los Angeles, the LAFD maintains the records regarding location and status of hazardous materials sites in the county and administers programs that regulate and enforce the transport, use, storage, manufacturing, and remediation of hazardous materials. By designating a CUPA, Los Angeles County has accurate and adequate information to plan for emergencies and/or disasters and to plan for public and firefighter safety.

Participating Agency is a local agency that has been designated by the local CUPA to administer one or more Unified Programs within their jurisdiction on behalf of the CUPA. The LAFD has designated the Los Angeles County Department of Public Works, the Burbank Fire Department, the Pasadena Fire Department, and the Torrance Fire Department as Participating Agencies for the UST program.

The LAFD, in their role as the CUPA, also oversees and addresses issues relating to the presence and handling of contaminated soils that may be present at the Project Site. Any such hazardous materials that may be encountered would be managed (using tools, such as a Soil Management Plan [SMP]) in accordance with all relevant and applicable federal, state, and local laws and regulations that pertain to the use, storage, transportation and disposal of hazardous materials and waste. The SMP, if required, would describe the methodology to identify and manage (reuse or off-site disposal) contaminated soil during soil excavation and/or construction. The SMP would also provide protocols for confirmation sampling, segregation and

stockpiling, profiling, backfilling, disposal, guidelines for imported soil, and backfill approval from the City's Department of Building and Safety (DBS). The SMP would also describe the methodology to manage underground features that may be encountered during construction. In addition, the LAFD may consult with other agencies (e.g., DTSC and the LARWQCB) if the nature of the contamination warrants the involvement of these agencies.

City of Los Angeles Hazard Mitigation Plan

The City of Los Angeles has completed the 2017 Hazard Mitigation Plan (HMP) to lessen the vulnerability to disasters and demonstrate the City's commitment to reducing risks from natural hazards. An HMP serves as a guide for decision makers as they commit City resources to minimize the effects of natural hazards. The HMP is intended to integrate with existing planning mechanisms such as building and zoning regulations, long-range planning mechanisms, and environmental planning. The planning process includes conducting a thorough hazard vulnerability analysis, creating community disaster mitigation priorities, and developing subsequent mitigation strategies and projects.

Los Angeles Fire Code

At the local level, the LAFD monitors the storage of hazardous materials for compliance with local requirements. Specifically, businesses and facilities that store more than threshold quantities of hazardous materials as defined in Chapter 6.95 of the California Health and Safety Code are required to file an Accidental Risk Prevention Program with the LAFD. This program includes information such as emergency contacts, phone numbers, facility information, chemical inventory, and hazardous materials handling and storage locations. The LAFD also issues permits for hazardous materials handling and enforces California's Hazardous Materials Release Response Plans and Inventory Law (HSC Section 25500 et seq.). Basic requirements of California's Hazardous Materials Release Response Plans and Inventory Law include the development of detailed hazardous materials inventories used and stored on-site, a program of employee training for hazardous materials release response, identification of emergency contacts and response procedures, and reporting of releases of hazardous materials. Any facility that meets the minimum reporting thresholds (i.e., a mixture containing a hazardous material that has a quantity at any one time during the reporting year that is equal to, or greater than, 55 gallons for materials that are liquids, 500 pounds for solids, or 200 cubic feet for compressed gas) must comply with the reporting requirements and file a Business Emergency Plan (BEP) with the local administering agency.

The LAFD also administers the Fire Life Safety Plan Check and Fire Life Safety Inspections interpreting and enforcing applicable standards of the Fire Code, Title 19, Uniform Building Code, City, and National codes concerning new construction and remodeling. As part of the Fire Life Safety Plan Check and Fire Life Safety Inspections, businesses that store hazardous waste or hazardous materials in amounts exceeding the thresholds noted above are subject to review.

Section 91.7109.2 of the Los Angeles Municipal Code (LAMC) requires LAFD notification when an abandoned oil well is encountered during construction activities and requires that any abandoned oil well not in compliance with existing regulations be re-abandoned in accordance with applicable rules and regulations of DOGGR (currently known as CalGEM).

2021 Los Angeles and Ventura Counties NPDES Permit

Effective on September 11, 2021, the Los Angeles RWQCB adopted Order No. R4-2021-0105, NPDES Permit No. CAS004004, Waste Discharge Requirements and NPDES Permit for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watersheds of Los Angeles and Ventura Counties. The permit establishes new performance criteria for new development and redevelopment projects in the coastal watersheds of Los Angeles and Ventura Counties (with the exception of unincorporated cities). Storm water

and non-storm water discharges consist of surface runoff generated from various land uses, which are conveyed via the municipal separate storm sewer system and ultimately discharged into surface waters throughout the region (“storm water” discharges are those that originate from precipitation events, while “non-storm water” discharges are all those that are transmitted through an MS4 Storm Water Permit and originate from precipitation events). Discharges of storm water and non-storm water from the MS4s, or storm drain systems, in the Coastal Watersheds of Los Angeles and Ventura Counties convey pollutants to surface waters throughout the Los Angeles Region. Non-storm water discharges through an MS4 in the Los Angeles Region are prohibited unless authorized under an individual or general NPDES permit; these discharges are regulated by the Los Angeles County NPDES Permit, issued pursuant to CWA Section 402. Coverage under a general NPDES permit such as the Los Angeles County permit can be achieved through development and implementation of a project-specific SWPPP (LARWQCB 2021).

City of Los Angeles Emergency Management Department (EMD)

The City of Los Angeles EMD is comprised of four divisions and two units including administrative services division, communications division, community emergency management division, operations division, planning unit, and training exercise unit. The EMD works with City departments, municipalities and with community-based organizations to ensure that the City and its residents have the resources and information they need to prepare, respond, and recover from emergencies, disasters, and significant events. The Emergency Operations Organization (EOO) is the operational department responsible for the City’s emergency preparations (planning, training, and mitigation), response and recovery operations. The EOO centralizes command and information coordination to enable its unified chain-of-command to operate efficiently and effectively in managing the City’s resources.

The Emergency Operation Center (EOC) is the focal point for coordination of the City’s emergency planning, training, response, and recovery efforts. EOC processes follow the National All-Hazards approach to major disasters such as fires, floods, earthquakes, acts of terrorism and large-scale events in the City that require involvement by multiple City departments.

City of Los Angeles General Plan Safety and Conservation Elements

The City of Los Angeles General Plan was adopted in September 2001. The Safety Element of the General Plan, which received a targeted update in 2021, provides a contextual framework for understanding the relationship between hazard mitigation, response to a natural disaster, and initial recovery from a natural disaster. The Safety Element addresses hazardous materials relative to potential natural hazards.

The intent of the Conservation Element of the General Plan is the conservation and preservation of natural resources. Policies of the Conservation Element address the conservation of petroleum resources (i.e., oil and gas) and appropriate, environmentally sensitive extraction of petroleum deposits to protect the petroleum resources for the use of future generations and to reduce the City’s dependency on imported petroleum and petroleum products.

Policies from the Safety and Conservation Elements related to Hazards and Hazardous Materials are listed below in **Table 4.8-5**.

TABLE 4.8-5 RELEVANT GENERAL PLAN HAZARDOUS MATERIALS GOALS, OBJECTIVES, AND POLICIES	
Safety Element – Hazard Mitigation	
Goal 1	A city where potential injury, loss of life, property damage and disruption of the social and economic life of the City due to hazards is minimized.
Objective 1.1	Implement comprehensive hazard mitigation plans and programs that are integrated with each other and with the City’s comprehensive emergency response and recovery plans and programs.
Policy 1.1.1	Coordination. Coordinate information gathering, program formulation and program implementation between City agencies, other jurisdictions and appropriate public and private entities to achieve the maximum mutual benefit.
Policy 1.1.2	Disruption reduction. Reduce potential disruption due to disaster, with emphasis on critical facilities, governmental functions, infrastructure and information resource.
Policy 1.1.3	Facility/systems maintenance. Locate new critical facilities and infrastructure outside of hazard areas, especially VHFHSZs, when feasible. If no feasible alternative site exists, ensure that these facilities incorporate all necessary protections to allow them to continue to serve essential community needs during and after disaster events. Provide redundancy (back-up) systems and strategies for continuation of adequate critical infrastructure systems and services so as to assure adequate circulation, communications, power, transportation, water and other services for emergency response in the event of disaster related systems disruptions and the growing climate emergency.
Policy 1.1.4	Health/environmental protection. Protect the public and workers from the release of hazardous materials and protect City water supplies and resources from contamination resulting from release or intrusion resulting from a disaster event, including protection of the environment and public from potential health and safety hazards associated with program implementation.
Policy 1.1.5	Risk reduction. Reduce potential risk hazards due to natural disaster with a focus on protecting the most vulnerable people, places and systems.
Policy 1.1.7	Building Community Capacity. Build social cohesion and increase local resilience through community collaboration and education. Provide outreach and education on topics including: local hazards, disaster prevention and preparation and evacuation procedures with an emphasis on reaching vulnerable communities.
Policy 1.1.8	Land Use. Consider hazard information and available mitigations when making decisions about future land use. Maintain existing low density and open space designations in Very High Fire Hazard Severity Zones. Ensure mitigations are incorporated for new development in hazard areas such as VHFHSZs, landslide areas, flood zones and in other areas with limited adaptive capacity.
Objective 1.2	Confront the global climate emergency by setting measurable targets for carbon reduction that are consistent with the best available methods and data, center equity and environmental justice, secure fossil free jobs, and foster broader environmental sustainability and resiliency.
Goal 2	A city that responds with the maximum feasible speed and efficiency to disaster events so as to minimize injury, loss of life, property damage and disruption of the social and economic life of the City and its immediate environs.
Objective 2.1	Develop and implement comprehensive emergency response plans and programs that are integrated with each other and with the City’s comprehensive hazard mitigation and recovery plans and programs.
Policy 2.1.1	Coordination. Coordinate program formulation and implementation between City agencies, adjacent jurisdictions and appropriate private and public entities so as to achieve, to the greatest extent feasible and within the resources available, the maximum mutual benefit with the greatest efficiency of funds and staff.
Policy 2.1.2	Health and environmental protection. Develop and implement procedures to protect the environment and public, including animal control and care, to the greatest extent feasible within the resources available, from potential health and safety hazards associated with hazard mitigation and disaster recovery efforts.

TABLE 4.8-5 RELEVANT GENERAL PLAN HAZARDOUS MATERIALS GOALS, OBJECTIVES, AND POLICIES	
Safety Element – Hazard Mitigation	
Policy 2.1.3	Information. Develop and implement training programs and informational materials designed to assist property owners, tenants, and the general public in understanding and mitigating disaster risks and regulations that may impact their homes and business, with emphasis on reaching vulnerable communities.
Policy 2.1.4	Interim procedures. Develop and implement pre-disaster plans for interim evacuation, sheltering and public aid for disaster victims displaced from homes and for disrupted businesses. Plan to utilize park space and other public facilities in emergency situations. Plans should include provisions to assist businesses, which provide significant services to the public and plans for reestablishment of the financial viability of the City and assistance for residents to remain in the City.
Policy 2.1.5	Response. Develop, implement, and continue to improve the City’s ability to respond to emergency events. Participate in regularly scheduled disaster exercises to better prepare Police, Fire, Public Works and other City employees with disaster responsibilities.
Policy 2.1.6	Standards/Fire. Continue to maintain, enforce and upgrade requirements, procedures and standards to facilitate more effective fire suppression and Safety. A. Enforce peak water supply / fire flow requirements and ensure that new development is able to sufficiently source water, including in VHFHSZs. B. Enforce minimum roadway widths and clearances for evacuation and fire suppression. C. Maintain special fire-fighting units at the Port of Los Angeles, Los Angeles International Airport, and Van Nuys Municipal Airport capable of responding to special emergencies unique to the operations of those facilities. D. Coordinate with CALFIRE, local fire agencies, fire safe councils, private landowners, and other responsible agencies to identify the best method(s) of fuel modification to reduce the severity of future wildfires, including: Prescribed fire; Forest thinning; Grazing; Mechanical clearing; Hand clearing (piling, burning/chipping); Education; and Defensible space. E. Maintain mutual aid or mutual assistance agreements with local fire departments to ensure an adequate response in the event of a major earthquake, wildfire, urban fire, fire in areas with substandard fire protection, or other fire emergencies.
Policy 2.1.7	Building Community Capacity. Develop and implement strategies for involving volunteers, community groups, and civic organizations in emergency response activities.

TABLE 4.8-6 RELEVANT GENERAL PLAN HAZARDOUS MATERIALS GOALS, OBJECTIVES, AND POLICIES	
Safety Element – Disaster Recovery (Multi-Hazard)	
Goal 3	A city where private and public systems, services, activities, physical condition and environment are reestablished as quickly as feasible to a level equal to or better than that which existed prior to the disaster.
Objective 3.1	Develop and implement comprehensive disaster recovery plans which are integrated with each other and with the City’s comprehensive hazard mitigation and emergency response plans and programs.
Policy 3.1.1	Coordination. Coordinate between City departments, County and State agencies, local with each other, jurisdictions and with appropriate private and public entities prior to a disaster to plan and establish disaster recovery programs and procedures which will enable cooperative ventures, reduce potential conflicts, minimize duplication and maximize the available funds and resources to the greatest mutual benefit following a disaster.
Policy 3.1.2	Health/safety/environment. Develop and establish procedures for identification and abatement of physical and health hazards which may result from a disaster. Provisions shall include measures for protecting workers, the public and the environment from contamination or other health and safety hazards associated with the hazard in addition to abatement, repair and reconstruction programs.

TABLE 4.8-6 RELEVANT GENERAL PLAN HAZARDOUS MATERIALS GOALS, OBJECTIVES, AND POLICIES	
Safety Element – Disaster Recovery (Multi-Hazard)	
Policy 3.1.4	Interim services/systems. Develop and establish procedures prior to a disaster for immediate reestablishment and maintenance of damaged or interrupted critical infrastructure systems and services so as to provide communications, circulation, power, transportation, water and other necessities for movement of goods, provision of services and restoration of the economic and social life of the City and its environs pending permanent restoration of the damaged systems.
Policy 3.1.5	Restoration. Look to the future and rebuild based on the lessons of the past. Prior to a disaster, develop and establish procedures for securing assistance and expediting inspection and permitting activities to facilitate the rapid repair and rebuilding of those parts of the private and public sectors which were damaged or disrupted as a result of the disaster with an added consideration of future safety. Develop and establish procedures to enhance the resilience of buildings and infrastructure that are rebuilt following a disaster. Develop tools to ensure that vulnerable residents and business owners are included in community rebuilding efforts.
Conservation Element – Resource Management (Fossil Fuels) - Petroleum (Oil and Gas)	
Policy 1	Continue to encourage energy conservation and petroleum product reuse.
Policy 3	Continue to protect neighborhoods from potential accidents and subsidence associated with drilling, extraction and transport operations, consistent with California Department of Conservation, Division of Oil and Gas requirements
SOURCE: City of Los Angeles Conservation Element, 2001, and Safety Element 2021	
^a DOGGR is now known as CalGEM.	

Los Angeles Municipal Code (LAMC)

Zoning

One of the primary purposes of zoning is to segregate uses that are thought to be incompatible. With respect to hazards, the City uses zoning to separate businesses that use, store, transport, treat, or dispose of hazardous materials, or businesses that engage in potentially hazardous activities, such as manufacturing or refining, from residential areas and the general public.

Methane Zones and Methane Buffer Zones

The Methane Seepage Regulations, contained within LAMC Chapter IX, Article 1, Division 71 (Sections 91.7101 through 91.7109), establishes requirements for mitigation and other general building requirements to prevent potential environmental and harmful health effects that could be caused by the construction of buildings located in a defined Methane Hazard Zone within the City of Los Angeles. All new buildings and paved areas located in a Methane Zone or Methane Buffer Zone must comply with the requirements of LAMC Sections 91.7103 and 91.7104 and the Methane Mitigation Standards established by the Superintendent of Building. The Methane Mitigation Standards identify installation procedures, design parameters and test protocols for the methane gas mitigation system. As established under LAMC Section 91.106.4.1, LADBS has the authority to withhold permits on projects located within a Methane Zone or Methane Buffer Zone. Building permits may be issued upon submittal of detailed plans that show adequate protection against flammable gas incursion by providing the installation of suitable methane mitigation and monitoring systems.

Section 91.7109.2 of the LAMC requires LAFD notification when an abandoned oil well is encountered during construction activities and requires that any abandoned oil well not in compliance with existing regulations be re-abandoned in accordance with applicable rules and regulations of DOGGR (currently known as CalGEM).

The plugging and abandonment of onshore oil and gas wells are regulated by the CCR and Public Resource Code (PRC) as follows (DOC 2022b):

- CCR, Title 14, Division 2, Chapter 4, Subchapter 1: Onshore Well Regulations, Article 3: Requirements, Section 1723 - Plugging and Abandonment-General Requirements
- PRC, Division 3: Oil & Gas, Chapter 1: Oil and Gas Conservation, Article 4: Regulation of Operations, Section 3208.1

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

The following thresholds of significance were developed based on Appendix G of the CEQA Guidelines. Implementation of the Proposed Project would have a significant impact related to hazards if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials (Threshold 4.8-1)
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment (Threshold 4.8-2)
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school (Threshold 4.8-3)
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and as a result, would it create a significant hazard to the public or the environment (Threshold 4.8-4)
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area (Threshold 4.8-5)
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan (Threshold 4.8-6)
- Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires (Threshold 4.8-7)

METHODOLOGY

For the Proposed Project, this impact analysis addresses the potential to encounter hazardous substances in soil and groundwater during future Project-related construction in the Project Area. The evaluation was performed based on existing conditions in the Project Area, information in environmental databases, applicable regulations and guidelines, and future Project-induced development that may have the potential to introduce hazards. Relationships and proximities of potential future development to schools, airports, and fire hazard zones were also identified. The above significance criteria are used in this section as the basis for determining the significance of impacts related to hazards and hazardous materials.

It is reasonably assumed that development projects would comply with applicable regulatory requirements pertaining to hazardous materials during construction and operation. Individual businesses are subject to intense regulatory review as part of the permit and approval process, as well as being subject to regulations regarding hazardous materials use, storage, transportation, and disposal. In most cases, this regulatory review and regulatory compliance review ensures that adjacent populations are protected from unusual

hazards from such uses. While the proposed project may encourage greater redevelopment of older potentially contaminated sites, they are subject to the federal, state, and local policies and guidelines discussed above.

PROJECT IMPACTS

Threshold 4.8-1 Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Impact 4.8-1 **Proposed Project:** Implementation of the Project would primarily introduce new residential, commercial, and light industrial development. Although certain heavy industrial facilities would remain and hazardous materials would continue to be transported through the Project Area, Plan implementation would not create a significant hazard to the public or environment related to the routine transport, use, or disposal of hazardous materials. This impact would be *less than significant*.

Project Impact

Construction Impacts

Implementation of the Proposed Project would include temporary construction impacts that are addressed in Impact 4.8-4.

Operational Impacts

The Proposed Project would allow for the development of new residential, commercial, and light industrial uses in the Project Area. The types of hazardous materials associated with operation of these uses in the Project Area would include small quantities of maintenance products (e.g., paints and solvents); oils, lubricants and refrigerants associated with building mechanical and HVAC systems; and grounds and landscape maintenance products formulated with hazardous substances, including fuels, cleaners and degreasers, solvents, paints, lubricants, adhesives, sealers, pesticides/herbicides, and industrial related chemicals. Heavy industrial uses would not be a permitted land use under the Proposed Project, and heavy industrial uses are not permitted by the zoning in the current CASP as well. Thus, implementation of the Project is not anticipated to generate substantial amounts of hazardous materials.

While the Proposed Project would accommodate additional dwelling units located in proximity to industrial uses, existing and future uses would be required to comply with existing safety standards related to the handling, use, and storage of hazardous materials, and applicable federal, state, and local laws and regulations. Moreover, although the placement of residences near industrial activity may increase the potential for exposure to existing hazards, it would not increase the use of hazardous materials or otherwise increase hazards to existing area residents. It would not be expected to increase, change, or exacerbate any risk currently existing from industrial uses that would impact the existing residents and businesses or future residents or businesses from development under the Proposed Project. As such, this would not be an environmental impact under CEQA. The Project would not create additional industrial-zoned parcels or additional parcels with an industrial land use designation. The routine transport, use, or disposal of hazardous materials within industrial areas, as with the entire Project Area, would be subject to applicable federal, state, and local regulations. Specifically, the USDOT Office of Hazardous Materials Safety prescribes regulations for the safe transportation of hazardous materials, as described in CFR Titles 40, 42, 45, and 49 and implemented by CCR Titles 17, 19, and 27, which requires appropriate documentation for all transport of hazardous waste offsite. Adherence to these regulations would reduce the likelihood and severity of accidents that have the potential to occur during transit.

To ensure that workers and others at individual development sites in the Project Area are not exposed to unacceptable levels of risk associated with the use and handling of hazardous materials, employers and businesses that handle large quantities of hazardous materials are required to implement existing hazardous materials regulations, with compliance monitored by the State (e.g., OSHA in the workplace or DTSC for hazardous waste) and the City. Compliance with applicable local, state, and federal regulations would ensure that impacts related to the use, transport, and disposal of hazardous materials under the Project would be *less than significant*.

Mitigation Measures

No significant impact would occur; therefore, mitigation is not required for the Proposed Project.

Threshold 4.8-2	Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
------------------------	--

Impact 4.8-2 **Proposed Project:** Implementation of the Project would introduce new residential, commercial, and light industrial development uses and allow for redevelopment of existing uses. Construction and operational activities associated with these uses would not create increased potential for upset or accident conditions involving hazardous materials release. Redevelopment, renovation, and demolition of structures built before 1978 (for LBPs) and 1989 (for ACMs) could potentially release asbestos or lead into the atmosphere. In addition, future development would potentially occur within Methane Zones and Methane Buffer Zones and near oil wells. However, compliance with federal, State, and local requirements, would reduce this impact to a *less than significant* level.

Project Impact

Impacts associated with Project implementation relate to possible temporary exposure to asbestos, lead, and PCBs during demolition and/or renovation of older buildings, temporary and long-term exposure to methane, and long-term exposure to hazardous materials associated with operation of individual developments. Potential impacts related to disturbance of soil and/or groundwater contamination are evaluated under Impact 4.8-4.

Construction Impacts

Asbestos/Lead/PCB Exposure

Demolition and/or renovation activities in the Project Area would potentially encounter ACMs, LBP, and/or PCBs, depending on the age of structures to be renovated or demolished. ACMs were widely used in structures built between 1945 and 1989. LBPs were widely used in residential structures built between 1945 and 1978. PCBs were widely used in structures built or renovated between 1950 and 1979. It is therefore reasonable to assume that these materials could be encountered during rehabilitation and demolition of structures built during this time period. Thus, site workers and neighboring properties could potentially be exposed to ACMs, LBP, or PCBs if these materials are not removed and properly disposed of prior to renovation or demolition.

With respect to ACMs, SCAQMD Rule 1403 (Asbestos Emissions from Demolition/Renovation Activities) requires the owner or operator of any demolition or renovation activity to complete a facility survey for the presence of asbestos prior to any demolition or renovation activity. The survey must include the inspection, identification, and quantification of all friable, and Class I and Class II non-friable ACMs. In instances

where friable ACMs are identified and could be disturbed by demolition or renovation activities, Rule 1403 also includes specific notification, removal, and disposal procedures for the ACMs. The individual conducting all work must be certified by Cal/OSHA. Compliance with Rule 1403 requirements would reduce the potential for impacts related to ACMs to a *less than significant* level.

Similarly, there are numerous regulations related to the handling of LBPs and PCBs in federal and State regulations (see e.g., Title 40 of the CFR and Title 22 of the CCR). Consequently, the impact related to the release of LBP or PCBs from individual construction projects that could be undertaken under the Proposed Project would be *less than significant*.

Oil Fields/Methane Exposure

As shown in **Figure 4.8-3**, the southwestern and northern-central portions of the Project Area have been designated as Methane Zones or Methane Buffer Zones (City of Los Angeles 2004). Methane and Methane Buffer Zones encompass all designations proposed in the Project and would accommodate a wide range of land uses including commercial, residential, public facility, civic, and industrial uses.

While not toxic, methane poses a hazard to humans because it is highly flammable and may form explosive mixtures with air. Methane is also an asphyxiant and may displace oxygen in an enclosed space; however, the concentrations at which flammable or explosive mixtures form are much lower than the concentration at which asphyxiation risk is significant. Thus, explosion due to the accumulation of methane in an enclosed area is the primary concern posed by methane. LAMC Section 91.7101 requires new buildings and paved areas in a Methane Zone or Methane Buffer Zone to follow Methane Mitigation Standard (as amended by Ordinance No. 175790) to incorporate a menu of measures to control methane intrusion emanating from geologic formations. The measures include requirements for site testing for methane hazard, methane mitigation systems, detection and ventilation systems, emergency procedures, potential application of the regulations outside the Methane Zone and Methane Buffer Zone, and other remedial measures, such as additional investigations and oil well abandonment (LADBS 2004). A project's specific mitigation requirements are determined based on the actual methane concentration and pressures detected in the subsurface at a project site. Mitigation measures may include both active and passive ventilation systems to provide an exchange of air, in conjunction with gas barriers (membranes under foundations), and sensors to monitor methane gas concentrations and pressure.

The Project Area also contains one plugged core hole well. Producing oil and gas wells can emit air toxics and dust, while idle wells can be a potential source of soil and groundwater contamination if not properly plugged and abandoned. LAMC Section 91.6105 prohibits the development of specific uses and buildings in proximity to an oil well casing. These include schools, sanitariums, an assembly occupancy (i.e., gathering place for 50 or more people), fuel manufacturing plant, or public utility generating, receiving, or distributing electricity, and buildings more than 400 square feet in area and taller than 36 feet in height. In addition, in accordance with LAMC Section 91.7109.2, any abandoned oil well encountered during construction is required to be evaluated by the LAFD and may be required to be re-abandoned in accordance with applicable rules and regulations of CalGEM.

Prior to soil disturbance in the vicinity of the plugged core hole well located within the Project Area, the applicant shall notify CalGEM of planned subsurface work in this area. The plugged oil well present onsite shall be evaluated by CalGEM to determine if the plugged oil well requires additional safety features. Section 1723 of the CCR, Plugging and Abandonment – General Requirements, CalGEM Construction Site Well Review Program per PRC Section 3208.1 (DOC 2022b), and the local permitting agencies shall also be consulted to evaluate whether any specific preconstruction requirements would apply to oil wells located within the Project Area construction footprint.

If required by CalGEM, oil well abandonment work, including sealing off oil and gas bearing units, pressure grouting, etc., must be performed by a State-licensed contractor under the regulatory oversight and approval of CalGEM. This re-abandonment work shall be conducted prior to conducting subsurface activities that disturb soil, and documentation of the work completed would be provided to the applicant. Undocumented oil wells within the Project Area would also be subject to this mitigation measure.

Compliance with existing regulations would ensure that the implementation of the Project would not create a significant hazard to the public or environment due to the release of methane or hazardous materials associated with oil production wells. Therefore, impacts related to methane and oil well hazards would be *less than significant*.

Operational Impacts

As discussed under Impact 4.8-1, future development in the Project Area would primarily involve residential and commercial uses, with limited light industrial activity. Such uses would include the use and storage of common hazardous materials similarly used in Project Area residences and businesses today, with similar risk of upset or accident conditions that would create health or safety risks. The extent and exposure of individuals to hazardous materials would be limited by the relatively small quantities of these materials that would be stored and used on individual properties and transported along roads throughout the Project Area. Although common maintenance products and chemicals may be used in new development projects, these hazardous materials would not pose any greater risk compared to other similar development or to existing conditions. Compliance with warning labels and storage recommendations from individual manufacturers would ensure people in the Project Area would not be exposed to unusual or significant risks from hazardous materials.

Furthermore, businesses that use, store, or transport large quantities of hazardous materials are required to comply with health and safety, and environmental protection laws and regulations previously described, which require businesses handling or storing certain amounts of hazardous materials to prepare a hazardous materials business plan. This plan includes an inventory of hazardous materials used or stored on-site and procedures to be used in the event of a significant or threatening significant release of a hazardous material. The hazardous materials plan must include a Safety Data Sheet (SDS) for each hazardous material used or stored. To accomplish this, and to otherwise provide a safe and healthy environment, businesses that use hazardous materials must implement health and safety policies and procedures. In addition, future development in the Project Area would be required to conform with applicable environmental review processes and environmental regulations related to hazardous materials storage, use and transport. Existing hazardous materials regulations would minimize the potential for the public to be exposed to adverse health or safety effects associated with the accidental release of hazardous materials into the environment.

In conclusion, all impacts related to release of hazardous materials from the use or transport of hazardous materials, methane zones, or oil and gas production uses would be *less than significant*.

Mitigation Measures

No significant impact would occur; therefore, mitigation is not required.

Threshold 4.8-3	Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school
------------------------	--

Impact 4.8-3

Proposed Project: Implementation of the Project would primarily introduce new residential, commercial, and light industrial development that would not involve the use of large quantities of hazardous materials. Although new development could occur within 0.25 mile of existing schools, such development would not be expected to create hazards associated with hazardous materials use. Grading and construction activity could potentially result in the release of soil and/or groundwater contamination, which could potentially affect schools. However, implementation of Mitigation Measures 4.8-4(a) and (b) along with compliance with applicable regulations would ensure this impact would be *less than significant with mitigation*.

Project Impact

Seventeen educational facilities (defined as colleges, high schools, elementary schools, preschools, or nursery schools) are located in or within 0.25 mile of the Project Area, including six within the Project Area and 11 within 0.25 mile of the Project Area. This includes 10 elementary schools (four inside the Project Area and six within 0.25 mile of the Project Area), two middle schools (one in the Project Area and one within 0.25 mile of the Project Area), two high schools (one in the Project Area and one within 0.25 mile of the Project Area), and one public K-12 school within 0.25 mile of the Project Area. To ensure that workers and others at individual development sites within the Project Area are not exposed to unacceptable levels of risk associated with the use and handling of hazardous materials, employers and businesses are required to implement existing hazardous materials regulations, with compliance monitored by the State (e.g., OSHA in the workplace or DTSC for hazardous waste) and the City. Similarly, future development in the Project Area would be required to comply with applicable federal, State, and local environmental regulations related to new construction and hazardous materials storage, use, and transport. California Health and Safety Code Chapter 6.95 “Hazardous Materials Release Response Plans and Inventory” requires businesses that handle more than a specified number of hazardous materials to submit a Hazardous Materials Business Plan. Such businesses are required to provide emergency response plans and procedures, training program information, and a hazardous material chemical inventory disclosing hazardous materials stored, used, or handled. In addition, various federal, State, and local regulations and guidelines pertaining to abatement of, and protection from, exposure to asbestos, lead, and other hazardous materials have been adopted for demolition activities and would apply to all new development. All demolition or renovation that could result in the release of lead and/or asbestos must be conducted according to Cal/OSHA standards. Compliance with existing regulations would ensure that schools and the general public would not be exposed to any unusual or excessive risks related to hazardous materials during construction and operational activities.

The Project would not involve direct handling or emissions of hazardous materials within 0.25 mile of schools. Additionally, reasonably anticipated development from the Proposed Project in the Project Area will foreseeably comply with all applicable local, State, and federal laws and regulations, as described in Regulatory Framework, would regulate, control, or respond to hazardous waste transport, storage, disposal, and clean-up in order to ensure that hazardous materials do not pose a significant risk to nearby receptors. Thus, impacts related to hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school due to future Project Area development would be less than significant.

As previously discussed, GeoTracker and EnviroStor identify the locations of hazardous material sites in the Project Area. As discussed in detail under Impact 4.8-4, a process to identify, and as necessary,

remediate soil and/or groundwater contamination exists and would normally address such hazards. However, because there is not a specific legal requirement to undertake a preliminary investigation to determine the possible presence of hazardous material contamination, it is possible that such contaminants could be overlooked. This could result in the release of hazardous materials during excavation and grading of individual construction sites, which could include potential grading up to 30 feet in total depth to encompass future development. Also, if within 0.25 mile of a school, such releases could have significant health and safety effects on school-aged children. Impacts related to the release of hazardous emissions during construction activities would be *potentially significant*.

Mitigation Measures

Mitigation Measure 4.8-4(a) and (b)

Significance After Mitigation

Implementation of Mitigation Measure 4.8-4 would reduce impacts to schools to a less than significant level by ensuring the identification, and as necessary, remediation of soil and/or groundwater contamination prior to excavation or grading on properties within 0.25 mile of schools. Impacts related to hazardous emissions would be *less than significant with mitigation incorporated*.

Threshold 4.8-4	Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and as a result, would it create a significant hazard to the public or the environment
------------------------	--

Impact 4.8-4 **Proposed Project:** Expected development from the Project may occur on properties listed as hazardous material sites. The possible presence of soil or groundwater contamination on such sites could expose construction workers and residents or visitors on neighboring properties to hazards during construction of individual future developments. However, implementation of Mitigation Measures 4.8-4(a) and (b) along with compliance with applicable regulations would ensure project impacts would be *less than significant with mitigation incorporated*.

Project Impact

Government Code section 65962.5 requires the CalEPA/DTSC to develop an updated Cortese List. The DTSC is responsible for a portion of the information contained in the Cortese List. Other State and local government agencies are required to provide additional hazardous material release information for the Cortese List (DTSC 2022). The following resources were reviewed to provide hazardous material release information:

- SWRCB GeoTracker database (SWRCB 2022)
- DTSC EnviroStor database (DTSC 2022)
- USEPA SEMS database in Envirofacts (USEPA 2021d)

As previously discussed and shown in **Table 4.8-1**, **Table 4.8-2**, **Table 4.8-3**, and Appendix G, the Project Area contains numerous sites that are identified on various regulatory databases as being contaminated from the release of hazardous substances in the soil or groundwater. One of these sites is the HACLA William Mead Homes site, which was identified to be an active cleanup site according to the EnviroStor and GeoTracker databases, and is currently undergoing a U.S. HUD Transformation Plan process that would result in a redevelopment plan for William Mead Homes, although the timeline and details associated with any future development on that site is unknown. In addition to sites that are identified in state

databases, the Project Area may also include properties with unidentified hazardous material impacts that could involve grading at depths of 20 or 30 feet. Additionally, an oil well and various methane zones are present within the Project Area. Therefore, there is the potential for unidentified soil, soil vapor, and/or groundwater contamination to be present. Thus, construction activity that disturbs soil or groundwater could have the potential to result in the release of hazardous materials, which could adversely affect construction workers and/or neighboring properties. In addition, operation of redeveloped properties with known impacts remaining onsite have the potential to adversely affect onsite occupants. To address such possible concerns, it is common for a Phase I Environmental Site Assessment (ESA) to be conducted prior to excavation and construction activity. The purpose of the Phase I ESA is to identify recognized environmental conditions (RECs) associated with soil and groundwater contamination. The scope of work for the Phase I ESA consists of four elements: records review, site reconnaissance, interviews, and report preparation. The Phase I ESA determines whether there are any known contaminated sites located near the site or if current or historical uses of the site could have resulted in contamination of the soil or groundwater. Based on the results of the Phase I ESA, a Phase II ESA (subsurface investigation) may be warranted to determine whether any identified RECs involve contamination exceeding regulatory action levels. If contamination exceeding action levels is identified, additional subsurface investigations and/or remediation with regulatory oversight from an appropriate agency may be warranted. Depending on the level and type of contamination, the oversight agency could be the City, County of Los Angeles, RWQCB, DTSC, or USEPA. Remedial actions would typically involve removal and proper disposal, capping, or treatment of contaminated soil or groundwater, construction of vapor barriers, or other engineering controls.

The process described above would normally identify, and as necessary, assess and remediate soil, soil vapor, and/or groundwater contamination. Remediation of contamination exceeding regulatory action levels would address potential impacts during ground disturbance and improve conditions in the long term. However, because there is not a specific legal requirement for a Phase I ESA for all excavation or construction, there is the potential for soil, soil vapor, and/or groundwater contamination to go undetected. Thus, future grading and construction would have the potential to result in exposure of Project Area construction workers and occupants of neighboring properties, and onsite occupants during operation to releases of hazardous materials. This would be a *potentially significant impact*.

Mitigation Measures

The following mitigation measure is required to ensure that soil, soil vapor, and/or groundwater contamination that may be present on Project Area properties is identified, and as necessary, assessed and/or remediated.

MM 4.8-4(a) Database Review, Investigation, and Remediation

Prior to issuance of a grading permit, the following databases shall be consulted to determine whether or not the site to be graded is within 500 feet of an identified active hazardous material site:

- SWRCB GeoTracker database (SWRCB 2022)
- DTSC EnviroStor database (DTSC 2022)
- USEPA SEMS database in Envirofacts (USEPA 2021d)
- DTSC Hazardous Waste Tracking System (refer to <https://hwts.dtsc.ca.gov>)
- LAFD Certified Unified Program Agency (refer to the active, inactive, and historical inventory lists at <https://www.lafd.org/fire-prevention/cupa/public-records>)
- Los Angeles County Fire Department Health Hazardous Materials Division (refer to the active and inactive facilities, site mitigation, and California Accidental Release Prevention inventory lists at <https://fire.lacounty.gov/public-records-requests>)

- SCAQMD Facility Information Detail (refer to <https://xappprod.aqmd.gov/find>)
- RCRA Small-Quantity Generator or Large-Quantity Generator (refer to the U.S. EPA Envirofacts database at <https://enviro.epa.gov/index.html>)

If the site is identified in the above-listed databases within 500 feet of an identified active hazardous material site, or if the site to be graded is located on a site that:

1. Is located in an Oil Drilling District or located on or within 50 feet of a property identified by CalGEM as having an oil well or oil field (active or inactive);
2. Was currently and/or previously designated with an industrial use class or industrial zoning, in whole or in part;
3. Was previously or is currently used as a gasoline station or dry cleaning facility; or
4. The applicant or property owner are aware or have reason to be aware that the site was previously used for an industrial use, gasoline station, or dry cleaner; and
5. The site has not been previously remediated to the satisfaction of the relevant regulatory agency/agencies for any contamination associated with the above uses or site conditions,

The following process shall be followed prior to issuance of a grading permit:

- A Phase I ESA shall be conducted by a qualified environmental professional in accordance with State standards/guidelines and current professional standards, including the ASTM Standard Practice for Environmental Site Assessments.
- If the Phase I ESA identifies a REC and/or if recommended in the Phase I ESA, a Phase II ESA (subsurface investigation) shall be conducted by a qualified environmental professional to determine whether the identified potential sources have resulted in soil, groundwater, or soil vapor contamination exceeding regulatory action levels.
- If the Phase II ESA identifies contamination exceeding regulatory action levels, additional assessment, remediation, or corrective action (e.g., removal of contamination, in-situ treatment, soil capping) shall be conducted under the oversight of State and/or local agency officials (as necessary) and in full compliance with applicable State and federal laws and regulations. If remediation is determined to be necessary, the grading permit shall not be issued until the applicable regulatory agency has indicated that further remedial action is not required by issuing a No Further Action letter or that any remedial action can be implemented in conjunction with excavation and/or grading.

MM 4.8-4(b) Notification of Intent to Excavate Language

For all projects not subject to Mitigation Measure 4.8-4(a) that are seeking excavation or grading permits, the LADBS shall obtain the following acknowledgement and affidavit from the applicant:

- No known recognized soil or groundwater contamination exceeding regulatory action levels is present on-site. If contamination exceeding regulatory action levels is discovered during excavation, grading, or construction activities, the applicant and his/her/its contractors shall provide evidence of compliance with all applicable federal, State, and local regulations for remediation of hazardous materials, including but not limited to notifying the appropriate oversight agency (e.g., DTSC, RWQCB, LAFD) of the contamination, hiring a qualified environmental professional to conduct the necessary assessments and abatement (including soil sampling, preparing a remediation plan to adequately abate the hazardous materials, and ultimately obtaining necessary clearance letters from the oversight agency), and issuance of a No Further Action letter, if applicable, before

obtaining an occupancy permit. If oversight or approval by a regulatory agency is not required, a qualified environmental professional shall provide written verification of compliance with and completion of the remediation plan, such that the site meets the applicable standards for the proposed use, which shall be maintained pursuant to appropriate proof of compliance requirements.

Significance After Mitigation

As discussed in Regulatory Framework, contamination of soils and groundwater with hazardous materials is heavily regulated by multiple statutes and agencies. Compliance with applicable laws and mitigation measures will ensure minimal impact. Mitigation measures are provided to ensure that applicants are put on notice of the need to determine if there is contamination on Site and avoid impacts that may result from lack of detection. The above measures provide for processes to ensure that any development under the Proposed Project would not create a significant hazard to the public or environment during construction or operation. Thus, this impact would be *less than significant with mitigation incorporated*.

Threshold 4.8-5	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the area?
------------------------	--

Impact 4.8-5 **Proposed Project:** The Project Area is not located within two miles of a public airport or public use airport. As such, Plan implementation would have *no impact* with respect to airport-related hazards.

Project Impact

The Project Area is not located within two miles of a public airport or public use airport. The nearest public airports to the Project Area are Hollywood Burbank Airport and San Gabriel Valley Airport, which are approximately 10 miles from the Project Area, and no portion of the Project Area is within an airport safety zone for any of these airports. Impacts related to excessive noise generated by public airports will be addressed in Section 4.11, *Noise*. Therefore, *no impact* related to airport safety would result from Project implementation.

Mitigation Measures

No significant impact would occur; therefore, mitigation is not required for the Project.

Threshold 4.8-6 Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Impact 4.8-6 **Proposed Project:** Future development resulting from the Proposed Project would increase traffic levels in and around the Project Area and would involve construction activity that could temporarily hinder access to individual properties. However, individual project applicants would be required to implement traffic management plans during construction and emergency response and evacuation plans would be adjusted as necessary to reflect changing Project Area conditions. Impacts would be *less than significant*.

Project Impact

Construction and operational activities associated with future Project Area development resulting in the Proposed Project could interfere with adopted emergency response or evacuation plans. For example, temporary construction activities such as temporary construction barricades within rights-of-way or other obstructions, could impede emergency access. Additionally, increased traffic intensity during operation could result in additional traffic within roadways, thereby potentially impeding emergency access. However, the Project Area is primarily a grid that provides multiple routes for emergency response and evacuation. In addition, the Project Area is crossed by multiple freeways that provide multiple points of regional access as well as multiple evacuation routes. Finally, the goals, objectives, and policies of the Safety Element of the Los Angeles City General Plan and the Los Angeles County Operational Area emergency response plan (ERP) provide guidance during unique situations requiring an unusual or extraordinary emergency response. Implementation of the ERP would also incorporate and coordinate all the facilities and personnel of County government, along with the jurisdictional resources of the cities and special districts in the County, into an efficient Operational Area organization capable of responding to any emergency using a Standard Emergency Management System, mutual aid and other appropriate response procedures. The City's General Plan Safety Element Policies 1.1.1, 2.1.1, and 3.1.1 call for coordination among City agencies and other jurisdictions to provide mutual assistance in the event of an emergency or natural disaster and establishment of disaster recovery programs. Compliance with these policies and plans would minimize potential interference with the City and County emergency response plans from construction and operational activities resulting from implementing the Proposed Project. The City's Emergency Operations Organization (EOO) implements the goals and policies of the Safety Element. The Safety Element outlines the scope of the EOO's on-going efforts to use experiences and new information to improve the City's hazard program. The EOO Master Plan and individual agency Emergency Response Plans set forth procedures for City personnel to follow in the event of an emergency situation stemming from natural disasters, technological incidents, and nuclear defense operations.

The City of Los Angeles Department of Transportation and LAFD would be responsible for ensuring that future development does not impair or physically interfere with an adopted emergency response or evacuation plan. As proposed, the Project assumes daily worker and truck trips to and from several simultaneous locations in the Project Area. The rough grading estimates equate to no more than 200,000 cubic yards of grading at any given time and for a wide range of probable construction activities which are expected to occur, such as site preparation and remediation, if necessary. As part of standard development procedures, plans would be submitted for review and approval to ensure that all new development has adequate emergency access and escape routes (clearly marked and delineated) in compliance with existing City regulations. Additionally, haul route permits would be reviewed and issued as part of the implementation of the Proposed Project and in compliance with the LAMC and LADBS policies. Nevertheless, the Project would not introduce any features that would preclude implementation of or alter these policies or procedures in any way. Additionally, the Project would not impair implementation of, or physically interfere with the ERP.

Based on the above, development and implementation of construction and traffic management plans for all construction activity would ensure that implementation of the Project would not impair or physically interfere with adopted emergency response or evacuation. Therefore, impacts related to emergency response plans and emergency evacuation plans would be *less than significant*.

Mitigation Measures

No significant impact would occur; therefore, mitigation is not required for the Project.

Threshold 4.8-7	Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires
------------------------	--

Impact 4.8-7 **Proposed Project:** No wildland fire hazard areas exist in the Cornfield Arroyo Seco Specific Plan Area. *No impact* associated with wildland fire risks will occur.

Project Impact

The entire Project Area is urbanized and lacks open hillside areas that are subject to wildland fire hazards. CAL FIRE has identified the entire Project Area as being located in the “Non-Very High Fire Hazard Severity Zone” in the Local Responsibility Area for incorporated cities (CAL FIRE 2022). This indicates that the Project Area is not subject to wildfire hazards. Therefore, *no impact* would occur.

Mitigation Measures

No significant impact would occur; therefore, mitigation is not required for the Project.

CUMULATIVE IMPACTS

The scope to analyze potential cumulatively considerable hazards and hazardous materials impacts is citywide.

Routine Transport, Use, or Disposal of Hazardous Materials

Impacts related to hazards and hazardous materials are generally site-specific and exposure to a hazard at one location generally does not increase hazards at another location. Therefore, although Citywide growth could potentially increase overall quantities of hazardous materials transported, use, and disposed in the City, impacts related to hazardous material transport, use, and disposal generally are not cumulative in nature. Further, as discussed under Impact 4.8-1, the Project would not foreseeably result in new development that would involve the use, storage, or transport of large quantities of hazardous materials. Moreover, businesses that transport, use, or dispose of hazardous materials throughout the City would be subject to federal, State, and local regulations, as discussed in Regulatory Framework, and compliance with these regulations would reduce the potential for any cumulative impacts to a less than significant level.

For these reasons, cumulative impacts related to hazardous material transport, use, and disposal would not be significant and the incremental effects of the Project related to hazardous material transport, use, and disposal would not be cumulatively considerable. Cumulative impacts would be *less than significant*.

Upset/Accident Involving Hazardous Materials

Impacts related to upsets and accidents involving hazardous materials are also generally site-specific and an accident at one location generally does not increase hazards at another location. Cumulative development could occur on properties listed on hazardous materials sites or involve the demolition of existing structures,

which may contain hazardous materials such as LBP and ACMs. Various regulations and guidelines pertaining to abatement of, and protection from, exposure to asbestos and lead have been adopted for demolition activities and would apply to all new development in the City and County. All demolition that could result in the release of lead and/or asbestos must be conducted according to Cal/OSHA standards.

As discussed under Impact 4.8-2, the Proposed Project would not foreseeably result in new development that would be expected to increase the potential for accidents involving hazardous materials. Additionally, businesses that transport or use hazardous materials throughout the City, including the Project Area, would be subject to federal, State, and local regulations. Therefore, although Citywide growth could increase the overall potential for accidents involving hazardous materials, impacts related to hazardous material accidents generally are not cumulative in nature.

For these reasons, the incremental effect of the Project related to accidents involving hazardous materials would not be cumulatively considerable and cumulative impacts would be *less than significant*.

Hazardous Materials Near Schools

As discussed above, impacts related to hazards and hazardous materials are generally site-specific and exposure to a hazard at one location generally does not increase hazards at another location. Therefore, although Citywide growth could potentially increase the overall potential for hazardous material emissions or releases to affect schools, such impacts generally are not cumulative in nature.

As discussed under Impact 4.8-3, the Proposed Project would not accommodate new development that would increase the use, storage, or transport of large quantities of hazardous materials near schools. Additionally, businesses that transport, use, or dispose of hazardous materials throughout the City, including the Project Area, would be subject to federal, State, and local regulations, as discussed in Regulatory Framework. Compliance with the applicable regulations and guidelines, identified in Regulatory Framework that pertain to abatement of, and protection from, exposure to ACMs, LBPs, and other hazardous materials, would ensure that schools would not be exposed to any unusual or excessive risks related to hazardous materials during construction and operational activities.

Compliance with applicable regulations and guidelines pertaining to abatement of, and protection from, exposure to hazardous materials would ensure that schools would not be exposed to any unusual or excessive risks related to hazardous materials during construction and operational activities. Furthermore, Mitigation required under Impact 4.8-4 would address any potential impacts in the Project Area related to the possible release of hazardous materials near schools from soil disturbance. For these reasons, the incremental effect of the Proposed Project with respect to use of hazardous materials near schools would not be cumulatively considerable and cumulative impacts would be *less than significant*.

Hazardous Material Sites

As discussed above, impacts related to the accidental release of soil or groundwater contaminants are site-specific and exposure to a hazard at one location generally does not increase hazards at another location. Therefore, although Citywide growth could potentially increase the overall potential for releases of hazardous materials from contaminated sites, such impacts generally are not cumulative in nature.

As discussed under Impact 4.8-4, the Proposed Project could involve disturbance of contaminated sites and thus result in the release of hazardous materials; however, such impacts would be localized in nature. Moreover, Mitigation Measures 4.8-4(a) and (b) would reduce impacts related to disturbance of contaminated sites to a less than significant level.

For these reasons, the incremental effect of the Proposed Project related to the release of hazardous material from such sites would not be cumulatively considerable and cumulative impacts would be *less than significant*.

Public Airports

Aircraft-related hazards occur only in the vicinity of airports or airstrips. Although citywide growth could increase the number of people who are exposed to aircraft-related hazards, such hazards would be localized in nature. In addition, new development would not increase the hazard.

Because no portion of the Project Area is located in the vicinity of a public airport, the Proposed Project would have no contribution to any cumulative impact related to these hazards.

For these reasons, the incremental effect of the Proposed Project with respect to potential for exposure to airport/airstrip-related hazards would not be cumulatively considerable and cumulative impacts would have *no impact*.

Emergency Response and Evacuation

Construction associated with cumulative development could potentially result in activities that may interfere with adopted emergency response or evacuation plans, primarily through the use of temporary construction barricades or other obstructions that could impede emergency access. However, such impacts would be localized and generally would not be cumulative in nature unless multiple construction projects were to occur simultaneously in close proximity to each other. The overall increase in traffic that may result from Citywide growth could also potentially hinder emergency response and/or evacuation. However, compliance with federal, state, and local regulations would prevent interference with adopted emergency plans. More specifically, compliance with City requirements on a project-by-project basis and periodic update of emergency response and evacuation plans to address changed conditions would ensure that cumulative impacts related to interference with adopted emergency plans, including temporary street closures and long-term increases in traffic, remain less than significant.

The Proposed Project's contribution to Citywide impacts would be similarly addressed through compliance with federal, state, and local regulations, including City requirements and periodic emergency response/evacuation plan updates.

For these reasons, the incremental effect of the Proposed Project with respect to emergency response and evacuation would not be cumulatively considerable and cumulative impacts would be *less than significant*.

Wildland Fire

Wildland fire hazards are limited to hillsides and similar areas that are subject to wildland fire. Although Citywide growth could increase the number of people who are exposed to wildland fire hazards, such hazards would be localized in nature. In addition, new development would not increase wildland fire potential. Because no portion of the Project Area is located in a wildland fire hazard area, the Proposed Project would have no contribution to any cumulative impact related to such hazards.

For these reasons, the incremental effect of the Proposed Project with respect to potential exposure to wildland fire hazards would not be cumulatively considerable and cumulative impacts would have *no impact*.

4.9 HYDROLOGY AND WATER QUALITY

This section analyzes impacts to the City’s water quality and hydrological resources from implementation of the updated Cornfield Arroyo Seco Plan (CASP) Plan (or “Proposed Project” or “Project”) in the existing CASP area of Los Angeles (or “Project Area”).

ENVIRONMENTAL SETTING

TOPOGRAPHY

Citywide

The City of Los Angeles consists of flat basins defined by the San Gabriel, Santa Susana and Santa Monica Mountains, three major rivers, and the Pacific Ocean. Elevation ranges from 5,074 feet at Sister Elsie Peak in the San Gabriel Mountains to nearly mean sea level in the southwestern part of the City.

The landforms and topography of Los Angeles consist of mountains and hills that trend east to west (Traverse Ranges province) or north-northwest to south-southeast (Peninsular Ranges province). Los Angeles has a mild climate with an annual average temperature of 63.8 degrees Fahrenheit with an average high temperature of approximately 71.7 degrees Fahrenheit and an average low temperature of approximately 55.9 degrees Fahrenheit. Annual precipitation of the region averages approximately 18.67 inches. Precipitation occurs during the months of October through April, averaging approximately 2.6 inches per month (US Climate Data 2017). For planning purposes, the Los Angeles Regional Water Quality Control Board (LARWQCB) uses the California Department of Water Resources (DWR) classification system, which divides surface waters into hydrologic units, areas, and subareas, and groundwaters into major groundwater basins. The Los Angeles-San Gabriel Hydrologic Unit covers most of Los Angeles County and small areas of southeastern Ventura County. This drainage area totals 1,608 square miles. This hydrologic unit is urbanized and much of the area is covered with semi-permeable or non-permeable material (i.e., paved). The Los Angeles River, San Gabriel River, and Ballona Creek, which are the major drainage systems in Los Angeles County, drain the coastal watersheds of the Transverse Ranges.

Project Area

The Project Area lies in northeast Los Angeles. Most of the Project Area’s topography is relatively level, with no significant hillside areas or slopes, although there is a slight downslope from the northern boundary of the Project Area toward the southern boundary; elevations in the Project Area range from approximately 290 feet in the southeast corner of the Project Area to 380 feet in the northwest tip of the Project Area.

WATERSHEDS AND SURFACE WATER

Citywide

The Los Angeles River is the major watercourse that drains the San Gabriel Mountains. Its watershed covers a land area of over 834 square miles, including the eastern portions of the Santa Monica Mountains and western portions of the San Gabriel Mountains. The Los Angeles River is approximately 55 miles long from its headwaters to its mouth, and 32 miles of the river is within the City of Los Angeles. The Los Angeles River originates at the west end of the San Fernando Valley in the northwest corner of Los Angeles County. The river channel extends east to Glendale, where it turns and flows south to the Pacific Ocean.

The Los Angeles River is part of a network of dams, reservoirs, debris collection basins, and spreading grounds built by the Los Angeles County Flood Control District and the U.S. Army Corps of Engineers to minimize flooding. The floodplain starts in the northeast part of the City of Los Angeles at the Arroyo Seco confluence and then passes through the cities of Los Angeles, Bell, Bell Gardens, South Gate, Lynwood, Lakewood, Paramount, Compton, Bellflower, Carson, Gardena and Long Beach on the way to its terminus at the Pacific Ocean (Upper Los Angeles River Watershed Management Group [ULARWVG] 2014).

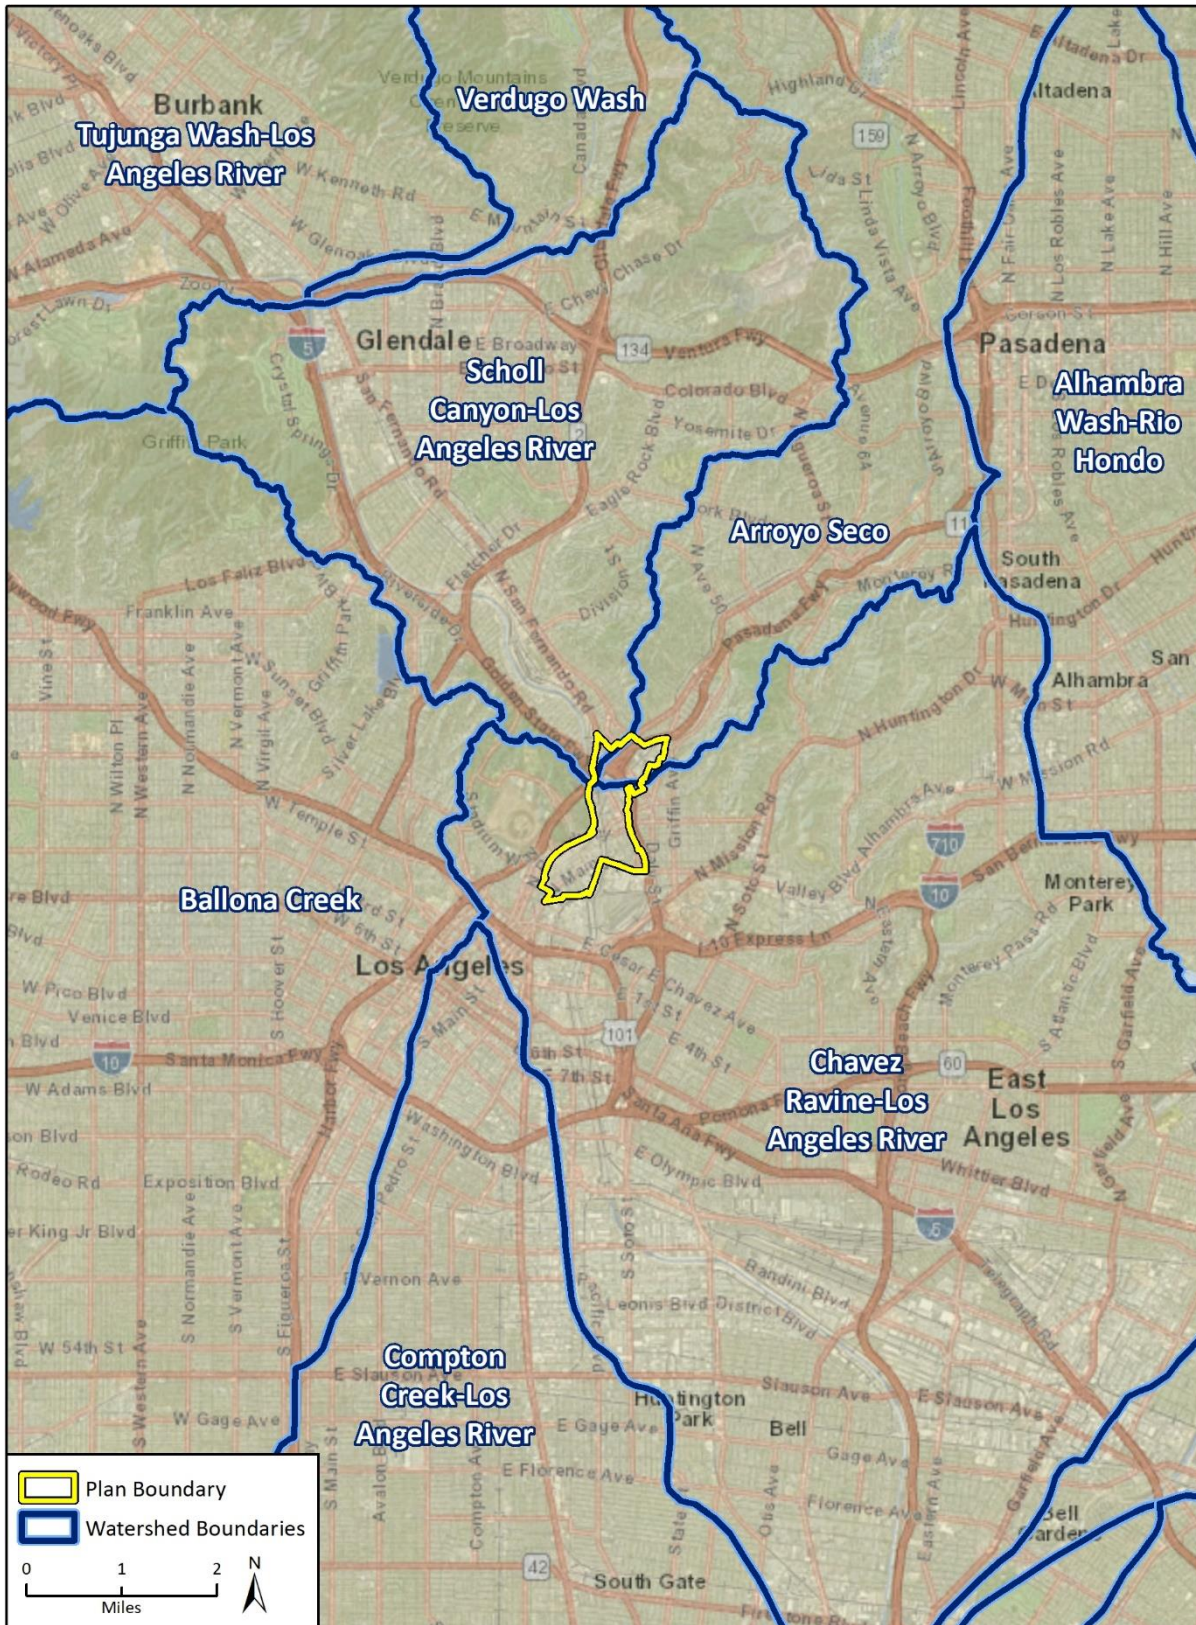

Project Area

The Project Area is located in the Lower Los Angeles River Watershed which overlies the Chavez Ravine sub-watershed and the Scholl Canyon sub-watershed.

The Arroyo Seco sub-watershed covers approximately 46 square miles of the Los Angeles Basin and consists of a stream that begins high in the San Gabriel Mountains and flows through the communities of La Canada Flintridge, Altadena, Pasadena, South Pasadena and Los Angeles, where it meets the waters of the Los Angeles River and continues on to the Pacific Ocean. It is bounded by the San Gabriel Valley to the east and the San Fernando Valley to the west and drains into the Los Angeles River at a confluence in Lincoln Heights.

The Lower Los Angeles River Watershed encompasses approximately 479 square miles and comprises the cities of Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Canada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Fernando, San Gabriel, San Marino, South Pasadena, and Temple City as well as the unincorporated areas of the County of Los Angeles. The Los Angeles River is approximately 55 miles long, and five of six reaches lie in the Upper Los Angeles River Watershed. The natural hydrology of the Los Angeles River has been altered by channelization and the construction of dams and flood control reservoirs. The Los Angeles River and many of its tributaries are lined with concrete for most or all of their length. Soft-bottomed segments of the Los Angeles River occur where groundwater upwelling prevents armoring of the river bottom (ULARWVG 2014). The Project Area is bounded by the Los Angeles River to the south and overlies the Chavez Ravine and Scholl Canyon sub-watersheds. Refer to **Figure 4.9-1** and **Figure 4.9-2**.

GROUNDWATER

Citywide

The Los Angeles Department of Water and Power (LADWP) provides water service in the City. The LADWP uses several sources of local groundwater, including the Coastal Plain of Los Angeles Groundwater Basin - Central Sub-basin (Central Basin), San Fernando Basin, and Sylmar Basin. The Upper Los Angeles River Area (ULARA) watershed is the principal groundwater resource where the City produces local groundwater from the San Fernando and Sylmar Basins. The City also owns water rights in the Eagle Rock and West Coast Basins but does not pump its entitlement from these basins due to the lack of production facilities and contamination (LADWP 2021). More information on water supply can be found in Section 4.14, *Utilities and Service Systems*, of this EIR.

Central Basin

The Central Basin encompasses approximately 277 square miles of surface area, bounded on the north by a surface divide called the La Brea high, and on the northeast and east by emergent less permeable Tertiary rocks of the Elysian, Repetto, Merced and Puente Hills. The southeast boundary between Central Basin and Orange County Groundwater Basin roughly follows Coyote Creek, which is a regional drainage boundary. The Los Angeles and San Gabriel Rivers drain inland basins and pass across the surface of the Central Basin on their way to the Pacific Ocean. Historically, groundwater flow in the Central Basin has been from recharge areas in the northeast part of the sub-basin, toward the Pacific Ocean on the southwest (LADWP 2004).

Sylmar Basin

The Sylmar Basin, in the northern part of ULARA, is the second largest basin, and it consists of 5,600 acres and comprises 4.6 percent of the total valley fill. It is bounded on the north and east by the San Gabriel Mountains; on the west by a topographic divide in the valley fill between the Mission Hills and the San Gabriel Mountains; on the southwest by the Mission Hills; on the east by sedimentary rocks along the east bank of the Pacoima Wash; and on the south by the eroded south limb of the Little Tujunga Syncline. (Upper Los Angeles River Area Watermaster 2017).

San Fernando Basin

The San Fernando Basin is the largest source of groundwater in the City of Los Angeles and has been adjudicated since 1979. It covers approximately 226 square miles, bounded on the northwest by the Santa Susana Mountains, on the northeast by the San Gabriel Mountains, on the east by the San Rafael Hills, on the west by the Simi Hills, and on the south by the Santa Monica Mountains. The valley is drained by the Los Angeles River and its tributaries.

Project Area

The Project Area is underlain by the Central Basin, however water use within the area is provided by LADWP from a mix of sources and does not come directly from the Central Basin groundwater aquifers, as will be discussed under *Environmental Impacts*. No additional existing conditions information for the Central Basin is required beyond that described in the Citywide Groundwater subsection above.

WATER QUALITY

The primary source of urban pollution to surface and groundwater resources within the City, including the Proposed Project Area, is stormwater runoff from paved areas, which can contain hydrocarbons, sediments, pesticides, herbicides, toxic metals, and coliform bacteria.

In addition to common urban runoff contaminants, industrial contamination issues have led to restricted use of local groundwater pumping by the LADWP. Much of LADWP's pumping capacity has been impaired by contaminants, primarily volatile organic compounds (VOCs). In the San Fernando Basin, more than 80 of LADWP's 115 water supply wells have been removed from service or restricted in use. In the neighboring Sylmar Basin, contamination has caused two of three LADWP water supply wells to be removed from service. Two of ten LADWP water supply wells in the Central Basin were taken off line and demolished as a result of groundwater contamination issues. Water quality problems associated with hydrocarbon pollutants caused LADWP to discontinue utilizing its West Coast Basin facilities in 1980. Furthermore, declining groundwater levels and overdraft conditions have become concerns for Los Angeles basins where decades of expanding urbanization, increasing impervious hardscape, and channelization of stormwater runoff have diverted natural replenishment away from local aquifers. Aging wellfields and distribution system infrastructure have also presented challenges to the development and use of the City's local groundwater resources. Combined, these challenges have caused the City to renew its focus on sustainable management of its local groundwater basins. Responding to groundwater contamination issues has been a high priority for the City, particularly in the San Fernando Basin. Expanded basin remediation systems are under development to remove contamination from the local groundwater basin to restore the beneficial uses of this important basin (LADWP 2021).

As detailed further under Section 4.9-2, *Regulatory Setting*, the SWRCB is required to designate certain state surface waters as 'impaired' under Section 303(d) of the federal Clean Water Act and to generate Total Maximum Daily Loads (TMDLs) of identified pollutants in order to maintain beneficial uses of these waters. Most of the major surface waters of the City of Los Angeles and surrounding areas are on the most recent 303(d) listings, including the major coastal bays such as Santa Monica Bay, San Pedro Bay and the Los Angeles/Long Beach Outer Harbor, as well as the major river systems and most of their tributaries including the Los Angeles and San Gabriel Rivers and associated tributaries (SWRCB 2018).

Within the Project Area, the Los Angeles River Reach 3 and Arroyo Seco Reach 1 form a confluence into the Los Angeles River Reach 2. All three waters are 303(d) listed as impaired and have TMDLs for trash and indicator bacteria; the reaches of the Los Angeles River also have TMDLs for ammonia, nutrients, and copper, and Reach 2 of the Los Angeles River has a further TMDL for lead (SWRCB 2018). New sources of these pollutants sited within the Project Area, which may discharge to these waters will be required to comply with regulations under the LARWQCB's water quality control plan which apply to these waters.

LADWP's water system supplied four million customers with nearly 160 billion gallons of treated water in 2016. The City's water met and surpassed most federal and state drinking water standards set by the U.S. Environmental Protection Agency and the State of California, Water Resources Control board – Division of Drinking Water (LADWP 2017).

FLOOD HAZARDS

Flooding

Citywide

The major flooding causes in the City of Los Angeles are high-intensity storms. Water courses in the City can flood in response to a succession of intense winter rainstorms, usually between early November and late March. A series of such weather events can cause severe flooding in the City due to the large percentage of impervious area and the age and capacity of the drainage system. Other types of floods that may occur include flooding from dam and levee failure, and power-failure-induced flooding. In the City, large floods occur approximately every 5 to 6 years (City of Los Angeles 2017).

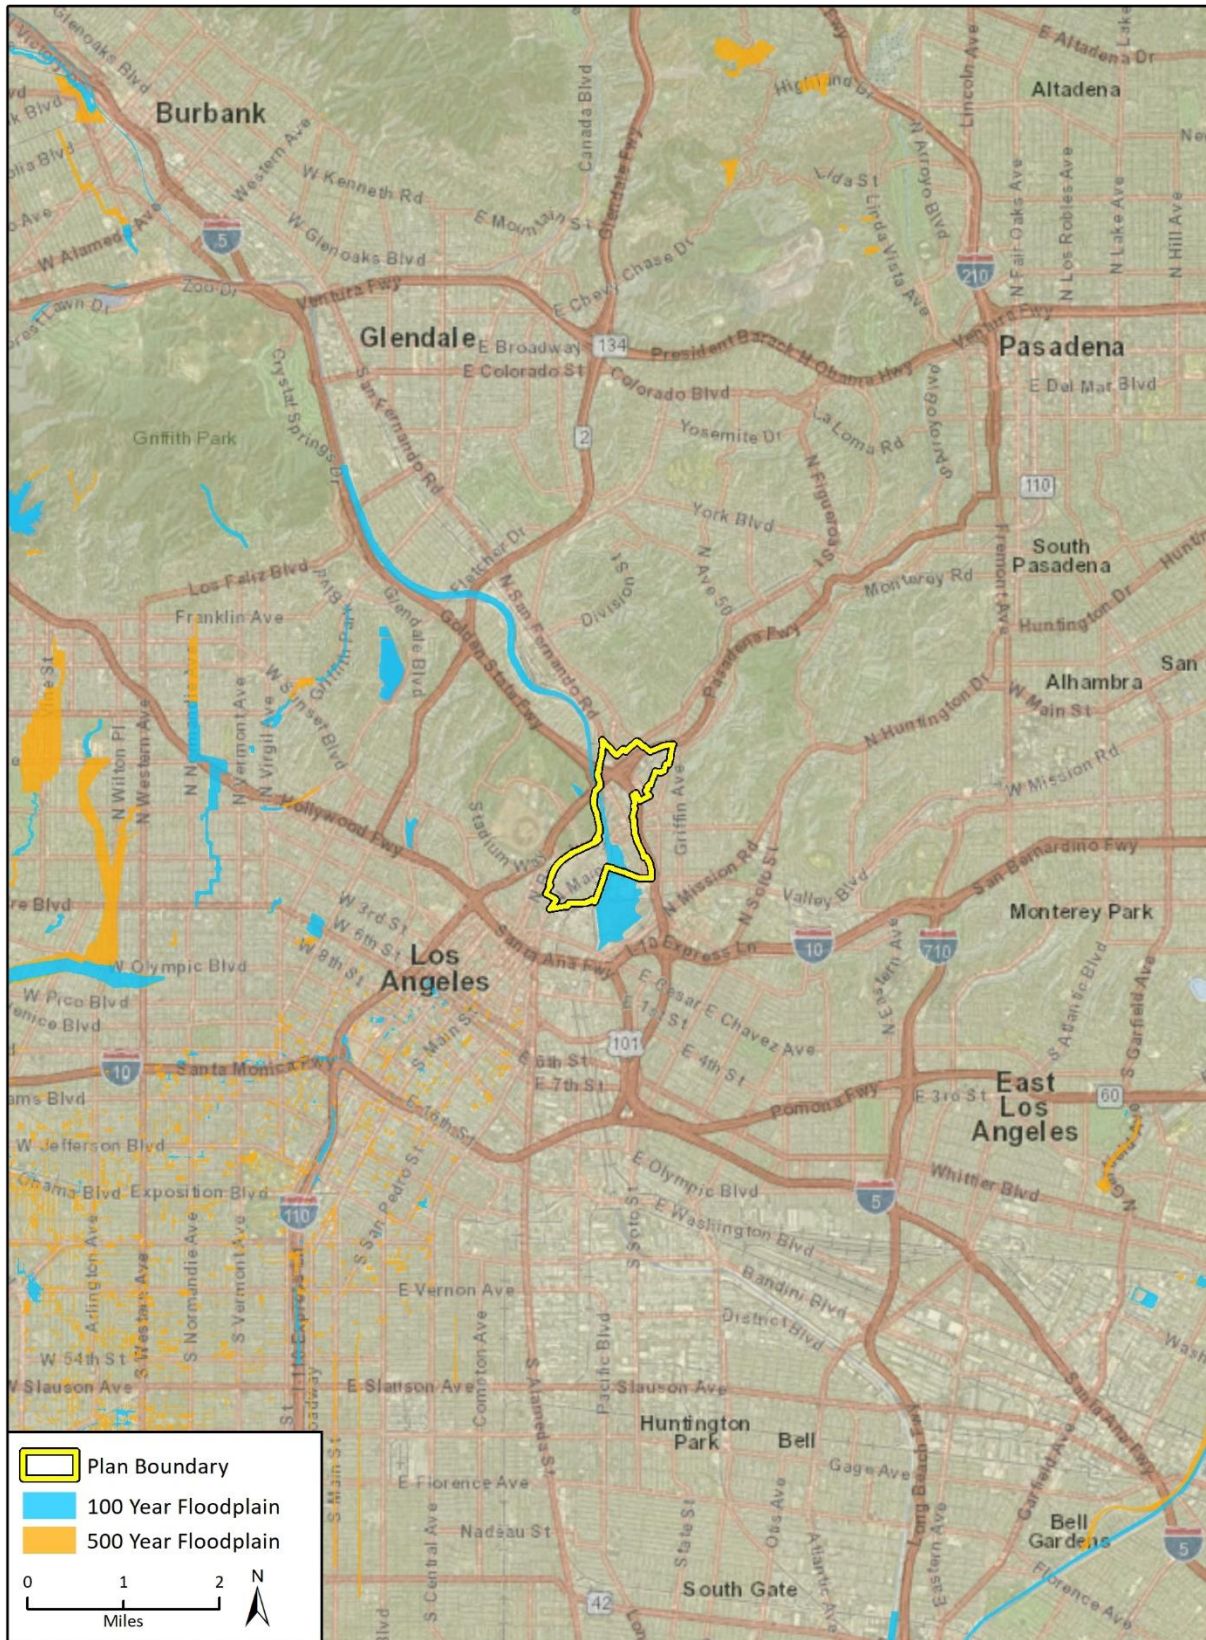

The Federal Emergency Management Agency (FEMA) has designated 100-year (one percent annual chance of flooding) and 500-year (0.2-percent annual chance of flooding) flood zones located throughout the City. According to the Safety Element of the General Plan, flood hazard areas subject to 100-year floods comprise 30 square miles within the City. At least 5,628 structures, 88 percent of them residential and 10 percent commercial or industrial, were located in the 100-year flood zone as of 2017 (City of Los Angeles 1996).

Portions of Los Angeles also fall within 500-year flood zones (City of Los Angeles 1996). A total of 38,927 structures, 89 percent residential and 9 percent commercial or industrial, are located in the 500-year flood zone (LA DWP 2017a).

Project Area

Potential flooding is not likely to occur in the Project Area from intense localized rainstorms and spillover from nearby flood control channels of the Los Angeles River. The Federal Emergency Management Agency (FEMA) establishes base flood heights for 100-year and 500-year flood zones, depicted in the Flood Insurance Rate Maps (FIRMs). As shown on **Figure 4.9-3**, the Project Area contains portions within the 100-year flood zone.

Figure 4.9-3 FEMA Flood Zones

Imagery provided by Microsoft Bing and its licensors © 2021.
Additional data provided by FEMA, 2020.

Dam Inundation

Citywide

Dam failure events are infrequent and usually coincide with events such as earthquakes, landslides and excessive rainfall, but may also occur from water storage facility failure. The City of Los Angeles has 12 dams located within City boundaries, including Eagle Rock, Elysian, Ensino, Hansen Recreation Lake, Lopez, Los Angeles Reservoir, Lower Franklin #2, Mulholland, Riviera Reservoir, Santa Ynez Canyon, Silver Lake, and Stone Canyon. However, dams outside of the City boundaries may have potential to cause inundation within the City. These dams include 10th and Western, Big Tujunga, Devils Gate, Diederich Reservoir, Glen Oaks 968, Green Verdugo, Greystone, Laguna Basin, Pacoima, Palos Verdes Reservoir, Sepulveda, and Upper Franklin (Los Angeles County Enterprise Geographic Information Systems 2017).

Project Area

Small portions of the Project Area lie within the inundation area for the Elysian Reservoir, which could potentially inundate a portion of the Project Area in the immediate vicinity of the reservoir in the event of structural failure. The Elysian reservoir inundation area is approximately the same as the flood zone depicted in **Figure 4.9-3** (Los Angeles County Enterprise Geographic Information Systems 2017).

Tsunamis and Seiches

Citywide

Tsunamis are rare along the Los Angeles Coast. However, depending upon the magnitude of the tsunami, coastal areas of the City could be inundated, most notably in the San Pedro and Los Angeles Harbor areas, and in neighboring Santa Monica (City of Los Angeles 2017).

A seiche is a surface wave created when a body of water is shaken. Seiches may cause inundation if the wave overflows a containment wall, such as the wall of a reservoir, water storage tank, dam or other artificial body of water. Mitigation of potential seiche action has been implemented by LADWP through regulation of the level of water in its storage facilities and providing walls of extra height to contain seiches and prevent overflow. Dams and reservoirs are monitored during storms and measures are implemented in the event of potential overflow (City of Los Angeles 2017).

Project Area

The Project Area is northeast of the Pacific Ocean and is outside of a Tsunami Hazard Area (LADWP 2017). No portion of the Project Area is subject to seiches.

REGULATORY FRAMEWORK

Development in Los Angeles is subject to various local, state, and federal regulations regarding the use of water resources.

FEDERAL

Clean Water Act

The Clean Water Act (CWA) was established by the 1972 amendments to the former the Federal Water Pollution Control Act, was first introduced in 1948, with major amendments in the 1960s, 1970s and 1980s.

The CWA authorizes Federal, state, and local entities to cooperatively create comprehensive programs for eliminating or reducing the pollution of state waters and tributaries.

Section 303 of the CWA requires states to develop water quality standards to protect the beneficial uses of receiving waters. In accordance with California's Porter/Cologne Act, the Regional Water Quality Control Boards (RWQCBs) of the State Water Resources Control Board (SWRCB) are required to develop water quality objectives that ensure their region meets the requirements of Section 303 of the CWA. All of Los Angeles is within the Los Angeles RWQCB, District 4's jurisdiction.

Under Section 303(d) States are required to submit a list to the U.S. EPA identifying waters within its boundaries not meeting water quality standards (impaired waters) and the water quality parameter (i.e. pollutant) not being met. The Los Angeles River Reach 2 (located within the Project Area) is listed by the SWRCB as Impaired Waters under Section 303(d). Section 404 of the Clean Water Act prohibits the discharge of dredged or fill materials into Waters of the United States or adjacent wetlands without a permit from the U.S. Army Corps of Engineers. Discharges of fill material generally include placement of fill that is necessary for structure construction, site development fills for recreational, industrial, commercial, residential, and other uses. A Corps permit is required whether the work is permanent or temporary.

Federal Antidegradation Policy

The Federal Antidegradation Policy has been incorporated within the Clean Water Act and requires states to develop state-wide antidegradation policies and identify methods for implementing them. Pursuant to the Code of Federal Regulations, state antidegradation policies and implementation methods must, at a minimum, protect and maintain: (1) existing in-stream water uses; (2) existing water quality, where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that allowing lower water quality is necessary to accommodate economic and social development in the area; and (3) water quality in waters considered an outstanding national resource.

Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) is the main federal law that ensures the quality of the Nation's drinking water. The SDWA was originally passed by Congress in 1974 to protect public health by regulating the nation's public drinking water supply and its sources: rivers, lakes, reservoirs, springs, and groundwater wells. Under SDWA, the USEPA sets standards for drinking water quality and oversees the states, localities, and water suppliers that implement those standards. The SDWA regulates contaminants of concern in domestic water supply, including MCLs, and that the EPA has delegated the Cal Dept. of Public Health the responsible agency for administering California's drinking water program. MCLs are established under CCR Title 22, Div. 4, Ch. 15, Article 4 (Title 22 Standards).

National Flood Insurance Program

The National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973 mandate the FEMA to evaluate flood hazards. FEMA provides flood insurance rate maps (FIRMs) for local and regional planners to promote sound land use and development practices, by identifying potential flood areas based on the current conditions. To delineate a FIRM, FEMA conducts engineering studies referred to as flood insurance studies (FIS). Using information gathered in these studies, FEMA engineers and cartographers delineate special flood hazard areas (SFHA) on FIRMs.

The Flood Disaster Protection Act requires owners of all structures within identified SFHAs to purchase and maintain flood insurance as a condition of receiving federal or federally-related financial assistance, such as mortgage loans from federally-insured lending institutions. Community members within designated areas are able to participate in the National Flood Insurance Program (NFIP) afforded by FEMA.

National Pollutant Discharge Elimination System

The 1972 CWA Amendments established the National Pollutant Discharge Elimination System (NPDES) permit program. The Program prohibits discharge of pollutants into the nation's waters without procurement of a NPDES permit from the United States Environmental Protection Agency (USEPA) or authorized State agency. The NPDES Permit Program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. Point sources are discrete conveyances such as pipes or man-made ditches. Examples of pollutants include, but are not limited to, rock, sand, dirt, and agricultural, industrial, and municipal waste discharged into waters of the United States. The purpose of the permit is to translate general requirements of the Clean Water Act into specific provisions tailored to the operations of each organization that is discharging pollutants. .

The NPDES Program requires NPDES permits for: (1) Municipal Separate Storm Sewer Systems (MS4) Permit generally serving, or located in, incorporated cities with 100,000 or more people (referred to as municipal permits); (2) 11 specific categories of industrial activity (including landfills); and (3) construction activity that disturbs five acres or more of land. As of March 2003, Phase II of the NPDES Program extended the requirements for NPDES permits to numerous small municipal separate storm sewer systems, construction sites of one to five acres, and industrial facilities owned or operated by small municipal separate storm sewer systems, which were previously exempted from permitting. The NPDES Program is generally administered at the State and Regional levels.

In California, the USEPA Region 9 issues NPDES permits for any discharges into federal ocean waters. However, the remaining NPDES Program permitting authority has been delegated to the State for implementation through the State Water Resources Control Board (SWRCB) and nine Regional Water Quality Control Boards (RWQCB). The SWRCB establishes requirements prescribing the quality of point sources of discharge and establishes water quality objectives. These objectives are established based on the designated beneficial uses (e.g., water supply, recreation, and habitat) for a particular surface water body or groundwater basin. The SWRCB also oversees the NPDES Program's implementation throughout the State. To do so, it coordinates with and supports Regional Water Board efforts, and reviews RWQCB actions. The NPDES permits are issued to point source dischargers of pollutants to surface waters and are issued pursuant to California Water Code Chapter 5.5 that implements the CWA. Examples include, but are not limited to, public wastewater treatment facilities, industries, power plants, and groundwater cleanup programs discharging to surface waters (State Water Resources Control Board, Title 23, Chapter 9, Section 2200). Discharge limits, under the NPDES permits, for minerals and pollutants are established and regulated by the RWQCB.

STATE

Porter-Cologne Water Quality Act (California Water Code)

The Porter-Cologne Water Quality Control Act, also known as the California Water Code (CWC) Section §13000 et seq., established the legal and regulatory framework for California's water quality control. The CWC authorizes the SWRCB to implement the provisions of the CWA, including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants.

Under the CWC, the State is divided into nine RWQCBs, which govern the implementation and enforcement of the CWC and the CWA. The Project Site is located within Region 4, also known as the LARWQCB. The RWQCBs develop and enforce water quality objectives and implement plans that will best protect California's waters, acknowledging areas of different climate, topography, geology, and hydrology. Each RWQCB is required to formulate and adopt a Water Quality Control Plan or Basin Plan for its region. The Basin Plan establishes beneficial use definitions for the various types of water bodies and serves as the basis for establishing water quality objectives, discharge conditions and prohibitions, and

must adhere to the policies set forth in the CWC and established by the SWRCB. In this regard, the LARWQCB issued the Los Angeles Basin Plan on August 29, 2014 for the Coastal Watersheds of Los Angeles and Ventura Counties, with subsequent amendments. The RWQCB is also given authority to issue waste discharge requirements, enforce actions against stormwater discharge violators, and monitor water quality.

Sustainable Groundwater Management Act (SGMA) of 2014

The Sustainable Groundwater Management Act of 2014 (SGMA) creates a framework for sustainable, local groundwater management in California. SGMA requires the designation of groundwater sustainability agencies (GSAs) by one or more local agencies and the adoption of groundwater sustainability plans (GSPs) for basins designated as medium- or high-priority by the California Department of Water Resources (DWR). SGMA grants new powers to GSAs, including the power to adopt rules, regulations, ordinances, and resolutions; regulate groundwater extractions; and to impose fees and assessments. SGMA also allows the State Water Resources Control Board (SWRCB) to intervene if local agencies will not or do not meet the SGMA requirements, in addition to mandating that critically over drafted basins be sustainable by 2040, and medium- or high-priority by 2042.

California Toxics Rule

In 2000, the California Environmental Protection Agency (Cal-EPA) promulgated the California Toxics Rule, which establishes water quality criteria for certain toxic substances to be applied to waters in the State. Cal-EPA promulgated this rule based on Cal-EPA's determination that the numeric criteria of specific concentrations of regulated substances are necessary for the State to protect human health and the environment. The California Toxics Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the LARWQCB as having beneficial uses protective of aquatic life or human health.

California State Water Resource Control Board (SWRCB)

The SWRCB was established through the California Porter Cologne Water Quality Act of 1969. At the State level, SWRCB has responsibility for the protection of water quality and sets Statewide policies and regulations for the implementation of water quality control programs mandated by federal and State water quality statutes and regulations. The SWRCB delegates to the nine RWQCBs the responsibility for the protection of water quality in each major drainage basin throughout the state. The LARWQCB has jurisdiction over the coastal drainages between Rincon Point (on the coast of western Ventura County) and the eastern Los Angeles County line. A more detailed discussion of the LARWQCB is presented below.

NPDES General Construction Activity Stormwater Permit (GCASP)

Pursuant to CWA Section 402(p) and the Porter-Cologne Water Quality Control Act, SWRCB has issued a Statewide NPDES General Permit, or GCASP, under Order No. 2009-0009-DWQ, NPDES No. CAR000002, which was adopted on September 2, 2009. The Order requires that prior to the beginning of construction activities, the permit applicant must obtain coverage under a GCASP permit by preparing and submitting a Notice of Intent (NOI) along with the appropriate fee to SWRCB. Construction activities subject to GCASP include clearing, grading, and disturbances to the ground, such as stockpiling or excavation, which results in soil disturbances of one acre of total land area or more.

Prior to obtaining the GCASP, an adequate Stormwater Pollution Prevention Plan (SWPPP) has to be prepared. The SWPPP specifies Best Management Practices (BMPs) that will prevent construction pollutants from contacting stormwater with the intent of keeping all products of erosion from moving off-site into receiving waters. BMPs are intended to diminish impacts to the Maximum Extent Practicable

(MEP), which is a standard developed by Congress to allow regulators the flexibility needed to shape programs to the site-specific nature of municipal stormwater discharges. The SWPPP has two major objectives: (1) to help identify the sources of sediment and other pollutants that affect the quality of stormwater discharges and (2) to describe and ensure the implementation of BMPs to reduce or eliminate sediment and other pollutants in stormwater as well as non-stormwater discharges. The SWPPP includes a description of: (1) the site, (2) erosion and sediment controls, (3) means of waste disposal, (4) implementation of approved local plans, (5) control of post-construction sediment and erosion control measures and maintenance responsibilities, and (6) non-stormwater management controls. Dischargers are also required to inspect their construction sites before and after storms to identify stormwater discharge associated with construction activity and to identify and implement controls where necessary.

BMPs are intended to diminish impacts to the MEP, which is a standard developed by Congress to allow regulators the flexibility needed to shape programs to the site-specific nature of municipal stormwater discharges. Reducing impacts to the MEP generally relies on BMPs that emphasize pollution prevention and source control, with additional structural controls as needed.

Within the City of Los Angeles, SWPPP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, development project plans are reviewed for compliance with the stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

Cobey-Alquist Flood Plain Management Act

CWC Sections 8400 et seq. documents the state's intent to support local governments in their use of land use regulations to accomplish floodplain management and to provide assistance and guidance, as appropriate.

REGIONAL

Water Replenishment District of Southern California

The City of Los Angeles is included within the Water Replenishment District of Southern California (WRD). The WRD service area is categorized as a High Priority basin and pursuant to the SGMA must either: (a) form a groundwater sustainability agency (GSA) to prepare and submit a groundwater sustainability plan; or directly submit an Alternative Analysis in lieu of forming a GSA. The WRD, in conjunction with key stakeholders including the LADWP, has prepared and submitted an Alternative Analysis that satisfies the requirements of the SGMA. The Alternative Analysis demonstrates compliance with applicable portions of the CWC and provides adequate information to show that the applicable, underlying Central Subbasin has operated within its sustainable yield over a period of at least 10 years; and that the Alternative Analysis satisfies SGMA's objectives by promoting sustainable management of the groundwater in the Central Subbasin.

Los Angeles County Standard Urban Stormwater Mitigation Plan (SUSMP)

On March 8, 2000, Los Angeles County Standard Urban Stormwater Mitigation Plan (SUSMP) requirements were approved by the LARWQCB as part of the MS4 permit to address stormwater pollution from new construction and redevelopment projects. SUSMP is a comprehensive stormwater quality program to manage urban stormwater and minimize pollution of the environment. The purpose of the SUSMP is to reduce the discharge of pollutants in stormwater by outlining BMPs that must be incorporated into the design plans of new development and redevelopment. The SUSMP requirements contain a list of minimum BMPs that must be employed to infiltrate or treat stormwater runoff, control peak flow discharge, and reduce the post-project discharge of pollutants from stormwater conveyance systems. The SUSMP

requirements define, based upon land use type, the types of practices that must be included and issues that must be addressed as appropriate to the development type and size. The SUSMP requirements apply to all development and redevelopment projects that fall into one of the following categories:

- Single-family hillside residences
- One acre or more of impervious surface area for industrial/commercial developments
- Automotive service facilities
- Retail gasoline outlets
- Restaurants
- Ten or more residential units (BMP)
- Parking lots of 5,000 square feet or greater or with 25 or more spaces
- Projects located in or directly discharging to an Ecologically Sensitive Area

The SUSMP requirements are enforced through the City's Building and Safety Department plan review and approval process. During the review process, individual development project plans are reviewed for compliance with stormwater requirements.

Water Quality Control Plan for the Los Angeles Region (Basin Plan)

All of Los Angeles is within the jurisdiction of the LARWQCB, which is one of the nine regional WQCBs in California. The LARWQCB provides permits for projects that may affect surface waters and groundwater locally and is responsible for preparing the Basin Plan, which is updated as necessary every three years. The Basin Plan establishes narrative and numerical water quality objectives for surface waters and groundwater within the Los Angeles region and designates the beneficial uses of inland surface waters, including the Hollywood Reservoir and Los Angeles River. Water quality objectives, as defined by the CWA Section 13050(h), are the "limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses or the prevention of nuisance within a specific area." The State has developed TMDLs, which are a calculation of the maximum amount of a pollutant that a water body can have and still meet water quality objectives established in the Basin Plan.

Enhanced Watershed Management Plans (EWMPs)

On July 23, 2021, RWQCB adopted the current municipal stormwater permit (NPDES Permit No. CAS004004, Order No. R4-2021-0105), which contains the most extensive provisions to date with 32 incorporated TMDLs, of which 22 affect the City, expanded programs for Minimum Control Measures, development and implementation of watershed management plans, and expanded monitoring provisions. The NPDES permit provides for the development of EWMPs by the MS4 permittees to implement the requirements of the permit on a watershed scale through customized strategies, control measures, and BMPs. EWMPs also address compliance requirements of the 22 TMDLs that currently are effective, as well as other elements of the City's Stormwater Program.

NPDES Permit Program

As indicated above, in California, the NPDES stormwater permitting program is administered by the SWRCB through its nine RWQCBs. This NPDES permit, referred to as General Permit for Stormwater Discharges from Construction Activities by the SWRCB, establishes a risk-based approach to stormwater control requirements for construction projects.

Construction: Stormwater Pollution Prevention Plan

For all construction activities disturbing one acre of land or more, California mandates the development and implementation of Stormwater Pollution Prevention Plans (SWPPP). The SWPPP documents the selection and implementation of best management practices (BMPs) to prevent discharges of water pollutants to surface or groundwater. The SWPPP also charges owners with stormwater quality management responsibilities. The developer or contractor for a construction site subject to the General Permit must prepare and implement a SWPPP that meets the requirements of the General Permit. The purpose of an SWPPP is to identify potential sources and types of pollutants associated with construction activity and list BMPs that would prohibit pollutants from being discharged from the construction site into the public stormwater system. BMPs typically address stabilization of construction areas, minimization of erosion during construction, sediment control, control of pollutants from construction materials, and post-construction stormwater management (e.g., the minimization of impervious surfaces or treatment of stormwater runoff). The SWPPP is also required to include a discussion of the proposed program to inspect and maintain all BMPs.

A site-specific SWPPP could include, but not be limited to the following BMPs:

- Erosion Control BMPs – to protect the soil surface and prevent soil particles from detaching. Selection of the appropriate erosion control BMPs would be based on minimizing areas of disturbance, stabilizing disturbed areas, and protecting slopes/channels. Such BMPs may include, but would not be limited to, use of geotextiles and mats, earth dikes, drainage swales, and slope drains.
- Sediment Control BMPs – are treatment controls that trap soil particles that have been detached by water or wind. Selection of the appropriate sediment control BMPs would be based on keeping sediments on-site and controlling the site boundaries. Such BMPs may include, but would not be limited, to use of silt fences, sediment traps, and sandbag barriers, street sweeping and vacuuming, and storm drain inlet protection.

The SWRCB adopted a General Permit for Stormwater Discharges from Construction Activities on September 2, 2009 and most recently amended the permit on July 17, 2012 (Order No. 2012-0006-DWQ, General NPDES Permit No. CAS000002). The Construction General Permit regulates construction activity, including clearing, grading, and excavation of areas one acre or more in size, and prohibits the discharge of materials other than stormwater, authorized non-stormwater discharges, and all discharges that contain a hazardous substance, unless a separate NPDES permit has been issued for those discharges.

To obtain coverage under the Construction General Permit, a developer is required to file a Notice of Intent (NOI) with the appropriate RWQCB and provide proof of the NOI prior to applying for a grading or building permit from the local jurisdiction and must prepare a State SWPPP that incorporates the minimum BMPs required under the permit as well as appropriate project-specific BMPs. The SWPPP must be completed and certified by the developer and BMPs must be implemented prior to the commencement of construction and may require modification during the course of construction as conditions warrant. When project construction is complete, the developer is required to file a Notice of Termination with the RWQCB certifying that all the conditions of the Construction General permit, including conditions necessary for termination, have been met.

NPDES Permit for Discharges of Groundwater from Construction and Project Dewatering

Dewatering operations are practices that discharge non-stormwater, such as ground water, which must be removed from a work location to proceed with construction into the drainage system. Discharges from dewatering operations can contain high levels of fine sediments, which if not properly treated, could lead to exceedance of the NPDES requirements. A NPDES Permit for dewatering discharges was adopted by

the LARWQCB on September 13, 2018 (Order No. R4-2018-0125, General NPDES Permit No. CAG994004.) Similar to the Construction General Permit, to be authorized to discharge under this Permit; the developer must submit a NOI to discharge groundwater generated from dewatering operations during construction in accordance with the requirements of this Permit and shall continue in full force until it expires November 13, 2023. In accordance with the NOI, among other requirements and actions, the discharger must demonstrate that the discharges shall not cause or contribute to a violation of any applicable water quality objective/criteria for the receiving waters, perform reasonable potential analysis using a representative sample of groundwater or wastewater to be discharged. The discharger must obtain and analyze (using appropriate methods) a representative sample of the groundwater to be treated and discharged under the Order. The analytical method used shall be capable of achieving a detection limit at or below the minimum level. The discharger must also provide a feasibility study on conservation, reuse, and/or alternative disposal methods of the wastewater and provide a flow diagram of the influent to the discharge point.

Operation: Los Angeles County Municipal Stormwater NPDES Program

The County of Los Angeles and the City are two of the Co-Permittees under the Los Angeles County MS4 Permit (NPDES Permit No. CAS004004, Order No. R4-2021-0105). The Los Angeles County MS4 Permit has been determined by the State Water Resources Control Board to be consistent with the requirements of the Clean Water Act and the Porter-Cologne Act for discharges through the public storm drains in Los Angeles County to statutorily-defined waters of the United States (33 United States Code [USC] §1342(p); 33 CFR Part 328.11). On September 8, 2016, the LARWQCB amended the Los Angeles County MS4 Permit to incorporate modifications consistent with the revised Ballona Creek Watershed Trash Total Maximum Daily Load (TMDL) and the revised Los Angeles River Watershed Trash TMDL, among other TMDLs incorporated into the Los Angeles County MS4 Permit and the Basin Plan for the Coastal Waters of Los Angeles and Ventura Counties.

Under the amended Los Angeles County MS4 Permit, the County and City are both required to implement development planning guidance and control measures that control and mitigate stormwater quality and runoff volume impacts to receiving waters as a result of new development and redevelopment. The County and the City also are required to implement other municipal source detection and elimination programs, as well as maintenance measures.

Under the Los Angeles County MS4 Permit, permittees are required to implement a development planning program to address stormwater pollution. This program requires project applicants for certain types of projects to implement a Low Impact Development (LID) Plan, except where the SUSMP is proven applicable. The purpose of the LID Plan is to reduce the discharge of pollutants in stormwater by outlining BMPs, which must be incorporated into the design of new development and redevelopment. These treatment control BMPs must be sufficiently designed and constructed to treat or retain the greater of an 85th percentile rain event or first 0.75 inch of stormwater runoff from a storm event.

The Los Angeles County MS4 Permit (Part VI.D.7.c, New Development/Redevelopment Project Performance Criteria) includes design requirements for new development and substantial redevelopment. These requirements apply to all projects that create or replace more than 5,000 square feet of impervious cover. Where redevelopment results in an alteration to more than 50 percent of impervious surfaces of a previously existing development and the existing development was not subject to post-construction stormwater quality control requirements, the entire project would be subject to post-construction stormwater quality control measures.

This Enhanced Watershed Management Program for the Upper Los Angeles River (ULAR EWMP) describes a customized compliance pathway that participating agencies will follow to address the pollutant reduction requirements of the Los Angeles County MS4 Permit. By electing the optional compliance

pathway in the MS4 Permit, the Upper Los Angeles River Watershed Management Group (EWMP Group) has leveraged this EWMP to facilitate a robust, comprehensive approach to stormwater planning for the Upper Los Angeles River watershed. The objective of the EWMP Plan is to determine the network of control measures (BMPs) that will achieve required pollutant reductions while also providing multiple benefits to the community and leveraging sustainable green infrastructure practices. The Permit requires the identification of Watershed Control Measures, which are strategies and BMPs that will be implemented through the EWMP, individually or collectively, at watershed-scale to address the Water Quality Priorities. The EWMP Implementation Strategy is used as a recipe for compliance for each jurisdiction to address Water Quality Priorities and comply with the provisions of the MS4 Permit. The EWMP Implementation Strategy includes individual recipes for each of the 18 jurisdictions and each watershed/assessment area – Los Angeles River above Sepulveda Basin, Los Angeles River below Sepulveda Basin, Compton Creek, Rio Hondo, Verdugo Wash, Arroyo Seco, Burbank Western Channel, Tujunga Wash, Bull Creek, Aliso Wash, Bell Creek, McCoy-Dry Canyon, and Browns Canyon Wash. Implementation of the EWMP Implementation Strategy will provide a BMP-based compliance pathway for each jurisdiction under the MS4 Permit. The Permit specifies that an adaptive management process will be revisited every two years to evaluate the EWMP and update the program. The EWMP strategy will evolve based on monitoring results by identifying updates to the EWMP Implementation Plan to increase its effectiveness.

The Los Angeles County MS4 Permit contains provisions for implementation and enforcement of the Stormwater Quality Management Program. The objective of the Stormwater Quality Management Program is to reduce pollutants in urban stormwater discharges to the “maximum extent practicable,” to attain water quality objectives and protect the beneficial uses of receiving waters in Los Angeles County. Special provisions are provided in the Los Angeles County MS4 Permit to facilitate implementation of the Stormwater Quality Management Program. In addition, the Los Angeles County MS4 Permit requires that permittees implement a LID Plan, as discussed above, that designates BMPs that must be used in specified categories of development projects to infiltrate water, filter, or treat stormwater runoff; control peak flow discharge; and reduce the post-project discharge of pollutants into stormwater conveyance systems. In response to the Los Angeles County MS4 Permit requirements, the City adopted Ordinance No. 173,494 (LID Ordinance), as authorized by Los Angeles Municipal Code (LAMC) Section 64.72.

The City supports the requirements of the Los Angeles County MS4 Permit through the City of Los Angeles’ *Development Best Management Practices Handbook, Low Impact Development Manual, Part B: Planning Activities* (5th edition, May 2016) (LID Handbook), which provides guidance to developers to ensure the post-construction operation of newly developed and redeveloped facilities comply with the Developing Planning Program regulations of the City’s Stormwater Program. The LID Handbook assists developers with the selection, design, and incorporation of stormwater source control and treatment control BMPs into project design plans and provides an overview of the City’s plan review and permitting process.

The City implements the requirement to incorporate stormwater BMPs, including LID BMPs, through the City’s plan review and approval process. During the review process, project plans are reviewed for compliance with the City’s General Plan, zoning ordinances, and other applicable local ordinances and codes, including stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

Stormwater Program – Los Angeles County MS4 Permit Citywide Implementation

The Watershed Protection Division of the Department of Public Works, Bureau of Sanitation is responsible for stormwater pollution control throughout the City in compliance with the Los Angeles County MS4 Permit. The Watershed Protection Division administers the City’s Stormwater Program, which has two major components: Pollution Abatement and Flood Control. The Watershed Protection Division publishes the two-part Development Best Management Practices Handbook that provides guidance to developers for compliance with the Los Angeles County MS4 permit through the incorporation of water quality

management into development planning. The Development Best Management Practices Handbook, Part A: Construction Activities, provides specific minimum BMPs for all construction activities. The Development Best Management Practices Handbook, LID Manual, Part B: Planning Activities (5th edition, May 2016) (LID Handbook) provides guidance to developers to ensure the post-construction operation of newly developed and redeveloped facilities comply with the Developing Planning Program regulations of the City's Stormwater Program. The LID Handbook assists developers with the selection, design, and incorporation of stormwater source control and treatment control BMPs into project design plans, and provides an overview of the City's plan review and permitting process. The LID Handbook addresses the need for frequent and/or regular inspections of infiltration facilities in order to ensure on-site compliance of BMP standards, soil quality, site vegetations, and permeable surfaces. These inspections are required to guarantee that facilities follow all proprietary operation and maintenance requirements.

During the development review process, project plans are reviewed for compliance with the City's General Plan, zoning ordinances, and other applicable local ordinances and codes, including stormwater requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address stormwater pollution prevention goals.

County of Los Angeles Hydrology Manual

Drainage and flood control in the City are subject to review and approval by the Department of Public Works, Bureau of Engineering (Bureau of Engineering). Storm drains within the City are constructed by both the City and the County Flood Control. The County Flood Control constructs and has jurisdiction over regional facilities such as major storm drains and open flood control channels, while the City constructs and is responsible for local interconnecting tributary drains. Per the City's Special Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County Department of Public Works' Hydrology Manual as its basis of design for storm drainage facilities. The Department of Public Works' Hydrology Manual requires that a storm drain conveyance system be designed for a 25-year storm event and that the combined capacity of a storm drain and street flow system accommodate flow from a 50-year storm event. Areas with sump conditions are required to have a storm drain conveyance system capable of conveying flow from a 50-year storm event. The County also limits the allowable discharge into existing storm drain (MS4) facilities based on the County's MS4 Permit, which is enforced on all new developments that discharge directly into the County's MS4 system.

Drainage and flood control structures and improvements within the City are subject to review and approval by the City's Department of Public Works and Department of Building and Safety. As required by the Department of Public Works, all public storm facilities must be designed in conformity with the standards set forth by Los Angeles County. The Department of Public Works reviews and approves MS4 plans prior to construction. Any proposed increases in discharge directly into County facilities, or proposed improvements of County-owned MS4 facilities, such as catch basins and drainage lines, require approval from County Flood Control to ensure compliance with the County's Municipal NPDES Permit requirements.

LOCAL

Los Angeles Municipal Code (LAMC)

The City of Los Angeles relies on Municipal Code Chapter VI, *Public Works and Property* to require permits and oversee the implementation of any land use or development involving grading activities, or the construction of new structures or paving. Article 4 *Sewers, Water Courses and Drains* and Article 4.4 *Stormwater and Urban Runoff Pollution Control* of the Municipal Code establishes minimum standards, guidelines, and/or criteria for specific discharges, connections, and/or BMPs. Additional measures are required by the City, when applicable, to prevent or reduce the discharge of pollutants to achieve water

quality standards and receiving water limitations. Article 4.4 includes prohibitions for illicit discharges to enter the MS4 and requires implementation of BMPs and LID practices per LAMC 64.70 (City of Los Angeles 2017). In addition, the City requires all construction activities and facility operations to be consistent with the landscape ordinance (Ordinance No. 170,978) as well as other related requirements, outlined in Chapter XII, *The Water Conservation Plan of the City of Los Angeles*, and the *Planning and Land Development Handbook for LID*. The *Handbook* is a tool for developers to comply with the requirements of the City's SUSMP. The handbook summarizes the City's project review and permitting process, identifies stormwater mitigation measures, and references source and treatment control BMP information. The latest edition was adopted on May 9, 2016.

Proposition O

Proposition O, a \$500 million bond, authorized the City to fund projects that protect public health, capture stormwater for reuse and meet the federal CWA through removal and prevention of pollutants entering regional waterways. Proposition O projects include but are not limited to the Temescal Canyon Park Stormwater BMP, Los Angeles Zoo Parking Lot, the Westchester Stormwater BMP, Echo Park Lake Rehabilitation Project, and the Hansen Dam Recreational Area Parking Lot and Wetlands Restoration. In addition, Proposition O funds were utilized for the Catch Basin Screen Cover and Insert Project, which provided for the installation of catch basin inserts and screen covers throughout the City beginning in 2005 with completion on September 30, 2007 (Phase I and Phase II). Phase III began in the spring of 2008 and will retrofit approximately 34,000 remaining catch basins with opening screen covers.

Flood Control Authority in the City of Los Angeles

In general, flood control authority can be summarized as follows: (1) the U.S. Army Corps of Engineers (USACE) oversees construction of projects associated with navigable bodies of water, including the Los Angeles River-related flood control systems and ocean harbors; (2) LACDPW oversees construction of ancillary Los Angeles County Flood Control District (LACFCD) facilities and designs and/or maintains the flood control drainage facilities, including the Los Angeles River system (under the guidance of USACE) to mitigate 100- and 500-year storms; and (3) LADPW BOE oversees construction and maintenance of the City's storm drainage system which is designed to mitigate 50-year magnitude storms. Various City agencies implement development permit, slope stability, and watershed protection regulations.

Los Angeles River Revitalization Master Plan (LARRMP)

Adopted in April 2007, the LARRMP contains goals in the creation of parks, paths, and open spaces along the Los Angeles River. The LARRMP includes recommendations for physical improvements along the Los Angeles River corridor; policies for managing public access and management structure; and short- and long-term priority projects and potential funding strategies.

River Improvement Overlay (RIO) District

Following the adoption of the LARRMP, the RIO District (Ordinance Nos. 18314 and 183145), effective August 2014 and revised in January 2015, was established to help implement the vision and goals of the LARRMP by focusing on sustainable environments in the surrounding neighborhoods, including guidelines for both private property and public rights-of-way. The RIO provides guidelines for new "complete" streets and includes mobility strategies to meet the needs of pedestrians, bicyclists, transit riders, and vehicle drivers. The RIO District includes all of the neighborhoods within the City of Los Angeles that are adjacent to the Los Angeles River, and generally extends 0.5-mile on either side of the River, creating an area that is potentially 32 miles long and one mile wide. As described in *Chapter 3, Project Description*, applicable development regulations and measures to protect sensitive biological resources in the existing RIO will be incorporated into Frontage Districts and development standard rules of the New Zoning Code.

City of Los Angeles General Plan Safety, Conservation, and Framework Elements

The intent of the Conservation Element is the conservation and preservation of natural resources. Policies of the Conservation Element address the effect of erosion on such natural resources as beaches, watersheds, and watercourses. The General Plan Framework Element is a more general, long-term, programmatic element. The policies in the Framework Element address infrastructure and public service systems, many of which are interrelated, and all of which support the City's population and economy. Objectives and policies related to hydrology and water quality contained in these elements are listed in **Table 4.9-1**, below.

TABLE 4.9-1 RELEVANT GENERAL PLAN HYDROLOGY & WATER QUALITY OBJECTIVES AND POLICIES	
Objective/Policy	Objective/Policy Description
Safety Element – Hazard Mitigation	
Policy 1.1.6	State and Federal Regulations. Assure compliance with applicable state and federal planning and development regulations. Regularly adopt new provisions of the California Building Standards Code, Title 24, and California Fire Code into the LAMC to ensure that new development meets or exceeds State and National standards. Facilitate existing non-conforming structures and evacuation routes coming into compliance with new standards.
Safety Element – Emergency Response (Multi-Hazard)	
Policy 2.1.2	Health and Environmental Protection. Develop and implement procedures to protect the environment, sensitive species and public from potential health and safety hazards associated with disaster events, hazard mitigation and disaster recovery efforts.
Conservation Element – Erosion	
Policy 2	Continue to prevent or reduce erosion that will damage the watershed or beaches or will result in harmful sedimentation that might damage beaches or natural areas.
Conservation Element – Ocean	
Policy 1	Continue to reduce pollutant discharge into the bays from both natural and human sources.
Framework Element – Chapter 9 Infrastructure and Public Services	
Policy 9.3.2	Consider the use of treated wastewater for irrigation, groundwater recharge, and other beneficial purposes.
Objective 9.5	Ensure that all properties are protected from flood hazards in accordance with applicable standards and that existing drainage systems are adequately maintained.
Policy 9.5.1	Develop a stormwater management system that has adequate capacity to protect its citizens and property from flooding which results from a 10-year storm (or a 50-year storm in sump areas, a pit or hollow in which liquid collects).
Policy 9.5.2	Assign the cost of stormwater system improvements proportionately to reflect the level of runoff generated and benefits.
Policy 9.5.3	Implement programs to correct any existing deficiencies in the stormwater collection system.
Policy 9.5.4	Ensure that the City's drainage system is adequately maintained.
Objective 9.6	Pursue effective and efficient approaches to reducing stormwater runoff and protecting water quality.
Policy 9.6.1	Pursue funding strategies which link the sources of revenues for stormwater system improvement to relevant factors including sources of runoff and project beneficiaries.
Policy 9.6.2	Establish standards and/or incentives for the use of structural and non-structural techniques which mitigate flood-hazards and manage stormwater pollution.
Policy 9.6.3	The City's watershed-based approach to stormwater management will consider a range of strategies designed to reduce flood hazards and manage stormwater pollution. The strategies considered will include, but not necessarily be limited to: <ul style="list-style-type: none"> a. Support regional and City programs which intercept runoff for beneficial uses including groundwater recharge; b. Protect and enhance the environmental quality of natural drainage features;

TABLE 4.9-1 RELEVANT GENERAL PLAN HYDROLOGY & WATER QUALITY OBJECTIVES AND POLICIES	
Objective/Policy	Objective/Policy Description
	<ul style="list-style-type: none"> c. Create stormwater detention and/or retention facilities which incorporate multiple-uses such as recreation and/or habitat; d. On-site detention/retention and reuse of runoff; e. Mitigate existing flood hazards through structural modifications (flood proofing) or property by-out; f. Incorporate site design features which enhance the quality of off-site runoff; and g. Use land use authority and redevelopment to free floodways and sumps of inappropriate structures which are threatened by flooding and establish appropriate land uses which benefit or experience minimal damages from flooding.
Policy 9.6.4	Proactively participate in inter-agency efforts to manage regional water resources, such as the Santa Monica Bay Restoration Project, the Los Angeles River Master Plan, the Los Angeles River Parkway Project and the Los Angeles County Drainage Area Water Conservation and Supply Feasibility Study.
Objective 9.7	Continue to develop and implement management practices based stormwater program which maintains and improves water quality.
Policy 9.7.1	Continue the City's active involvement in the regional NPDES municipal stormwater permit.
Policy 9.7.2	Continue to aggressively develop and implement educational outreach programs designed to foster an environmentally-aware citizenry.
Policy 9.7.3	Investigate management practices which reduce stormwater pollution to identify technically feasible and cost effective-approaches, through: <ul style="list-style-type: none"> a. Investigation of sources of pollution using monitoring, modeling and special studies; b. Prioritization of pollutants and sources; c. Conducting research and pilot projects to study specific management practices for the development of standards; and d. Developing requirements which establish implementation standards for effective management practices.
Objective 9.9	Manage and expand the City's water resources, storage facilities, and water lines to accommodate projected population increases and new or expanded industries and businesses.
Policy 9.9.3	Protect existing water supplies from contamination and clean up groundwater supplies so those resources can be more fully utilized.
Policy 9.9.4	Work to improve water quality and reliability of supply from the State Water Project and other sources.
Policy 9.9.5	Maintain existing rights to groundwater and ensure continued groundwater pumping availability.
Objective 9.11	Ensure, to the maximum extent possible, the continued provision of water capacity, quality and delivery after an earthquake or other emergency.
Policy 9.11.1	Provide for the prompt resumption of water service with adequate quantity and quality of water after an emergency.

Low Impact Development Ordinance

In 2011, the City adopted a Citywide LID Ordinance (LID Ordinance) that amended the City's existing Stormwater Ordinance (LAMC Section Nos. 64.70 and 64.72, discussed above). The LID Ordinance, effective May 12, 2012, and updated in September 2015 (Ordinance No. 183,833), enforces the requirements of the Los Angeles County MS4 Permit. LID is a stormwater management strategy with goals to mitigate the impacts of increased runoff and stormwater pollution as close to their source as possible; and that promotes the use of natural infiltration systems, evapotranspiration, and the reuse of stormwater.

The goal of LID practices is to remove nutrients, bacteria, and metals from stormwater while also reducing the quantity and intensity of stormwater flows. Through the use of various infiltration strategies, LID is aimed at minimizing impervious surface area. Where infiltration is not feasible, the use of bioretention, rain gardens, green roofs, and rain barrels that will store, evaporate, detain, and/or treat runoff can be used.

The intent of LID standards is to:

- Require the use of LID practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff.
- Reduce stormwater/urban runoff while improving water quality.
- Promote rainwater harvesting.
- Reduce off-site runoff and provide increased groundwater recharge.
- Reduce erosion and hydrologic impacts downstream; and
- Enhance the recreational and aesthetic values in our communities.

The Citywide LID strategy addresses land development planning as well as storm drain infrastructure. Toward this end, LID is implemented through BMPs that fall into four categories: site planning BMPs, landscape BMPs, building BMPs, and street and alley BMPs. While the LID Ordinance and the BMPs contained therein comply with Los Angeles County MS4 Permit requirements for stormwater management, the MS4 requirements apply only to proposed new development and redevelopment of a certain size, primarily address stormwater pollution prevention as opposed to groundwater recharge and vary over time as the permit is reissued every five years. The LID Ordinance provides a consistent set of BMPs that are intended to be inclusive of, and potentially exceed, SUSMP standards, apply to existing as well as new development, and emphasize natural drainage features and groundwater recharge in addition to pollution prevention in receiving waters. The LID Ordinance requires the capture and management of the greater of an 85th percentile rain event or the first 0.75-inch of runoff flow during storm events defined in the City's LID BMPs, through one or more of the City's preferred LID improvements in priority order: on-site infiltration, capture and reuse, or biofiltration/biotreatment BMPs, to the maximum extent feasible.

Per the City's 2016 LID Manual's Figure 3.3 and Section 4.1, the City's preferred LID improvement is on-site infiltration of stormwater, site since it allows for groundwater recharge and reduces the volume of stormwater entering municipal drains. If Project Site conditions are not suitable for infiltration, the City requires on-site retention via stormwater capture and reuse. Should capture and reuse be deemed technically infeasible, high efficiency bio-filtration/ bioretention systems should be utilized. Lastly, under the LID Ordinance (LAMC Section 64.72 (C) 6), as interpreted in the LID Manual, if no single approach listed in the LID Manual is feasible, then a combination of approaches may be used.

The LID Ordinance applies first to a project in lieu of SUSMP. If a large project cannot meet the requirements of the LID Ordinance, then SUSMP applies instead.

Los Angeles Floodplain Hazard Management Specific Plan Ordinance (No. 172,081)

On April 14, 2021, the City adopted an update to the Los Angeles Floodplain Hazard Management Specific Plan Ordinance (No. 172,081). This amendment ensured that the Specific Plan Ordinance conforms to federal regulations and maps relating to the NFIP. Conformance to the requirements of the NFIP is necessary in order to participate in the program. Requirements of the ordinance include new construction and substantial improvements in flood-prone areas including service facilities to be designed to prevent water entry or accumulation, new or replacement water supply and sanitary sewer systems to minimize or eliminate infiltration and to require on-site waste disposal systems be located to avoid impairment or

contamination, notification of neighboring communities of watercourse alterations or relocations, among other requirements.

2020 Floodplain Management Plan

The 2020 Floodplain Management Plan (FMP) identifies 78 flood hazard mitigation actions to mitigate impacts of flood hazards in the Los Angeles area. These include coordinating local floodplain management activities with federal, state and regional programs, educating residents on the flooding hazard, loss reduction measures, and the natural and beneficial functions of floodplains, and fulfilling planning requirements for obtaining state or federal assistance.

Local Hazard Mitigation Plan

The Local Hazard Mitigation Plan (LHMP) is a regulatory document that includes long-term and short-term policies, programs, projects, and other activities to alleviate the death, injury, and property damage that can result from a disaster. The LHMP complies with federal and state hazard mitigation planning requirements to establish eligibility for funding under FEMA grant programs.

Los Angeles Municipal Code Section 62.105, Construction “Class B” Permit

Proposed drainage improvements within the street rights-of-way or any other property owned by, to be owned by, or under the control of the City, require the approval of a B-permit (LAMC Section 62.105). Under the B-permit process, storm drain installation plans are subject to review and approval by the Bureau of Engineering. Additionally, connections to the MS4 system from a property line to a catch basin or a storm drain pipe require a storm drain permit from the Bureau of Engineering.

Los Angeles Municipal Code Sections 12.40 through 12.43, Landscape Ordinance

In 1996, Ordinance No. 170,978 amended LAMC Sections 12.40 through 12.43 to establish consistent landscape requirements for new projects within the City. LAMC Section 12.40 contains general requirements, including a point system for specific project features and techniques in order to determine compliance with the Ordinance, and defines exemptions from the Ordinance. LAMC Section 12.41 sets minimum standards for water delivery systems (irrigation) to landscapes. LAMC Section 12.43 defines the practices addressed by the Ordinance, of which two are applicable to stormwater management. The Heat and Glare Reduction practice states among its purposes the design of vehicular use areas that reduce stormwater runoff and increase groundwater recharge. The Soil and Watershed Conservation practice is intended to encourage the restoration of native areas that are unavoidably disturbed by development; to conserve soil and accumulated organic litter and reduce erosion by utilization of a variety of methods; and to increase the “residence time of precipitation” (i.e., the time between the original evaporation and the returning of water masses to the land surface as precipitation) within a given watershed. Implementation guidelines developed for the Ordinance provide specific features and techniques for incorporation into projects, and include water management guidelines addressing runoff, infiltration, and groundwater recharge. This Ordinance is incorporated into the LID Ordinance discussed below.

Los Angeles Municipal Code Section 64.70, Stormwater and Urban Runoff Pollution Control Ordinance

LAMC Section 64.70, the Stormwater and Urban Runoff Pollution Control Ordinance, was added by Ordinance No. 172,176 in 1998 and prohibits the discharge of unauthorized pollutants in the City. The Watershed Protection Program (Stormwater Program) for the City is managed by the Bureau of Sanitation along with all City Flood Protection and Pollution Abatement (Water Quality) Programs, including but not limited to, regulatory compliance, implementation, operations, reporting and funding. Section 64.70 sets

forth uniform requirements and prohibitions for discharges and places of discharge into the storm drain system and receiving waters necessary to adequately enforce and administer all federal and state laws, legal standards, orders and/or special orders that provide for the protection, enhancement and restoration of water quality. Through a program employing watershed-based approaches, the regulation implements the following objectives:

1. To comply with all Federal and State laws, lawful standards and orders applicable to stormwater and urban runoff pollution control.
2. To prohibit any discharge which may interfere with the operation of, or cause any damage to the storm drain system, or impair the beneficial use of the receiving waters.
3. To prohibit illicit discharges to the storm-drain system.
4. To reduce stormwater runoff pollution.
5. To reduce non-stormwater discharge to the storm-drain system to the maximum extent practicable; and
6. To develop and implement effective educational outreach programs designed to educate the public on issues of stormwater and urban runoff pollution.

The Ordinance applies to all dischargers and places of discharge that discharge stormwater or non-stormwater into any storm drain system or receiving waters. While non-stormwater discharge is generally prohibited under the County's Municipal NPDES Permit, adoption of the Ordinance allows enforcement by the Department of Public Works as well as the levy of fines for violations. General Discharge Prohibitions require that no person shall discharge, cause, permit, or contribute to the discharge any hazardous materials and substances (liquids, solids, or gases) into to the storm drain system or receiving waters that constitute a threat and/or impediment to life and the storm drain system, singly or by interaction with other materials. A specific list of prohibited substances can be found under LAMC Section 64.70.

Under LAMC Section 64.70.02.D, Requirement to Prevent, Control, and Reduce Stormwater Pollutants, any owner of a facility engaged in activities or operations as listed in the Critical Sources Categories, Section III of the Board's Rules and Regulations shall be required to implement BMPs as promulgated in the Rules and Regulations. The owner/developer of a property under construction shall be required to implement the stormwater pollution control requirements for construction activities as depicted in the project plans approved by the Department of Building and Safety. In the event a specified BMP proves to be ineffective or infeasible, the additional and/or alternative, site-specific BMPs or conditions deemed appropriate to achieve the objectives of this Ordinance as defined in Subsection B of LAMC Section 64.70.

Los Angeles Municipal Code Section 64.72, Stormwater Pollution Control Measures for Development Planning and Construction Activities

LAMC Section 64.72, Stormwater Pollution Control Measures for Development Planning and Construction Activities, was added by Ordinance 173,494 (LID Ordinance) in 2000 and sets forth requirements for construction activities and facility operations of development and redevelopment projects to comply with the requirements of the NPDES permit SUSMP requirements. The provisions of this section contain requirements for construction activities and facility operations of development and redevelopment projects to comply with the Land Development requirements of the Los Angeles County MS4 permit through integrating LID practices and standards for stormwater pollution mitigation, and maximize open, green and pervious space on all developments and redevelopments consistent with the City's Landscape Ordinance and other related requirements in the Development Best Management Practices Handbook. The LID Ordinance applies first to a project in lieu of SUSMP. If a large project cannot meet the requirements of the LID Ordinance, then SUSMP measures are applied.

Water Quality Compliance Master Plan for Urban Runoff

The Water Quality Compliance Master Plan for Urban Runoff (Water Quality Compliance Master Plan) was developed by the Department of Public Works, Bureau of Sanitation, Watershed Protection Division, and was adopted in April 2009.

The Water Quality Compliance Master Plan addresses planning, budgeting, and funding for achieving clean stormwater and urban runoff for the next 20 years and presents an overview of the status of urban runoff management within the City. The Water Quality Compliance Master Plan identifies the City's four watersheds; summarizes water quality conditions in the City's receiving waters as well as known sources of pollutants; summarizes regulatory requirements for water quality; describes BMPs required by the City for stormwater quality management; and discusses related plans for water quality that are implemented within the Los Angeles region, particularly TMDL Implementation Plans and Watershed Management Plans in Los Angeles.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the *CEQA Guidelines*, the Proposed Project would have a significant impact to hydrology and water quality if it would:

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality (Threshold 4.9-1)
- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin (Threshold 4.9-2)
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
 - Result in substantial erosion or siltation on- or off-site.
 - Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site.
 - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
 - Impede or redirect flood flows (Threshold 4.9-3)
- Be in flood hazard, tsunami, or seiche zones, thus risking release of pollutants due to project inundation (Threshold 4.9-4)
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan (Threshold 4.9-5)

METHODOLOGY

Baseline information for the analysis was compiled from a review of data and reports published by State or other agencies as well as information compiled and evaluated by the City in conjunction with its stormwater management and hazard mitigation programs. The result of the effort is a general and qualitative analysis

of the types of hydrologic and water quality changes that could be expected relative to the implementation of the Proposed Project.

The analysis of water quality impacts identifies the types of pollutants potentially associated with future development as a result of implementation of the Proposed Project and considers their effects on water quality. Consideration is given to relevant regulations and requirements that would serve to minimize pollutants in stormwater runoff and restrict discharges into surface water. There is a comprehensive regulatory framework implemented at the State, regional, and City level to reduce the impacts of effects related to storm drainage, urban pollutants, and flood hazards. Regulatory requirements such as the creation of a qualified SWPPP or incorporation of post-construction LID features would be approved or incorporated in the project design prior to project approvals or obtaining coverage under key permits. Based upon the comprehensiveness of the regulations, an assumption regarding compliance with all applicable laws, regulations, and standards is reasonable. Therefore, the analysis presented herein assumes compliance with all applicable laws, regulations, and standards.

The impact analysis is based on several factors, including the policies and land uses of the Proposed Project, the degree to which existing land uses and pervious surfaces in the Proposed Project would change, and the thresholds of significance for hydrology and water quality.

The analysis of inundation by seiche, tsunami, and dam failure is based on the proximity of the potential development locations to sizeable bodies of water, dams, and other large water structures.

In 2015, the California Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District (CBIA v. BAAQMD)*, held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of a project. However, if a project exacerbates a condition in the existing environment, the lead agency is required to analyze the impact of that exacerbated condition on the environment, which may include future residents and users within the Project Area. The decision from *CBIA v. BAAQMD* will inform the analysis of Appendix G thresholds provided above.

PROJECT IMPACTS

Threshold 4.9-1	Would implementation of the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?
------------------------	--

Impact 4.9-1 **Proposed Project:** The Proposed Project would be subject to Federal, State, and local requirements for protecting water quality. Construction activities and operational effects associated with the Proposed Project would potentially involve runoff, discharge, or de-watering. However, all such discharges would be required to comply with permit requirements, SWPPP BMPs, and similar regulations. Compliance with applicable regulations and policies would prevent violation of water quality standards or waste discharge requirements and substantial degradation of surface or ground water quality. This impact would be *less than significant*.

Project Impacts

Future development under the Proposed Project would be subject to Federal, State, and local standards and regulations protecting water quality and hydrological resources. The Proposed Project does not contain any changes that would violate any water quality standards or waste discharge requirements. In addition, the Proposed Project includes a number of policies to support stormwater management and improve water quality. Individual development projects would be required to comply with applicable regulations,

standards, and policies, which would prevent violations of water quality standards and waste discharge requirements. Regulations and policies that would apply to project construction and operational activities are discussed below.

Due to the existing urbanized nature of the Project Area, there would not be a substantial increase in stormwater flows to the City's system that discharges into the Los Angeles River and connected urban watersheds from the stormwater runoff that may indirectly result from the Proposed Project.

Construction

Grading, excavation, and other construction activities associated with the Project could impact water quality due to erosion resulting from exposed soils and the generation of water pollutants, including trash, construction materials, and equipment fluids. Section D of LAMC Article 4.4, *Stormwater and Urban Runoff Pollution Control*, requires owners or developers to implement stormwater pollution control requirements for construction activities depicted in the project plans, which are subject to approval by the Department of Building and Safety; the Director of the Department may require additional and/or alternative site-specific BMPs or conditions, if needed. In addition, construction activities on a site of more than one acre, or on a site which is part of a larger development plan that would total more than one acre, would be subject to the CGP. Operators of a construction site would be responsible for preparing and implementing SWPPPs that outline project-specific BMPs to control erosion, sediment release, and otherwise reduce the potential for discharge of pollutants in stormwater.

Required elements of the SUSMP include provisions for:

- Peak stormwater runoff discharge rates
- Conservation of natural areas
- Minimization of stormwater pollutants of concern
- Protection of slopes and channels
- Storm drain system stenciling and signage
- Properly designed outdoor material storage areas
- Properly designed trash storage areas
- Proof of ongoing BMP maintenance
- Provisions of individual property project categories
- Limitations on use of infiltration BMPs

BMP requirements are enforced through the City's plan approval and permitting process and plans for all new development projects are subject to City inspection. Compliance with the LAMC would ensure that future development projects occurring under the Proposed Project do not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality.

Construction activities, such as excavation for subterranean parking structures and foundation-laying for high-rises, may extend down into the water table. The LACDPW provides historical and current groundwater depth measurements throughout Los Angeles County (LA County DPW 2017). There are several wells within or near the Project Area; groundwater depth measured in these wells ranges from 40 to 50 feet below ground surface (bgs).

Construction activities overlying areas with shallower groundwater depth could expose groundwater resources in the Project Area to contamination or could necessitate de-watering of the soils to lower the water table. Depending on the method used for de-watering, displaced groundwater may need to be captured

and discharged elsewhere, possibly into surface waters, such as the Los Angeles River. The Regional Dewatering Permit establishes requirements for discharges of groundwater from construction dewatering to surface waters in coastal watersheds of Los Angeles and Ventura County. The permit sets criteria for the quality of discharges and an acceptable water pH and temperature range, and criteria for the quality of the receiving water after it has received the discharge. The permit also requires that the discharger store potential pollutants in areas where they would not contribute to runoff and to contain, remove, and clean any spills of such materials immediately.

The risk of groundwater contamination during construction is minimal and would most likely occur due to spills or leaks from equipment or materials used in construction, which would be required to be analyzed in the SWPPP and have appropriate BMPs in place but could also occur from operational discharges related to subterranean areas existing below the water table. The use of such areas is unlikely for all but the tallest buildings and would be required to provide hydrogeological and engineering studies demonstrating the measures taken to reinforce the subterranean areas against interaction with the local groundwater.

Operation

All developments in the Project Area are required to comply with the post-construction LID requirements of the CGP, LID Ordinance, Stormwater and Urban Runoff Pollution Control Ordinance, and NPDES permit requirements, which prohibit discharge of pollutants into the storm drain system or receiving waters and require the inclusion of features in a project's design to prevent, control and reduce stormwater pollutants. Typical BMPs include source prevention and treatment control, such as catch basin filters and infiltration/detention basins, as well as minimizing impervious paving. The City's Stormwater and Urban Runoff Pollution Control Ordinance requires future development to comply with the SUSMP requirements, integrate LID practices and standards for stormwater pollution mitigation, and maximize open, green, and pervious space on all development consistent with the City's landscape ordinance and other related requirements.

Required elements of the SUSMP include provisions for:

- Peak stormwater runoff discharge rates
- Conservation of natural areas
- Minimization of stormwater pollutants of concern
- Protection of slopes and channels
- Storm drain system stenciling and signage
- Properly designed outdoor material storage areas
- Properly designed trash storage areas
- Proof of ongoing BMP maintenance
- Provisions of individual property project categories
- Limitations on use of infiltration BMPs

BMP requirements are enforced through the City's plan approval and permitting process and plans for all new development projects are subject to City inspection. Compliance with the LAMC would ensure that future development projects occurring under the Proposed Project do not violate any water quality standards or discharge requirements or otherwise substantially degrade water quality.

All Project-related activities would also be subject to Sections A and B of the LAMC Article 4.4, which generally prohibits discharge of specific materials into the storm drain system or receiving waters, such as

the L.A. River located along the eastern boundary of the Project Area, and specifically prohibits the discharge of certain materials associated with industrial or commercial activities.

As detailed in the *Setting* above, the Los Angeles River and tributaries in the project area are listed as 303(d) impaired for a variety of pollutants that would be expected to be produced by development facilitated by the Proposed Project, such as urban trash and potentially nutrient pollution from landscaping fertilizer. Measures to reduce discharges of these pollutants are incorporated into the general WDRs of the Regional Permit and the regional and local water quality control plans (including the Basin Plan) and would be a part of the overall regulatory requirements of the Proposed Project.

Conclusion

Compliance with Federal, State, and local regulations would ensure impacts resulting from future development in the Project Area due to implementation of the Proposed Project. Furthermore, the Proposed Project does not introduce any features that would preclude implementation of or alter these policies and procedures in any way. Therefore, implementation of the Proposed Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. Therefore, impacts would be *less than significant*.

Mitigation Measures

None required.

Threshold 4.9-2	Would the Proposed Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?
------------------------	---

Impact 4.9-2 **Proposed Project:** Reasonably anticipated development from the Proposed Project would not interfere with groundwater recharge because the Project Area is already mostly paved and/or developed and future development would be subject to policies and regulations that support the preservation and expansion of pervious surfaces. In addition, court adjudicated rules placing limits on groundwater withdrawal would further prevent the depletion of groundwater supplies. Therefore, impacts to groundwater supply and recharge in the Project Area from Project implementation would be *less than significant*.

Project Impacts

Construction Impacts

While construction activities may use water (typically provided by LADWP) for varying purposes, the duration of such activities and the amount of water used is generally limited and would not have the potential to deplete groundwater supplies as construction activities are short-term and generally use less water than the future site use. Section 4.17, *Utilities and Service Systems*, of this EIR addresses sources of LADWP water as well as temporary increases in water use associated with construction activities and indicates that such uses would not be substantial in relation to groundwater supplies. Use of groundwater for construction would not reduce the yields of groundwater wells or well fields.

Future development would be subject to the stormwater quality BMPs. Implementation of BMPs would ensure that surface water quality is effectively maintained so that stormwater infiltration, if any, would not represent a substantial risk to groundwater quantity or quality. In addition, compliance with the City's Stormwater and Urban Runoff Pollution Control Ordinance and NPDES GCASP permit requirements is mandatory. These regulations would ensure construction activities associated with future development

would not substantially deplete groundwater supplies or interfere with groundwater recharge. Thus, implementation of the Proposed Project would not have a significant impact on groundwater level in a way that would change potable water levels sufficiently. Thus, impacts related to groundwater supplies during construction would be less than significant.

Operational Impacts

The Project Area lies above the Central Basin of the Los Angeles Coastal Plain Groundwater Basin, which has provided as much as 11 percent of the City's local groundwater supply between 2010 and 2015 (LADWP 2021). However, Central Basin groundwater is not used by LADWP directly and in general is not utilized within the Project Area (Central Basin Watermaster 2013). Groundwater from the Los Angeles Coastal Groundwater Basin is not a substantial source of water for the region. Water supply for residential and commercial uses in the Project Area is provided by LADWP. While LADWP obtains some of its water from groundwater sources within the City of Los Angeles, the majority of water is provided by the Los Angeles Aqueduct and Metropolitan Water District (MWD). Due to issues with groundwater overdraft beginning over 50 years ago, withdrawals from much of the Central Basin is controlled by court adjudications (LADWP 2015). LADWP currently has the right to withdraw 17,236 acre-feet per year (AFY) from the Central Basin. This prevents depletion of groundwater supplies from the Central Basin and limits the amount of groundwater resources that could be used to serve the Project Area development. While future Project Area development would increase demand for LADWP water by increasing the intensity of use and residential density, this demand would be met in a number of ways other than increasing groundwater withdrawal, such as increasing the amount of water purchased from the Metropolitan Water District, implementing water conservation measures, increasing use of recycled water, and/or implementing groundwater recharge projects. See Section 4.17, *Utilities and Service Systems*, of this EIR, for a discussion of the adequacy of LADWP water supplies for meeting future demand, including that associated with future development in the Project Area.

The Proposed Project would not substantially increase the amount of impervious surface in the Project Area because the Project Area is already urbanized and largely covered with impervious surfaces; therefore, the Proposed Project would not interfere substantially with groundwater recharge. Implementation of the Proposed Project may provide some benefits to groundwater recharge by replacing older development with new development subject to open space, landscaping, and stormwater BMP requirements that would increase pervious surfaces associated with development. In addition, as discussed in Section 4.14, *Recreation*, of this EIR, the Proposed Project includes a number of policies to support the construction of new parks and green spaces that would also increase the amount of pervious surface and facilitate groundwater recharge. Operational impacts related to groundwater supplies would be *less than significant*. Compliance with numerous regulatory requirements related to groundwater recharge would ensure that implementation of the Proposed Project would not substantially deplete groundwater supplies or substantially interfere with groundwater recharge. Additionally, the court imposed groundwater withdrawal limits further protects against groundwater depletion. Impacts would be *less than significant*.

Mitigation Measures

None required.

Threshold 4.9-3	<p>Would the Proposed Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river through the addition of impervious surfaces, in a manner which would:</p> <ul style="list-style-type: none"> (i) Result in substantial erosion or siltation on- or off-site. (ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on-or off-site (iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or (iv) Impede or redirect flood flows?
------------------------	---

Impact 4.9-3 **Proposed Project:** The Proposed Project would accommodate redevelopment of infill sites in an already urbanized area and, therefore, would not substantially alter Project Area drainage patterns. In addition, Proposed Project development in the Project Area would be required to incorporate features to manage stormwater and reduce runoff, comply with flood control design standards, and adhere to post-construction hydromodification requirements. Impacts would be *less than significant*.

Project Impacts

Construction Impacts

Although Project implementation would increase the intensity of uses and residential density in the Project Area, it is not expected to result in substantial additional sources of polluted runoff. The Project Area is urbanized and almost entirely paved and developed, with the exception of parks and other green spaces. The Proposed Project primarily expand capacity for residential, commercial, retail, and light industrial uses. Reasonably anticipated development will preserve the existing open spaces, including public parks and riverfront areas adjacent to industrial land uses, while redeveloping existing development. Construction activities could result in small, localized changes in surface drainage patterns that could increase erosion potential when soils are exposed during construction. Future development would be subject to the City's building codes, which establish design standards that deal with flood prevention and control. The City's zoning codes that establish zoning designs allow for floodplains and flood control facilities and the City's LID Ordinance, which requires all development or redevelopment that is 500 square feet or more in size to capture and manage 100 percent of the first three-quarter-inch of stormwater on-site by implementing best management practices for on-site infiltration, capture and use, and biofiltration/bio-treatment to the maximum extent feasible. Through the building permit application review and approval process, the City would be able to monitor and ensure the availability of sufficient drainage capacity. Compliance with the City's ordinances and regulations, as well as compliance with NPDES permit requirements, would ensure that future development during the lifetime of the Proposed Project would not cause a substantial increase in the peak flow rates or volumes of stormwater runoff that would cause on-site or off-site flooding. Therefore, impacts related to surface runoff that would result in flooding are less than significant.

All earthwork and grading activities would require grading permits from the Department of Building and Safety that include requirements and standards designed to limit potential erosion and siltation. Additionally, earthwork and grading activities would be required to comply with applicable provisions of LAMC Chapter IX, Division 70, which addresses grading, excavations, and fills. This section of the LAMC also requires the preparation of a site-specific geotechnical report to evaluate soils issues for new development. Applicants of development projects will be required to comply with the recommendations contained within the geotechnical report. Additionally, all applicable development must comply with

LAMC Chapter VI, Article 4.4, Section 664.72, which governs pollutant control requirements and construction activity. Compliance with these precautions within the LAMC would reduce erosion and siltation potential within the Project Area.

As discussed in Section 4.9.2 *Environmental Setting*, of this EIR, the FEMA FIRMs identify a 100-year flood zone and floodway that is limited to the Los Angeles River channel, which runs down the center of the Project Area.. The Proposed Project's implementation would not place structures or alter drainage patterns in the 100-year flood hazard area that would impede or redirect flood flows. Any new development or re-development projects would be required to incorporate design BMPs to capture and treat runoff, in accordance with regulations deriving from the NPDES permit and local regulations (i.e., SUSMP, SWPPP, LID Ordinance, LID Handbook), which would ensure that future development would not result in changes to surface drainage patterns that could cause substantial increased erosion or siltation. The NPDES permit sets erosion control standards and requires implementation of nonpoint source control of surface drainage through the application of a number of BMPs to decrease the effects of erosion and sedimentation associated with grading. These BMPs are meant to reduce the amount of constituents, including eroded sediment, that enter streams and other water bodies. Similarly, post-construction hydromodification requirements must comply with the CGP and local municipal regulations in addition to NPDES permit requirements. These requirements would ensure runoff from individual projects would not exceed the local stormwater system capacity nor result in flooding on or offsite. NPDES Permit requirements would ensure that future developments within the Project Area would not result in changes to surface drainage patterns that could cause increased erosion or siltation. Construction impacts related to drainage patterns would be less than significant.

Operational Impacts

Stormwater runoff is influenced by rainfall intensity, ground surface permeability, watershed size and shape, and physical barriers. The introduction of impermeable surfaces greatly reduces natural infiltration, allowing for a greater volume of runoff. In addition, paved surfaces and drainage conduits can accelerate the velocity of runoff, concentrating peak flows in downstream areas faster than under natural conditions. Significant increases to runoff and peak flow can overwhelm drainage systems and alter flood elevations in downstream locations.

Future development under the Proposed Project would occur primarily as infill on previously developed or, to a lesser extent, vacant sites. Any new development within the Project Area, regardless of building densities and lot coverage, would not result in a substantial increase in non-permeable surfaces such that surface drainage patterns would be altered. Further, new development has the potential to increase the permeable surface as new projects will be required to provide a certain amount of outdoor amenity space designed with a minimum amount of permeable surface. Thus, operational impacts related to drainage patterns would be less than significant.

Because implementation of the Proposed Project would not significantly alter the existing drainage pattern and development would be required to comply with all applicable hydromodification and flood control requirements, reasonably anticipated development in the Project Area would not generate a substantial increase in runoff that would exceed the capacity of existing storm drains. Impacts related to drainage and runoff would be *less than significant*.

Mitigation Measures

None required.

Threshold 4.9-4	Would the Proposed Project be in flood hazard, tsunami, or seiche zones, thus risking release of pollutants due to project inundation?
------------------------	--

Impact 4.9-4 **Proposed Project:** The Project Area is located within a flood hazard area but would not site new major sources of pollutants in these areas. Impacts would be *less than significant*.

Project Impacts

As discussed above, the Project Area is located within the 100-year floodplain of the Los Angeles River and in the inundation area of a local reservoir, the Elysian Reservoir.

The type of reasonably anticipated development from the Proposed Project is typical of urban environments. Under the Proposed Project, the open space areas within the Project Area would be preserved and no development would occur within the potential inundation areas associated with the Los Angeles River. While the Proposed Project would increase overall development capacity in the Project Area, it would not cause or accelerate the potential for flooding, including from sudden release of water from the Hollywood Reservoir or the Mulholland Dam. In fact, the redevelopment of Project Area properties with new development that meets current standards related to detention/retention of site runoff would be expected to incrementally reduce overall flood hazards.

The Elysian Reservoir is a 55-million-gallon reservoir that has traditionally supplied water to people in Downtown Los Angeles and surrounding communities. In 2008, the reservoir was drained due to water quality issues. In 2012, the LADWP voted to cover up the reservoir's water with a giant rubber cap to meet federal water quality guidelines. The reservoir functions as auxiliary water storage, rather than as flood control. It is also located in a natural canyon and surrounded by parkland and, if flooded, would drain along an undeveloped path into the Los Angeles River, located 0.2 mile to the southeast. The downstream hazard from failure of the reservoir is rated 'High' by the DWR Division of Dam Safety (DWR 2022), however the reservoir is not considered at risk of failure by DWR. In addition, no component of the Proposed Project would increase the potential for flooding from the reservoir.

The Proposed Project includes an element of light industrial development. Such components may require the siting of new storage of industrial pollutants within the Project Area. However, no such pollutant storage would be sited within the designated flood hazard zone as no development is situated within the 100-year floodplain under the Proposed Project. Therefore, the Proposed Project would not create new sources of pollutants within a flood hazard area, thereby risking release of pollutants from inundation, and impacts would be *less than significant*.

The Project Area is located approximately 12 miles from the coastline and is not at risk of inundation from a tsunami (Los Angeles County Enterprise Geographic Information Systems 2017). Seiches, which are standing waves in an enclosed or partially enclosed body of water, can quickly alter the height of the water body and typically have localized impacts limited to the water body and waterfront areas. The water body nearest to the Project Area is the Elysian Reservoir, mentioned above. However, there is no existing or planned development adjacent to the reservoir. Because the Project Area would not be exposed to inundation by seiche or tsunami, impacts would be *less than significant*.

Mitigation Measures

None required.

Threshold 4.9-5	Would the Proposed Project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?
------------------------	---

Impact 4.9-5 **Proposed Project:** The Proposed Project would not conflict with or obstruct the implementation of a water quality control plan or sustainable groundwater management plan because future development would be required to comply with applicable regulations and plans. Impacts would be *less than significant*.

Project Impacts

Future Project Area development would be subject to federal, state, and local standards and regulations protecting water quality and hydrological resources. In addition, the Proposed Project would require compliance with a number of federal, state, and local policies to support stormwater management and improve water quality. Individual development projects under the Proposed Project would be required to comply with applicable regulations, standards, and policies, which would prevent violations of water quality standards and the waste discharge requirements that are set in order to maintain compliance with the goals of the Basin Plan. As a result, impacts related to obstruction of a water quality control plan would be *less than significant*.

Mitigation Measures

None required for the Proposed Project.

CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable recreation impacts includes the entire City of Los Angeles and greater surrounding area including all areas which are hydrologically connected, including the Upper and Lower Los Angeles River watersheds and the Central, Sylmar, and San Fernando Basins. Much of the surface water throughout this area is highly channeled, lined, and controlled, and the groundwater resources are all adjudicated and carefully distributed. As the Proposed Project would not alter any of the hydrological or hydrogeological connections or systems within the greater area or throughout the larger watersheds, the cumulative scope can appropriately be narrowed to focus on the City of Los Angeles itself and the underlying groundwater basins.

Water Quality Standards/Water Quality Degradation

Construction and operation of new developments Citywide would potentially increase pollutants in surface waters. However, Section D of LAMC Article 4.4, *Stormwater and Urban Runoff Pollution Control*, requires owners or developers to implement stormwater pollution control requirements for construction activities and construction activities on a site of more than one acre would be subject to the NPDES Statewide General Construction Activity Stormwater Permit. In addition, all future developments would be required to comply with the LID Ordinance and Stormwater and Urban Runoff Pollution Control Ordinance, which require the inclusion of BMPs in a project's design to prevent, control and reduce stormwater pollutants. Continued enforcement of these requirements would reduce cumulative impacts to a *less than significant* level.

As discussed under Impact 4.9-1, Project Area development would be subject to the above requirements, which would reduce impacts related to the Proposed Project to a less than significant level. Based on this information, the Proposed Project would not result in cumulatively considerable contributions to water quality degradation. Cumulative impacts would be *less than significant* related to water quality standards.

Groundwater

Reasonably anticipated development in the Project Area and the City would be subject to the City's stormwater quality BMPs, Stormwater and Urban Runoff Pollution Control Ordinance, and NPDES GCASP permit requirements. These regulations would ensure construction activities associated with future development would not substantially deplete groundwater supplies or interfere with groundwater recharge. Additionally, as discussed above, groundwater withdrawals throughout the greater Los Angeles area are controlled by court imposed withdrawal limits that prevent depletion of groundwater supplies. Future development in the Project Area and the City would be subject to several regulations and requirements that ensure construction activities associated with future development would not substantially interfere with groundwater recharge. Much of the Project Area and surrounding region is already covered with impermeable surfaces and fully developed, which would not result in demonstrable or sustained reduction of groundwater recharge capacity, such that there would be lowering of the local groundwater table level. Groundwater recharge conditions throughout this area are already poor, and the multiple planning and water departments have been implementing increasingly strict regulations regarding loss of recharge area for decades. As discussed under Impact 4.9-2, reasonably anticipated development in the Project Area would not interfere substantially with groundwater recharge and may provide some benefits to groundwater recharge by replacing older development with new development subject to open space, landscaping, and stormwater BMP requirements that would increase pervious surfaces associated with development. Additionally, although existing conditions related to groundwater recharge are poor, the Proposed Project's incremental contribution groundwater recharge interference would not be cumulatively considerable. Therefore, cumulative impacts related to the Project would be *less than significant*.

Drainage/Runoff

Growth throughout Los Angeles would generally increase the intensity of uses and residential density Citywide, which would generally increase impervious surface area and surface runoff. However, new development would be subject to current regulations derived from the Permit obtained from the LARWQCB (i.e., SUSMP, LID Ordinance, LID Handbook), which features numerous hydromodification requirements to restrict runoff rates and control erosion, siltation, and modification of flood flows. Compliance with these requirements would minimize impacts to regional surface hydrology and, in instances involving redevelopment of developed sites, peak runoff levels may actually decline. Thus, the cumulative impacts to drainage and runoff related to the Proposed Project would be *less than significant*. The Proposed Project would primarily expand capacity for residential, commercial, retail, and light industrial uses. Reasonably anticipated development in the Project Area would generally involve redevelopment of already developed sites so would not substantially increase impervious surface area or runoff. New development would also be subject to the regulations cited above regarding alteration of stormwater runoff rates or otherwise adversely affecting hydrological conditions. Based on this information, the Proposed Project incremental contribution to increases in drainage and surface runoff would not be cumulatively considerable and cumulative impacts would be *less than significant*.

Flood Hazards

As discussed under Impact 4.9-3, 100-year flood zones are located throughout the City. New development in these areas would be subject to local flood control requirements, which require that the design of developments avoid 100-year flood hazards and does not substantially increase flood risk on other properties. New sources of pollutants are strictly regulated, including regarding their siting with regards to potential flood hazards. The Proposed Project would not site new sources of stored hazardous pollutants within a 100-year flood hazard area even if the light industrial categories of development did feature such uses. Based on this information, the Proposed Project's incremental contribution to inundation would not be cumulatively considerable. Continued implementation of these requirements would reduce the risk of cumulative flood impacts from release of pollutants due to inundation throughout the analysis area to a *less than significant* level.

4.10 LAND USE AND PLANNING

This section addresses impacts related to the City’s land uses and planning efforts from implementation of the updated Cornfield Arroyo Seco Plan (CASP) (or “Proposed Project” or “Project”) in the existing CASP area of Los Angeles (or “Project Area”). Topics include the potential to physically divide an established community, inconsistencies with applicable land use plans and policies, and inconsistencies with adopted habitat conservation plans. Key sources used to gather information on the City’s zoning and land use policies included the City’s Zone Information Map Access System (ZIMAS, <http://zimas.lacity.org/>; Los Angeles Department of City Planning [LADCP] 2017a), the City’s General Plan (https://planning.lacity.org/GP_elements.html; LADCP various dates), and the Southern California Association of Governments (SCAG’s) 2020-2045 Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS).

ENVIRONMENTAL SETTING

EXISTING CONDITIONS

The Project Area is located entirely within the incorporated City of Los Angeles just northeast of downtown Los Angeles, within City Council District 1. The Project Area comprises portions of the Central City North, Northeast Los Angeles, and Silver Lake-Echo Park-Elysian Valley Community Plan Areas and includes two opportunity areas identified in the Los Angeles River Revitalization Master Plan: the Cornfield and Arroyo Seco. The Project Area is approximately 600 acres (0.93 square miles) and is predominantly developed, with transportation infrastructure being a central feature of the Project Area. Interstate 5 (I-5) and State Route-110 (SR-110) bisect the northern portion of the Project Area. Entrances and exits to and from SR-110 are located on the northern perimeter of the Project Area. Entrances and exits to I-5 are located at North Broadway/Pasadena Avenue and at Avenue 26 across from Lacy Street. Other major arterials located in the Project Area include Figueroa Street in the northern portion of the Project Area, San Fernando Road in the central portion of the Project Area, and Spring Street, Broadway Avenue, and Main Street in the southern portion of the Project Area. The Los Angeles County Metropolitan Authority (LA Metro) L Line (Gold) cuts across the northern portion of the Project Area and provides frequent access to downtown Los Angeles, northeastern sections of Los Angeles, and the cities of South Pasadena and Pasadena.

The Project Area comprises approximately 1,600 assessor parcels in an area northeast of downtown just east of Chinatown and comprising portions of Lincoln Heights. The existing built environment within the Project Area varies as a result of different phases of development that have occurred throughout the Project Area over time. The Project Area can generally be split into four sections including a northern section, western section, central section, and eastern section. Information on historical resources in the Project Area can be referenced in Section 4.4, *Cultural Resources*. These surrounding land uses are discussed in detail below:

- **Northern Section**

The section north of the Arroyo Seco comprises mainly of the properties facing Figueroa Street and Avenue 26, which are largely commercial in character. Properties along Figueroa Street have seen extensive redevelopment and remodeling over the last half of the 20th century, leading to a mix of older one-story commercial buildings, a neighborhood movie theater (eventually converted to a store), gas stations, and a Google-style diner. The former Los Angeles Railway Huron Substation

is located in this section, as is the former Lawry's California Center (now the Los Angeles River Center and Gardens).

- **Western Section**

The section west of the Los Angeles River is characterized by blocks of industrial buildings constructed throughout the 20th century. The section along Spring Street historically surrounded the Southern Pacific River Station, which is now Los Angeles State Historic Park. In 2005, the Los Angeles State Historic Park was the site of an art project by Lauren Bon called "Not a Cornfield," which is where the Project Area gets part of its name. One of the more notable industrial buildings in the section is the Raphael Junction Block/NY Suspenders Factory, a flatiron-shaped building adjacent to the Los Angeles State Historic Park. The western section also includes Los Angeles Department of Water and Power (LADWP) generating and maintenance facilities and William Mead Homes Public Housing. A rare extant section of the Zanja Madre, the main irrigation ditch that fed the early Pueblo de Los Angeles, is located just north of the Los Angeles State Historic Park along the Metro L Line (Gold) alignment.

- **Central Section**

The section between the Los Angeles River and I-5, south of Arroyo Seco is mixed in character, containing residential, commercial, and industrial uses, often adjacent to each other. Approximately five blocks on the south side of Broadway Avenue contain a concentration of late 19th and early 20th century residences, as well as the Albion Elementary School. Albion Cottages and Milagro Market are located in this small residential area. Broadway Avenue and Pasadena Avenue act as commercial corridors through the area. Industrial properties are interspersed throughout the section, but the north half of the section is particularly industrial in character.

- **Eastern Section**

Located east of I-5 and south of Arroyo Seco, this section is largely industrial, with the exception of a few older homes left over from the original residential tract that existed before industry expanded into it. The Lincoln/Cypress L Line (Gold) stop is located in this section, which spurred multi-family housing development in the mid-2000s. Lacy Street is defined by a mix of historic and new buildings, including the old Columbia Mills (now Lacy Street Studios), Lacy Street Neighborhood Park, the North Central Animal Care Center, and former offices of the Cannon Electric Development Company. Other industries in the area were historically involved in metal work, from the manufacturing of brass to general fabrication of metal objects and building materials.

Current General Plan Land Use Designations and Zoning

Adopted in 1996, the City's General Plan Framework Element is a strategy for long-term growth and development, setting a citywide context for the update of the 35 Community Plans and other citywide general plan elements. While the General Plan Framework Element incorporates a diagram that depicts the generalized distribution of centers, districts, and mixed-use boulevards throughout the City, the specific General Plan Land Use Designations are established and applied by the community plans.

The existing General Plan designations for the Project Area are established in the Central City North, Northeast Los Angeles, and Silver Lake-Echo Park-Elysian Valley Community Plans.

General Plan Land Use Designations

The following section summarizes the General Plan Framework Element designations throughout the City, categorized by broader land use categories of residential, commercial, industrial, open space, and public facilities land uses.

Residential

Residential General Plan land use designations in the City consist of low-density and multi-family residential. Low-density residential ranges from one to nine dwelling units per acre (du/ac) using the categories Minimum, Very Low, Very Low I, Very Low II, and Low. Multi-family residential ranges from Low Medium I (10-17 du/ac), Low Medium II (18-29 du/ac), Medium (30-55 du/ac), High Medium (56-109 du/ac), and High (110-218 du/ac), although some community plans encourage greater densities. In addition, residential uses are permitted within Commercial General Plan land use designations.

Commercial

Commercial General Plan land use designations in the City consist of Regional, Community, Neighborhood, Highway Oriented, Limited, and General Commercial. Regional Commercial areas allow for the highest development potential and widest variety of uses, including corporate and professional offices, retail commercial, offices, and personal services, eating and drinking establishments, entertainment, major cultural facilities, commercial overnight accommodations, and mixed-use structures that integrate housing with commercial uses. Community, Neighborhood, Highway-Oriented, and General Commercial designations may restrict various uses and development potential is typically lower than the Regional designation. Limited Commercial is the most restrictive designation. All commercial areas allow multi-family residential development.

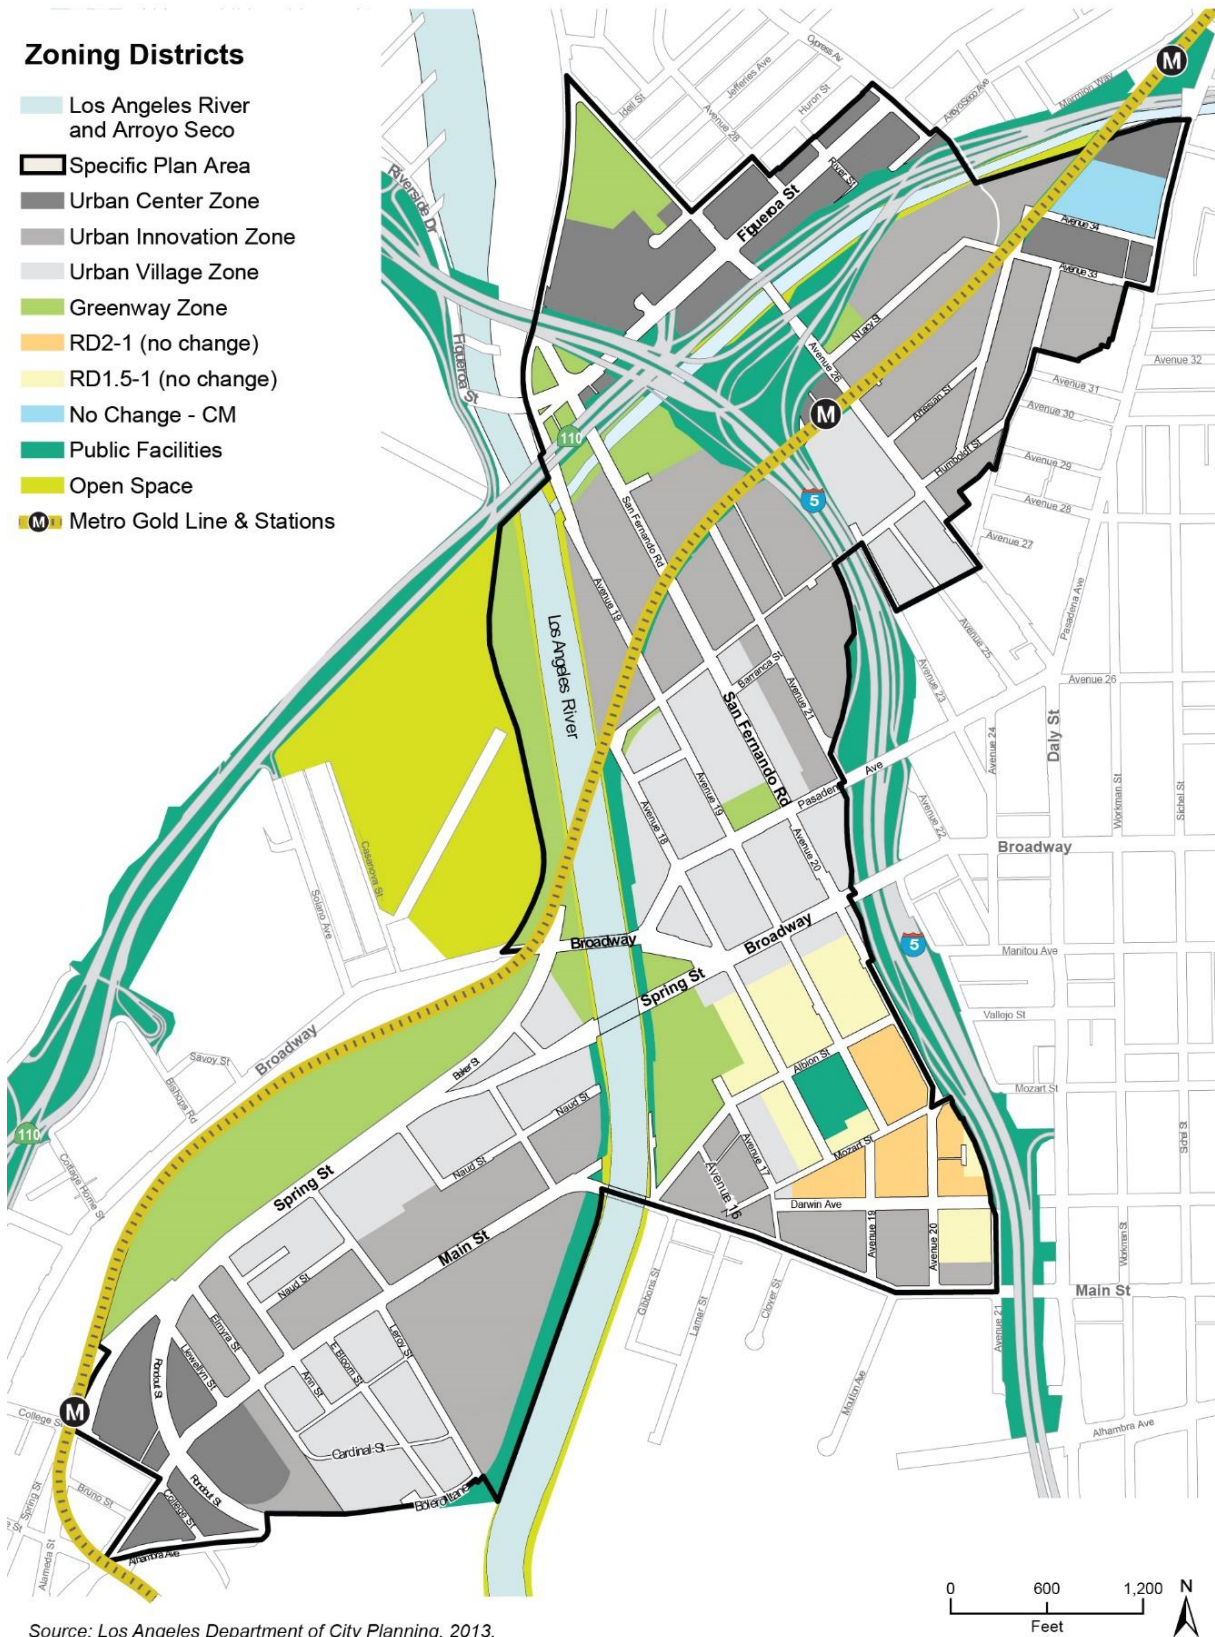

Industrial

Industrial General Plan land use designations in the City consist of Commercial Manufacturing, Hybrid, Limited, Light, and Heavy Industrial. Hybrid industrial areas allow for a mix of residential and clean, light industrial uses. Limited and Light Industrial designations are more restrictive to allow for greater compatibility with residential uses. Heavy industrial areas allow the widest range of industrial, machinery, and manufacturing uses, and do not permit any by-right residential uses.

Open Space

Open space land use designations in the City include park and recreation facilities (bicycle trails, equestrian trails, walking trails, park land/lawn areas, child care facilities, and athletic fields), natural resource preserves (forest land, waterways, watersheds, agricultural lands, areas containing mineral deposits), ecological preserves and habitat protection sites, closed sanitary landfills sites, public water supply reservoir (uncovered), and water conservation areas such as percolation basins and floodplain areas.

Figure 4.10-1 CASP Zoning Districts as Approved in 2013

Existing Project Area Affordable Housing Incentives

Conventional zoning typically divides cities into zones that rigidly separate residential, commercial, industrial, and institutional uses into discrete areas, and thereby further promote sprawl and dependence upon automobile travel to reach destinations. The Project Area incorporates the use of zoning districts based on development intensity and use mix instead of segregated land use zones; this reflects the functions of and interrelationships between each part of the Project Area. Specifically, and as shown above in Figure 4.10-1, the Specific Plan as adopted in 2013 has four zones that are unique to the Specific Plan: the Urban Innovation zone (144 acres), Urban Village zone (90 acres), and Urban Center zone (40 acres), which all correspond with the Hybrid Industrial land use designation, and the Greenway zone (74 acres), which corresponds with the Open Space designation. Other zones in the Project Area include the OS zone (34 acres), RD1.5 and RD2 zones (29 acres), PF zone (57 acres), and CM zone (5 acres).

The existing Project Area also has an incentive-based zoning system that grants developers additional floor area rights in exchange for reserving a portion of units for low-income households. The system seeks to capture the land value increases that result from rezoning and public investment to create public benefits such as affordable housing.

Presently, project applicants may obtain additional floor area rights by complying with the Affordable Housing Bonus Option, Strategy A or B, and/or the Community Benefit Bonus Options, as set forth below:

Affordable Housing Bonus Option - Strategy A

If an applicant agrees to set aside a portion of the residential units in a project for affordable housing, then the project shall be granted a Floor Area Bonus.

Affordable Housing Bonus Option - Strategy B

If an applicant agrees to set aside a portion of the residential units in a project for affordable housing, then for each square foot of affordable housing constructed, the applicant shall be granted the right to construct additional floor area above the Base FAR for the project, as set forth in the Bonus Square Footage Table in the existing Proposed Project. One additional square foot shall be added to the bonus numbers set forth below for square footage that is used to construct affordable units containing three or more bedrooms.

Community Benefit Bonus Options

Project applicants may obtain additional Floor Area Rights by providing the following Community Benefits:

- **Open Space:** A project applicant may add 3 square feet of floor area for each square foot of publicly accessible open space provided.
- **Community Facility:** A project applicant may add 6 square feet of floor area for each square foot of area provided for a Community Facility.
- **Passageway:** A project applicant may add 3 square feet of floor area for each square foot of a public passageway that extends from an adjacent street to another public right-of-way

Additionally, the existing Specific Plan sets forth a Transfer of FAR (TFAR) Program available to non-residential projects to transfer unused floor area from a Donor site to a Receiver site, up to the allowable Maximum FAR limit on a site.

REGULATORY FRAMEWORK

Federal, State, and Local land use and planning laws, Regulations, and adopted plans applicable to the Proposed Project are summarized below.

FEDERAL

There are no federal land use regulations applicable to the Proposed Project.

STATE

California Government Code Section 65302 (General Plan)

California law requires that every city and county prepare and adopt a long-range comprehensive General Plan to guide future development and to identify the community's environmental, social, and economic goals. As stated in Section 65302 of the California Government Code, "The general plan shall consist of a statement of development policies and shall include a diagram or diagrams and text setting forth objectives, principle, standard, and plan proposals." While a general plan will contain the community vision for future growth, California law also requires each plan to address the mandated elements listed in Section 65302. The mandatory elements for all jurisdictions are land use, circulation, housing, conservation, open space, noise, safety, and environmental justice.

State Density Bonus Law (Government Code Section 65915)

The State Density Bonus law (signed into law in 1979) requires jurisdictions to provide applicants with a density bonus and incentives or concessions for the production of housing development in which affordable housing is also provided. Eligible projects include housing developments with 10 percent housing for lower income households, 5 percent of the housing for very low-income households, senior citizen housing, and 10 percent of the total dwelling units provided as affordable housing in condominium projects. The City has implemented the State Density Bonus Law in various municipal code sections of the LAMC.

On September 27, 2014, Governor Brown signed AB 2222, which amended sections of the State Density Bonus Law (Government Code Section 65915). AB 2222 requires that density bonus projects resulting in a loss of existing affordable and otherwise locally regulated (i.e., rent-stabilized) housing units replace those units one-for-one. It also extends the affordability period from 30 to 55 years and expands the use of equity sharing in for-sale units. Several other clarifications of the existing law are also included, but they were not judged to represent a change to current City policy.

State Density Bonus Law (Government Code Section 65915)

The State Density Bonus law (signed into law in 1979) requires jurisdictions to provide applicants with a density bonus and incentives or concessions for the production of housing development in which affordable housing is also provided. Eligible projects include housing developments with 10 percent or more housing for lower income households, 5 percent or more of the housing for very low income households, senior citizen housing, and 10 percent of the total dwelling units provided as affordable housing in condominium projects. The City has implemented the State Density Bonus Law in various municipal code sections of the LAMC.

On September 27, 2014, Governor Brown signed AB 2222, which amended sections of the State Density Bonus Law (Government Code Section 65915). AB 2222 requires that density bonus projects resulting in a loss of existing affordable and otherwise locally-regulated (i.e., rent-stabilized) housing units replace

those units one-for-one. It also extends the affordability period from 30 to 55 years and expands the use of equity sharing in for-sale units. Several other clarifications of the existing law are also included, but they were not judged to represent a change to current City policy.

Sustainable Communities and Climate Protection Act of 2008 (Senate Bill 375 (SB 375))

The Sustainable Communities and Climate Protection Act of 2008 (Sustainable Communities Act, SB 375, Chapter 728, Statutes of 2008) supports the state's climate action goals to reduce greenhouse gas (GHG) emissions through coordinated transportation and land use planning with the goal of creating more sustainable communities. Under the Sustainable Communities Act, the California Air Resources Board (CARB) sets regional targets for GHG emissions reductions from passenger vehicle use. In 2010, CARB established these targets for 2020 and 2035 for each region covered by one of the State's metropolitan planning organizations (MPO). ARB periodically reviews and updates the targets.

SB 375 requires MPOs to prepare a "sustainable communities strategy" (SCS) in conjunction with their Regional Transportation Plan (RTP). The City of Los Angeles is a member of the Southern California Association of Governments (SCAG) MPO, which adopted the 2016-2040 RTP/SCS in 2016. The document provides integrated land use and transportation strategies and policies intended to reduce the region's GHG emissions from passenger vehicle use to meet the GHG reduction targets set by CARB. The RTP/SCS guides the transportation policies and investments for the region. CARB must review the adopted SCS to confirm and accept SCAG's determination that the SCS, if implemented, would meet the regional GHG targets. Proposed Project consistency with the 2016-2040 RTP/SCS is analyzed under Impact 4.10 - 2.

Complete Streets Act (AB 1358)

Assembly Bill 1358, the Complete Streets Act (Government Code Sections 65040.2 and 65302), was signed into law by former Governor Arnold Schwarzenegger in September 2008. As of January 1, 2011, the law requires cities and counties, when updating the part of a local general plan that addresses roadways and traffic flows, to ensure that those plans account for the needs of all roadway users. Specifically, the legislation requires cities and counties to ensure that local roads and streets adequately accommodate the needs of bicyclists, pedestrians and transit riders, as well as motorists. At the same time, the California Department of Transportation (Caltrans) unveiled a revised version of Deputy Directive 64, an internal policy document that now explicitly embraces Complete Streets as the policy covering all phases of state highway projects, from planning to construction to maintenance and repair.

REGIONAL

2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)

On September 3, 2020, the Southern California Association of Governments (SCAG) Regional Council adopted the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), also known as Connect SoCal. The 2020-2045 RTP/SCS presents a long-term transportation vision through the year 2045 for the six-county region of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties. The 2020-2045 RTP/SCS contains baseline socioeconomic projections that are used as the basis for SCAG's transportation planning, and the provision of services by other regional agencies. SCAG's overarching strategy for achieving its goals is integrating land use and transportation. SCAG policies are directed towards the development of regional land use patterns that contribute to reductions in vehicle miles and improvements to the transportation system. Rooted in past RTP/SCS plans, Connect SoCal's "Core Vision" centers on maintaining and better managing the region's transportation network, expanding mobility choices by co-locating housing, jobs, and transit, and increasing investment in transit and complete streets. The plans "Key Connections" augment the "Core Vision" to address challenges

related to the intensification of core planning strategies and increasingly aggressive greenhouse gas reduction goals, and include but are not limited to, Housing Supportive Infrastructure, Go Zones, and Shared Mobility. Connect SoCal intends to create benefits for the SCAG region by achieving regional goals for sustainability, transportation equity, improved public health and safety, and enhancement of the regions' overall quality of life. These benefits include but are not limited to a five percent reduction in VMT per capita and vehicle hours traveled by nine percent, increase in work-related transit trips by two percent, create more than 264,500 new jobs, reduce greenfield development by 29 percent, and, building off of the 2016-2040 RTP/SCS, increase the share of new regional household growth occurring in High Quality Transit Areas (HQTAs) by six percent and the share of new job growth in HQTAs by 15 percent.

Regional Housing Needs Assessment (RHNA)

The RHNA is a key tool used by SCAG and its member governments to plan for growth. The 6th cycle Final RHNA Allocation Plan was adopted by the SCAG Regional Council on March 4, 2021 and quantifies the need for housing within each jurisdiction between 2021 and 2029. Communities then plan and determine how they will address this need through the process of completing the housing elements of their general plans. The RHNA allows communities to anticipate growth, so that they can grow in ways that enhance quality of life, improve access to jobs, transportation and housing, and not adversely impact the environment. The RHNA is produced periodically by SCAG, as mandated by State law, to coincide with the region's schedule for preparing housing elements.

The existing need assessment is based on data from the most recent U.S. Census to measure ways in which the housing market is not meeting the needs of current residents. These variables include the number of low-income households paying more than 30 percent of their income for housing, as well as severe overcrowding. The future need for housing is determined primarily using the forecasted growth in households in a community, historical growth patterns, job creation, household formation rates, and other factors. The need for new dwelling units is then adjusted to account for an ideal level of vacancy needed to promote housing choice, maintain price competition, and encourage acceptable levels of housing upkeep and repair. The RHNA also accounts for units expected to be lost due to demolition, natural disaster, or conversion to non-housing uses. The sum of these factors – household growth, vacancy need, and replacement need – form the “construction need” assigned to each community. In addition, the RHNA considers how each jurisdiction might grow in ways that will decrease the concentration of low-income households in certain communities. The need for new housing is distributed among different income groups so that each community moves closer to the regional average income distribution.

LOCAL

City of Los Angeles General Plan

California law requires that cities prepare and adopt a comprehensive, integrated, long-term General Plan to direct future growth and development. The General Plan is the fundamental policy document of a city. It defines how a city's physical and economic resources are to be managed and utilized over time. Decisions by a city with regard to the use of its land, design and character of buildings and open spaces, conservation of existing and provision of new housing, provision of supporting infrastructure and public and human services, and protection of residents from natural and man-caused hazards are guided by and must be consistent with the General Plan. State law requires general plans to contain seven elements: land use, circulation, housing, conservation, open space, noise, and safety. Cities can also adopt additional General Plan elements. The Land Use Element of the City of Los Angeles General Plan is composed of 35 community plans, which are the official guides to the future development of the City. The 35 Community Plans guide the location and intensity of private and public uses of land; direct the arrangement of land uses, streets, and services; and encourage the economic, social, and physical health, safety, welfare, and convenience of people who live and work in the community. In addition to incremental updates to the City's

Land Use Element through the Community Plan update program, the City of Los Angeles launched a program to update the City's General Plan in 2018. This effort will result in a new 20-year citywide plan for the sustainable development of the City.

The City's elements, other than land use, include:

- Framework Element
- Air Quality Element
- Conservation Element
- Housing Element
- Noise Element
- Open Space Element
- Service Systems Element/Public Recreation Plan
- Safety Element
- Mobility Element (Mobility Plan 2035)
- Plan for a Healthy Los Angeles

Some of the key elements are discussed below.

Framework Element

The City of Los Angeles General Plan Framework Element (General Plan Framework) establishes the conceptual basis for the City's General Plan. The General Plan Framework sets forth a Citywide comprehensive long-range growth strategy and establishes Citywide policies regarding land use, housing, urban form, neighborhood design, open space and conservation, economic development, transportation, infrastructure, and public services. The General Plan Framework provides guidelines for future updates of the City's community plans and does not supersede the more detailed community and specific plans.

Land Use Chapter

The General Plan Framework Land Use Chapter designates Districts (i.e., Neighborhood Districts, Community Centers, Regional Centers, Downtown Center, and Mixed-Use Boulevards) that include standards and policies that shape the scale and intensity of proposed uses with the purpose of supporting the vitality of the City's residential neighborhoods and commercial districts. The establishment of the designated arrangement of land uses and development densities addresses an array of environmental issues, including, but not limited to: reductions in VMT, reductions in noise impacts, improved efficiency in the use of energy, improved efficiency and thus greater service levels within the infrastructure systems, availability of open space, compatibility of land uses, support for alternative modes of transportation, and provision of an attractive pedestrian environment.

Housing Chapter

The overarching goal of the General Plan Framework Housing Chapter is to define the distribution of housing opportunities by type and cost for all residents of the City. The General Plan Framework Housing Chapter recognizes that the distribution of housing in proximity to transit can reduce vehicle trips and provide residents with the opportunity to walk between their home, job, and/or neighborhood services. The Housing Chapter provides the following policies to achieve this goal through a number of measures:

- Concentrating opportunities for new development in the City's Neighborhood Districts and in Community Centers, Regional Centers, and the Downtown Center, as well as along primary transit corridors/boulevards.
- Providing development opportunities along boulevards located near existing or planned major transit facilities and areas characterized by low-intensity or marginally viable commercial uses with structures that integrate commercial, housing, and/or public service uses; and
- Focusing mixed uses around urban transit stations, while protecting and preserving surrounding low-density neighborhoods from the encroachment of incompatible land uses.

Urban Form and Neighborhood Design Chapter

The General Plan Framework Urban Form and Neighborhood Design Chapter establishes the goal of creating a city that is attractive to future investment and a city of interconnected, diverse neighborhoods that builds on the strength of those neighborhoods and functions at both the neighborhood and Citywide scales. The purpose of the Urban Form and Neighborhood Design Chapter is two-fold: first, to support the population distribution principles of the General Plan Framework through proper massing and design of buildings and second, to enhance the physical character of neighborhoods and communities within the City. The General Plan Framework does not directly address the design of individual neighborhoods or communities but embodies general neighborhood design and implementation programs that guide local planning efforts and lay a foundation for community plan updates. The Urban Form and Neighborhood Design Chapter encourages growth in areas that have a sufficient base of both commercial and residential development to support transit service. The existing and planned transit system provides the opportunity to concentrate development and conserve the existing character of stable neighborhoods.

Open Space and Conservation Chapter

The General Plan Framework Open Space and Conservation Chapter provides guidance for overall City provision of open space and sets forth policies for the protection of the City's natural environment resources. The Open Space and Conservation Chapter's objectives are oriented around the conservation of natural resources, provision of outdoor recreational opportunities, minimization of public risks from environmental hazards, and use of open space to enhance community and neighborhood character. Economic, social, and ecological imperative require the City to take full advantage of all existing open space elements. The ecological dimension is based on the improvement of water quality and supply, the reduction of flood hazards, improved air quality, and the provision of ecological corridors for birds and wildlife.

Economic Development Chapter

The General Plan Framework Economic Development Chapter includes goals, policies and objectives that address the appropriate land use locations for development. The chapter also establishes mutual development objectives for land use and economic development. This Chapter set forth policies for the development of an infrastructure investment strategy to support population and employment growth areas. The Chapter also includes goals, objectives, and policies focused on preserving commercial uses within walking distance to residential areas and promoting opportunities in areas where growth can be accommodated without encroaching on residential neighborhoods. It also focuses on establishing a balance of land uses that provide for commercial and industrial development which meet the needs of local residents, sustaining economic growth, and assuring maximum feasible environmental quality.

Transportation Chapter

The General Plan Framework Transportation Chapter includes proposals for major improvements to enhance the movement of goods and to provide greater access to major intermodal facilities. While the focus of the Transportation Chapter is on guidance for transportation investments, the Transportation Chapter also includes goals, policies and objectives that overlap with policies included in other Framework chapters of the General Plan Framework regarding land use patterns and the relationship of the pedestrian system to arrangement of land uses. The Transportation Chapter of the General Plan Framework is implemented through the General Plan's Mobility Plan 2035, which is a comprehensive update of the General Plan Transportation Element.

Infrastructure and Public Services Chapter

The General Plan Framework Infrastructure and Public Services Chapter addresses infrastructure and public service systems, including wastewater, stormwater, water supply, solid waste, police, fire, libraries, parks, power, schools, telecommunications, street lighting, and urban forests. For each of the public services and infrastructure systems, basic policies call for monitoring service demands and forecasting the future need for improvements, maintaining an adequate system/service to support the needs of population and employment growth, and implementing techniques that reduce demands on utility infrastructure or services. Generally, these techniques encompass a variety of conservation programs (e.g., reduced use of natural resources, increased site permeability, watershed management, and others). Strategic public investment is advocated in the Infrastructure and Public Services Chapter as a method to stimulate economic development as well as maintain environmental quality. Attention is also placed on the establishment of procedures for the maintenance and/or restoration of service after emergencies, including earthquakes.

Mobility Plan 2035

The Mobility Plan 2035, adopted on January 20, 2016, and readopted September 7, 2016, is a comprehensive update of the General Plan Transportation Element. The Mobility Plan 2035 provides the policy foundation for achieving a transportation system that balances the needs of all road users, incorporates "complete streets" principles and lays the policy foundation for how future generations of Angelenos interact with their streets, in compliance with the Complete Streets Act (Assembly Bill [AB] 1358).

The purpose of the Mobility Plan 2035 is to present a guide to the future development of a Citywide transportation system for the efficient movement of people and goods. While the Mobility Plan 2035 focuses on the City's transportation network, it complements other components of the General Plan that pertain to the arrangement of land uses to reduce VMT and policies to support the provision and use of alternative transportation modalities. The Mobility Plan 2035 includes the following five main goals that define the City's high-level mobility priorities:

- Safety First;
- World Class Infrastructure;
- Access for All Angelenos;
- Collaboration, Communication, and Informed Choices; and
- Clean Environments and Healthy Communities.

Housing Element

The Housing Element of the General Plan is prepared pursuant to state law and provides planning guidance in meeting housing needs identified in the SCAG Regional Housing Needs Assessment (RHNA). The

Housing Element identifies the City's housing conditions and needs, establishes the goals, objectives, and policies that are the foundation of the City's housing and growth strategy, and provides the array of programs the City intends to implement to create and preserve sustainable, mixed-income neighborhoods across the City. The goals of the 2021-2029 Housing Element are as follows:

- A City where housing production results in an ample supply of housing to create more equitable and affordable options that meet existing and projected needs.
- A City that preserves and enhances the quality of housing and provides greater housing stability for households of all income levels.
- A City in which housing creates healthy, livable, sustainable, and resilient communities that improve the lives of all Angelenos.
- A City that fosters racially and socially inclusive neighborhoods and corrects the harms of historic racial, ethnic, and social discrimination of the past and present.
- A City that is committed to preventing and ending homelessness.

Conservation Element

The City of Los Angeles General Plan includes a Conservation Element, which addresses the preservation, conservation, protection, and enhancement of the City's natural resources. Section 5 of the Conservation Element recognizes the City's responsibility for identifying and protecting its cultural and historical heritage. The Conservation Element establishes an objective to protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes and a corresponding policy to continue protecting historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities. The Conservation Element refers to the Open Space Element for a discussion of open space aspects of the City, including park sites.

Los Angeles Municipal Code (LAMC)

Development in the City is also governed by the City of Los Angeles Zoning Code (Chapter 1 of the LAMC), which regulates development through zoning designations and development standards. The Comprehensive Zoning Plan of the City of Los Angeles (Zoning Ordinance) set forth in LAMC Section 12.00 et seq. includes development standards for zoning districts in the City. LAMC Section 13.00 et seq. includes development standards for various supplemental use districts in the City that apply to specific parcels. The LAMC is currently undergoing a comprehensive update to all Zoning Code sections as part of the re:code LA effort (which became the "New Zoning Code"). The New Zoning Code, which started in 2013 and continues through 2023, will update the Zoning Code to make the Code more streamlined, visual, and easy to use. The existing Zoning Code will continue to be located in Chapter 1 of the LAMC, while the New Zoning Code will be located in Chapter 1A of the LAMC.

River Improvement Overlay (RIO)

Effectuated by Ordinance No. 183,145 in August 2014, the River Improvement Overlay (RIO) District enables the City of Los Angeles to better coordinate land use development along the 32-mile corridor of the Los Angeles River that flows within the City's boundaries. The RIO District is a proposed special use district that requires new development projects to follow and implement applicable development regulations and design guidelines. The purposes of the RIO District are to support the goals of the Los Angeles River Revitalization Master Plan (LARRMP); contribute to the environmental and ecological health of the City's watersheds; provide native habitat and support local species; establish a positive interface between the Los Angeles River and adjacent properties; promote pedestrian, bicycle and other multi-modal connections between the River and surrounding neighborhoods; provide an aesthetically

pleasing environment; provide safe, convenient access to and along the River; promote River identity; and support the City's stormwater ordinances and programs.

Redevelopment Plan(s)

Redevelopment Plans outline a community vision and revitalization opportunities within specific neighborhoods across the City. Each Redevelopment Project Area has a unique set of land use restrictions designed specifically to enhance the quality of life for the community. There is no adopted or active redevelopment project area within the CASP boundaries.

Plan for a Healthy LA

The Plan for a Healthy Los Angeles, the Health, Wellness and Equity Element of the City's General Plan, provides high-level policy vision, along with measurable objectives and implementation programs to elevate health as a priority for the City's future growth and development and complies with the requirements for the City to have an environmental justice element consistent with Senate Bill 1000. The Plan for a Healthy Los Angeles was originally adopted in 2015, and targeted amendments to the Plan were adopted by the City Council on November 24, 2021. Through a new focus on public health from the perspective of the built environment and City services, the City seeks to achieve better health and social equity through its programs, policies, plans, budgeting, and community engagement. The Plan acknowledges the relationship between public health and issues such as transportation, housing, environmental justice, and open space, among others. The Plan includes the following goals:

- Los Angeles, A Leader in Health and Equity.
- A City Built for Health.
- Bountiful Parks and Open Spaces.
- Food that Nourishes the Body, Soul, and Environment.
- An Environment Where Life Thrives.
- Lifelong Opportunities for Learning and Prosperity; and
- Safe and Just Neighborhoods.

Included in this General Plan Element are policies pertaining to the arrangement of land uses within the City and building design procedures. As such, these policies address characteristics of the physical environment that contribute to public health.

Los Angeles River Revitalization Master Plan (LARRMP)

Adopted in April 2007, the LARRMP contains goals in the creation of parks, paths, and open spaces along the Los Angeles River. The LARRMP includes recommendations for physical improvements along the Los Angeles River corridor; policies for managing public access and management structure; and short- and long-term priority projects and potential funding strategies.

Citywide Design Guidelines

The Citywide Design Guidelines serve to implement the General Plan Framework Element's urban design principles and are intended to be used by City of Los Angeles Department of City Planning staff, developers, architects, engineers, and community members in evaluating project applications, along with relevant policies from the Framework Element and Community Plans. By offering more direction for proceeding with the design of a project, the Citywide Design Guidelines illustrate options, solutions, and

techniques to achieve the goal of excellence in new design. The Citywide Design Guidelines, which were initially adopted by the City Planning Commission in July 2013 and updated in October 2019, are intended as performance goals and not zoning regulations or development standards and, therefore, do not supersede regulations in the LAMC. The guidelines “carry out the common design objectives that maintain neighborhood form and character while promoting quality design and creative infill development solutions” and are organized in relation to Pedestrian-First Design, 360 Degree Design, and Climate-Adapted Design. The Citywide Design Guidelines incorporate the goals of the previous Walkability Checklist and interact with other guidelines such as those found in Community Design Overlays.

Industrial Land Use Policy Project

In January 2008, the Department of City Planning (DCP) and the Community Redevelopment Agency of Los Angeles (CRA/LA) presented the findings of the Industrial Land Use Policy (ILUP) Project to the City Planning Commission. The ILUP Project was a two-year study that gathered and analyzed information regarding the viability of the City’s industrial districts, particularly those areas experiencing pressure to be converted to residential uses. The result of the two-year effort underscored the appropriateness of the current policy adopted by the City Council and Mayor and contained in the General Plan Framework and elsewhere in adopted documents and made no change to any policy. The ILUP Project does not establish new land use plans or policies and was never formally presented to the City Council for consideration or adoption. Since the ILUP was never formally adopted by the City Council, the City considers zone changes and General Amendments from industrial designations on a case-by-case basis, as it has historically done.

Freeway Adjacent Advisory Notice for Sensitive Users (ZI No. 2427)

Zoning Information File 2427 (ZI No. 2427) provides design and siting guidelines for discretionary residential projects and sensitive uses (i.e., schools, day care centers, and senior care centers) located within 1,000 feet of a freeway. ZI No. 2427 requires all projects seeking discretionary approval for which findings must be made regarding conformance to the General Plan to adhere to the Citywide Design Guidelines, including those that address freeway proximity.

Affordable Housing Linkage Fee Ordinance

On December 13, 2017, Mayor Eric Garcetti passed the Affordable Housing Linkage Fee Ordinance. The ordinance requires developers to pay a fee for new development projects in order to mitigate the need for affordable housing associated with the new project. The ordinance exempts new development projects with at least 40 percent moderate-income dwelling units, 20 percent low-income households, 11 percent very low, or 8 percent extremely low-income dwelling units, public institution projects, hospitals, grocery stores, and other categories of development.

Residential Hotel Unit Conversion and Demolition Ordinance

The Residential Hotel Unit Conversion and Demolition Ordinance (RHO) prohibits conversion or demolition of dwelling units in a residential hotel without approval from the Los Angeles Housing Department (LAHD). The ordinance adds Article 7.1 to Chapter IV of the LAMC and amends Sections 91.106.4.1, 151.06, and 151.09. The ordinance seeks to preserve dwelling units provided by residential hotels, which often serve as affordable housing for the very low income, elderly, and disabled.

Rent Stabilization Ordinance

LAMC Chapter XV encodes the City’s Rent Stabilization Ordinance (RSO). Generally, the Rent Stabilization Ordinance (RSO) applies to rental properties that were built on or before October 1, 1978, as well as replacement units. The RSO applies to most dwelling units with the exception of single-family

homes that solely occupy a parcel and caps annual rent increases for continuing tenants based on the Consumer Price Index averaged for a 12-month period.

Transit Oriented Communities Affordable Housing Incentive Program

The Transit Oriented Communities Affordable Housing Incentive Program (TOC Program) was developed pursuant to Section 6 of Measure JJJ, which was passed by City voters in 2016 (LADCP 2018a). The program provides incentives for developers to build properties that include affordable units within a one-half mile radius of a major transit stop. TOC Program Guidelines were released by the City Planning department on September 22, 2017 and last revised on February 26, 2018.

Development projects can qualify for incentives under one of four tiers (Tier 1 through 4). Each tier has different eligibility requirements related to the type of transit options located in proximity to the property and the composition of affordable units offered. The higher the tier number, the more transit options and affordable housing units a development needs to qualify. All TOC-eligible developments receive baseline incentives, which include an increase in the number of allowable dwelling units, an increase in the allowable floor-area ratio (FAR), and reduced parking requirements. Developments with a higher tier number are also eligible for additional incentives with higher tiers being permitted a greater number of additional incentives.

Value Capture Ordinance

On December 13, 2017, the City Council approved the Value Capture Ordinance (City of Los Angeles 2017). The ordinance requires residential and mixed-use development projects seeking a development density or FAR higher than permitted, through entitlements not subject to Measure JJJ such as Conditional Use Permits (CUPs) to provide a certain percent of restricted affordable dwelling units. The ordinance also provides an additional density bonus for projects that provide restricted affordable units beyond the minimum percentage required.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the *CEQA Guidelines*, a project would have a significant impact related to land use and planning if it would:

- Physically divide an established community (Threshold 4.10-1)
- Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect? (Threshold 4.10-2)

METHODOLOGY

A community can be physically divided by the construction of a new road, freeway, or railway that effectively isolates a portion of the community from the remainder of the community, or when major land use and zoning changes results in radically different land use patterns that can physically divide a neighborhood by creating a new street pattern that impedes access from one area to another. Therefore, the potential of the proposed to physically divide an established community (Threshold 4.10-1) is evaluated by determining whether implementation of the Proposed Project would result in the construction of major new roads, freeways, railways, or other barriers through an existing neighborhood.

The discussion of a significant impact with regard to conflicts with any applicable land use plan, policy, or regulation serves two purposes: identifying significant impacts related to land use and compliance with CEQA Guidelines Section 15125(d), which requires that an EIR include a discussion of any inconsistencies with applicable plans. A conflict between a project and an applicable plan is not necessarily a significant environmental impact under CEQA unless the inconsistency would result in an adverse physical change to the environment (per CEQA Guidelines Section 15382). An excerpt from the legal practice guide CEB, Practice under the California Environmental Quality Act, Section 12.34 illustrates this point:

...if a project affects a river corridor, one standard for determining whether the impact is *significant* might be whether the project violates plan policies protecting the corridor; the environmental *impact*, however, is the physical impact on the corridor.

Under State Planning and Zoning law (Government Code Section 65000, et seq.) strict conformity with all aspects of a plan is not required. Generally, plans reflect a range of competing interests and agencies are given great deference to determine consistency with their own plans. A proposed project should be considered consistent with a general plan or elements of a general plan if it furthers one or more policies and does not obstruct other policies (Governor's Office of Planning and Research 2017). Generally, given that land use plans reflect a range of competing interests, a project should be compatible with a plan's overall goals and objectives, but need not be in perfect conformity with every plan policy.

The Project would comprise a portion of the Land Use Element for the City of Los Angeles and would need to be consistent with other elements in the General Plan. Los Angeles is a member of SCAG and looks to policies established for the region in the 2020-2045 RTP/SCS, which centers on co-locating housing, jobs, and transit, along with other strategies, to improve sustainability, transportation equity, public health and safety, and overall quality of life. Therefore, the potential of the Proposed Project to conflict with an applicable land use plan, policy, or regulation (Threshold 4.10-2) is evaluated by comparing the Proposed Project to applicable policies and objectives contained in the City's General Plan and the 2020-2045 RTP/SCS. For purposes of identifying significant impacts related to conflict with any applicable land use plan, policy, or regulation, they can be either direct or indirect. Direct impacts interfere with land use plans, including habitat or wildlife conservation plans that result in significant environmental effects. Land use compatibility is typically addressed based on direct physical environmental impacts – primarily noise and air quality but also aesthetics, traffic, hazards, water quality and other physical environmental issues, i.e., where one use generates physical impacts that could significantly adversely affect another use. These issues are generally addressed through existing regulations and policies and are comprehensively addressed in each environmental issue area in this document and summarized as applicable and appropriate in the discussion of Impact 4.10-2, below. As related to impact analysis, this section focuses on direct land use impacts. Indirect impacts are secondary effects resulting from land use policy implementation and are generally addressed in other topical sections of this Draft EIR. For example, air impacts resulting from increased car trips as a result of reasonably anticipated development under the Proposed Project would be discussed in the air impact section of this Draft EIR; public service impacts resulting from increased demand from increased development under the Proposed Project is discussed in public services section of this EIR.

DESCRIPTION OF PROJECT FOR PURPOSES OF LAND USE IMPACT ANALYSIS

The Proposed Project is intended to guide development through the year 2040. The Project creates new employment and housing opportunities throughout this specific area north of downtown, and particularly in areas near transit, consistent with the Citywide comprehensive growth strategy identified in the City's Framework and Housing Elements. The Proposed Project would guide the physical development in this particular area of the City in a sustainable manner while protecting existing neighborhoods, open space areas, and public facilities parcels. The Project components are described in more detail below and can also be found in Chapter 3.0, Project Description.

The Proposed Project would amend the text, map, and tables of the CASP (or “Specific Plan”), including new land use and zoning regulations, incentives, and boundaries, for the purpose of encouraging affordable and mixed-income housing production. The Proposed Project would strengthen the existing CASP’s affordable housing requirements, including the recalibration of the CASP’s existing incentive zoning system; establish a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities; include provisions that facilitate the production of new 100% affordable housing and permanent supportive housing projects on public land; increase the zoning capacity for housing in targeted areas; and adopt a modernized zoning system based on the City’s new modular Zoning Code.

The Proposed Project will include the adoption of necessary revisions and any other amendments necessary to implement this update, including amendments to General Plan elements (such as the Framework Element), Community Plans, and other ordinances to implement those updates.

The Proposed Project may also include additional amendments to the LAMC (Chapter 1 and Chapter 1A) to better comport the regulations of the CASP to the structure and provisions of Chapter 1A. This may include moving Specific Plan provisions to Chapter 1A to become part of the base zoning of the respective Community Plan, and potentially removing the Specific Plan designation, for simplicity and ease of implementation. Such amendments would not substantively change the effect of the regulations.

The Proposed Project is comprised of several components including:

- **Updated Zoning.** The Proposed Project would accommodate additional housing in the Project Area by expanding the residential emphasis Urban Village zoning designation to select parcels within the Project Area. Each of the Proposed Project’s unique zones would be updated to permit a broader range of uses, such as 100 percent affordable housing and permanent supportive housing. A new Public Use (P2) zone would be utilized to more precisely regulate the types of uses allowed on publicly-owned land and to support the provision of community benefits.
- **Updated Affordable Housing Requirements.** The Proposed Project’s existing zoning incentives would be restructured and recalibrated to deliver more affordable housing, while being simpler to understand and implement. The revised zoning incentives include a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities.
- **Updated Plan Boundaries.** New updated boundaries would exclude parcels that currently do not have CASP zoning (e.g., RD zones) to clarify the non-applicability of the Specific Plan on those parcels. The boundaries would also be modified to exclude the Greenway (Open Space) parcels adjacent to Elysian Park, which are the only parcels in the Project Area located within the Silver Lake-Echo Park-Elysian Valley Community Project Area.
- **Updated Development Standards.** The existing building form, urban design, open space, parking, conservation, performance, sign, and streets standards of the Project Area would be updated to improve clarity and reduce redundancy.
- **Updated Administration Chapter.** The administration chapter of the Proposed Project would receive technical updates to improve ease of implementation, consistency, and clarity.
- **Updated Mitigation Monitoring Program.**

The changes to the proposed zoning and land uses in the Project Area are summarized below in **Table 4.10-1**.

TABLE 4.10-1 EXISTING AND PROPOSED ZONING				
Zone	No Project		Proposed Project	
	Area (Acres)	Percentage	Area (Acres)	Percentage
Urban Village	90	19%	132	28%
Urban Innovation	144	30%	65	14%
Urban Center	40	8%	30	6%
Greenway	74	15%	0	0%
RD1.5/RD2	29	6%	29	6%
CM	5	1%	5	1%
Open Space (OS)	35	7%	103	22%

FWY	0	0%	40	8%
Public Use (P2)	0	0%	70	15%
C2	8	2%	8	2%
	483*	100%	483*	100%

* Total area shown excludes the area within public rights-of-way. Total acreage is rounded up.

PROPOSED ZONING CHANGES

Expansion of the Urban Village Zone

As described in Section 2.4.4, the existing Specific Plan has four zones that are unique to the Project Area: Urban Innovation (mixed-use industrial), Urban Village (mixed-use residential), Urban Center (mixed-use commercial), and Greenway (open space). The Urban Village zone, which is the only zone that allows for predominantly residential development, comprises approximately 19 percent of land area (90 acres) among parcels within the Project Area.

One of the key objectives of the Proposed Project is to increase the production of affordable and mixed-income housing within the Project Area. The Proposed Project would increase the amount of land that is zoned Urban Village to 28 percent of land area (132 acres) among parcels within the Project Area, which is a 46 percent increase from the existing Specific Plan Urban Village land use. This increase in Urban Village zoned land would expand where housing could be built in the Project Area and support an increase to its housing stock, while still retaining a substantial amount of land for the Specific Plan's other policy objectives, such as the preservation of open space and land for job-producing uses.

The Urban Village zone would be expanded in two subareas of the Project Area: 1) the area west of the Los Angeles River, generally between Main Street and Naud Street, and 2) the area generally bounded by the Los Angeles River to the west, the Arroyo Seco and State Route 110 to the north, and Interstate 5 to the east.

New Public Use District (P2)

The Proposed Project would utilize a new Public Use District (P2) to more clearly demarcate land that is publicly-owned, support the joint public and private development of community-serving uses, and allow by-right 100% affordable housing projects. Currently, 34 percent of land area (165 acres) within the Project Area is owned by a government agency, with approximately half of that land (77 acres) having an Urban Innovation, Urban Village, or Urban Center zoning designation that does not reflect the public ownership of those parcels.

The new Public Use District would allow government buildings, structures, offices, and service facilities. Other uses may be permitted based on the most permissive zoning of adjoining properties; however, such uses must be a joint public and private development approved in accordance with the discretionary processes and procedures set forth in the updated Specific Plan. In contrast to the Urban Innovation, Urban Village, or Urban Center zones, solely private developments would not be permitted within the Public Use zone.

The new Public Use District would be applied to approximately 70 acres of publicly-owned parcels within the Project Area. Not all publicly-owned properties would receive the Public Use zoning designation. For example, freeways would retain the existing Public Facilities (PF) zone, while parks will receive the Open Space zone (OS). Publicly-owned properties that are currently zoned Urban Village would retain their existing zoning.

In sum, the new Public Use zone would allow for a broader range of uses to occur on certain publicly-owned parcels, depending on the zoning of adjoining properties, but such development may require a discretionary review process and would be limited to joint public and private development. Solely public development such as government buildings, structures, offices, and service facilities would be allowed ministerially.

Updated Use Table for Proposed Project Zones

The Proposed Project would replace the existing *Use Classification Table* and *Use Limits Table* (see **Table 2-5** and **Table 2-6** of the existing CASP), which is proprietary to the Specific Plan, with an updated use table substantially based on that of the City's proposed New Zoning Code. The updated list of uses and definitions would be aligned with the proposed *Use Article* of the New Zoning Code to enhance consistency between the documents and improve ease of implementation.

While the format of the use table would change, the general uses allowed for each of the existing Specific Plan zones would largely be unchanged. The Urban Innovation, Urban Village, and Urban Center Use Districts will continue to remain mixed-use industrial, residential, and commercial zones, respectively. However, the Proposed Project would incorporate a few changes to the use limits to further support the production of affordable and mixed-income housing.

For example, the existing Urban Village zone's limitation of multi-family residential uses to 90 percent of a development project's total floor area would be lifted, allowing for purely residential buildings in the Urban Village Use District, instead of mandating a mix of uses within the same building. The additional flexibility afforded by this change increases the feasibility of residential development, especially affordable and mixed-income housing projects.

The existing Urban Innovation and Urban Center zones also prescribe a mix of uses, limiting multi-family residential uses to no more than 15 percent of a development project's total floor area. The Proposed Project would continue to prioritize job-producing uses over residential development in these zones. However, rather than a cap on the percentage of residential uses allowed, the Proposed Project would establish a minimum Floor Area Ratio (FAR) of industrial, commercial, or other job-producing uses within a development project in the Urban Innovation and Urban Center zones. This approach is consistent with the standards of the proposed New Zoning Code and would result in less ambiguity and greater ease of implementation compared to the existing proprietary system.

The Proposed Project would exempt 100 percent restricted affordable housing and permanent supportive housing projects from the minimum job-producing FAR requirements of the Urban Innovation and Urban Center zones. This change would substantially increase the area where affordable and permanent supportive

housing could be built in the Project Area compared to the existing Specific Plan by allowing those uses in all three of the Project’s “Urban” Use Districts: Urban Innovation, Urban Village, and Urban Center.

Updated Affordable Housing Incentives

As described in Section 2.4.5, *Existing Affordable Housing Incentives*, the existing CASP has an incentive-based zoning system that grants developers additional floor area rights, in exchange for reserving a portion of units for low-income households. The system seeks to capture the land value increases that result from rezoning and public investment to create public benefits such as affordable housing.

The Proposed Project would update and recalibrate these incentives to deliver more affordable units, while being simpler to understand and implement. The current incentive system would be replaced with a new graduated base and bonus system (Community Benefits Program), similar to that found in the proposed New Zoning Code for the Downtown Plan, intended to establish a clearer set of objective standards for projects that wish to build beyond their base zoning. The proposed Community Benefits Program is separate from and may be supplemented by other affordable housing requirements or fees, such as the Affordable Housing Linkage Fee (AHLF).

The main incentive used to garner public benefits under the Proposed Project is through floor area rights (depicted as FAR). As noted in Chapter 2 of the updated CASP, Form Districts would outline Base and Bonus FAR for each parcel. The Base FAR is available by-right. The Bonus FAR is available for projects that participate in the Community Benefits Program.

PROJECT IMPACTS

Threshold 4.10-1	Physically divide an established community
-------------------------	--

Impact 4.10-1 **Proposed Project:** The Proposed Project does not include any features that would physically divide an established community. Therefore, *no impact* would occur.

Project Impact

Overall, the Project Area is an established urbanized area within the City, having a mix of commercial, residential, light industrial, and institutional uses at varying densities and intensities. The revisions proposed under the Proposed Project would include amendments to strengthen the existing CASP’s affordable housing requirements, including the recalibration of the CASP’s existing incentive zoning system; establish a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities; include provisions that facilitate the production of new 100% affordable housing and permanent supportive housing projects on public land; increase the zoning capacity for housing in targeted areas; and adopt a modernized zoning system based on the City’s New Zoning Code. Further details of the proposed land use and zoning strategies are described under “Proposed Zoning Changes” above and in Chapter 3.0 *Project Description* of this Draft EIR.

The land use and zoning changes proposed are intended to help support the development of affordable, mixed-income, and permanent supportive housing in the Project Area. The Project does not introduce new land uses to the area that would include barriers that would divide existing neighborhoods. Rather, the Project would encourage land uses that complement and bridge existing neighborhoods to new neighborhoods, thus, maintaining and improving community cohesiveness. For example, the Housing Authority of the City of Los Angeles (HACLA) William Mead Homes property is currently an Urban Village zoned site surrounded by predominantly light industrial uses and Urban Innovation zoned land. The Project would revise the zoning of the general area immediately surrounding William Mead Homes to Urban Village, in order to create linkages between the William Mead Homes site and public open spaces

such as the Los Angeles State Historic Park. Rather than fundamentally altering land use patterns in the Project Area, the Proposed Project would incrementally allow for increased housing capacity in targeted areas, while requiring and incentivizing more affordable housing than under the current Specific Plan.

The Proposed Project does not propose major transportation infrastructure that would physically divide the Project Area and generally maintains and supports current land use development patterns, such as the continued transition of the Project Area to a more mixed-use environment, which began with the current Specific Plan. Proposed land uses would not involve physical barriers that would divide the community. Therefore, the Proposed Project would have *no impact* related to the division of an established community.

Mitigation Measures

Significant impacts related to the division of an established community have not been identified; therefore, mitigation is not required.

Threshold 4.10-2	Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?
-------------------------	---

Impact 4.10-2 **Proposed Project:** The Proposed Project would generally be consistent with the applicable land use policies, goals, strategies, and/or objectives, including those contained in the City of Los Angeles General Plan and SCAG’s 2020-2045 RTP/SCS. Impacts related to the Proposed Project would be *less than significant*.

Project Impact

In addition to analyzing the threshold questions above, which is intended to focus on whether environmental impacts will result from the Proposed Project conflicting with applicable plans, policies or regulations, the following evaluation is also intended to satisfy the requirements of Guidelines Section 15125(d) to identify any inconsistencies between the Proposed Project and the applicable general, specific or regional plans. Pursuant to State Planning Law, the policies and programs included in the Proposed Project would need to be consistent with policies and programs included in other elements of the General Plan. **Table 4.10-2** provides a consistency analysis of the Proposed Project with applicable objectives and policies¹ contained in the General Plan that were adopted for the purpose of minimizing any environmental effect.

As demonstrated in **Table 4.10-2**, the Proposed Project would generally be consistent with policies contained in the City’s General Plan. As identified in **Table 4.10-2** for Framework Element Policy, 3.14; Central City North Community Plan Objectives 3.1 and 3.2; and Northeast Los Angeles Community Plan Objective 3.3, the Proposed Project may be in partial conflict with policies related to protection of industrial land. However, those policies were not adopted for the purpose of avoiding or mitigating an environmental effect, but instead for protecting jobs, which is a social economic impact. The Proposed Project would not make any existing industrial uses illegal. It is speculative the change in allowed uses would displace existing businesses or new uses that would have come to the Project Area but now seek to move elsewhere. First, there is limited demand for new heavy industrial uses in this area of the City and in particular, north of Downtown Los Angeles. Light industrial uses would continue to be allowed within the Project Area. Furthermore, there are many areas in the Southern California region that can accommodate industrial uses, in and outside the City, such as the San Gabriel Valley and the Harbor Gateway Corridor. Displacement of uses can potentially result in impacts to air, greenhouse gas emissions, or transportation if employee or work trips are longer or if it results in new construction and the new construction has impacts. But it is not possible to make assumptions where such uses would go and whether they would result in longer trips. A

¹ The analysis of the objectives listed in Table 4.10-2 includes analysis of the policies associated with those objectives.

business moving to San Gabriel Valley may shorten trips for employees who live in the San Gabriel Valley and commute to the Project Area. In such a case, the impact would be beneficial. Without knowing a particular project, it would not be possible to determine whether such a displacement would result in adverse impacts. Additionally, growth under the Proposed Project is expected to generate air pollutant emissions exceeding SCAQMD significance thresholds, as discussed in Section 4.2, *Air Quality*; however, the Proposed Project would facilitate infill, transit-oriented and mixed-use development. As such, the Proposed Project is designed to reduce vehicle trips to, from, and within the Project Area, which would have a beneficial effect on air quality. Therefore, the Proposed Project would be consistent overall with applicable policies and objectives contained in the City’s General Plan.

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
Framework Element (1995, 1996, 2001)	
Chapter 3. Land Use	
<p>3.7 Provide for the stability and enhancement of multi-family residential neighborhoods and allow for growth in areas where there is sufficient public infrastructure and services and the residents' quality of life can be maintained or improved.</p>	<p>Consistent Existing multi-family residential development in the Project Area is located predominantly on Urban Village zoned properties, such as the William Mead Homes and the area adjacent to the Lincoln/Cypress Metro L Line (Gold) station. The Proposed Project would retain these Urban Village zoned areas to support the stability of these multi-family residential neighborhoods, while also expanding the Urban Village zoning designation to select properties, thereby increasing the zoning capacity for new multi-family residential development, with a particular emphasis on affordable, mixed-income, and permanent supportive housing. As discussed in Section 4.17, <i>Utilities and Service Systems</i>, and Section 4.13, <i>Public Services</i>, the Project Area would be served by sufficient public infrastructure and services to ensure that residents' quality of life can be maintained or improved.</p>
<p>3.8 Reinforce existing and establish new neighborhood districts which accommodate a broad range of uses that serve the needs of adjacent residents, promote neighborhood activity, are compatible with adjacent neighborhoods, and are developed as desirable places to work and visit.</p>	<p>Consistent The Project Area is characterized by a significant mix of uses that will be reinforced by the Proposed Project's updated zoning designations, which support residential, industrial, commercial, institutional, and open space uses. These designations allow for the development of multi-unit residential uses, with incentives and/or requirements for affordable housing, and community-serving uses, in proximity to neighborhood amenities.</p>
<p>3.14 Provide land and supporting services for the retention of existing and attraction of new industries.</p>	<p>Partially Consistent and Partially Inconsistent Land for industrial uses would be retained under the Urban Innovation and Urban Center Use Districts of the Proposed Project, while allowing new residential uses in the Urban Village Use District, which would be expanded in targeted areas. While the expansion of the Urban Village Use District could result in a reduction in the amount of available land for new industries, the updated zoning designations still accommodate new and existing light industrial and commercial spaces. Also, the Proposed Project sets forth minimum employment-related floor area for properties located in the Urban Innovation use district to support the retention of existing and attraction of new industries.</p>

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
<p>3.15 Focus mixed commercial/residential uses, neighborhood-oriented retail, employment opportunities, and civic and quasi-public uses around urban transit stations, while protecting and preserving surrounding low-density neighborhoods from the encroachment of incompatible land uses.</p>	<p>Consistent The Project Area is well served by public transit including local and rapid bus lines, and the Metro L (Gold) Line station, with three stations within or proximate to the Project Area. Also, see responses to Policy 3.7 and 4.2.</p>
<p>3.16 Accommodate land uses, locate and design buildings, and implement streetscape amenities that enhance pedestrian activity.</p>	<p>Consistent The Proposed Project’s form district and frontage regulations would require development projects contribute to inviting streetscapes and pedestrian activity with requirements relating to building setbacks, ground floor transparency, and entrance spacing requirements.</p>
<p>3.18 Provide for the stability and enhancement of multi-family residential, mixed-use, and/or commercial areas of the City and direct growth to areas where sufficient public infrastructure and services exist.</p>	<p>Consistent See responses to Policies 3.7 and 3.8.</p>
Chapter 4. Housing	
<p>4.1 Plan the capacity for and develop incentives to encourage production of an adequate supply of housing units of various types within each City subregion to meet the projected housing needs by income level of the future population to the year 2010.</p>	<p>Consistent The Proposed Project would allow for the development of additional housing in the Project Area. The Proposed Project also includes a Community Benefits Program, which offers development incentives for residential buildings in exchange for providing affordable housing. As discussed in Section 4.12, <i>Population and Housing</i>, Proposed Project development would meet and exceed projected housing needs of the future population.</p>
<p>4.2 Encourage the location of new multi-family housing development to occur in proximity to transit stations, along some transit corridors, and within some high activity areas with adequate transitions and buffers between higher-density developments and surrounding lower-density residential neighborhoods.</p>	<p>Consistent The Project Area is well-served by existing transit and many of the residential developments permitted would occur in areas proximate to transit corridors and along major arterials. The Proposed Project supports new moderate density residential development, with Form District buffers for those developments that are adjacent to lower-density residential neighborhoods.</p>
<p>4.3 Conserve scale and character of residential neighborhoods.</p>	<p>Consistent The Proposed Project does not include any changes to the lower-density RD-zoned residential neighborhoods within the Project Area and would thus conserve the existing scale and character of these residential neighborhoods.</p>
<p>4.4 Reduce regulatory and procedural barriers to increase housing production and capacity in appropriate locations.</p>	<p>Consistent The Proposed Project would adopt a modernized zoning system based on the City’s New Zoning Code to reduce regulatory and procedural barriers, which will ultimately help to support the production of new affordable, mixed-income, and permanent supportive housing within the Project Area. Existing proprietary regulations that are redundant or overly complex will be simplified and made consistent with Citywide processes and standards.</p>

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
Chapter 5. Urban Form and Neighborhood Design	
5.2 Encourage future development in centers and in nodes along corridors that are served by transit and are already functioning as centers for the surrounding neighborhoods, the community or the region.	Consistent The Proposed Project would expand the predominantly residential Urban Village Use District in select areas proximate to transit, including Metro L (Gold) Line stations. Furthermore, the highest levels of permitted development intensity, with respect to Floor Area Ratio, are centered around the most transit served areas within the Project Area.
5.5 Enhance the liveability of all neighborhoods by upgrading the quality of development and improving the quality of the public realm.	Consistent The Proposed Project includes updated form, frontage, use, and development standards that improve the quality of the public realm and urban design within the Project Area, with a particular focus on scale, walkability, landscaping, and publicly-accessible spaces.
5.6 Conserve and reinforce the community character of neighborhoods and commercial districts not designated as growth areas.	Consistent The Proposed Project does not include any changes to the existing lower-density RD-zoned residential neighborhoods within the Project Area and would thus conserve the existing scale and character of these residential neighborhoods.
5.8 Reinforce or encourage the establishment of a strong pedestrian orientation in designated neighborhood districts, community centers, and pedestrian-oriented subareas within regional centers, so that these districts and centers can serve as a focus of activity for the surrounding community and a focus for investment in the community.	Consistent As discussed above, the proposed zoning tools would govern the building forms and features of future development and would be utilized to establish strong pedestrian orientation throughout the Project Area.
Chapter 6. Resource Conservation and Development	
6.1 Protect the City's natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region.	Consistent The Project Area is entirely urbanized and encompasses a major metropolitan area. The Proposed Project would allow for greater growth and development in an urban environment, thus avoiding impacts to the City's remaining natural settings. In addition, the Proposed Project's land use regulations would support the revitalization of the Los Angeles River as envisioned in the Los Angeles River Revitalization Master Plan (LARRMP). The LARRMP proposes to enhance and create riparian habitat along the sides of the Los Angeles River, which could occur in the Project Area. A long-term goal of the LARRMP is to restore the ecological and hydrological functioning of the River, through the creation of a riparian habitat corridor within the channel, and through the removal of concrete walls where feasible.
6.2 Maximize the use of the City's existing open space network and recreation facilities by enhancing those facilities and providing connections, particularly from targeted growth areas, to the existing regional and community open space system.	Consistent The Proposed Project retains the Open Space use designations of the existing CASP to support the expansion of parks, enhance existing parks, and improve the safety of open spaces within the Project Area, which would encourage greater use of the open space network. In addition, the Project Area includes major transit hubs that provide access to major community and regional open spaces, such as the Los Angeles State Historic Park.

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
Chapter 9. Infrastructure and Public Services	
9.6 Pursue effective and efficient approaches to reducing stormwater runoff and protecting water quality.	Consistent Proposed Project standards, in combination with federal, state, and local requirements pertaining to stormwater runoff control, would reduce stormwater runoff and protect water quality. See Section 4.9, <i>Hydrology and Water Quality</i> , for a more detailed discussion.
9.7 Continue to develop and implement a management practices based stormwater program which maintains and improves water quality.	Consistent Proposed Project development would be required to comply with National Pollutant Discharge Elimination System (NPDES) permit requirements, the City's stormwater requirements, and the City's 2020 Urban Water Management Plan (UWMP). See Section 4.9, <i>Hydrology and Water Quality</i> , for a more detailed discussion.
9.9 Manage and expand the City's water resources, storage facilities, and water lines to accommodate projected population increases and new or expanded industries and businesses.	Consistent See Section 4.9, <i>Hydrology and Water Quality</i> , Threshold 4.9-2, for a discussion of groundwater use as it relates to the Proposed Project and Section 4.17, <i>Utilities and Service Systems</i> , for a discussion of water availability and Proposed Project use. As discussed in these sections, LADWP plans to expand the City's water resources and will be able to meet future demand generated by development levels proposed by the Proposed Project.
9.10 Ensure that water supply, storage, and delivery systems are adequate to support planned development.	Consistent See the response to Policy 9.9.
9.40 Ensure efficient and effective energy management in providing appropriate levels of lighting for private outdoor lighting for private streets, parking areas, pedestrian areas, security lighting, and other forms of outdoor lighting and minimize or eliminate the adverse impact of lighting due to light pollution, light trespass, and glare.	Consistent Future development would be required to comply with energy efficiency lighting and light pollution reduction requirements included in the 2016 California Building Code, including the CALGreen Code, and the Los Angeles Building Code and Los Angeles Green Building Code (LAMC Chapter IX); the Los Angeles Building Code and Green Building Code largely incorporate and amend the 2013 California Building Code and CALGreen Code, respectively. For example, Subsection 99.05.106.8 of the Los Angeles Green Building Code sets restrictions on residential outdoor lighting, and Section 99.04.211.4 requires residences to be constructed with solar-ready features as specified in the California Energy Code. Lighting requirements and potential light pollution and glare impacts would be less than significant, as discussed in Section 4.1, <i>Aesthetics</i> .
Plan for a Healthy Los Angeles: Health and Wellness Element (2015)	
1.5 Plan for Health Improve Angelenos' health and well-being by incorporating a health perspective into land use, design, policy, and zoning decisions through existing tools, practices, and programs.	Consistent Future development would be required to comply with use adjacency buffers regulated by zoning under the Development Standard Set. These buffers are required when industrial or heavy commercial Use Districts are adjacent to Use Districts allowing for residential uses.
2.2 Healthy Building Design and Construction Promote a healthy built environment by encouraging the design and rehabilitation of buildings and sites for healthy living and working conditions, including promoting enhanced pedestrian-oriented circulation,	Consistent The Proposed Project includes standards to support the development of a pedestrian-oriented environment, including form, frontage, landscaping, and development standards. In addition, the Proposed Project would encourage redevelopment of sites with older structures that may contain hazardous building materials, such as asbestos, lead, and other contaminants. As discussed in Section

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
lighting, attractive and open stairs, healthy building materials and universal accessibility using existing tools, practices, and programs.	4.8, <i>Hazards & Hazardous Materials</i> , demolition of existing structures would be required to comply with federal, State and local regulations that would prevent hazardous levels of exposure during demolition. New construction would not have the same levels of hazardous materials, and as subject to existing hazard mitigation requirements, redevelopment would also contribute to a healthier built environment.
3.2 Expand Parks Improve Angelenos’ mental and physical health by striving to equitably increase their access to parks, increasing both their number and type throughout the city; prioritize implementation in the most park-poor areas of the city.	Consistent Developers of residential development projects in the Project Area would be required to pay park impact fees, Quimby in-lieu fees, or dedicate land for parks, which would support the provision of new park facilities inside and outside the Project Area. This would incentivize the creation of new open space areas and community amenities. Additionally, the Proposed Project retains the Open Space use designations of the existing CASP to support the retention and expansion of public parks and open spaces.
4.1 Land for urban agriculture and healthy food Encourage and preserve land for urban agriculture in the City to ensure a long-term supply of locally produced healthy food, promote resiliency, green spaces, and healthy food access; increase the number of urban agriculture sites including but not limited to: community gardens, parkway gardens, urban farms and rooftop gardens in low-income and undeserved areas.	Consistent The Proposed Project includes use districts that allow for urban agriculture and local food production within the Project Area.
5.1 Air pollution and respiratory health Reduce air pollution from stationary and mobile sources; protect human health and welfare and promote improved respiratory health.	Consistent Reasonably anticipated development under the Proposed Project would generate emissions exceeding SCAQMD significance thresholds, as discussed in Section 4.2, <i>Air Quality</i> . However, growth is consistent with the RTP/SCS. In addition, as discussed in Section 4.15, <i>Transportation and Traffic</i> , VMT per service population that accounts for both residents and employee trips for the Proposed Project would be less than or equal to the projections for the 2040 RTP/SCS, which would limit vehicular emissions and associated regional air quality impacts and contribute toward attainment of state and federal air quality standards. In addition, stationary and mobile sources in the Project Area would be subject to local, state, and national regulations to reduce air pollutant emissions, including California’s clean car standards (i.e., Pavley regulations), ARB diesel engine requirements, and SCAQMD rules and regulations. Finally, the Proposed Project supports reduced air pollution from mobile sources and improved respiratory health by supporting development of public transit, the development of residences and employment centers near transit, expanding and improving the safety of active transport infrastructure, and improving pedestrian and bike access to buildings.

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
<p>5.2 People Reduce negative health impacts for people who live and work in close proximity to industrial uses and freeways through health promoting land uses and design solutions.</p>	<p>Consistent Land uses supported by the Proposed Project include light industrial uses, such as research and development, clean technology, and light manufacturing, and limits heavy industrial uses typically associated with high levels of negative health impacts. In addition, the Proposed Project does not allow heavy industrial uses where residential uses are permitted. This would reduce exposure of residents and workers not employed by industry to potential health impacts from industrial activities.</p>
<p>5.7 Land use planning for public health and GHG emission reduction Promote land use policies that reduce per capita greenhouse gas emissions, result in improved air quality and decreased air pollution, especially for children, seniors, and others susceptible to respiratory diseases.</p>	<p>Consistent See response to Policy 5.1.</p>
Air Quality Element (1992)	
<p>1.1 Reduce air pollutants consistent with the Regional Air Quality Management Plan (AQMP), increase traffic mobility, and sustain economic growth citywide.</p>	<p>Consistent As discussed in Section 4.2, <i>Air Quality</i>, Proposed Project development would generate emissions exceeding SCAQMD significance thresholds. However, growth under the Proposed Project would be consistent with SCAG forecasts upon which the AQMP is based. In addition, the Project Area includes a wide range of transportation options and consequently, as discussed in Section 4.15, <i>Transportation and Traffic</i>, vehicle miles traveled (VMT) per service population in the Project Area are forecast to remain well below city and regional averages.</p>
<p>2.1 Reduce work trips as a step towards attaining trip reduction objectives necessary to achieve regional air quality goals</p>	<p>Consistent The Proposed Project would reduce work trips by promoting development near major transit hubs, promoting development of residences near employment, improving and expanding pedestrian, bicycle, and transit facilities, and supporting complete communities with a mix of residences and community-serving uses. Therefore, the Proposed Project would generally promote land use and development patterns that reduce vehicle trips and would maximize and improve the link between land use and multi-modal transportation to encourage the use of a range of transit modes. In addition, as discussed in Section 4.15, <i>Transportation and Traffic</i>, service population VMT that also accounts for employment-related VMT for the Proposed Project would be less than or equal to the projections for the 2040 RTP/SCS.</p>
<p>2.2 Increase vehicle occupancy for non-work trips by creating disincentives for single passenger vehicles and incentives for high occupancy vehicles</p>	<p>Consistent The Proposed Project promotes higher vehicle occupancy. As discussed in Section 4.15, <i>Transportation and Traffic</i>, the Proposed Project would also enhance access to transit, through applying new land use and zoning regulations to encourage mixing and implementing transportation improvements within the framework established in MP 2035.</p>

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
3.1 Increase the portion of work trips made by transit to levels that are consistent with the goals of the AQMP and Congestion Management Plan (CMP).	Consistent See the response to Policy 2.1.
3.2 Reduce vehicular traffic during peak periods.	Consistent See the response to Policy 2.1.
4.2 Reduce vehicle trips and vehicle miles traveled associated with land use patterns.	Consistent See the response to Policy 2.1.
4.3 Ensure that land use plans separate major sources of air pollution from sensitive receptors, such as schools, hospitals and parks.	Consistent Reasonably anticipated development from the Proposed Project would primarily be residential, commercial, and light industrial development that would not be a major source of air pollution. The Proposed Project does not propose zoning that would permit development of heavy industrial uses in the Project Area.
Conservation Element (2001)	
Archaeological and paleontological Protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.	Consistent As discussed in Section 4.4, <i>Cultural Resources</i> , with mitigation, Proposed Project development would not result in significant impacts to archaeological and paleontological resources.
Cultural and historical Protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.	Consistent Future development under the Proposed Project could potentially result in modifications to or loss of historic resources due to their ubiquity in the Project Area, as discussed in Section 4.4, <i>Cultural Resources</i> , under Impact 4.4-1. However, the Proposed Project includes various policies to protect the area's important cultural and historical sites, as discussed in the response to Framework Element Policy 3.17.
Land form and scenic vistas Protect and reinforce natural and scenic vistas as irreplaceable resources and for the aesthetic enjoyment of present and future generations.	Consistent As discussed in Section 4.1, <i>Aesthetics</i> , Impact 4.1-1, the Project Area is already urbanized and lacks major identified scenic resources. Impacts to land forms and scenic vistas from Proposed Project development would be less than significant.
Housing Element (2013)	
2.2 Promote sustainable neighborhoods that have mixed-income housing, jobs, amenities, services and transit.	Consistent See the responses to Framework Element Policies 3.8, 4.2, and 5.2.
2.3 Promote sustainable buildings, which minimize adverse effects on the environment and minimize the use of non-renewable resources.	Consistent Proposed Project development would be required to comply with the Los Angeles Green Building Code, which largely incorporates and amends the 2013 CALGreen Code, and also 2016 CALGreen Code requirements, which include standards to enhance energy efficiency and resource conservation.

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
<p>2.4 Promote livable neighborhoods with a mix of housing types, quality design and a scale and character that respects unique residential neighborhoods in the City.</p>	<p>Consistent See the responses to Framework Element Policies 3.8, 4.2, and 5.2, and the discussion under Impact 4.10-1.</p>
Noise Element (1999)	
<p>3 Reduce or eliminate noise impacts associated with proposed development of land and changes in land use.</p>	<p>Consistent Future development in the Project Area would be required to reduce noise impacts in accordance with the City’s Noise Ordinance and incorporate mitigation provided in Section 4.11, <i>Noise</i>, as applicable.</p>
Open Space Element (1973)	
<p>The provision of malls, plazas, green areas, etc., in structures or building complexes and the preservation and provision of parks shall be encouraged.</p>	<p>Consistent See the response to Health and Wellness Element Policy 3.2 regarding the provision of parks.</p>
Service Systems Element/ Public Recreation Plan	
<p>Recreational facilities and services should be provided for all segments of the population on the basis of present and future projected needs, the local recreational standards, and the City’s ability to finance.</p>	<p>Consistent See the response to Health and Wellness Element Policy 3.2.</p>
Mobility Element – Mobility Plan 2035 (2016)	
Chapter 3: Access for All Angelenos	
<p>3.1 Access for All Recognize all modes of travel, including pedestrian, bicycle, transit, and vehicular modes - including goods movement - as integral components of the City’s transportation system.</p>	<p>Consistent The Proposed Project would support transit-oriented development by allowing greater development intensities proximate to transit stations, such as the Metro L (Gold) Line stations within the Project Area. Additionally, the Proposed Project includes standards that support all modes of travel, with a particular emphasis on pedestrian and bicycle usage.</p>
<p>3.3 Land Use Access and Mix Promote equitable land use decisions that result in fewer vehicle trips by providing greater proximity and access to jobs, destinations, and other neighborhood services.</p>	<p>Consistent The Proposed Project designations support mixed uses throughout almost the entirety of the Project Area providing greater proximity and access to jobs, destinations, and neighborhood services. As discussed in Section 4.15, <i>Transportation and Traffic</i>, VMT per service population in the Project Area are forecast to remain below City and regional averages.</p>
<p>3.5 Multi-Modal Features Support “first-mile, last-mile solutions” such as multi-modal transportation services, organizations, and activities in the areas around transit stations and major bus stops (transit stops) to maximize multi-modal connectivity and access for transit riders</p>	<p>Consistent The Proposed Project supports first-mile, last mile solutions through its updated zoning designations, which promote mixed-use development near transit areas, as well as standards supporting active transport and transit.</p>

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
Chapter 5: Clean Environments & Healthy Communities	
5.1 Sustainable Transportation Encourage the development of a sustainable transportation system that promotes environmental and public health.	Consistent The Proposed Project supports development of active and alternative modes of transport. See the response to Policy 3.1.
5.2 Vehicle Miles Traveled (VMT) Support ways to reduce vehicle miles traveled (VMT) per capita.	Consistent The Project Area includes a variety of transportation options and reasonably anticipated development from the Proposed Project would include a mix of uses that supports the use of alternative transportation modes, such as transit, walking, and bicycling. As discussed in Section 4.15, <i>Transportation and Traffic</i> , vehicle miles traveled (VMT) per service population in the Project Area are forecast to remain well below city and regional averages.
Central City North Community Plan (2000)	
Chapter 3: Land Use Plan Policies and Programs	
1.1 To provide for the preservation of existing housing and for the development of new housing to meet the diverse economic and physical needs of the existing residents and projected population of the Central City North Plan area to the year 2010.	Consistent The Proposed Project identifies additional areas where new housing could be located within the Project Area in order to accommodate projected growth in Citywide population through the year 2040. Additionally, the Proposed Project sets forth an incentive zoning program that supports more affordable housing and permanent supportive housing in order to meet the diverse economic and physical needs of residents.
1.2 To locate new housing in a manner which reduces vehicular trips and makes it accessible to services and facilities.	Consistent The Proposed Project designations support mixed uses throughout almost the entirety of the Project Area providing greater proximity and access to jobs, destinations, and neighborhood services, reducing vehicular trips. As discussed in Section 4.15, <i>Transportation and Traffic</i> , VMT per service population in the Project Area are forecast to remain below City and regional averages.
1.3 To preserve and enhance the varied and distinct residential character and integrity of existing residential neighborhoods.	Consistent The Proposed Project retains the existing zoning for the RD-zoned properties of the Project Area and does not propose changes that would allow for new mixed-use development in those areas, serving to preserve the residential character and integrity of those residential neighborhoods. These RD-zoned areas are mainly east of the Los Angeles River, and south of North Broadway.
1.4 To promote and insure the provision of adequate housing for all persons regardless of income, age, or ethnic background.	Consistent As noted, the Proposed Project identifies additional areas where new housing could be located within the Project Area in order to accommodate projected growth in Citywide population through the year 2040. Additionally, the Proposed Project sets forth an incentive zoning program that supports more affordable housing and permanent supportive housing for all persons regardless of income, age, or ethnic background. The Proposed Project includes an incentive that encourages the provision of two or more-bedroom units within a development to support housing for various family sizes.

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
<p>2.1 To conserve and strengthen viable commercial development in the community and to provide additional opportunities for new commercial development and services.</p>	<p>Consistent The Proposed Project's mixed-use zoning designations, including Urban Village, Urban Center, and Urban Innovation, support a range of uses, including commercial uses, to provide opportunities for new commercial development and services.</p>
<p>2.2 To attract uses which strengthen the economic base and expand market opportunities for existing and new businesses.</p>	<p>Consistent See response to Objective 2.1 above.</p>
<p>2.4 To enhance the appearance of commercial districts.</p>	<p>Consistent The Proposed Project sets forth Form Districts and Frontage Districts that regulate the appearance of buildings, including those located in commercial areas, to encourage walkability and environmental sustainability.</p>
<p>3.1 To provide for existing and future industrial uses which contribute job opportunities for residents and which minimize environmental and visual impacts to the community.</p>	<p>Partially Consistent and Partially Inconsistent Land for industrial uses would be retained under the Urban Innovation and Urban Center Use Districts of the Proposed Project, while allowing new residential uses in the Urban Village Use District, which would be expanded in targeted areas. While the expansion of the Urban Village Use District could result in a reduction in the amount of available land for new industries, the updated zoning designations still accommodate new and existing light industrial and commercial spaces. Also, the Proposed Project sets forth minimum employment-related floor area for properties located in the Urban Innovation use district to support the retention of existing and attraction of new industries. The Proposed Project also sets forth performance standards which minimize environmental and visual impacts to the community.</p>
<p>3.3 To retain industrial plan designations to maintain the industrial employment base for community residents and to increase it whenever possible.</p>	<p>Partially Consistent and Partially Inconsistent See response to Objective 3.1 above.</p>
<p>4.1 To conserve, maintain and better utilize existing recreation and park facilities which promote the recreational needs of the community.</p>	<p>Consistent The Proposed Project sets forth dedicated Open Space areas in the Project Area, including areas that are not yet currently developed as parks or other open space. Additionally, the Proposed Project includes an incentive system that supports the production of publicly-accessible open space and recreational areas within private development.</p>
<p>5.1 To preserve existing open space resources and where possible develop new open space.</p>	<p>Consistent See response to Objective 4.1 above.</p>

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
Northeast Los Angeles Community Plan (1999)	
Chapter 3: Land Use Policies and Programs	
1.1 To preserve and enhance existing residential neighborhoods.	Consistent The Proposed Project retains the existing zoning for the RD-zoned properties of the Project Area and does not propose changes that would allow for new mixed-use development in those areas, serving to preserve the residential character and integrity of those residential neighborhoods. These RD-zoned areas are mainly east of the Los Angeles River, and south of North Broadway.
1.2 To allocate land for new housing to accommodate a growth of population that is consistent with and promotes the health, safety, welfare, convenience, and pleasant environment of those who live and work in the community based on adequate infrastructure and government services, especially schools.	Consistent The Proposed Project identifies additional areas where new housing could be located within the Project Area in order to accommodate projected growth in Citywide population through the year 2040. Additionally, the Proposed Project sets forth an incentive zoning program that supports more affordable housing and permanent supportive housing in order to meet the diverse economic and physical needs of residents. See Chapter 4.13, <i>Public Services</i> , for discussion on the Proposed Project's impacts on infrastructure and public services, including schools.
1.3 To preserve and enhance the residential character and scale of existing single- and multi-family neighborhoods.	Consistent See response to Objective 1.1 above.
1.6 To promote and ensure the provision of fair and equal housing opportunities for all persons regardless of income and age groups or ethnic, religious, or racial background.	Consistent As noted, the Proposed Project identifies additional areas where new housing could be located within the Project Area in order to accommodate projected growth in Citywide population through the year 2040. Additionally, the Proposed Project sets forth an incentive zoning program that supports more affordable housing and permanent supportive housing for all persons regardless of income, age, or ethnic background. The Proposed Project includes an incentive that encourages the provision of two or more-bedroom units within a development to support housing for various family sizes.
2.1 To conserve and strengthen potentially viable commercial areas in order to stimulate and revitalize existing businesses and create opportunities for appropriate new commercial development.	Consistent The Proposed Project's mixed-use zoning designations, including Urban Village, Urban Center, and Urban Innovation, support a range of uses, including commercial uses, to provide opportunities for new commercial development and services.
2.2 To enhance the identity and appearance of commercial districts.	Consistent The Proposed Project sets forth Form Districts and Frontage Districts that regulate the appearance of buildings, including those located in commercial areas, to encourage walkability and environmental sustainability.
2.3 To minimize conflicts between auto-related and pedestrian-oriented activities and encourage use of public transportation in commercial areas.	Consistent The Proposed Project supports first-mile, last mile solutions through its updated zoning designations, which promote mixed-use development near transit areas, as well as standards supporting active transport and transit. Additionally, the Project includes a Streets chapter that supports investments into pedestrian

TABLE 4.10-2 CONSISTENCY ANALYSIS WITH THE CITY OF LOS ANGELES GENERAL PLAN	
Objective	Project Consistency
	infrastructure to minimize conflicts between auto-related and pedestrian-oriented activities.
3.1 To resolve conflicts between industrial uses and other adjacent uses.	Consistent Future development would be required to comply with use adjacency buffers regulated by zoning under the Development Standard Set. These buffers are required when industrial or heavy commercial Use Districts are adjacent to Use Districts allowing for residential uses.
3.2 To provide for existing and future industrial uses that contribute job opportunities for residents and minimize adverse environmental and visual impacts on the community	Consistent The Proposed Project sets forth minimum employment-related floor area for properties located in the Urban Innovation use district to support the retention of existing and attraction of new industries. The Proposed Project also sets forth performance standards which minimize environmental and visual impacts to the community. Additionally, see response to Objective 3.1 above.
3.3 To retain industrial plan designations in order to attract appropriate industrial development to maintain the industrial employment base for community residents.	Partially Consistent and Partially Inconsistent Land for industrial uses would be retained under the Urban Innovation and Urban Center Use Districts of the Proposed Project, while allowing new residential uses in the Urban Village Use District, which would be expanded in targeted areas. While the expansion of the Urban Village Use District could result in a reduction in the amount of available land for new industries, the updated zoning designations still accommodate new and existing light industrial and commercial spaces. Also, the Proposed Project sets forth minimum employment-related floor area for properties located in the Urban Innovation use district to support the retention of existing and attraction of new industries.
4.2 To preserve existing open space resources and, where possible, encourage acquisition of new open space.	Consistent The Proposed Project sets forth dedicated Open Space areas in the Project Area, including areas that are not yet currently developed as parks or other open space. Additionally, the Proposed Project includes an incentive system that supports the production of publicly-accessible open space and recreational areas within private development.
5.1 To conserve, expand, maintain, and better utilize existing recreation and park facilities to address the recreational needs of the community.	Consistent See response to Objective 4.2 above.

Los Angeles is a SCAG member and looks to SCAG’s current regional transportation and land use planning strategies and goals for Southern California, which are established in the 2020-2045 RTP/SCS, as described earlier. **Table 4.10-3** provides a consistency analysis of the Proposed Project with applicable goals contained in the 2020-2045 RTP/SCS. The Proposed Project would be consistent with applicable actions and strategies contained in SCAG’s 2020-2045 RTP/SCS.

TABLE 4.10-3 CONSISTENCY ANALYSIS WITH THE SCAG 2020-2045 RTP/SCS	
Actions/Strategies	Cornfield Arroyo Seco Specific Plan Consistency
Focus Growth Near Destinations & Mobility Options	
Emphasize land use patterns that facilitate multimodal access to work, educational and other destinations	Consistent The Proposed Project includes several mixed-use zones, including Urban Village, Urban Center, and Urban Innovation, in proximity to transit to support multimodal access to work, educational and other destinations, resulting in reduced VMT. As discussed in Section 4.15, <i>Transportation and Traffic</i> , VMT per service population in the Proposed Project are forecast to remain below City and regional averages.
Focus on a regional jobs/housing balance to reduce commute times and distances and expand job opportunities near transit and along center-focused main streets Plan for growth near transit investments and support implementation of first/last mile strategies	Consistent The Proposed Project would concentrate future growth in areas well-served by transit, including bus lines and light rail. Furthermore, the Project Area is within or adjacent to a High Quality Transit Areas (HQTA). See the response to Framework Element Policy 5.2.
Promote the redevelopment of underperforming retail developments and other outmoded nonresidential uses	Consistent The Proposed Project’s mixed-use zoning designations, including Urban Village, Urban Center, and Urban Innovation, support a range of uses, including commercial uses, to provide opportunities for new commercial development and services.
Prioritize infill and redevelopment of underutilized land to accommodate new growth, increase amenities and connectivity in existing neighborhoods	Consistent The Proposed Project’s land use strategy supports infill development of underutilized land to enhance connectivity to amenities for existing neighborhoods. For example, the Proposed Project will expand the Urban Village zone to connect the existing William Mead Homes development to other existing Urban Village zoned properties and the Los Angeles State Historic Park.
Encourage design and transportation options that reduce the reliance on and number of solo car trips (this could include mixed uses or locating and orienting close to existing destinations)	Consistent The Proposed Project would concentrate future growth in areas well-served by transit, including bus lines and light rail. Furthermore, the Project Area is within or adjacent to a High Quality Transit Areas (HQTA). See the response to Framework Element Policy 5.2.
Identify ways to “right size” parking requirements and promote alternative parking strategies (e.g. shared parking or smart parking)	Consistent The Proposed Project does not set forth minimum automobile parking requirements to reduce auto-related negative impacts to the built environment.
Promote Diverse Housing Choices	
Preserve and rehabilitate affordable housing and prevent displacement Create incentives and reduce regulatory barriers for building context-sensitive accessory dwelling units to increase housing supply	Consistent The Proposed Project sets forth an incentive zoning program that supports more affordable housing and permanent supportive housing in order to meet the diverse economic and physical needs of residents and prevent displacement.
Provide support to local jurisdictions to streamline and lessen barriers to housing development that supports reduction of greenhouse gas emissions	Consistent The Proposed Project retains the existing ministerial administrative review process of the existing CASP for development projects that comply with the Specific Plan, including its affordability and sustainability provisions.

Conclusion

Based on the above, the Proposed Project would be consistent with applicable local and regional plans and policies. Thus, impacts related to inconsistency with land use plans and policies would be *less than significant*.

Mitigation Measures

The Proposed Project would not conflict with applicable City or SCAG policies; therefore, impacts would be *less than significant* and mitigation is not required.

CUMULATIVE IMPACTS

Cumulative impacts related to land use and planning consider Citywide development through 2045, which would add about 659,000 new residents, 293,000 new households, and 345,000 new employees (SCAG 2020-2045 RTP/SCS).

Division of an Established Community

As discussed above, the project has no impacts to the division of an established community because it includes no infrastructure or other type of physical barrier. Therefore, the project has *no cumulative impact*.

Consistency with Land Use Plans/Policies

Future projects throughout the City may conflict with policies contained in the General Plan and 2020-2045 RTP/SCS that would result in adverse physical impacts to the environment. However, as discussed under Impact 4.10-2, the Proposed Project is consistent with applicable land use policies. Based on these facts, the Proposed Project would not have impacts that are cumulatively considerable as related to consistency with plans and policies. Cumulative impacts are *less than significant*.

4.11 NOISE

This section evaluates noise and groundborne vibration impacts resulting from the construction and operation of the Proposed Project. Noise monitoring data and calculations are included in Appendix H. Topics addressed include short-term construction and long-term operational noise and vibration.

FUNDAMENTALS OF NOISE AND VIBRATION

Noise is defined as unwanted sound that disturbs human activity. Noise level (or volume) is generally measured in decibels (dB) using the A-weighted sound pressure level (dBA). The A-weighting scale is an adjustment to the actual sound pressure levels to be consistent with that of human hearing response, which is most sensitive to frequencies around 4,000 Hertz (about the highest note on a piano) and less sensitive to low frequencies (below 100 Hertz).

NOISE DEFINITIONS

This noise analysis discusses sound levels in terms of Community Noise Equivalent Level (CNEL), Day-Night Noise Level (Ldn), and Equivalent Noise Level (Leq).

Community Noise Equivalent Level (CNEL). CNEL is an average sound level during a 24-hour period. CNEL is a noise measurement scale, which accounts for noise source, distance, single event duration, single event occurrence, frequency, and time of day. Human reaction to sound between 7:00 p.m. and 10:00 p.m. is as if the sound were actually 5 dBA higher than if it occurred from 7:00 a.m. to 7:00 p.m. From 10:00 p.m. to 7:00 a.m., humans perceive sound as if it were 10 dBA higher due to the lower background level. Hence, the CNEL is obtained by adding an additional 5 dBA to sound levels in the evening from 7:00 p.m. to 10:00 p.m. and 10 dBA to sound levels in the night from 10:00 p.m. to 7:00 a.m. Because CNEL accounts for human sensitivity to sound, the CNEL 24-hour figure is always a higher number than the actual 24-hour average.

Day-Night Noise Level (Ldn). Ldn is similar to CNEL except that a 10 dBA penalty is added from 10:00 p.m. to 7:00 a.m. There is no 5 dBA penalty that exists for the CNEL calculation.

Equivalent Noise Level (Leq). Leq is the average noise level on an energy basis for any specific time period. The Leq for one hour is the energy average noise level during the hour. The average noise level is based on the energy content (acoustic energy) of the sound. Leq can be thought of as the level of a continuous noise which has the same energy content as the fluctuating noise level. The equivalent noise level is expressed in units of dBA.

CHARACTERISTICS OF NOISE

Sound pressure level is measured on a logarithmic scale with the 0 dBA level based on the lowest detectable sound pressure level that people can perceive (an audible sound that is not zero sound pressure level). Based on the logarithmic scale, a doubling of sound energy is equivalent to an increase of 3 dBA, and a sound that is 10 dBA less than the ambient sound level has no effect on ambient noise. Because of the nature of the human ear, a sound must be about 10 dBA greater than the ambient noise level to be judged as twice as loud. In general, a 3 dBA change in the ambient noise level is noticeable, while 1-2 dBA changes generally are not perceived. Quiet suburban areas typically have noise levels in the range of 40-50 dBA, while areas

adjacent to arterial streets are typically in the 50-60+ dBA range. Normal conversational levels are usually in the 60-65 dBA range, and ambient noise levels greater than 65 dBA can interrupt conversations.

Noise levels from different sources attenuate (or drop off) at different rates. Noise from point sources, such as individual pieces of machinery, typically attenuates at a rate of 6 dBA per doubling of distance from the noise source. Noise from linear transportation sources typically attenuates at a lower rate because such sources actually consist of a number of individual noise generators (such as automobiles or train cars). Noise from lightly traveled roads typically attenuates at a rate of about 4.5 dBA per doubling of distance. Noise from heavily traveled roads typically attenuates at about 3 dBA per doubling of distance. Noise attenuation over distance applies to both ground distance and elevation. In other words, noise also attenuates as height increases, such as across a multi-story building. Noise levels may also be reduced by intervening structures; generally, a single row of buildings between the receptor and the noise source reduces noise levels by about 5 dBA, while a solid wall or berm reduces noise levels by 5 to 10 dBA (Federal Transit Administration [FTA] 2018). The manner in which homes in California are constructed generally provides a reduction of exterior-to-interior noise levels of approximately 20 to 25 dBA with closed windows (FTA 2018). The materials of older buildings constructed before the introduction of modern insulation standards, such as some buildings in the Project Area, may have less effective exterior-to-interior noise reduction.

In areas where traffic noise is the predominant noise source, the relationship between peak hourly Leq values and associated Ldn/CNEL values depends on the distribution of traffic over the entire day. There is no precise way to convert a peak hour Leq to Ldn or CNEL. However, in urban areas near heavy traffic, the peak hour Leq is typically 2-4 dBA lower than the daily Ldn/CNEL. Because the Project Area is an urban area, the Ldn/CNEL in the area would be approximately 2-4 dBA higher than peak hour Leq in areas where traffic is the primary noise source. In more suburban areas, the peak hour Leq is typically roughly equal to the Ldn/CNEL. **Figure 4.11-1** shows typical noise levels generated by various activities.

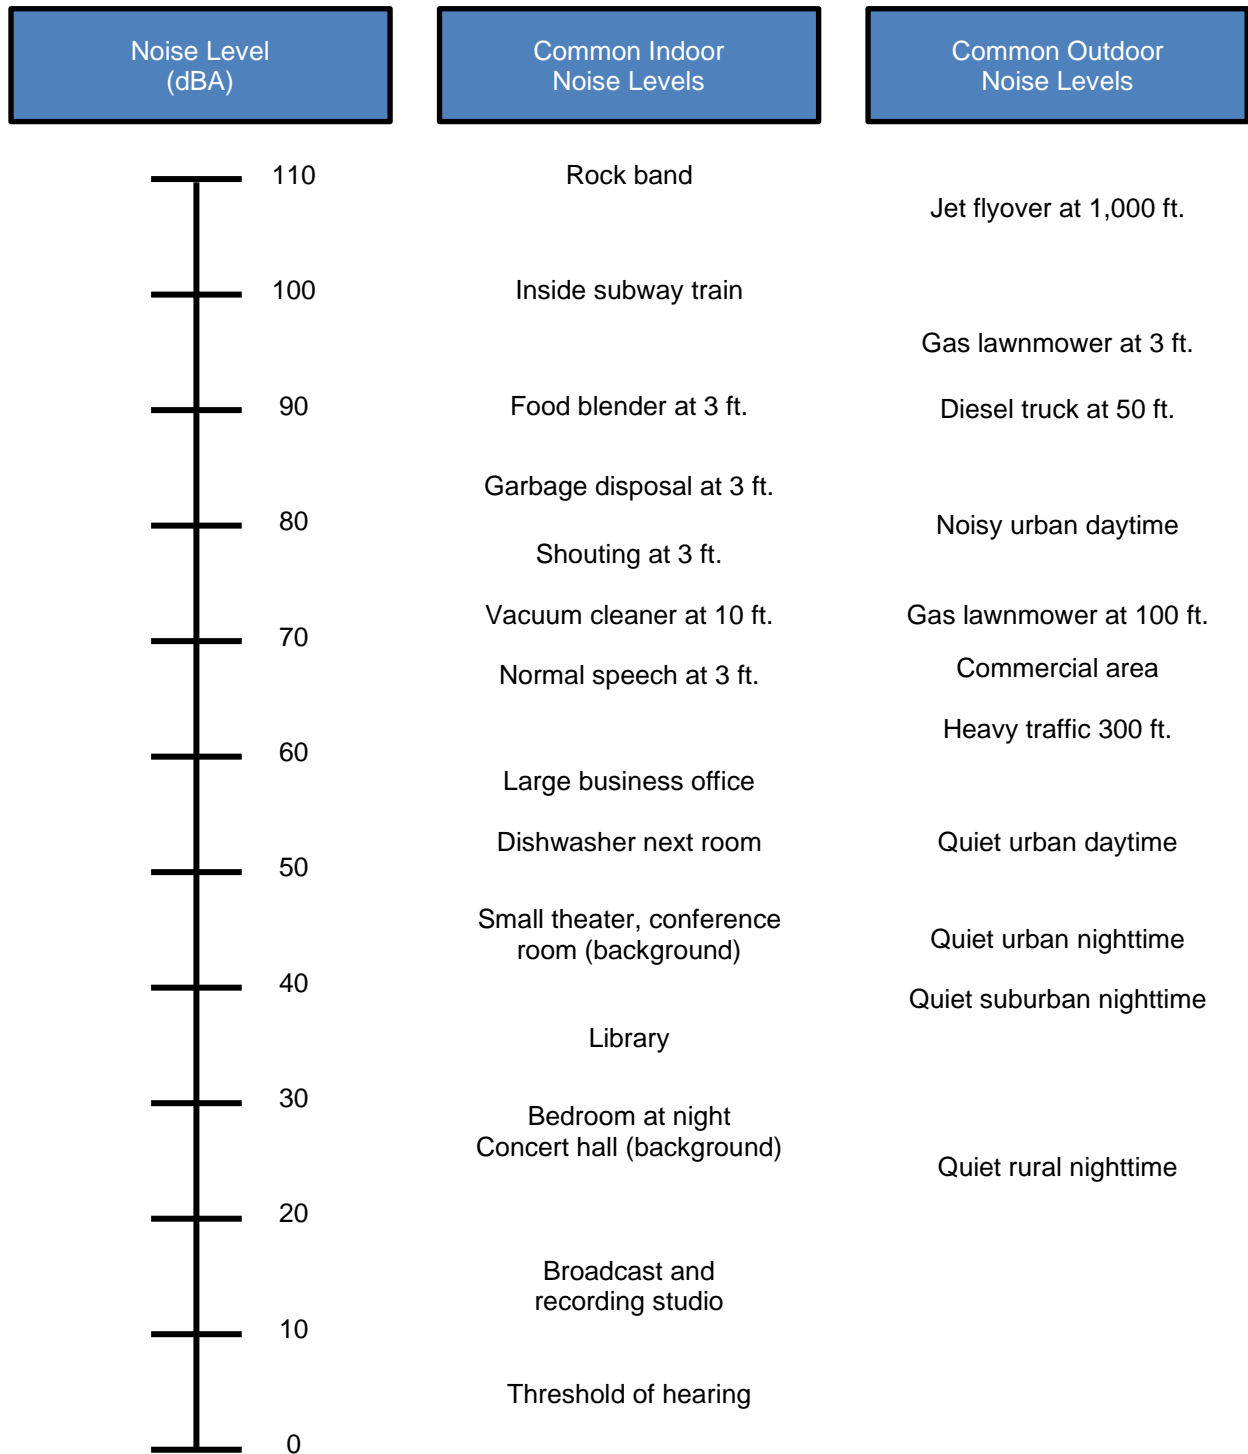

HEALTH EFFECTS OF ENVIRONMENTAL NOISE

The degree to which noise can impact the human environment ranges from levels that interfere with speech and sleep (annoyance and nuisance) to levels that cause adverse health effects (hearing loss and psychological effects). Human response to noise is subjective and can vary greatly from person to person. Factors that influence individual response include the intensity, frequency, and pattern of noise, the amount of background noise present before the intruding noise, and the nature of work or human activity that is exposed to the noise source. The World Health Organization's *Guidelines for Community Noise* details the adverse health effects of noise, including hearing impairment, speech intelligibility, sleep disturbance, physiological functions (e.g., hypertension and cardiovascular effects), mental illness, performance of cognitive tasks, social and behavioral effects (e.g., feelings of helplessness, aggressive behavior), and annoyance (Berglund et al 1999).

CHARACTERISTICS OF VIBRATION

Vibration refers to groundborne noise and perceptible motion. Vibration is a unique form of noise because its energy is carried through buildings, structures, and the ground, whereas noise is simply carried through the air. Thus, vibration is generally felt rather than heard. Some vibration effects can be caused by noise; for example, the rattling of windows from passing trucks. This phenomenon is caused by the coupling of the acoustic energy at frequencies that are close to the resonant frequency of the material being vibrated. Typically, groundborne vibration generated by manufactured activities will attenuate rapidly as distance from the source of the vibration increases. The ground motion caused by vibration is measured as particle velocity in inches per second and is referenced as vibration decibels (VdB) in the U.S.

Figure 4.11-1 Examples of Typical Noise Levels

SOURCE: California Department of Transportation 1998.

Typical human reactions to vibration are summarized in **Table 4.11-1**. The vibration velocity level threshold of perception for humans is approximately 65 VdB. A vibration velocity of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels for many people. The range of interest is from approximately 50 VdB, which is the typical background vibration velocity level, to 90 VdB, which is the general threshold where minor damage can occur in fragile buildings. Most perceptible indoor vibration is caused by sources within buildings such as operation of mechanical equipment, movement of people, or the slamming of doors. Typical outdoor sources of perceptible groundborne vibration are construction equipment, steel wheeled trains, and traffic on rough roads.

TABLE 4.11-1 HUMAN RESPONSE TO DIFFERENT LEVELS OF GROUNDBORNE VIBRATION	
Vibration Velocity Level	Human Reaction
65 VdB	Approximate threshold of perception for many people.
75 VdB	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find that transportation vibration at this level is unacceptable.
85 VdB	Vibration acceptable only if there are an infrequent number of events per day.
<i>Notes: VdB = decibel notation (i.e., vibration velocity amplitude)</i>	
<i>SOURCE: FTA 2018.</i>	

ENVIRONMENTAL SETTING

CITYWIDE EXISTING CONDITIONS

Noise Sources

The Project Area is affected by a variety of noise sources, including mobile and stationary sources. Mobile noise is primarily generated by automobiles, trucks, trains, and airplanes. Mobile-source noises generally affect numerous receptors along lengths of roadways, railroad tracks, or flight paths. Stationary source noise is primarily generated by industrial and commercial land uses; however, all land uses can generate some type of noise.

Chapter XI, Noise Regulation, of the Los Angeles Municipal Code (LAMC) addresses sources of noise other than construction activities. Chapter XI is intended to prohibit unnecessary, excessive, and annoying noises from all sources within the City. A noise level increase from certain regulated noise sources of 5 dBA over the existing or presumed ambient noise level at an adjacent property line is considered a violation of the Noise Regulations. The 5-dBA increase above ambient is applicable to City-regulated noise sources (e.g., mechanical equipment – LAMC Section 112.02), and it is applicable any time of the day. The LAMC states that the baseline ambient noise shall be the actual measured ambient noise level or the City's presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise levels averaged over a period of at least 15 minutes. The LAMC indicates that in cases where the actual measured ambient conditions are not known, the City's presumed noise levels should be used, as shown in **Table 4.11-2**. However, Chapter XI will be implemented through actual ambient conditions rather than presumed levels

TABLE 4.11-2 PRESUMED EXISTING AMBIENT NOISE LEVEL			
Type	Zones	dBA	
		Daytime (7:00 a.m. to 10:00 p.m.)	Nighttime (10:00 p.m. to 7:00 a.m.)
Residential	A1, A2, RA, RE, RS, RD, RW1, RW2, R1, R2, R3, R4, and R5	50	40
Commercial	P, PB, CR, C1, C1.5, C2, C4, C5, and CM	60	55
Industrial	M1, MR1, and MR2	60	55
	M2 and M3	65	65

SOURCE: LAMC, Section 111.03.

Vibration Sources

Sources of vibration are dominated by vehicular movement. Like mobile-source noises, vibration by vehicular movement generally affects numerous receptors along lengths of roadways and depends on pavement and type and weight of the vehicle. Other sources of vibration may be generated by construction equipment (e.g., earth-moving equipment and pile driving); however, these sources are temporary and would vary on a project-by-project basis. The FTA estimates that, at 50 feet, the typical background vibration in urban areas is 52 VdB, vibration from buses and trucks is about 63 VdB, and vibration from bulldozers is about 93 VdB.

Sensitive Receptors

Noise and vibration sensitive land uses are locations where people reside or where the presence of unwanted sound could adversely affect the use of the land. Sensitive uses typically include residences, transient lodgings, schools, libraries, churches or other places of assembly, concert halls, hospitals, and long-term care facilities, playgrounds, and parks. These areas are generally described in Section 4.10, *Land Use and Planning*. Refer to Section 4.13, *Public Services*, for a discussion of schools and libraries in the City, and Section 4.14, *Recreation*, for a discussion of parks and recreational facilities in the City. Also, refer to Section 4.4, *Cultural Resources*, for a discussion of historic properties, which may be sensitive to increases in noise and vibration levels. Noise and vibration in the City is regulated by the LAMC and siting of sensitive land uses is guided by the City’s General Plan.

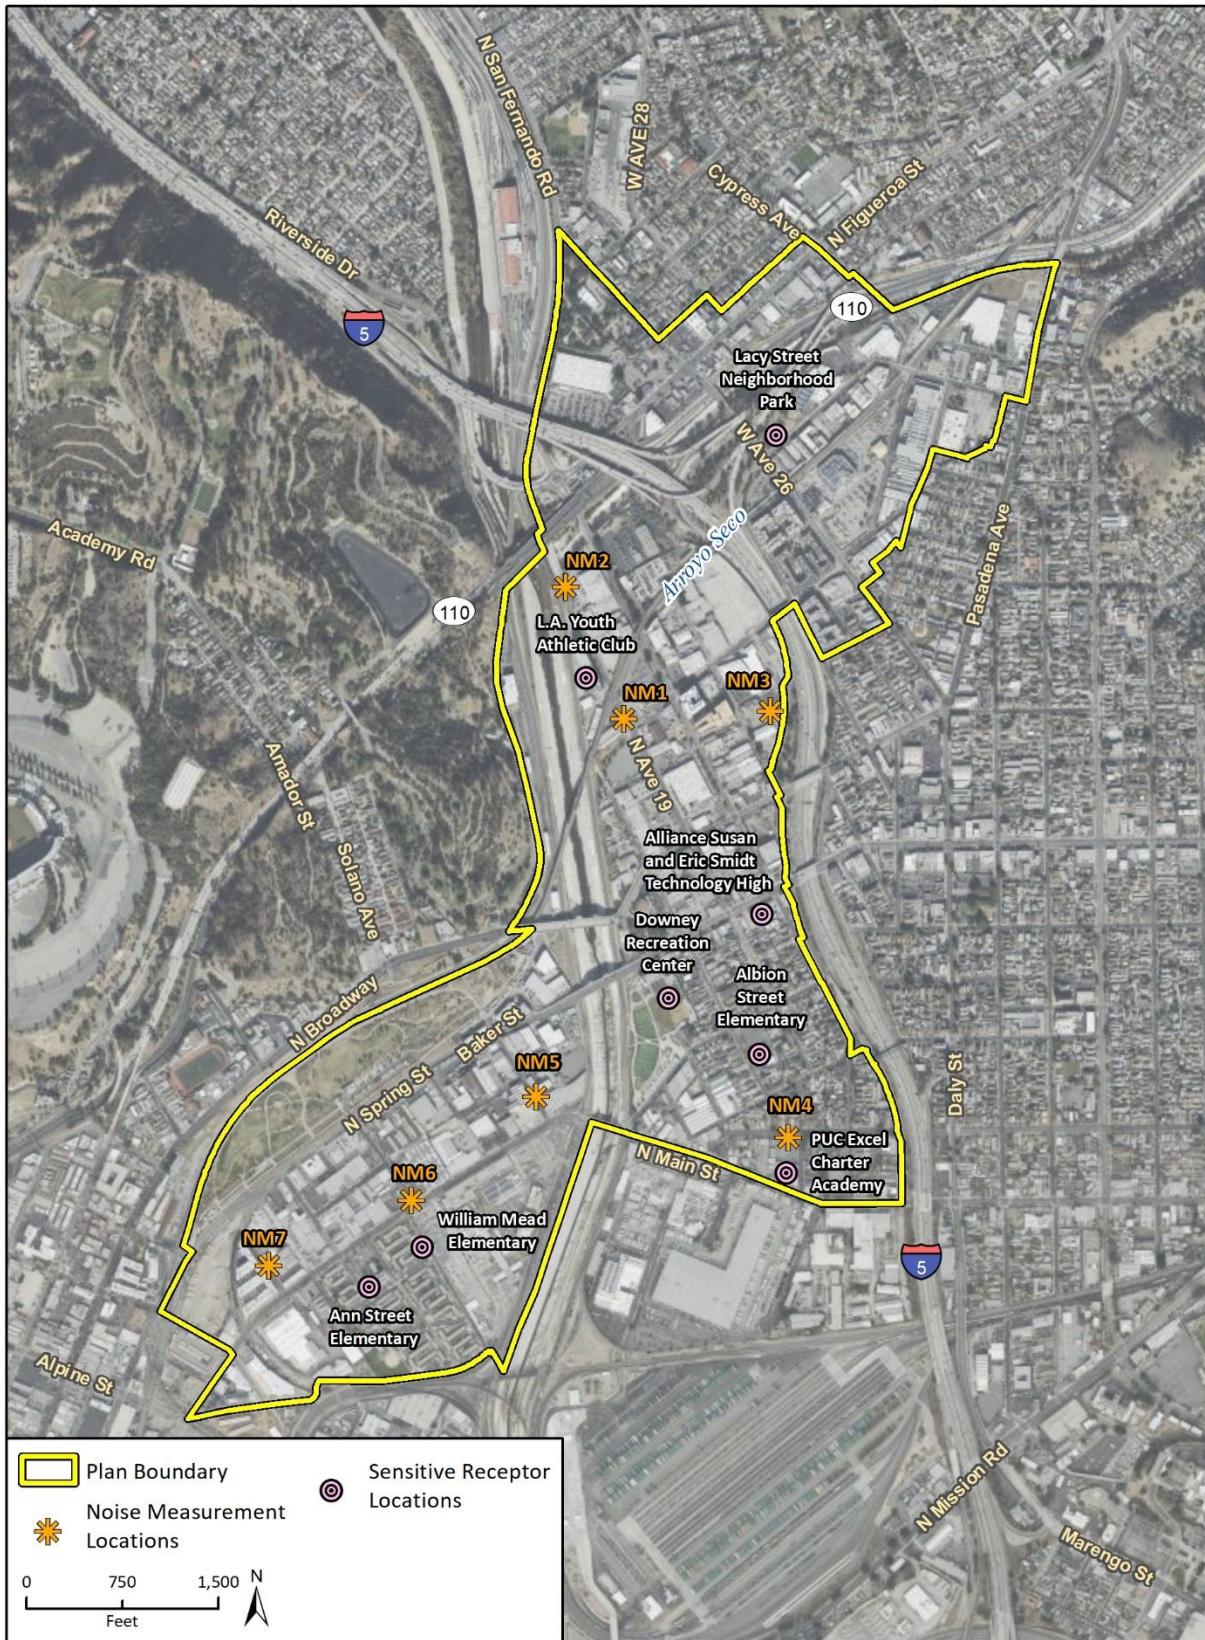

PROJECT AREA EXISTING CONDITIONS

Noise Sources

Similar to the rest of the City, the Project Area includes a variety of noise sources, including mobile and stationary sources. Sources of mobile noise include automobiles, trucks, and freight and passenger trains. Industrial and commercial activities are the primary stationary noise sources affecting the Project Area; however, all land uses can generate noise and the high levels of human activity throughout the Project Area result in relatively high ambient noise levels typical of an urban environment.

A total of 7 daytime sound measurements were taken on April 19, 2022, to characterize existing conditions in the Project Area. Sound Measurements were taken using an Extech 407780A model Type 2 integrating sound level meters calibrated before and after the measurements. Noise monitoring locations are shown in **Figure 4.11-2**.

Figure 4.11-2 Sensitive Receptor Locations with Noise Measurement Locations

Imagery provided by Microsoft Bing and its licensors © 2022.

Fig 4.11-3 Sensitive Receptor Locations with Noise Measurements

The locations were selected to represent the range of noise conditions in the Project Area. Measurements 1-3 were taken in predominantly industrial areas, measurement 4 was taken in a residential/commercial area, and measurements 5-7 were taken in commercial areas with high concentrations of residential uses. Residential uses are located intermittently throughout the Project Area. **Table 4.11-3** shows measured noise levels in the Project Area, which ranged from 59 to 69 dBA Leq. All measurements were taken at ground level along local roadways. Exterior noise levels exceeding 70 dBA are generally considered “normally unacceptable” for uses such as single and multi-family homes, schools, hospitals, hotels and playgrounds, while noise levels exceeding 75 dBA Leq are considered “normally unacceptable” for commercial and industrial uses according to policies provided in the Noise Element to the City’s General Plan (Exhibit I).

Vibration Sources

Common sources of vibration in the Project Area include heavy vehicles on rough roads and construction activities (e.g., earth-moving equipment and pile driving). In addition, commercial or industrial activities may generate vibration (e.g., businesses that recycle construction debris and use heavy equipment). Most of the industrial activities in the Project Area are limited to the entertainment and sales industry and do not involve these kinds of activities.

TABLE 4.11-3 PROJECT AREA NOISE MONITORING RESULTS			
Measurement ID No.	Noise Monitoring Location	Existing Land Use	Measured Sound Level (dBA Leq)
1	Near the Intersection of Avenue 19 and Humboldt Street	Industrial/Commercial	66.4
2	Near the Intersection of North Avenue 19 and the 110 Freeway	Industrial/Commercial	67.9
3	Parking Lot of Society of St. Vincent de Paul Los Angeles Thrift Store	Industrial/Commercial	59.8
4	Intersection of Darwin Avenue and South Avenue 19	Residential/Commercial	67.6
5	Near the Intersection of Wilhardt Street and Naud Street	Industrial/Commercial	68.7
6	Intersection of Sotello Street and North Main Street	Residential/Commercial	66.7
7	Llewellyn Street	Residential/Commercial	58.9

NOTE: Due to the nature of short-term measurements, noise levels are more variable than measurements taken over longer time periods.

Sensitive Receptors

The Project Area encompasses approximately 600 acres of land (0.94 square miles). The Project Area is predominantly developed with a mix of industrial, commercial, residential, institutional, educational, and recreational uses. Industrial development is the largest sector within the Project Area, totaling approximately 3.7 million square feet of industrial space across 153 buildings. The total residential inventory in the Project Area comprised approximately 1,814 housing units. Approximately 75 percent of the Project Area’s existing housing stock (1,343 units) is multi-family development, totaling 1.3 million square feet of area, with the remaining 471 units as single-family homes. Public facilities are currently scattered throughout the Project Area and are not particularly concentrated in particular areas. These areas are described in detail in Section 4.10, *Land Use and Planning*.

As described in Section 4.13, *Public Services*, there are six LAUSD schools and three parks and recreational facilities in the Project Area boundary. The nearest library is Lincoln Heights Library, located 0.34 miles east of the Project Area. Also, refer to Section 4.4, *Cultural Resources*, for a discussion of historic

properties, which may be sensitive to increases in noise and vibration levels. **Figure 4.11-2** shows the locations of schools and libraries in the Project Area boundary. Additionally, the Project Area includes a variety of single- and multi-family residential uses; and parks and outdoor recreational land uses such as Albion Riverside Park and Los Angeles State Historic Park.

REGULATORY FRAMEWORK

FEDERAL

Occupational Safety and Health Act of 1970

Under the Occupational Safety and Health Act of 1970 (29 U.S.C. §1919 et seq.), the Occupational Safety and Health Administration (OSHA) has adopted regulations designed to protect workers against the effects of occupational noise exposure. These regulations list permissible noise level exposure as a function of the amount of time during which the worker is exposed. The regulations further specify a hearing conservation program that involves monitoring noise to which workers are exposed, ensuring that workers are made aware of overexposure to noise, and periodically testing the workers' hearing to detect any degradation (US Dept. of Labor).

Noise Control Act of 1972

Under the authority of the Noise Control Act of 1972, the United States Environmental Protection Agency (U.S. EPA) established noise emission criteria and testing methods published in Parts 201 through 205 of Title 40 of the Code of Federal Regulations (CFR) that apply to some transportation equipment (e.g., interstate rail carriers, medium trucks, and heavy trucks) and construction equipment. In 1974, U.S. EPA issued guidance levels for the protection of public health and welfare in residential areas of an outdoor L_{dn} of 55 dBA and an indoor L_{dn} of 45 dBA. These guidance levels are not standards or regulations and were developed without consideration of technical or economic feasibility. There are no federal noise standards that directly regulate environmental noise related to the construction or operation of the Project. Moreover, the federal noise standards are not reflective of urban environments that range by land use, density, proximity to commercial or industrial centers, etc. As such, for purposes of determining acceptable sound levels to determine and evaluate intrusive noise sources and increases, this document utilizes the City of Los Angeles Noise Regulations, discussed below.

Federal Transit Administration Vibration Standards

There are no federal vibration standards or regulations adopted by any agency that are applicable to evaluating vibration impacts from land use development projects such as the proposed Project. However, the Federal Transit Administration (FTA) has adopted vibration criteria for use in evaluating vibration impacts from construction activities. The vibration damage criteria adopted by the FTA are shown in **Table 4.11-4 Construction Vibration Damage Criteria**.

Building Category	PPV (in/sec)
I. Reinforced-concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Source: FTA, Transit Noise and Vibration Impact Assessment Manual, 2018.

The FTA has also adopted standards associated with human annoyance for determining the groundborne vibration and noise impacts from ground-borne noise on the following three off-site land-use categories: Vibration Category 1 – High Sensitivity, Vibration Category 2 – Residential, and Vibration Category 3 – Institutional (FTA). The FTA defines Category 1 as buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes. Category 2 refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals. Category 3 refers to institutional land uses such as schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment but that still potentially involve activities that could be disturbed by vibration. The vibration thresholds associated with human annoyance for these three land-use categories are shown in **Table 4.11-5 Groundborne Vibration and Groundborne Noise Impact Criteria for General Assessment**. No thresholds have been adopted or recommended for commercial or office uses.

Land Use Category	Frequent Events ^a	Occasional Events ^b	Infrequent Events ^c
Category 1: Buildings where vibration would interfere with interior operations.	65 VdB ^d	65 VdB ^d	65 VdB ^d
Category 2: Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB
Category 3: Institutional land uses with primarily daytime use.	75 VdB	78 VdB	83 VdB

a "Frequent Events" is defined as more than 70 vibration events of the same source per day.
b "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
c "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day.
d This criterion is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes.
Source: FTA, Transit Noise and Vibration Impact Assessment Manual, 2018.

STATE

Office of Planning and Research Guidelines for Noise Compatible Land Use

The State of California has not adopted statewide standards for environmental noise, but the Governor's Office of Planning and Research (OPR) has established guidelines for evaluating the compatibility of various land uses as a function of community noise exposure, as presented in **Table 4.11-6**. The purpose of these guidelines is to maintain acceptable noise levels in a community setting for different land use types.

Noise levels are divided into four general categories, which vary in range according to land use type: “normally acceptable,” “conditionally acceptable,” “normally unacceptable,” and “clearly unacceptable.” The City has developed its own compatibility guidelines in the Noise Element of the General Plan based in part on OPR Guidelines. California Government Code Section 65302 requires each county and city in the State to prepare and adopt a comprehensive long-range general plan for its physical development, with Section 65302(f) requiring a noise element to be included in the general plan. The noise element must: (1) identify and appraise noise problems in the community; (2) recognize Office of Noise Control guidelines; and (3) analyze and quantify current and projected noise levels.

TABLE 4.11-6 GUIDELINES FOR NOISE COMPATIBLE LAND USE (DBA CNEL)				
Land Use	Normally Acceptable¹	Conditionally Acceptable²	Normally Unacceptable³	Clearly Unacceptable⁴
Single-Family, Duplex, Mobile Homes	50-60	55-70	70-75	Above 75
Multifamily Homes	50-65	60-70	70-75	Above 75
Schools, Libraries, Churches, Hospitals, Nursing Homes	50-70	60-70	70-80	Above 80
Transient Loading – Motels, Hotels	50-65	60-70	70-80	Above 75
Auditoriums, Concert Halls, Amphitheaters	--	50-70	--	Above 70
Sports Arenas, Outdoor Spectator Sports	--	50-75	--	Above 75
Playgrounds, Neighborhood Parks	50-70	--	70-80	Above 80
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50-75	--	70-80	Above 80
Office Buildings, Business and Professional Commercial	50-70	67-77	Above 75	--
Industrial, Manufacturing, Utilities, Agriculture	50-75	70-80	Above 75	--

¹ Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

² New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

³ New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

⁴ New construction or development should generally not be undertaken.

SOURCE: Office of Planning and Research, State of California General Plan Guidelines and California Department of Health Services, October 2003; City General Plan Noise Element, February 1999.

The State has established noise insulation standards for new multi-family residential units, hotels, and motels. These requirements are collectively known as the California Noise Insulation Standards (Title 24, California Code of Regulations). The noise insulation standards set forth an interior standard of 45 dBA CNEL in any habitable room. The standards require an acoustical analysis demonstrating that dwelling units have been designed to meet this interior standard where such units are proposed in areas subject to exterior noise levels greater than 60 dBA CNEL. Title 24 standards are typically enforced by local jurisdictions through the building permit application process.

Caltrans Vibration/Groundborne Noise Standards

The State of California has not adopted Statewide standards or regulations for evaluating vibration or groundborne noise impacts from land use development projects such as the proposed Project. Although the

State has not adopted any vibration standard, Caltrans in its *Transportation and Construction Vibration Guidance Manual* (Caltrans 2013) recommends the following vibration thresholds that are more practical than those provided by the FTA.

The state noise and vibration guidelines are to be used as guidance with respect to planning for noise, not standards and/or regulations to which the City of Los Angeles must adhere.

TABLE 4.11-7 GUIDELINE VIBRATION DAMAGE POTENTIAL THRESHOLD CRITERIA		
Structure and Condition	Maximum PPV (inch/sec)	
	Transient Sources¹	Continuous/Frequent Intermittent Sources²
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
Historic and some old buildings	0.50	0.25
Older residential structures	0.50	0.30
New residential structures	1.00	0.50
Modern industrial/commercial buildings	2.00	0.50

Source: Table 19, Transportation and Construction Vibration Guidance Manual (Caltrans 2013).
¹ Transient sources create a single, isolated vibration event, such as blasting or drop balls.
² Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

REGIONAL

Los Angeles County Airport Land Use Commission Comprehensive Land Use Plan

In Los Angeles County the Regional Planning Commission has the responsibility for acting as the Airport Land Use Commission and for coordinating the airport planning of public agencies within the county. The Airport Land Use Commission coordinates planning for the areas surrounding public use airports. The Comprehensive Land Use Plan provides for the orderly expansion of Los Angeles County's public use airports and the area surrounding them. It is intended to provide for the adoption of land use measures that will minimize the public's exposure to excessive noise and safety hazards. In formulating the Comprehensive Land Use Plan, the Los Angeles County Airport Land Use Commission has established provisions for safety, noise insulation, and the regulation of building height within areas adjacent to each of the public airports in the County.

LOCAL

Los Angeles Municipal Code

The City of Los Angeles Noise Regulations are provided in Chapter XI of the Los Angeles Municipal Code (LAMC). LAMC Section 111.02 provides procedures and criteria for the measurement of the sound level of "offending" noise sources. In accordance with the LAMC, a noise source that causes a noise level increase of 5 dBA over the existing average ambient noise level as measured at an adjacent property line creates a noise violation. This standard applies to radios, television sets, air conditioning, refrigeration, heating, pumping and filtering equipment, powered equipment intended for repetitive use in residential

areas, and motor vehicles driven on-site. To account for people's increased tolerance for short-duration noise events, the Noise Regulations provide a 5 dBA allowance for a noise source that causes noise lasting more than 5 but less than 15 minutes in any one-hour period, and an additional 5 dBA allowance (for a total of 10 dBA) for a noise source that causes noise lasting 5 minutes or less in any one-hour period (LAMC).

The LAMC provides that in cases where the actual ambient conditions are not known, the City's presumed daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) minimum ambient noise levels as defined in LAMC Section 111.03 should be used. The presumed ambient noise levels for these areas where the actual ambient conditions are not known as set forth in the LAMC Sections 111.03 are provided in **Table 4.11-8, City of Los Angeles Presumed Ambient Noise Levels**. For example, for residential-zoned areas, the presumed ambient noise level is 50 dBA during the daytime and 40 dBA during the nighttime.

TABLE 4.11-8 CITY OF LOS ANGELES PRESUMED AMBIENT NOISE LEVELS		
Zone	Daytime Hours (7 A.M. to 10 P.M.) dBA (L_{eq})	Nighttime Hours (10 P.M. to 7 A.M.) dBA (L_{eq})
Residential (A1, A2, RA, RE, RS, RD, RW1, RW2, R1, R2, R3, R4, and R5)	50	40
Commercial (P, PB, CR, C1, C1.5, C2, C4, C5, and CM)	60	55
Manufacturing (M1, MR1 and MR2)	60	55
Heavy Manufacturing (M2 and M3)	65	65
<i>Source: LAMC Section 111.03.</i>		

LAMC Section 112.02 limits increases in noise levels from air conditioning, refrigeration, heating, pumping and filtering equipment. Such equipment may not be operated in such manner as to create any noise which would cause the noise level on the premises of any other occupied property, or, if a condominium, apartment house, duplex, or attached business, within any adjoining unit, to exceed the ambient noise level by more than 5 dB.

LAMC Section 112.04 prohibits the operation of any lawn mower, backpack blower, lawn edger, riding tractor, or any other machinery equipment, or other mechanical or electrical device, or any hand tool that creates a loud, raucous or impulsive sound, within any residential zone or within 500 feet of any residence between 10:00 PM and 7:00 AM. Section 113.01 prohibits rubbish and garbage collection within 200 feet of any residence between 9:00 PM and 6:00 AM.

LAMC Section 112.05 sets a maximum noise level for construction equipment of 75 dBA at a distance of 50 feet when operated within 500 feet of a residential zone. Compliance with this standard shall not apply where compliance therewith is technically infeasible. LAMC Section 41.40 prohibits construction between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, 6:00 p.m. and 8:00 a.m. on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 a.m. to 9:00 p.m.; and Saturdays and National Holidays between 8:00 a.m. to 6:00 p.m.). In general, the City's Department of Building and Safety enforces Noise Ordinance provisions relative to equipment and the Los Angeles Police Department (LAPD) enforces provisions relative to noise generated by people.

LAMC Section 41.40 prohibits construction between the hours of 9:00 PM and 7:00 AM Monday through Friday, 6:00 PM and 8:00 AM on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 AM to 9:00 PM; and Saturdays and national holidays between 8:00 AM to 6:00 PM). In general, the City's Department of Building and Safety enforces Noise Ordinance provisions

relative to equipment and the Los Angeles Police Department (LAPD) enforces provisions relative to noise generated by people.

LAMC Section 113.01 prohibits collecting or disposing of rubbish or garbage, operating any refuse disposal truck, or collecting, loading, picking up, transferring, unloading, dumping, discarding, or disposing of any rubbish or garbage, as such terms are defined in LAMC Section 66.00, within 200 feet of any residential building between the hours of 9:00 p.m. and 6:00 a.m. of the following day, unless a permit therefore has been duly obtained beforehand from the Board of Police Commissioners.

LAMC Section 114.03 prohibits the loading or unloading of any vehicle, operation of any dollies, carts, forklifts, or other wheeled equipment, which causes any impulsive sound, raucous or unnecessary noise within 200 feet of any residence between 10:00 PM and 7:00 AM.

LAMC Section 91.1206 establishes noise insulation performance standards to protect persons within new hotels, motels, dormitories, residential care facilities, apartment houses, dwellings, private schools, and places of worship from the effects of excessive noise, including but not limited to, hearing loss or impairment and interference with speech and sleep. According to Subsection 91.1206.14.1, these structures shall be designed to prevent the intrusion of exterior noise beyond prescribed levels when located in noise critical areas, such as proximity to highways, country roads, city streets, railroads, airports, and commercial or industrial areas. Proper design shall include, but shall not be limited to, orientation of the structure, setbacks, shielding, and sound insulation of the building itself. Specifically, Subsection 91.1206.14.2 limits interior noise levels attributable to exterior sources to 45 dBA L_{dn} or CNEL in any habitable room. Worst-case noise levels, either existing or future, are to be used as the basis for determining compliance with this requirement. Future noise levels are to be predicted for a period of at least ten years from the time of building permit application. Furthermore, according to Subsection 91.1206.14.3, structures identified under Subsection 91.1206.1 that are exposed to airport noise greater than 60 dBA L_{dn} or CNEL, shall require an acoustical analysis showing that the proposed design will achieve the allowable interior noise level.

Section 91.1207.14.2 prohibits interior noise levels attributable to exterior sources from exceeding 45 dBA in any habitable room. The noise metric shall be either the day-night average sound level (L_{dn}) or the CNEL, consistent with the noise element of the local general plan.

City of Los Angeles General Plan Noise Element

The Noise Element of the City's General Plan policies include the CNEL guidelines for land use compatibility as shown in **Table 4.11-9** and includes a number of goals, objectives, and policies for land use planning purposes. The overall purpose of the Noise Element is to guide policymakers in making land use determinations and in preparing noise ordinances that would limit exposure of citizens to excessive noise levels (City of LA General Plan Noise Element). The following policies and objectives from the Noise Element apply to the Proposed Plan.

- Objective 2:** **Non-Airport.** Reduce or eliminate non-airport related intrusive noise, especially relative to noise sensitive uses.
- Policy 2.2:** Enforce and/or implement applicable city, state, and federal regulations intended to mitigate proposed noise producing activities, reduce intrusive noise and alleviate noise that is deemed a public nuisance.
- Objective 3:** **Land Use Development.** Reduce or eliminate noise impact associated with proposed development of land and changes in land use.
- Policy 3.1:** Develop land use policies and programs that will reduce or eliminate potential and existing noise impacts.

The Noise Element of the City’s General Plan policies include the CNEL guidelines for land use compatibility, as shown in **Table 4.11-9**. The Noise Element also addresses noise mitigation regulations, strategies, and programs, and delineates the authority of federal, State, and City bodies in regulating automotive, rail, aircraft, and nuisance noise. The Noise Element does not include any mandatory standards for land use planning or quantitative thresholds for construction or operational groundborne vibration.

TABLE 4.11-9 GUIDELINES FOR NOISE COMPATIBLE LAND USE (CNEL)				
Land Use Category	Normally Acceptable¹	Conditionally Acceptable²	Normally Unacceptable³	Clearly Unacceptable⁴
Residential Single-Family, Duplex, Mobile Homes	50-55	55-70	70-75	Above 75
Residential Multi-Family Homes	50-60	60-70	70-75	Above 75
Transient Lodging – Motels, Hotels	50-60	60-70	70-80	Above 75
Schools, Libraries, Churches, Hospitals, Nursing Homes	50-60	60-70	70-80	Above 80

Office Buildings, Business and Professional Commercial	50-65	65-75	Above 75	--
Agriculture, Industrial, Manufacturing, Utilities	50-70	70-75	Above 75	--

¹ Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

² New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

³ New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

⁴ New construction or development should generally not be undertaken.

Source: Los Angeles 1999

Exhibit I of the Noise Element also contains guidelines for noise compatible land uses. The following **Table 4.11-10** summarizes these guidelines, which are based on OPR guidelines from 1990.

TABLE 4.11-10 EXHIBIT I OF THE NOISE ELEMENT: GUIDELINES FOR NOISE COMPATIBLE LAND USE

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

The following thresholds of significance were developed based on Appendix G of the CEQA Guidelines. Impacts would be significant if the Proposed Project would result in:

- Generation of substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies (Threshold 4.11.1)
- Generation of excessive groundborne vibration or groundborne noise levels (Threshold 4.11.2)
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, exposure of people residing or working in the area to excessive noise levels (Threshold 4.11.3)

METHODOLOGY

The City relies on Appendix G of the CEQA Guidelines as the threshold of significance. Threshold one addresses consistency with standards, and noise associated with permanent traffic increases, long-term operation and construction; threshold two addresses construction vibration; and threshold three addresses noise associated with airports/airstrips. Below are the methods and criteria used by the City to analyze and answer those questions.

Construction Noise

Construction noise is assessed in context of the provisions of the LAMC discussed in the Regulatory Setting, including allowable hours of construction and maximum equipment noise levels. Development in urban infill locations is very common and usual within urban locations, such as the City and the Project Area, as are the associated short-term construction activities and noise created by those activities. Construction noise from typical projects is intermittent throughout the day during the duration of construction activity. Construction noise levels may fluctuate dependent on type of equipment being used, construction phase, or equipment location. Although some individuals may find construction noise of any kind or of any duration very disturbing, as a general matter, typical construction, including with the imposition of the regulatory measures described in the Regulatory Setting, does not result in and would not be considered a significant impact.

Projects on urban infill sites are not likely to result in substantial construction noise impacts because construction activities at these sites are inherently limited by the size of the project site. The size of urban infill project sites typically limits the use of the largest (i.e., noisiest) pieces of heavy-duty equipment. The size of a project site also typically limits the size of the development and the related duration of construction activities. Therefore, while urban infill projects that meet the following criteria could result in disturbance to residents and employees at adjacent properties, resulting noise levels are not considered to be potentially significant physical impacts to the overall environment:

- One subterranean level or less (approximately 20,000 cubic yards of material);
- Construction durations of 18 months or less (excluding interior finishing);
- Equipment rated 300 horsepower or less, typically small and medium backhoes, bulldozers, etc.; and
- No potential for impact pile driving.

Larger projects that require extended construction or heavy-duty equipment could expose sensitive uses and users in the surrounding environment to more continuous and/or louder noise impacts and result in significant short-term noise exposure. When noise-sensitive land uses (e.g., residences, schools, libraries, hospitals) are located within 500 feet of a project site, projects that meet one or more of the characteristics below are considered to have the potential to result in significant impacts.

- Two subterranean levels or more (approximately 20,000 cubic yards of material);
- Construction durations (excluding interior finishing) of 18 months or more;
- Use of large, heavy-duty equipment rated 300 horsepower or greater; or
- The potential for impact pile driving.

Operational Noise

The following thresholds take into account incremental changes in 24-hour noise levels as well as potential regular occurrences of single event, impulsive noise. As noted above, the LAMC defines impulsive sound as sound of short duration, usually less than one second, with an abrupt onset and rapid decay. Such single event noise generating activities could be of short duration but permanently reoccurring depending on the source and associated land use (e.g., movie studios). The Proposed Project would have significant impact on noise levels from operations if:

- Permanent ambient noise level measured at the property line of affected uses increases by 3 dBA CNEL to or within the “normally unacceptable” or “clearly unacceptable” categories, as shown in **Table 4.11-4**, or any 5 dBA CNEL or more increase in noise level.

The land use and noise compatibility guidelines in the Noise Element are not adopted standards relevant to determining the significance of incremental increases in permanent noise levels. Exhibit I of the Noise Element includes criteria or general guidance associated with incremental increases in noise. Exhibit I is shown in Table 4.11-4. Exhibit I was developed in 1990 to help guide determination of appropriate land use and mitigation measures related to existing or anticipated ambient noise levels. This guidance is applicable to assessing if a land use is compatible with the existing noise environment (i.e., impact of the environment on a project), but is not useful alone for assessing if a project would significantly increase existing noise levels. This is particularly true in urban environments like the Project Area, where existing noise levels often exceed the guidelines shown in Table 4.11-4. In addition, sound transmission control requirements are included in the International Building Code, which are the basis for the 2016 CBC and which in turn are incorporated into the City of Los Angeles Building Code (LAMC Section 91). The CBC provides noise insulation standards (CBC Title 24, Section 1207.4). The standards require that intrusive noise not exceed 45 dBA in any habitable room.

Construction and Operational Vibration

Consistent with FTA *Transit Noise and Vibration Impact Assessment Manual*, vibration impacts associated with human annoyance would be significant if:

- Vibration caused by new reasonably anticipated development from the Proposed Project exceeds 85 VdB, which is the vibration level that is considered to be acceptable only if there are an infrequent number of events per day; and/or
- Groundborne vibration caused by new reasonably anticipated development from the Proposed Project exceeds the FTA vibration damage threshold of approximately 98 VdB for engineering concrete and masonry building, 94 VdB for fragile buildings (i.e., non-engineered timber and masonry buildings) and approximately 90 VdB for extremely fragile historic buildings (i.e., buildings extremely susceptible to vibration damage).

Construction vibration levels are based on example equipment levels provided in FTA's *Transit Noise and Vibration Impact Assessment* guidance document.

PROJECT IMPACTS

Threshold 4.11-1	Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies
-------------------------	---

Impact 4.11-1 All construction would be required to comply with the appropriate Regulatory Compliance Measures as well as LAMC Chapter 41.40, Section 112.05. Nevertheless, reasonably anticipated development from the Proposed Project would potentially result in construction with lengthy durations, substantial soil movement, use of large, heavy-duty equipment, and/or pile driving near noise-sensitive land uses that would result in significant impacts that cannot be feasibly mitigated. Therefore, the impact generated by temporary construction noise would also be *significant and unavoidable*. Future reasonably anticipated development from the Proposed Project would include mechanical equipment, loading, trash pick-up, and other noise-generating activities. However, such activities would be typical of the urban environment within the Project Area. In addition, any on-site activities would be required to comply with applicable provisions of the LAMC. Thus, permanent noise increases due to stationary operational activities would be *less than significant*. However, future reasonably anticipated development from the Proposed Project would increase vehicle trips in the Project Area that would generate mobile noise. Mobile noise would increase noise levels to be above the “normally unacceptable” category for land uses adjacent to these corridors. With this, permanent noise increases due to mobile operational activities would be *significant and unavoidable*.

This section analyzes impacts related to temporary construction noise and operational stationary and mobile noise sources.

Impact Discussion

The LAMC includes multiple standards associated with long-term and permanent noise sources. Relevant standards are discussed above within Regulatory Framework and include:

- Section 112.01 - Radios, Television Sets, and Similar Devices
- Section 112.02 - Air Conditioning, Refrigeration, Heating, Pumping, Filtering Equipment
- Section 112.04 - Powered Equipment Intended for Repetitive Use in Residential Areas and Other Machinery, Equipment, and Devices
- Section 112.06 - Places of Public Entertainment
- Section 113.01 - Rubbish and Garbage Collection and Disposal
- Section 114.03 - Vehicles – Loading and Unloading
- Section 114.04 - Audible Signaling Devices

The City actively enforces the LAMC and it is presumed that all persons would follow legal requirements set forth in the LAMC related to long-term and permanent source of noise. Therefore, related to compliance with operational noise standards in the LAMC would be *less than significant*.

Permanent Noise Impacts

Operational Stationary Noise

A substantial permanent increase in noise would occur if the ambient noise level measured at the property line of affected uses increases by 3 dBA CNEL to or within the “normally unacceptable” or “clearly unacceptable” categories, as shown above, in **Table 4.11-4**, or any 5 dBA CNEL or more increase in noise. Regarding operational noise, the Proposed Project would accommodate new residential, commercial, and light industrial development at increased intensity and density throughout the Project Area. For the residential, commercial, and light industrial land uses anticipated, typical noise sources include stationary mechanical equipment and on-site vehicle movement (e.g., parking structure activity, loading/unloading, trash pick-up). Certain commercial uses, such as bars and restaurants, may also include outdoor activities and use of amplified sound systems. However, such activities would be typical of the urban environment within the Project Area, and heavy commercial and industrial use projects would be required to comply with buffering requirements when cited adjacent to more sensitive uses. In addition, any on-site activities would be required to comply with applicable provisions of the LAMC. Thus, permanent noise increases due to stationary noise impacts would be *less than significant*.

Mechanical Equipment

For mechanical equipment, residential and most commercial uses are generally limited to HVAC and pool equipment. Industrial and manufacturing land uses can contain significant sources of stationary mechanical equipment noise. According to the Cannery Park Project Environmental Noise Assessment conducted in San Jose, noise levels from commercial rooftop HVAC systems typically range from about 60 to 70 dBA Leq at a distance of 15 feet from the source (Illingworth & Rodkin, Inc. 2015). At 50 feet, an HVAC system that generates 70 dBA Leq would be approximately 59 dBA Leq. HVAC systems are typically placed on rooftops in urban environments and not typically audible above existing traffic noise and other types of urban source noise. Thus, noise generated by HVAC equipment generally would not exceed ambient noise levels in much of the Project Area, which have been measured at 59 to 69 dBA Leq (see **Table 4.11-3**).

The design of mechanical equipment must comply with Section 112.02 of the LAMC, which prohibits noise from air conditioning, refrigeration, heating, pumping, and filtering equipment from exceeding the ambient noise level on the premises of other occupied properties by more than 5 dBA. Further, residential uses, schools and other noise sensitive uses are typically separated from noisy industrial uses. On-site equipment would be designed such that it would be shielded by sound barriers that block the line-of-sight to sensitive receptors, and appropriate noise-muffling devices would be installed in the equipment to reduce noise. In addition, nighttime noise limits would apply to any equipment required to operate between the hours of 10:00 PM and 7:00 AM (e.g., HVAC units, exhaust fans, refrigeration, heating, pumping, and filtering equipment, etc.). Further, noise increases would be incremental given the already urbanized nature of the Project Area, where ambient noise levels are in the 59 to 69 dBA Leq range (see **Table 4.11-3**). Mechanical equipment would have a *less than significant* noise impact.

Vehicle Activity (Loading/Unloading, Trash Hauling, Parking Structure Vehicles)

Future Project Area development would increase the number of delivery and trash hauling trucks traveling through the Project Area and to individual development sites. Increased delivery and trash hauling trucks along roadways could impact various sensitive receptors located intermittently throughout the Project Area. Section 23130 of the California Motor Vehicle Code establishes maximum sound levels of 86 dBA Leq at 50 feet for trucks operating at speeds less than 35 miles per hour. Noise at this level exceeds ambient noise levels throughout most of the Project Area (see **Table 4.11-3**); therefore, individual truck pass-bys and/or loading or trash pick-up operations would likely be audible at nearby properties. However, truck-related noise would be an intermittent noise source that would not increase the 24-hour CNEL by 3 dBA or more.

Moreover, California Code of Regulations Title 13 Section 2435 prohibits trucks from idling for longer than five minutes. In addition, per the LAMC, truck loading/unloading activity is prohibited between the hours of 10:00 PM and 7:00 AM when located within 200-feet of a residential land use. Because trash and delivery trucks would be required to comply with LAMC standards and would be subject to state regulations, impacts would be *less than significant*.

Parking areas/garages are the other potential source of vehicular noise. Typical noise sources associated with parking lots include tire squealing, door slamming, car alarms, horns, and engine start-ups. **Table 4.11-11** shows typical sound levels at this distance from various noise sources on parking lots.

TABLE 4.11-11 MAXIMUM NOISE LEVELS FROM PARKING LOT ACTIVITY	
Noise Source	Noise Level at 50 feet (dBA Leq)
Autos at 14 mph	50
Car Alarm Signal	69
Car Alarm Chirp	54
Car Horns	69
Door Slams or Radios	64
Talking	36
Tire Squeals	66
<i>SOURCE: Atkins 2012. Estimates are based on actual noise measurements taken at various parking lots.</i>	

Intermittent parking lot noise could range from 36 to 69 dBA Leq, which would not exceed ambient noise levels in much of the Project Area (which, as shown in **Table 4.11-3**, reach up to 69 dBA Leq). In addition, parking structures located within 200-feet of any residential use would be constructed with a solid wall abutting the residences and utilize textured surfaces on garage floors and ramps to minimize tire squeal. Further, most future parking structures would likely be subterranean, which would not generate noise at street level and would not audibly increase noise levels at adjacent sensitive land uses. As a result, these structures would have little to no effect on adjacent sensitive uses. Parking structures that are at or above grade and surface parking lot noise would be greater than subterranean parking facilities, however, they would not present an unusual noise source within an urban environment. Further, per the LAMC, these parking structures would be required to comply with parking standards such as perimeter walls and encased parking, which would reduce noise levels. Because parking lot/garage design and placement would be required to comply with LAMC and LADBS standards and requirements, impacts would be *less than significant*.

Outdoor Activity Areas

Reference noise levels for outdoor patios and roof decks are based on noise levels from a certified EIR for the Citrus Heights City Hall and Medical Office Building, which included an outdoor patio area that would have on average 25 people conversing. Noise levels associated with this comparable outdoor patio area were 50 dBA Leq at a distance of 50 feet (City of Citrus Heights 2015). To provide a conservative analysis, this analysis assumes that 50 people would be conversing in an outdoor restaurant or bar area in a development accommodated by the Proposed Project. Based on the logarithmic scale, a doubling of sound energy is equivalent to an increase of 3 dBA. Therefore, it is assumed that an outdoor bar or restaurant with an average of 50 people conversing would have an estimated noise level of 53 dBA Leq at a distance of 50 feet. Other outdoor activity areas, such as parks and outdoor school uses generally produce the same level of noise as the primary source of noise in people conversing.

Based on a noise level of 53 dBA Leq and due to the urbanized nature of the Project Area with ambient noise in the 59-69 dBA range (see **Table 4.11-3**), noise generated by outdoor bars and restaurants would

not exceed ambient noise or result in a 3 dBA increase above ambient levels. Further, amplified noise would be required to comply with Chapter 11 Section 115.02 of the LAMC, which prohibits amplified noise within 500 feet of a residential zone and restricts amplified noise to between 7:00 AM – 10:00 PM in commercial zones. Outdoor activity noise, such as noise generated by outdoor bars and restaurants, and all amplified noise would be required to comply with LAMC standards and, therefore, would have a *less than significant* impact on surrounding land uses.

Operational Mobile Noise

The transportation analysis, on which the noise analysis is based, evaluates reasonably anticipated development that is expected to occur by 2040 as a result of the Proposed Project (see Section 4.15, Transportation and Traffic). The reasonably anticipated development is based on the acreage of land designated for each type of land use, allowable densities and intensities for each land use designation, reasonably expected levels of development through the life of the Proposed Project. Actual noise levels that could result from the Proposed Project may not be as high as noise levels calculated in this analysis.

Conservatively assuming that the entire increase in noise in the future would be attributable to the Proposed Project, the ambient noise level as a result of traffic increases under the Proposed Project (Future with Project compared to Existing) would increase. As shown in **Table 4.11-12**, daily vehicle trips would increase by approximately 276 percent over existing 2021 conditions by the year 2040 under the Proposed Project. A 276 percent increase in traffic on a roadway would equate to an increase of 5.8 dBA. It is possible that noise level increases of this size could result in noise levels that are within the “normally unacceptable” category for land uses adjacent to these corridors, including residential, school, and commercial uses. Therefore, mobile noise impacts would be *potentially significant*.

TABLE 4.11-12 DAILY VEHICLE TRIP SUMMARY	
	Total Daily Vehicle Trips
Baseline Conditions (2021)	41,323
Future with Proposed Project (2040)	155,383
Change in Vehicle Trips	+114,060
Percent Change in Vehicle Trips (%)	276%
<i>Source: F&P 2022</i>	

Mitigation Measures

With regard to operational traffic noise, the noise increase in the Project Area is created by the Proposed Project increasing density in an underutilized area through infill development. The VMT per service population would decrease under the Proposed Project, indicating that VMT traveled per person will become more efficient and, thus, traffic noise generated per person would lessen. However, the substantial increase in population and related vehicle trips in the Project Area that the Proposed Project is designed to accommodate would lead to a potentially significant noise increase in traffic noise. Measures to reduce traffic noise typically occur through the implementation of large sound walls, which is not feasible in a developed area due to property logistics, access gaps that eliminate noise attenuation of the walls, and excessive costs. Therefore, no feasible mitigation measures exist to reduce noise levels to less than significant.

Significance After Mitigation

Operational Noise Impacts

As stated above, no feasible mitigation measures exist to reduce operational traffic noise level increases to less than significant. Therefore, traffic noise levels would be *significant and unavoidable*.

Temporary Noise Impacts

Future construction activity occurring in the Project Area would result in temporary increases in ambient noise levels on an intermittent basis. Noise levels would fluctuate depending on the construction phase, equipment type and duration of use, distance between the noise source and receptor, and presence or absence of noise attenuation barriers. Construction activities typically require the use of a variety of noise-generating equipment. Typical noise levels at 50-feet from various types of equipment that may be used during construction are listed in **Table 4.11-8**. The loudest noise levels are typically generated by impact equipment (e.g., pile drivers) and heavy-duty equipment (e.g., scrapers and graders). Construction noise would occur intermittently throughout construction and, in some instances, multiple pieces of equipment may operate simultaneously, generating overall noise levels that are incrementally higher than what is shown in **Table 4.11-8**.

Table 4.11-9 shows noise levels by construction phase at 50 feet. The grading/excavation and finishing phases typically generate the loudest noise levels at 89 dBA Leq without equipment mufflers, and 86 dBA Leq with equipment mufflers.

Construction activities occurring in the Project Area are subject to the Regulatory Compliance Measures (RCMs) adopted pursuant to the City's noise ordinances. These include:

- Compliance with the Noise Ordinance No. 161.574, and any subsequent ordinances, which prohibit the emission or creation of noise beyond certain levels at adjacent uses unless technically infeasible.
- Compliance with Section 41.40 of the LAMC, which restricts construction activities to the hours of 7:00 AM to 6:00 PM Monday through Friday, and 8:00 AM to 6:00 PM on Saturday and federal holidays, and prohibits activities on Sundays.
- Compliance with the City's Building Regulations Ordinance No. 178.048, which requires a construction site notice to be provided that includes the following information: job site address, permit number, name and phone number of the contractor and owner or owner's agent, hours of construction allowed by code or any discretionary approval for the site, and City's telephone numbers where violations can be reported. The notice shall be posted and maintained at the construction site prior to the start of construction and displayed in a location that is readily visible to the public and approved by the City's Department of Building and Safety.
- LAMC Chapter 41.40, Section 112.05 establishes performance standards for powered equipment or tools. The maximum allowable noise level for most construction equipment within 500 feet of any residential zone is 75 dBA measured at 50 feet from the noise source. This restriction holds unless compliance is not technically feasible even with the use of noise "mufflers, shields, sound barriers, and/or other noise reduction devices or techniques."

Sensitive receptors are located throughout the Project Area and could be exposed to noise associated with construction activities related to reasonably anticipated development from the Proposed Project. Sensitive receptors that could potentially be affected by construction noise include:

- Ann Street Elementary School, located in the southwestern section of the Project Area

- PUC Excel Charter Academy, located in the eastern section of the Project Area
- Albion Street Elementary, located in the eastern section of the Project Area
- Downey Recreation Center, located in the central section of the Project Area

In addition, various parks and recreational uses, transient lodgings, churches or other places of assembly, concert halls, hospitals and long-term care facilities, and residential uses are located intermittently throughout the Project Area (including several mixed commercial/residential uses).

As discussed in the Methodology section, projects that could result in significant construction noise impacts include those located on relatively large sites. These projects tend to include relatively lengthy construction durations (longer than 18 months), use heavier equipment, and generally include noisier activities. Such larger projects are not considered usual and could potentially result in significant noise impacts. When noise-sensitive land uses are located within 500-feet of the project site (e.g., residences, schools, hospitals, and parks), projects that meet one of the characteristics below would have the potential to result in disturbing and disruptive impacts to ambient noise levels that would be potentially significant:

- Two subterranean levels or more (approximately 20,000 cubic yards of material or more).
- Construction durations of 18 months or more (excluding interior finishing).
- Use of large, heavy-duty equipment rated 300 horsepower or greater: and
- The potential for impact pile driving.

Specific development projects have not yet been determined at individual sites, therefore, this analysis assumes that sensitive receptors could be as close as 50-feet from where construction would take place. As shown in **Table 4.11-8**, sensitive receptors would experience maximum noise levels ranging from about 76 to 101 dBA. Construction noise levels would vary depending on the type of equipment, the duration of use, and the distance to receptors. Engine noise reduction technology, including mufflers, continues to improve, but heavy construction equipment remains noisy.

It is difficult to determine whether or not construction noise levels at various sensitive land uses would result in significant noise impacts without a detailed noise analysis. The above criteria can serve as guidelines in determining whether or not an impact is anticipated to occur based upon the type and size of project being constructed. Based on the allowed uses in the Proposed Project, it is reasonably foreseeable that there would be some construction projects that would exceed the criteria above. Although noise levels generated by construction typically do not vary greatly from project to project, the proximity of sensitive receivers and the overall duration of construction are typically key factors in determining whether construction-related noise is significant. It is reasonable to anticipate that one or two projects per year would require a level of construction duration or equipment activity that could result in significant construction noise impacts to nearby sensitive receptors.

Based on the above, construction activity associated with reasonably anticipated development under the Proposed Project could result in *potentially significant* temporary noise impacts.

Mitigation Measures

4.11-1 Project-Specific Noise Study

A Noise Study, prepared by a qualified noise expert to meet the requirements herein, shall be required for all discretionary projects in the Project Area located within 500 feet of noise-sensitive land uses and that have one or more of the following characteristics:

- Two or more subterranean levels or 20,000 cubic yards or more of excavated material;
- Construction duration (excluding architectural coatings) of 18 months or more;
- Use of large, heavy-duty equipment rated 300 horsepower or greater; or
- The potential for impact pile driving.

Noise-sensitive land uses are residences, transient lodgings, schools, libraries, churches (or other places of assembly), hospitals, nursing homes, auditoriums, concert halls, amphitheaters, playgrounds, and parks. The Noise Study shall characterize sources of construction noise, quantify noise levels at noise-sensitive uses, and identify measures to reduce noise exposure. The Noise Study shall identify reasonably available noise reduction devices or techniques to reduce noise levels to acceptable levels and/or durations including through reliance on any relevant federal, state or local standards or guidelines or accepted industry practices, and in compliance with LAMC standards. Noise reduction devices or techniques shall include but not be limited to: mufflers, shields, sound barriers, and time and place restrictions on equipment and activities. Each measure in the Noise Study shall identify anticipated noise reductions at noise-sensitive land uses.

Project applicants shall be required to comply with all measures identified and recommended by the Noise Study and shall maintain proof that notice of, as well as compliance with, the identified measures have been included in contractor agreements.

Significance After Mitigation

As described above, the construction activity associated with reasonably anticipated development from the Proposed Project could result in potentially significant temporary noise impacts. Mitigation Measure 4.11-1 requires completion of a Noise Study for all discretionary projects in the Project Area located within 500 feet of a noise-sensitive land use that includes one of four characteristics associated with substantial construction activity levels. Mitigation Measure 4.11-1 requires the implementation of mufflers, shields, sound barriers and/or any other available noise reduction device or techniques. However, because the nature, size, and location of future projects is unknown and mitigation measure 4.11-1 only applies to discretionary projects, construction noise at various sensitive land uses could result in significant impacts. Therefore, the Proposed Project would result in a *significant and unavoidable* impact related to temporary and periodic noise after mitigation.

In consideration of the related health effects of reasonably anticipated development from the Proposed Project, to determine the number of incidences of exceedance of noise thresholds we can be guided by historical development. It is reasonable to anticipate that one or two projects per year would require a level of construction duration or equipment activity that could result in significant construction noise impacts to nearby sensitive receptors. As detailed under *Health Effects of Environmental Noise*, human health effects range from annoyance to hearing loss and physiological effects, but response to noise is subjective and can vary greatly from person to person. Factors that influence individual response include the intensity, frequency, and pattern of noise, the amount of background noise present before the intruding noise, and the nature of work or human activity that is exposed to the noise source. It is not feasible to determine a specific number of persons that could experience health effects from significant construction noise impacts since such effects would depend on the intensity and duration of noise, the distance between noise sources and receivers, and whether noise barriers are present between sources and receivers, but it is likely that individuals in the Project Area will experience varying levels of disturbance related to construction noise with or without implementation of the Proposed Project.

Threshold 4.11-2	Generation of excessive groundborne vibration or groundborne noise levels
-------------------------	---

Impact 4.11-2 Reasonably anticipated development in the Project Area generally is not anticipated to involve activities that would result in substantial vibration levels (e.g., blasting operations). However, future construction activity, specifically pile driving, could potentially generate vibration exceeding the 90 VdB threshold for buildings extremely susceptible to building damage (e.g., historic structures). Although mitigation is available to reduce the potential effects of construction-related vibration, it cannot be assured that construction-related vibration would not result in building damage and reduce all significant impacts to less than significant levels. Thus, the Proposed Project would result in a *less than significant impact* for operational vibration and a *significant and unavoidable impact* related to construction vibration.

Impact Discussion

Construction Vibration

Construction activity can result in varying degrees of ground vibration depending on the equipment and methods employed. Operation of construction equipment causes vibrations that spread through the ground and diminish in strength with distance. Buildings founded on the soil in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the lowest levels, low rumbling sounds and perceptible vibrations at moderate levels, and damage at the highest levels.

Table 4.11-15 shows construction equipment vibration levels based on various reference distances. Construction vibration is a localized event and is typically only perceptible to a receptor that is in close proximity to the vibration source. High-rise buildings and development on sites with certain geologic conditions may require pile driving. Construction equipment would typically generate vibration levels up to 87 Vdb at 25 feet, although pile driving could generate a vibration level of 112 Vdb at 25-feet. Heavy equipment could potentially operate within 25-feet of nearby buildings.

Caisson drilling, loaded trucks, jackhammers, and bulldozers would not exceed the 90 VdB threshold for extremely fragile buildings. However, the vibration levels associated with pile driving could exceed the thresholds for each of the identified sensitive building types: 98 VdB for engineering concrete and masonry buildings, 94 VdB for fragile buildings, and 90 VdB for extremely fragile buildings. The City's Office of Historic Resources has recorded Historic-Cultural Monuments (HCMs) in the Central City Community Plan Area (see Section 4.4, *Cultural Resources*, for a detailed list of HCMs) and portions of the Project Area. Therefore, impacts related to construction vibration from development associated with the Proposed Project would be *potentially significant* because it is unknown if there would be projects of the size necessary to cause a significant impact to fragile buildings.

TABLE 4.11-15 APPROXIMATE VdB GENERATED BY CONSTRUCTION EQUIPMENT				
Equipment	Approximate VdB			
	25 Feet	50 Feet	75 Feet	100 Feet
Pile Driver (Impact)	112	106	102	100
Caisson Drilling	87	81	77	75
Large Bulldozer	87	81	77	75
Loaded Trucks	86	80	76	74
Jackhammer	79	73	69	67
Small Bulldozer	58	52	48	46

SOURCE: FTA, Transit Noise and Vibration Impact Assessment September 2018.

Operational Vibration

It is not anticipated that new development within the Project Area would involve activities that would result in substantial vibration levels (e.g., blasting operations). Operational groundborne vibration in the vicinity of new development associated with the Proposed Project would be primarily generated by vehicular travel on the local roadways. According to the FTA *Transit Noise and Vibration Impact Assessment* guidance document, rubber tires and suspension systems dampen vibration levels from trucks to a level that is rarely perceptible (2006). Accounting for additional vehicle trips that would be accommodated by the Proposed Project, traffic vibration levels would be similar to existing conditions and not perceptible by sensitive receptors. Therefore, impacts related to operational vibration under the Proposed Project would be *less than significant*.

Mitigation Measures

The following mitigation measures for the Project Area addresses potentially significant impacts related to construction vibration in the vicinity of buildings extremely susceptible to building damage (e.g., historic structures).

4.11-2(a) Vibration Control Plan

For construction activity for discretionary projects involving heavy construction equipment (e.g., large bulldozer or excavator) within 25 feet of an extremely fragile building (non-engineered masonry) or historical resource (designated or in SurveyLA or other City recognized survey), the applicant shall prepare a Vibration Control Plan. The Vibration Control Plan requirement will also apply to use of pile drivers within 135 feet of an extremely fragile building or historical resource. The Vibration Control Plan shall be prepared by a qualified structural engineer and shall include methods to minimize vibration, including but not limited to:

- Use of drilled piles or the use of a sonic vibratory pile driver rather than impact pile driving
- Use of rubber-tired equipment rather than metal-tracked equipment
- Avoiding the use of vibrating equipment when allowed by best engineering practices

The Vibration Control Plan shall include a pre-construction survey letter establishing baseline conditions at potentially affected extremely fragile buildings/historical resources. The survey letter shall provide a shoring design to protect the extremely fragile building/historical resource from potential damage. At the conclusion of vibration causing activities, the qualified structural engineer shall issue a follow-up letter describing damage, if any, to impacted buildings. The letter shall include recommendations for any repair, as may be necessary, in conformance with the Secretary of the Interior Standards. Repairs shall be

undertaken and completed in conformance with all applicable codes including the California Historical Building Code (Part 8 of Title 24).

A Statement of Compliance signed by the Applicant and Owner is required to be submitted to LADBS at plan check and prior to the issuance of any permit. The Vibration Control Plan, prepared as outlined above shall be documented by a qualified structural engineer, and shall be provided to the City upon request.

4.11-2(b) Best Management Practices for Vibration

For projects that are not required to comply with mitigation measure 4.11-2(a), the City shall notify developers of the following best management practices to reduce damage to vibration-sensitive uses:

- Impact pile drivers shall be avoided to eliminate excessive vibration levels. Drilled piles or the use of a sonic vibratory pile driver are alternatives that shall be utilized where geological conditions permit their use.
- Construction activities shall involve rubber-tired equipment rather than metal-tracked equipment.
- The construction contractor shall manage construction phasing (scheduling demolition, earthmoving, and ground-impacting operations so as not to occur in the same time period), use low-impact construction technologies, and shall avoid the use of vibrating equipment when allowed by best engineering practices.

Significance After Mitigation

Construction Vibration

Development projects in the City of Los Angeles typically do not result in vibration damage even though vibration generating equipment is utilized for all urban infill construction. Although most construction activities located in the Project Area are not anticipated to have significant vibration impacts, it is possible that a small number of development projects in the Project Area could have significant vibration impacts during construction. This would most commonly occur when a development project would be located next to a historical resource constructed of fragile building materials, which is more sensitive to vibration damage, than structures that were built based on more recent building codes. Mitigation Measure 4.11-2(a) would reduce vibration impacts whenever a development project is located near a historical resource constructed of fragile materials. Although, it is difficult to quantify the vibration reduction associated with Mitigation Measure 4.11-2(a) without knowing the specifics of a development project, including the distance from the equipment to the historical resource. Implementing caisson drilling instead of impact pile driving would reduce vibration levels from 112 Vdb at 25 feet to approximately 87 Vdb at 25 feet. The unmitigated analysis also concludes that vibration levels could exceed 98 VdB significance threshold for engineered concrete and masonry buildings without plaster (e.g., typical urban development), causing building damage or substantial human annoyance. Vibration is an unavoidable byproduct of construction activity. In an urban environment, vibration from construction equipment is related to the weight and movements of equipment. In the absence of specific development projects with detailed construction requirements and known adjacent uses, there is no way to determine specific potential for impact and feasible, appropriate mitigation to control equipment weight and movements from construction activity associated with each infill project.

Requiring Mitigation Measures 4.11-2(a) and/or 4.11-2(b) for all development projects would be infeasible because the City has determined that the use of staff resources to apply these mitigation measures to all ministerial projects is not justified. It would require City staff to evaluate each and every ministerial project to determine if that project, because of its unique characteristics, should be subject to this mitigation measure. Additionally, it would require rezoning every property to get authority to review ministerial

projects. From an implementation and administrative point of view requiring these procedures or actions would be extremely difficult and require an inordinate amount of staff time and resources to capture the small number of projects that could have significant impacts.

It is anticipated that Mitigation Measure 4.11-2(a) would substantially reduce/control construction vibration for historical resources or those of fragile construction. In addition, Mitigation Measure 4.11-2(b) would limit vibration levels at uses other than historic properties. However, in the absence of construction details associated with specific projects and without knowing the proximity of construction activities to specific receptors, it is anticipated that construction vibration levels at certain particularly fragile adjacent buildings could exceed the thresholds of significance. Therefore, the Project's construction-related vibration impact would remain *significant and unavoidable*.

Operational Vibration

Impacts related to operational vibration were determined to be *less than significant without mitigation*.

Threshold 4.11-3	For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels
-------------------------	---

Impact 4.11-3 The Project Area is not located in the vicinity of a public airport or private airstrip; therefore, *no impact* related to airport or airstrip noise would result from the Project.

Impact Discussion

The Project Area is not located in the vicinity of a public airport or private airstrip. Los Angeles International Airport (LAX), Bob Hope (Burbank) Airport, Santa Monica Airport, and El Monte Airport are all about 12 miles from the Project Area and no portion of the Project Area would be exposed to noise exceeding 60 dBA CNEL from any of these airports. Therefore, *no impact* related to airport or airstrip noise would result from Plan implementation.

Mitigation Measures

No impact related to airport noise would occur under the Project. Therefore, mitigation is not required.

CUMULATIVE IMPACTS

Substantial Temporary Increase in Ambient Noise Levels

Construction noise impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for sources of construction noise, the cumulative setting is development in the Project Area and areas immediately adjacent to the Project Area. Construction of future development projects in the City would produce temporary noise impacts. Cumulative development in the City is not likely to result in the exposure of on-site or off-site sensitive receptors to excessive construction noise due to the localized nature of noise impacts and the fact that all construction would not occur at the same time and at the same location. Therefore, only sensitive receptors located in close proximity to each construction site would be potentially affected by each activity.

Construction activities associated with reasonably anticipated development projects from the Proposed Project may overlap for some time with construction activities for other development projects, which are adjacent to, or within the Project Area. Typically, if a development site is 500 feet or more away from

another site then noise levels would have attenuated to a point that they would not combine to produce a cumulative noise impact. Therefore, construction noise levels would typically become cumulative if two development sites were to have construction occurring within 500 feet of each other.

Per the LAMC, construction activities would be prohibited between the hours of 9:00 PM and 7:00 AM Monday through Friday, before 8:00 AM or after 6:00 PM on Saturdays and national holidays, and on Sundays. However, as discussed above, larger or more unusual projects could result in significant short-term increases in noise levels. These projects could combine together, or combine with smaller projects, to substantially increase noise levels at specific land uses. Therefore, the significant and unavoidable construction noise impacts of the Proposed Project could add to construction noise impacts associated with cumulative development, especially on the periphery of the Project Area where receptors could be exposed to noise sources from within and outside the Project Area. The incremental effect of the Proposed Project would be cumulatively considerable and this cumulative temporary impact would be ***significant and unavoidable***.

Permanent Increase in Ambient Noise Levels

Stationary Noise

Stationary noise impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for stationary noise sources, the cumulative setting is development in the Project Area and areas immediately adjacent to the Project Area. Future development in the City would include mechanical equipment, loading, trash pick-up, and other noise-generating activities. However, such activities would be typical of the urban environment within the City and any on-site activities would be required to comply with applicable provisions of the LAMC. Sources of Stationary noise are well regulated. Therefore, there would be no cumulative impact related to stationary noise sources. Therefore, the incremental effect of the Project with respect to stationary noise sources would not be cumulatively considerable and cumulative impacts would be ***less than significant***.

Mobile Noise

The cumulative setting for mobile noise impacts is the City and adjacent communities because, as detailed in Section 4.15, *Transportation and Traffic*, the Project was modeled with future forecasts from SCAG for the City of Los Angeles and adjacent communities when determining VMT. The traffic analysis presented herein considers the combined effect of Project-generated traffic, existing traffic volumes and pass-through future traffic from areas both within and outside the Project Area. Table 4.11-7 presents the cumulative increase in future mobile source noise levels. The transportation analysis approach used in this analysis applied established traffic forecasting tools that have been empirically proven and previously accepted under CEQA. However, these forecasting tools may prove to be conservative if some of the recent trends in travel persist. It is not clear what direction the trends will take at this point. VMT per capita has been generally dropping since around 2004, increased for many decades prior, and has now begun to climb again since January 2014. Trends in Los Angeles are also pulling in multiple directions. If the trends toward higher levels of walking, bicycling, and transit use exceed what is forecast in this analysis, this could result in fewer driving related impacts than the Proposed Project conservatively accounts for in this analysis.

As shown in **Table 4.11-7**, future mobile noise levels including reasonably anticipated development from the Proposed Project would increase by more than 3 dBA CNEL at all but four locations, in comparison to existing conditions. Thus, it would increase noise levels that will exceed the “normally unacceptable” category for adjacent land uses. Therefore, the incremental effect of the Project on mobile source noise levels would be cumulatively considerable and cumulative impacts would be ***significant and unavoidable***.

Vibration

Construction Vibration

Construction vibration impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for sources of construction vibration, the cumulative setting is development in the Project Area and areas immediately adjacent to the Project Area. Construction of future development projects in the city would produce temporary vibration impacts. Cumulative development in the city is not likely to result in the exposure of on-site or off-site sensitive receptors to excessive ground-borne noise and vibration due to the localized nature of vibration impacts and the fact that all construction would not occur at the same time and at the same location. Therefore, only sensitive receptors located in close proximity to each construction site would be potentially affected by each individual activity.

Construction activities associated with reasonably anticipated development projects from implementation of the Project may overlap for some time with construction activities for other development projects, which are adjacent to, or within the Project Area. However, for the combined vibration impact from simultaneous construction projects to reach cumulatively significant levels, intense construction from these projects would have to occur simultaneously in close proximity to a sensitive receptor. Proposed Project construction-related vibration would not result in additive vibration in combination with cumulative development in most areas of the City. However, individual development projects near the periphery of the Project Area could potentially be constructed concurrently with other development adjacent to, but outside the Project Area, such that intense construction from two or more projects would simultaneously occur in close proximity to existing sensitive receptors. Therefore, the significant and unavoidable construction vibration impacts of the Proposed Project could add to vibration impacts associated with cumulative development on the periphery of the Project Area. Therefore, the incremental effect of the Proposed Project would be cumulatively considerable and temporary cumulative vibration impacts related to construction activity would be *significant and unavoidable*.

Operational Vibration

Operational ground-borne vibration impacts are localized to a project site and sensitive receptors within the immediate vicinity. Therefore, for sources of operational ground-borne vibration, the cumulative setting is development in the Project Area and areas immediately adjacent to the Project Area. Ground-borne vibration could conceivably be generated by the operation of future development projects within the City. It is not anticipated that new development within the Project Area would include substantial sources of operational ground-borne vibration. It is reasonable to assume that other projects outside the Project Area would have similar characteristics. Therefore, cumulative impacts related to operational ground-borne noise and vibration at any sensitive receptor would not be significant. The incremental effect of the Proposed Project would not be cumulatively considerable and cumulative impacts would be *less than significant*.

Public Airports/Private Airstrips

Aircraft-related noise impacts occur only in the vicinity of airports or airstrips. Although Citywide growth could increase the number of people who are exposed to aircraft-related noise impacts, such impacts would be localized in nature. In addition, new development would not increase aircraft-related noise impacts. Because no portion of the Project Area is not located in the vicinity of a public airport or private airstrip, the Proposed Project would have no contribution to any cumulative impact related to these hazards. For these reasons, the incremental effect of the Proposed Project related to airport and air strip noise would not be cumulatively considerable and cumulative impacts would be *less than significant*.

4.12 POPULATION, HOUSING, AND EMPLOYMENT

This section analyzes population, housing and employment impacts associated with the Proposed Project. Topics addressed include local and regional assessments, expected population, housing, and employment growth, and the potential displacement resulting from implementation of the Proposed Project. The analysis presented in this section utilizes information from a variety of public agencies, including the City of Los Angeles Department of City Planning (DCP), the U.S. Census Bureau (U.S. Census), and the Southern California Association of Governments (SCAG).

ENVIRONMENTAL SETTING

EXISTING CONDITIONS

CEQA requires an EIR to compare existing physical conditions (baseline) to the physical conditions after implementation of a project. Neither component of the Proposed Project would result in direct impacts. However, indirect effects could result from the reasonably anticipated development that is anticipated to occur with the Proposed Project. Assessing the impacts of the Proposed Project requires determining reasonably anticipated development and identifying the current conditions. Both of these determinations rely in part on estimates of the current population, housing, and employment, and the projected growth in population, housing, and employment.

Baseline Conditions

CEQA requires an EIR to compare existing physical conditions (baseline) to the physical conditions after implementation of a project. For purposes of the Proposed Project (or CASP), which plans for growth and development, there is no expected direct effect from the Proposed Project (such as for a construction project), but there are expected indirect effects from the reasonably anticipated development that is expected to occur. To assess the impacts of the Proposed Project requires determining reasonably anticipated development and identifying the current conditions. Both determinations rely in part on estimates of the current population, housing, and employment, and the forecasted growth in population, housing, and employment.

A function of SCAG, in preparing the RTP/SCS, is to forecast or prepare population, housing and employment projections in consultation with cities in the region. These projections are derived from a combination of sources and consider factors such as birth rates; migration rates; historical trends; household size; market and economic projections; existing and planned land uses; and consistency with relevant adopted local, regional and state land use policies and growth strategies. The development of the growth forecast is driven by collaboration between SCAG and local jurisdictions. The integration of the regional and local forecasts is achieved through joint efforts and collaboration among the various contributors.

CEQA Guidelines section 15125(a) requires that an EIR include a description of the physical environmental conditions in the vicinity of a project as they exist at the time the Notice of Preparation (NOP) is published. The NOP for this EIR was published on April 8, 2021 (see **Appendix A**). Thus, the EIR uses 2021 as the baseline for existing conditions. While SCAG's 2020-2045 RTP/SCS (adopted in September 2020) is the most recently adopted RTP/SCS, this document relies on the 2016-2040 RTP/SCS as the most up to date and validated Los Angeles Transportation Demand Forecasting (TDF) model contains data and information from the 2016-2040 RTP/SCS. However, the population, housing, and employment projections of these two regional plans are consistent with each other in the Project Area. The current TDF Model, which was

developed in the last few years as part of the City’s effort to move to vehicle miles traveled (VMT) thresholds of significance, relies on the 2016-2040 RTP/SCS. This model and its outputs are used in various section of this Draft EIR and therefore, the 2016-2040 RTP/SCS is utilized as the analysis baseline throughout this document.

The latest adopted 2020-2045 RTP/SCS, using a baseline year of 2016, estimates a Project Area population of 6,202 in 2021, while the 2016-2040 RTP/SCS, using a baseline year of 2012, estimates a Project Area population of 6,027 in 2021. To address the time gap between the RTP/SCS baseline years of 2012 and 2016 and the EIR’s baseline year of 2021, the demographic data were interpolated to estimate 2021 existing conditions. Annual demographics data are not immediately available and there is usually a lag time in the data released. Therefore, the interpolated population numbers using an annual growth average rate represented the most reasonable estimate available in 2021. Between the 2016-2040 RTP/SCS and 2020-2045 RTP/SCS, the population and households estimates for the EIR baseline year (2021) differ by less than 3 percent and 4 percent, respectively. The 2016-2040 RTP/SCS estimates that baseline year employment within the Project Area is 5,411 jobs, compared to the 2020-2045 RTP/SCS’s estimate of 6,189 jobs, a difference of 14 percent. The use of the 2016-2040 RTP/SCS’s lower employment figure represents a more conservative analysis, as the EIR would be analyzing a greater employment delta over the course of the Proposed Project compared to the 2020-2045 RTP/SCS’s higher baseline year employment figure.

Population

Table 4.12-1 shows citywide and Project Area population data for 2021 (existing) and 2040 (projected). Based on projections from SCAG, the City’s population is anticipated to increase from approximately 4,047,000 residents in 2021 to 4,609,000 residents in 2040, resulting in a net population growth of approximately 562,000 residents or 14 percent. The Project Area has approximately 6,000 residents in 2021, and the Project Area population expects an increase to approximately 14,000 residents in 2040, resulting in a net population growth of approximately 8,000 residents or 133 percent, based on SCAG estimates. The Project Area population comprises approximately 0.15 of one percent of the City’s population, and recent population growth in the Project Area has greatly exceeded population growth trends citywide.

TABLE 4.12-1 EXISTING AND PROJECTED POPULATION IN LOS ANGELES AND THE PROJECT AREA							
Planning Area	Existing Baseline (2021)	No Project (2040)	Proposed Project (2040)	SCAG Projected (2040)	% of Citywide Baseline	Net Change (SCAG Projected-Baseline)	% Change (SCAG Projected-Baseline)
Citywide	4,047,000			4,609,000	100%	562,000	14%
Project Area	6,000	36,000	57,000	14,000*	0.15%	8,000	133%

Note: Numbers are rounded to the nearest thousand.
 *Number reflects population including portions of whole TAZ outside of Project Area.
SOURCES: SCAG 2016-2040 RTP/SCS.

Housing

The City of Los Angeles as a whole, and the Project Area include a mix of commercial, retail, residential development, public facility, and industrial uses and encompasses several distinct neighborhoods.

Table 4.12-2 shows Citywide and Project Area housing data estimates for 2021 and 2040 No Project, Proposed Project, and SCAG projected. Housing units can be accounted for in different ways by providers of demographic data. SCAG accounts for housing units by providing an estimate of the number of households, or occupied housing units, meaning that vacant units are excluded. Other demographic data sources, such as the 2020 Census provide households and as well as the total housing unit number, including both occupied units and vacant units. For consistency between different data sources, all housing data provided in **Table 4.12-2** show total households. As shown therein, the number of households citywide is expected to increase from approximately 1,454,000 in 2021 to 1,690,000 in 2040, resulting in a net increase of approximately 236,000 households or approximately 16 percent. In comparison, the Project Area has approximately 2,000 households in 2021, with a projected increase to approximately 5,000 in 2040. This represents a net increase of approximately 3,000 households, or 150 percent. With the Proposed Project in 2040, the Project Area expects a net increase of approximately 18,000 housing units, and 11,000 in 2040 without the Proposed Project, both of which are higher than the SCAG 5,000 estimate. This indicates that the rate of housing growth in the Project Area will be higher than the rate of citywide housing growth in the next couple decades.

TABLE 4.12-2 EXISTING AND PROJECTED HOUSING INVENTORY IN LOS ANGELES AND THE PROJECT AREA							
Planning Area	Existing Baseline (2021)	No Project (2040)	Proposed Project (2040)	SCAG Projected (2040)	% of Citywide Baseline	Net Change (SCAG Projected-Baseline)	% Change (SCAG Projected-Baseline)
Citywide	1,454,000			1,690,000	100%	236,000	16%
Project Area	2,000	13,000	20,000	5,000*	0.14%	3,000	150%
Notes: Numbers are rounded to the nearest thousand, and percentages are calculated from the rounded values.							
*For conservative purposes, this forecast assumes there are no vacant units and all forecasted units are occupied.							
SOURCES: Citywide - SCAG 2016-2040 RTP/SCS.							

The housing market can be influenced by population growth, income, housing unit cost, and housing locations. Age distribution is also a key market characteristic because housing demand can be influenced by the housing preference of certain age groups due to limited income. In many cases the majority of the young adult population (20 to 34 years old) tends to occupy apartments and smaller single-family units. The population in the 35 to 65 years old age bracket occupies a range of housing types, including larger single-family homes, condominiums, and apartments, based on income and household sizes. The population in the 65+ year old age bracket occupies the above types, as well as assisted living homes and nursing homes.

Employment

Table 4.12-3 summarizes baseline (2021), No Project (2040), Proposed Project (2040), and SCAG projected (2040) employment data for Los Angeles citywide and the Project Area. As shown therein, citywide employment is expected to increase from approximately 1,913,000 in 2021 to 2,169,000 in 2040, resulting in a net growth of approximately 256,000 jobs, or about 13 percent. In comparison, the Project Area has approximately 5,000 jobs in 2021 and is expected to increase to 9,000 jobs in 2040, which represents a net increase of approximately 4,000 jobs or 80 percent. With the Proposed Project in 2040, the Project Area expects a net increase of approximately 3,000 jobs, and a net increase of approximately 5,000

jobs in 2040 without the Proposed Project. Similar to the population and housing growth trajectories, the employment growth trajectory in the Project Area is expected to exceed citywide area growth.

TABLE 4.12-3 EXISTING AND PROJECTED EMPLOYMENT IN LOS ANGELES AND THE PROJECT AREA							
Planning Area	Existing Baseline (2021)	No Project (2040)	Proposed Project (2040)	SCAG Projected (2040)	% of Citywide Baseline	Net Change (SCAG Projected-Baseline)	% Change (SCAG Projected-Baseline)
Citywide	1,913,000			2,169,000	100%	256,000	13%
Project Area	5,000	10,000	8,000	9,000*	0.26%	4,000	80%

Notes: Numbers are rounded to the nearest thousand, and percentages are calculated from the rounded values.
 *Number reflects population including portions of whole TAZ outside of Project Area

REGULATORY FRAMEWORK

FEDERAL

Comprehensive Housing Affordability Study (CHAS)

CHAS was enacted by the Cranston-Gonzalez National Affordable Housing Act of 1990 and was run by the U.S. Department of Housing and Urban Development (HUD). The primary purpose of the CHAS data is to demonstrate the number of households in need of housing assistance. This is estimated by the number of households that have certain housing problems and have income low enough to qualify for HUD’s programs (primarily 30, 50, and 80 percent of median income). CHAS also considers the prevalence of housing problems among different types of households, such as the elderly, disabled, minorities, and different household types. The CHAS data provide counts of the numbers of households that fit these HUD-specified characteristics in HUD-specified geographic areas.

In addition to estimating low-income housing needs, the CHAS data contribute to a more comprehensive market analysis by documenting issues such as lead paint risks, affordability mismatch, and the interaction of affordability with variables such as age of homes, number of bedrooms, and type of building.

Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Relocation Act)

The Uniform Relocation Act (Public Law 91-646) provides important protections and assistance for people affected by federally funded projects. This law was enacted by Congress to ensure that people whose real property is acquired, or who move as a result of projects receiving federal funds, will be treated fairly and equitably and will receive assistance in moving from the property they occupy.

STATE

California Housing Element Law

California Government Code Section 65583 and 65584(a)(1). Section 65583 of the California Government Code requires cities and counties to prepare a housing element, as one of the state-mandated elements of

the General Plan, with specific direction on its content. Pursuant to Section 65584(a)(1) the California Department of Housing and Community Development (HCD) is responsible for determining the regional housing needs assessment (segmented by income levels) for each region's planning body known as a "council of governments" (COG), the Southern California Association of Governments (SCAG) being the COG serving the Southern California area. HCD prepares an initial housing needs assessment and then coordinates with each COG in order to arrive at the final regional housing needs assessment. To date, there have been four previous housing element update "cycles." California is now in its fifth "housing-element update cycle." The SCAG Regional Housing Needs Assessment (RHNA) and the City's General Plan Housing Element are discussed further below.

Senate Bill 2

California SB 2, adopted in 2007 and effective January 2008, amended the HAA and the State Housing Element Law to require local governments to take specific zoning actions to encourage the development of emergency shelters and transitional and supportive housing. It also clarifies that under the HAA, a jurisdiction cannot deny applications for such types of housing and shelter without making specific evidence-based findings.

Senate Bill 9

On September 16, 2021 Governor Newsom signed Senate Bill (SB) 9, the California Housing Opportunity and More Efficiency (HOME) Act, which facilitates the process for building two dwelling units on a single-family residential lot or splitting a single-family residential lot into two lots (urban lot split), allowing for a total of up to four units on the two lots, by ministerial approval, if the housing development meets certain requirements. When a lot is subdivided into two, one parcel shall not be smaller than 40 percent of the lot area of the original parcel and both parcels may not be smaller than 1,200 square feet each. The owner will need to sign an affidavit stating they intend to occupy one of the units from the urban lot split as their primary residence for at least three years.

To be eligible for SB 9, the single-family lot must not be located within a historic district, included on the State Historic Resources Inventory, or designated or listed as a city or county landmark or historic property or district. Housing that is 1) subject to a recorded covenant, ordinance, or law that restricts rents to levels affordable to persons and families of moderate, low, or very low income or 2) has been occupied by a tenant in the last three years may not be demolished or altered. In addition, the parcel has to satisfy the requirements specified in subparagraphs (B) to (K), inclusive, of paragraph (6) of subdivision (a) of Section 65913.4. Paragraph (6) subparagraphs (B) to (K) of Section 65913.4 excludes development that are located on specific types of hazard or protected sites, including prime farmland or farmland of statewide importance, wetlands, within very high fire hazard severity zone, designated hazardous waste sites, and special flood hazard areas subject to 100-year floods.

Senate Bill 375 (SB 375)

The Sustainable Communities and Climate Protection Act of 2008 (Sustainable Communities Act, SB 375, Chapter 728, Statutes of 2008) focuses on aligning transportation, housing, and other land uses to achieve regional greenhouse gas (GHG) emission reduction targets established under the California Global Warming Solutions Act, also known as Assembly Bill (AB) 32. SB 375 requires Metropolitan Planning Organizations (MPO) to develop a Sustainable Communities Strategy (SCS) as part of the Regional Transportation Plan (RTP), with the purpose of identifying policies and strategies to reduce per capita passenger vehicle-generated GHG emissions. As set forth in SB 375, the SCS must: (1) identify the general location of land uses, residential densities, and building intensities within the region; (2) identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period; (3) identify areas within the region sufficient to

house an eight-year projection of the regional housing need; (4) identify a transportation network to service the regional transportation needs; (5) gather and consider the best practically available scientific information regarding resource areas and farmland in the region; (6) consider the state housing goals; (7) establish the land use development pattern for the region that, when integrated with the transportation network and other transportation measures and policies, will reduce GHG emissions from automobiles and light-duty trucks to achieve GHG emission reduction targets set by the California Air Resources Board (CARB), if there is a feasible way to do so; and (8) comply with air quality requirements established under the Clean Air Act.

Existing law requires local governments to adopt a housing element as part of their general plan and update the housing element as frequently as needed and no less than every five years. Under SB 375, this time period has been lengthened to eight years and timed so that the housing element period begins no less than 18 months after adoption of the RTP, to encourage closer coordination between housing and transportation planning. SB 375 also changes the implementation schedule required in each housing element. Previous law required the housing element to contain a program that set forth a five-year schedule to implement the goals and objectives of the housing element. The new law instead requires this schedule of actions to occur during the eight-year housing element planning period and requires that each action have a timetable for implementation. SB 375 also requires that the schedules for the regional transportation plan (RTP) and RHNA processes be synchronized and requires the RHNA to allocate housing units within the region in a manner consistent with the development pattern adopted by the SCS.

As discussed further below, on September 3, 2020, SCAG adopted its Connect SoCal: The 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020-2045 RTP/SCS), which is an update to the previous 2016 RTP/SCS. Using growth forecasts and economic trends, the RTP/SCS provides a vision for transportation throughout the region for the next 25 years that achieves the statewide reduction targets; and in so doing identifies the amount and location of growth expected to occur within the region.

Housing Crisis Act of 2019 – (SB 330, Skinner)

On October 9, 2019, the Governor signed into law the Housing Crisis Act of 2019 (SB 330). SB 330 seeks to speed up housing production in the next half decade by eliminating some of the most common entitlement impediments to the creation of new housing, including delays in the local permitting process and cities enacting new requirements after an application is complete and undergoing local review—both of which can exacerbate the cost and uncertainty that sponsors of housing projects face. In addition to speeding up the timeline to obtain building permits, the bill prohibits local governments from reducing the number of homes that can be built through down-planning or down-zoning or the introduction of new discretionary design guidelines. The bill is in effect as of January 1, 2020 but is temporary in nature as the bill’s provisions expire on January 1, 2025.

Fair Employment and Housing Act (FEHA)

The FEHA of 1959 (Government Code Section 12900 *et seq.*) prohibits housing discrimination on the basis of race, color, religion, sexual orientation, marital status, national origin, ancestry, familial status, disability, or source of income.

The Unruh Civil Rights Act

The Unruh Civil Rights Act of 1959 (Civ. Code Section 51) prohibits discrimination in “all business establishments of every kind whatsoever.” The provision has been interpreted to include businesses and persons engaged in the sale or rental of housing accommodations.

California Relocation Assistance Act

Section 7261(a) of the California Government Code requires that programs or projects undertaken by a public entity shall be planned in a manner that (1) recognizes, at an early stage in the planning of the programs or projects and before the commencement of any actions which will cause displacements, the problems associated with the displacement of individuals, families, businesses, and farm operations, and (2) provides for the resolution of these problems in order to minimize adverse impacts on displaced persons and to expedite program or project advancement and completion. The head of the displacing agency shall ensure the relocation assistance advisory services are made available to all persons displaced by the public entity. If the agency determines that any person occupying property immediately adjacent to the property where the displacing activity occurs is caused substantial economic injury as a result thereof, the agency may make the advisory services available to the person.

Density Bonuses and Other Incentives (i.e., State Density Bonus Law; Government Code Section 65915)

The State Density Bonus law (signed into law in 1979) requires jurisdictions to provide applicants with a density bonus and incentives or concessions for the production of housing development in which affordable housing is also provided. Eligible projects include housing developments with (1) at least 10 percent housing for lower income households; (2) at least five percent of the housing for very low-income households; (3) a senior citizen housing development or mobile home park restricted to older persons; and (4) at least 10 percent of the total dwelling units in common interest development for moderate-income families or persons. AB 1763, effective January 1, 2020, amends the State Density Bonus Law (Section 65915) to allow for taller and denser 100 percent affordable housing developments, especially those near transit, through the creation of an enhanced affordable housing density bonus.

Assembly Bill (AB) 2222

On September 27, 2014, the governor signed AB 2222, which amended sections of the State Density Bonus Law (Government Code Section 65915). AB 2222 requires that density bonus projects resulting in a loss of existing affordable and otherwise locally-regulated (i.e., rent-stabilized) housing units replace those units one-for-one. It also extends the affordability period from 30 to 55 years and expands the use of equity sharing in for-sale units. Several other clarifications of the existing law are also included but did change current City policy.

Accessory Dwelling Unit (ADU) Laws

Accessory Dwelling Units (ADU) are a valuable form of housing and an essential component of the State's housing supply as declared by the California Legislature and are allowed in zones that allow single-family and multi-family housing, in Government Code Section 65852.150. An ADU is an accessory dwelling unit with complete independent living facilities for one or more persons and has several forms, meaning it can be detached from the primary structure, attached to the primary structure, or be converted existing space. Updated ADU laws became effective on January 1, 2021 that further reduce barriers, streamline approval processes, and accommodate the development of ADUs and junior accessory dwelling units (JADUs). A JADU is converted existing space that is contained entirely within a single-family residence. The state's ADU law is the statutory minimum requirement and local governments may go beyond the statutory minimum and adopt local ADU ordinances, but in consistency with Section 65852.150.

California Housing Accountability Act

The Housing Accountability Act (HAA; SB 167) is a California state law designed to promote infill development by speeding housing approvals. The HAA was passed in 1982 in recognition that the lack of housing, including emergency shelter, is a critical statewide problem. The HAA empowers the State of California to limit the ability of local government to restrict the development of new housing.

Homeowners and Private Property Protection Act (Proposition 99)

In 2008, California voters approved Proposition 99, the Homeowners and Private Property Protection Act, which amended the California Constitution so that local governments are prohibited from using eminent domain authority to acquire an owner-occupied residence for the purposes of conveying it to a private recipient, with limited exceptions. Proposition 99 applies only to owner-occupied residences. Cities may still use eminent domain authority to convey multi-family and non-residential property to other private parties.

REGIONAL

Southern California Association of Governments

The City of Los Angeles is located within the jurisdiction of SCAG, a Joint Powers Agency established under California Government Code Section 6502 et seq. Pursuant to federal and State law, as discussed above, SCAG serves as a Council of Governments, a Regional Transportation Planning Agency, and the (Metropolitan Planning Organization (MPO) for Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial Counties. SCAG's mandated responsibilities include developing plans and policies with respect to the region's population growth, transportation programs, air quality, housing, and economic development. Specifically, SCAG is responsible for preparing the RTP/SCS and RHNA, in coordination with other State and local agencies. These documents include population, employment, and housing projections for the region and its 15 subregions. The City of Los Angeles is located within the Los Angeles Subregion.

SCAG is tasked with providing demographic projections for use by local agencies and public service and utility agencies in determining future service demands. Projections in the SCAG RTP/SCS serve as the basis for demographic estimates in this analysis of Project consistency with growth projections. The findings regarding growth in the region are consistent with the methodologies prescribed by SCAG and reflect SCAG goals and procedures.

SCAG data is periodically updated to reflect changes in development activity and actions of local jurisdictions (e.g. zoning changes). Through these updates, public agencies have advance information regarding changes in growth that must be addressed in planning for their provision of services. Changes in the growth rates are reflected in the new projections for service and utilities planning through the long-term time horizon.

Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)

Pursuant to Government Code Section 65080(b)(2)(B), SCAG must prepare a RTP/SCS which (1) identifies the general location of uses, residential densities, and building intensities within the region; (2) identify areas within the region sufficient to house all the population of the region over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth; (3) identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to Government Code Section 65584; (4) identify a transportation network to service the transportation needs of the region; (5)

gather and consider the best practically available scientific information regarding resource areas and farmland in the region; and (6) consider the state housing goals specified in Sections 65580 and 65581, (7) set forth a forecasted development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the GHG emissions from automobiles and light trucks to achieve the GHG reduction targets approved by the state board, and (8) allow the RTP to comply with air quality conformity requirements under the federal Clean Air Act.

On September 3, 2020, SCAG's Regional Council adopted the Connect SoCal 2020–2045 RTP/SCS. On October 30, 2020, CARB accepted SCAG's determination that the SCS would achieve GHG emission reduction targets. The 2020-2045 RTP/SCS meets federal and state requirements and is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS contains baseline socioeconomic projections that serve as the basis for SCAG's transportation planning. It includes projections of population, households, and employment forecasted for the years 2020, 2030, 2035, and 2045 at the regional, county, and local jurisdictional levels, and Traffic Analysis Zones (TAZ) that provide small area data for transportation modeling. However, TAZ-level projections are utilized by SCAG for regional modeling purposes and are not adopted as part of Connect SoCal nor included as part of the Forecasted Regional Development Pattern.

Regional Housing Needs Assessment.

SCAG prepares the RHNA mandated by State law so that local jurisdictions can use this information during their periodic update of the General Plan Housing Element. The RHNA identifies the housing needs for very low income, low income, moderate income, and above moderate-income groups, and allocates these targets among the local jurisdictions that comprise SCAG. The RHNA addresses existing unmet needs and future housing needs. The need for new housing is distributed among income groups so that each community moves closer to the regional average income distribution. The most recent RHNA allocation, the "6th Cycle RHNA Allocation Plan," was adopted by SCAG's Regional Council on March 22, 2021. The City of Los Angeles was assigned a RHNA of 456,643 units, of which 184,721 units must be affordable to lower income households (Very Low and Low levels) for the October 2021 to October 2029 planning period. Local jurisdictions are required by State law to update their General Plan Housing Elements based on the most recently adopted RHNA allocation.

Measure H

Measure H is a county sales tax measure that was passed by Los Angeles County voters in March 2017. Through ¼-cent sales tax, Measure H is expected to generate \$355 million a year for 10 years in funding dedicated to fighting homelessness. The five-year goal is to provide permanent housing for 45,000 families and individuals, while preventing homelessness for 30,000 others. In June 2017, the Board of Supervisors approved funding allocations for each of the Measure H-eligible Homeless Initiative strategies and detailed implementation plans were developed for new strategies and those that are significantly expanded and/or enhanced with Measure H funding.

LOCAL

The Housing Authority of the City of Los Angeles (HACLA) Year 2022 Agency Plan (Agency Plan)

The Agency Plan sets forth the Housing Authority's primary goals, as well as policies to support those goals. Goals include financing the redevelopment and rehabilitation of public housing assets, improve the public housing community environment through a public safety approach, and maintain comprehensive economic development and self-sufficiency opportunities for extremely-low, very-low, and low income

residents and program participants (HACLA 2022). The Plan also reports on the status of existing public housing initiatives.

City of Los Angeles General Plan

The City General Plan was prepared pursuant to State law to guide future development and to identify the community's environmental, social, and economic goals. The General Plan sets forth goals, objectives, and programs to provide a guideline for day-to-day land use policies and to meet the existing and future needs and desires of the community, while at the same time integrating a range of State-mandated elements including Transportation, Noise, Safety, Housing, Open Space/Conservation, and Environmental Justice. The General Plan also includes the General Plan Framework Element (General Plan Framework), discussed below, and the Community Plan, which guides land use at the level of the community plan area.

Framework Element

The General Plan Framework sets forth a Citywide comprehensive long-range growth strategy and defines Citywide policies regarding land use, housing, urban form, neighborhood design, open space and conservation, economic development, transportation, infrastructure, and public services. General Plan Framework land use policies are implemented at the community level through the City's Community Plans and Specific Plans. The General Plan Framework also includes population, housing, and employment projections to guide future Community Plan amendments. However, the General Plan Framework makes clear that its population forecasts are estimates for guiding amendments: "... it [Framework Element] is not dependent upon these population levels or distributions for its implementation. It does not mandate specific levels of growth for any specific area (neither minimums nor caps)."

The General Plan Framework housing chapter states that housing production has not kept pace with the demand for housing. According to the General Plan Framework, the City has insufficient vacant properties to accommodate the projected population growth and the supply of land zoned for residential development is constrained. The Housing Chapter states that new residential development will require the recycling and/or intensification of existing developed properties. The General Plan Framework states that the City must strive to meet the housing needs of the population in a manner that contributes to stable, safe, and livable neighborhoods, reduces conditions of overcrowding, and improves access to jobs and neighborhood services, particularly by encouraging future housing development near transit corridors and stations. The Housing Chapter includes goals, objectives and policies to guide future development. In particular, Policy 4.1.1 states that the City should "[p]rovide sufficient land use and density to accommodate an adequate supply of housing units by type and cost within each City subregion to meet the 20-year projections of housing needs." Objective 4.2 "[e]ncourage[s] the location of new multi-family housing development to occur in proximity to transit stations, along some transit corridors, and within some high activity areas with adequate transitions and buffers between higher-density developments and surrounding lower-density residential neighborhoods."

Housing Element

The Housing Element of the General Plan is prepared pursuant to State law and provides planning guidance in meeting the housing needs identified in SCAG's RHNA. The Housing Element identifies the City's housing conditions and needs, establishes the goals, objectives, and policies that are the foundation of the City's housing and growth strategy, and provides the array of programs the City intends to implement to create sustainable, mixed-income neighborhoods. The State requires that the Housing Element include a detailed analysis of the City's demographic, economic and housing characteristics; a comprehensive analysis of constraints to producing and preserving housing; a review of the City's progress in implementing current housing policies and programs; an identification of goals, objectives, and policies, in addition to a

full list of program that will implement the vision of the plan; and a list of sites that could accommodate new housing, demonstrating the City's ability to meet its RHNA allocation.

The 2021-2029 Housing Element, an update to the previous 2013-2021 Housing Element that is based on the updated 2021 RHNA, was adopted by the City Council on November 24, 2021. Policies include Policy 1.1.2, which states that the City should “[p]lan for appropriate land use designations and density to accommodate an ample supply of housing units by type, cost, and size within the City to meet housing needs, according to Citywide Housing Priorities and the City’s General Plan.” Also, Policy 1.1.6, states that the City should “[a]llocate citywide housing targets across Community Plan areas in a way that seeks to address patterns of racial and economic segregation, promote jobs/housing balance, provide ample housing opportunities, and affirmatively further fair housing.” The Housing Element carries forward the goals of the Framework Element Housing chapter to encourage the development of livable neighborhoods and preservation of the housing supply.

Further, Chapter 1, Housing Needs Assessment, identifies the City’s share of the housing needs established in the RHNA. In particular, Table 1.27, City of Los Angeles Regional Housing Needs Assessment Allocation, indicates that the City’s needs assessment allocation includes 456,643 housing units. Of that total number, approximately 40 percent of the units (184,732 units) must be affordable to Very Low- and Low-income households. The identified housing needs represent targets to be met and do not establish development caps. The allocation of 456,643 housing units represents one-third of the total need of 1,341,827 housing units identified for the six-county SCAG region. The percentage significantly increased from the previous housing needs cycle (5th cycle) and City proportion, which was approximately one-fifth of the regional need for the same types of units. As previously stated, there is a significant increase because the current housing needs cycle includes existing unmet housing needs in the allocation number. The City’s 2021-2029 Housing Element identified an anticipated shortfall and the need for a Rezoning Program, which “prioritizes additional housing capacity, particularly lower-income capacity, in Higher Opportunity Areas, promotes housing near transit, and protects environmentally sensitive areas.”

Land Use Element

The Land Use Element of the City’s General Plan includes 35 community plans. Community plans are intended to provide an official guide for future development and propose approximate locations and dimensions for land use. The community plans establish standards and criteria for the development of housing, commercial uses, and industrial uses, as well as circulation and service systems. The community plans implement the City’s General Plan Framework at the local level. The community plans consist of both text and an accompanying generalized land use map. The community plans’ texts express goals, objectives, policies, and programs to address growth in the community. The community plans’ maps depict the desired arrangement of land uses as well as street classifications and the locations and characteristics of public service facilities. Per State law, each community plan must be consistent with the other elements and components of the General Plan and, thus, incorporates information from these plans. The Community Plan includes residential, commercial, and industrial objectives and policies that establish a development concept for its neighborhoods and districts. The Central City North, Northeast LA and Silverlake/Echo Park/Elysian Valley Community Plans are among the 35 community plans that make up the City’s Land Use Element.. The Proposed Project would update the goals and policies of the Central City North, Northeast LA and Silverlake/Echo Park/Elysian Valley Community Plans Community Plans to reflect land use patterns, address land use issues, and carry out the community’s vision for the Project Area.

City of Los Angeles Consolidated Plan (2018-2022)

The 2018-2022 Consolidated Plan (ConPlan) is the City’s strategic plan for leveraging annual allocations of federal funds granted by HUD (e.g., Community Development Block Grant, Emergency Solutions Grant, HOME Investment Partnerships Program (HOME), and Housing Opportunities for Persons with AIDS).

The City's 2018-2022 ConPlan represents the nation's first transit-oriented ConPlan and integrates transit, community, economic, and housing development investments. The ConPlan identifies the City's fiscal and policy challenges, establishes goals, and projected five-year goal outcomes to be achieved with federal funds. The Five-Year Plan in turn informs an Annual Plan prepared by the City each year that provide action plans for implementing projects and programs funded with federal grants (Los Angeles Housing + Community Investment Department 2018).

Plan for a Healthy LA (General Plan Health, Wellness and Equity Element)

In 2015, the City adopted the Plan for a Healthy Los Angeles as an Element of the General Plan. The development of the Plan built on the Health Atlas for the City of Los Angeles (2013), which provided a data-driven methodology for identifying and addressing key health issues and community vulnerabilities in Los Angeles and helped inform the Plan's outreach efforts, policies, and goals. On November 24, 2021, the City Council approved targeted amendments to the Plan for a Healthy LA that address environmental justice (Senate Bill 1000); the Plan for a Healthy LA is the document that houses the City's environmental justice goals, policies, and implementation programs. The Plan for a Healthy LA identifies housing as a key component of building a healthier and more just city. Several of the policies in the element speak to housing, such as Policy 1.6 "Reduce the debilitating impact that poverty has on individual, familial, and community health and well-being by: promoting cross-cutting efforts and partnerships to increase access to income; safe, healthy, and stable affordable housing options; and attainable opportunities for social mobility."

Los Angeles Municipal Code (LAMC)

Zoning regulations provide for the types and densities of commercial, institutional, industrial, and residential uses permitted in each of the City's zones. Zoning in the City establishes the maximum allowable development in a zone. Zoning also includes height limitations and other development standards which together regulate setbacks, building heights, floor area ratios (FAR), open space and parking for each parcel within the City, as applicable.

The LAMC is currently undergoing a comprehensive update to all Zoning Code sections as part of the re:code LA effort. Re:code LA, which started in 2013, will update the Zoning Code to make the Code more streamlined, visual, and easy to use. The existing Zoning Code will continue to be located in Chapter 1 of the Los Angeles Municipal Code, while the New Zoning Code will be located in a new Chapter 1A of the Los Angeles Municipal Code.

Affordable Housing and Labor Standards Initiative (Proposition JJJ)

Proposition JJJ, approved on November 8, 2016, is a measure to impose affordable housing and local labor hiring requirements on new development projects, as well as set a minimum wage for hired construction workers. Key provisions of measure JJJ are as follows:

- All development projects that include 10 or more residential units and require changes to the General Plan or other zoning would be required to make a percentage of the units affordable to low-income and working residents or pay a fee to fund affordable housing and enforce laws that protect renters.
- Developers of any such residential projects would have to hire contractors who:
 - Are licensed according to City and State law.
 - Guarantee to offer at least 30 percent of work-hours to city residents, with 10 percent coming from those living within five miles of the project.
 - Pay standard wages for the area; and

- Employ members of apprenticeship training programs and workers with real-world experience.
- Amendments to community plans requires an assessment to consider whether the amendment will “reduce the capacity for creation and preservation of affordable housing and access to local jobs.”
- Developers would be required to make as much as 20 percent of the units in a project affordable for low-income and working renters. That number can be as high as 40 percent for homes that are for sale.
- Moreover, projects planned around public transit within a half mile of significant public transit stops would be encouraged through an incentive program that would apply only to projects that include affordable housing and require contractors to comply with the restrictions laid out in the second bullet above.
- No tax dollars to be used.

Transit Oriented Communities (TOC) Affordable Housing Incentive Program

Pursuant to the voter-approved Measure JJJ, LAMC Section 12.22 A.31 was added to create the Transit Oriented Communities (TOC) Affordable Housing Incentive Program (TOC Program). The program provides incentives for developers to build affordable housing located within a one-half mile radius of major transit stops; see Section 4.10, *Land Use*, for more information. All development projects that include 10 or more residential units and involve a zone change, general plan amendment, or height district change would be subject to the new requirements.

Affordable Housing Linkage Fee (AHLF) Ordinance

The City Council adopted the AHLF Ordinance on December 13, 2017 and became effective on February 17, 2018, with a phased-in fee structure. The AHLF Ordinance places a fee on certain new market-rate residential and commercial developments to generate local funding for affordable housing. The fee amount is based on the fee schedule in effect at the time the building permit for a project is issued, and the market area within which it is located. Fees will be adjusted annually for inflation beginning July 1, 2019 using the Consumer Price Index (CPIU). The market areas may be updated by City Council every five years beginning July 1, 2023.

Affordable Housing Trust Fund

The City created and administered the Affordable Housing Trust Fund (Fund), which is codified in the LAMC. The Fund establishes a special fund for the purposes of receiving and disbursing monies to address the affordable housing needs of the City. The Fund requires 25 percent of the received initial and continuing net revenue of the 2001 business tax and payroll expense tax amnesty program and the revenue program of the Revenue and Taxation Code Section 1955.1 (Assembly Bill 63) be allocated to the Fund.

Density Bonus Ordinance

The purpose of the City’s Density Bonus Ordinance, codified as LAMC Section 12.22 A.25, is to establish procedures for implementing State Density Bonus requirements, as set forth in California Government Code Sections 65915-65918, and to increase the production of affordable housing, consistent with City policies. Subject to the provisions of LAMC Section 12.22 A.25, housing development projects that include an affordable housing component or a senior citizen housing development project may be granted a density bonus, allowing for a density increase over the otherwise maximum allowable residential density under the applicable zoning ordinance and/or specific plan. The density bonus is determined based on the percentage and type of restricted affordable housing units provided and shall not exceed 35 percent. The amount of parking required for these projects may also be reduced. In addition, a housing development project that

qualifies for a density bonus may be granted incentives set forth in the ordinance that allow for modification to a City development standard or requirement.

Homelessness Reduction and Prevention, Housing, and Facilities Bond (Proposition HHH)

Proposition HHH, approved on November 8, 2016, is a \$1.2 billion general obligation bond to finance the construction of supportive and affordable housing for homeless people in the City. The purpose of the bond is to provide safe, clean affordable housing for the homeless and for those in danger of becoming homeless, such as battered women and their children, veterans, seniors, foster youth, and the disabled; and provide facilities to increase access to mental health care, drug and alcohol treatment, and other services.

Residential Hotel Unit Conversion and Demolition Ordinance

The Residential Hotel Unit Conversion and Demolition Ordinance (RHO) prohibits conversion or demolition of dwelling units in a residential hotel without approval from the Housing + Community Investment Department (HCIDLA). The ordinance adds Article 7.1 to Chapter IV of the LAMC and amends Sections 91.106.4.1, 151.06, and 151.09 (City of Los Angeles 2008). The ordinance seeks to preserve dwelling units provided by residential hotels, which often serve as affordable housing for the very low income, elderly, and disabled (HCIDLA 2018).

Rent Stabilization Ordinance (RSO)

The City's RSO was established in response to the shortage of affordable housing in Los Angeles and went into effect May 1, 1979. The RSO's purpose is to regulate rents so as to safeguard tenants from excessive rent increases, while at the same time providing landlords with just and reasonable returns from their rental units. The RSO addresses allowable rent increases, the registration of rental units, legal reasons for eviction, and the causes for eviction requiring relocation assistance payment to the tenant. Properties subject to the RSO are those that are within the City limits, contain two or more units, and have a Certificate of Occupancy prior to October 1, 1978, as well as replacement units under LAMC Section 151.28. A complaint can be filed by any tenant who believes that an owner, manager, or agent has committed a violation of the RSO. The Housing and Community Investment Department oversees and enforces the RSO. The RSO comprises Chapter XV of the LAMC.

In 2017, two ordinances amending the RSO went into effect. The "Ellis Amendments" (Ordinance No. 184873) amended the RSO requirements for demolition or permanent withdrawal of RSO units. The amendments provide clarification on the applicability of RSO to both vacant and occupied units, the unit withdrawal process, and relocation service requirements. In addition, the amendments require that property owners file annual status reports on withdrawn properties and allow landlords to qualify for an exemption on newly constructed units where RSO units are demolished by providing a certain amount of affordable housing. The second amendment (Ordinance No. 184822) addresses relocation assistance for unpermitted rental units and requires that eviction notices must list one of the permitted RSO eviction reasons (Los Angeles Housing + Community Investment Department 2017).

City of Los Angeles Accessory Dwelling Units (Ordinance No. 186481)

The City Council adopted Ordinance No. 186481 on December 19, 2019 (CF 16-1468), which provides for the creation of Accessory Dwelling Units (ADU) and Junior Accessory Dwelling Units (JADU) consistent with California Code Sections 65852.2 and 65852.22. "The ADU Ordinance incorporates state ADU provisions and further regulates the size and form of ADUs in relation to the main home, requires additional standards for construction of new ADUs in certain hillside neighborhoods, and allows for Movable Tiny Houses to be used as ADUs." The ordinance specifies the development standards and requirements for the different types of ADUs and JADUs permitted in the City. ADUs are generally not permitted on lots that

are designated as both a Very High Fire Hazard Severity Zone and a Hillside Area, unless specific development standards are met. The ordinance also has parking standards of generally one parking space per ADU, although there are exemptions available under certain conditions, such as if the ADU is within one-half mile walking distance of public transit. The Department of City Planning issued a memo on February 27, 2020 regarding the implementation of the City's ADU Ordinance and the State ADU law, summarizing key provisions applicable to detached ADUs and Movable Tiny Houses and key provisions applicable to attached ADUs and JADUs.

Green New Deal

In April 2019, Mayor Eric Garcetti released the Green New Deal (Sustainable City pLAn 2019), a program of actions designed to create sustainability-based performance targets through 2050 in order to advance economic, environmental, and equity objectives. L.A.'s Green New Deal is a mayoral initiative rather than an adopted plan and is the first four-year update to the City's first Sustainable City pLAn that was released in 2015. It augments, expands, and elaborates in even more detail L.A.'s vision for a sustainable future and it tackles the climate emergency with accelerated targets and new aggressive goals. The Housing & Development Chapter of the Green New Deal includes the following targets for the number of new housing units to be provided within the City:

- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025; and 75 percent by 2035.
- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.
- Create or preserve 50,000 income-restricted affordable housing units by 2035 and increase stability for renters.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

The following thresholds of significance were developed in accordance with CEQA Guidelines, specifically, Appendix G. The Proposed Project would have a significant impact with respect to population and housing if it would:

- Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure) (Threshold 4.12.1)
- Displace substantial amounts of existing people or housing, necessitating the construction of replacement housing elsewhere (Threshold 4.12.2)

METHODOLOGY

Growth Inducement

This analysis considers reasonably anticipated population, housing unit, and employment growth that would occur with implementation of the Proposed Project, and whether this growth within local or regional forecasts, whether it can be considered substantial with respect to growth projections Citywide, and whether it would result in the displacement of housing or people which could then result in the need for replacement housing.

For Threshold 4.12.1, the following criteria related to growth inducement are considered relevant to the Proposed Project:

- The degree to which the project would cause growth (i.e., new housing or employment generators) or accelerate development in an undeveloped area that exceeds projected/planned levels for the year of project occupancy/build out, and that would result in an adverse physical change in the environment;
- Whether the project would introduce unplanned infrastructure that was not previously evaluated in the adopted Community Plan or General Plan;
- The extent to which growth would occur without implementation of the project.

The State of California requires regions and cities to plan for changes in population, housing, and employment. If regional growth is projected, each city must accommodate a share of anticipated growth. SCAG is responsible for producing socio-economic estimates and projections at multiple geographic levels. The socio-economic estimates and projections are used for state mandated long-range planning efforts, such as the RTP/SCS. Every four years, SCAG prepares socioeconomic projections that are used by various City departments and agencies for their long-range planning efforts. These projections are derived from a combination of sources and consider factors such as birth rates, migration rates, historical trends, household size, market and economic projections, existing and planned land uses, and consistency with relevant adopted local, regional and state land use policies and growth strategies.

The citywide population is anticipated to increase by 13 percent from the 2021 estimate to approximately 4.6 million persons by the year 2040, according to the SCAG 2016-2040 RTP/SCS. The growth projections for the City of Los Angeles are based on several factors, including historical development trends, land values, as well as smart growth strategies to direct development to areas in proximity to rail and major bus stations, community centers, regional centers, and Downtown Los Angeles.

The Los Angeles Department of City Planning (LADCP) allocates the City's projected population and employment to the City's 35 community plans consistent with the City's General Plan Framework Element and other City policies, which call for directing growth to regional, commercial and transit centers. The City then accommodates the projected levels of population, housing, and employment through its Community Plan updates. With implementation of the Cornfield Arroyo Seco Plan Update, the zoning designations, intensities, and densities of the Project Area would be updated to accommodate population growth, housing, and employment demand projected by SCAG through the year 2040, as well as to meet the other project objectives, including locating growth in transit centers and along transit corridors. The development growth assumptions for the Proposed Project are based on the acreage of land designated for each type of land use; allowable densities and intensities in each designation; anticipated levels of development in the life of the Proposed Project; and development constraints, such as topography, land values, and historic preservation regulations (as described in Methodology, Appendix B)

As discussed in Appendix B, the reasonably anticipated development and associated growth in population, housing and employment anticipated to occur with the Proposed Project is based on assumptions about the level of development that can be reasonably expected to occur during the life of the Proposed Project (through the horizon year 2040), given the Proposed Project's land use designations, zoning/height districts, and policies and using best practices and knowledge. Past building data demonstrates that not all sites will be built to the maximum densities permitted by the Project for a variety of reasons including economic conditions, market trends, financial lending practices, construction and land acquisition costs, physical site constraints, and other General Plan policies or regulations. For this reason, 100 percent development to maximum allowable densities and intensities is a theoretical scenario that is not analyzed, but rather a more realistic reasonably anticipated development is used to guide and analyze the potential environmental impacts of those changes.

For all impact areas, the analysis in this section considers reasonably expected population, housing, and employment growth that would occur with implementation of the Proposed Project.

Displacement

For Threshold 4.12.2, the determination of significance related to population and housing displacement takes into consideration the following factors that are considered relevant to the Proposed Project:

- The total number of residential units to be demolished, converted to market rate, or removed through other means as a result of the Proposed Project, in terms of net loss of market-rate and affordable units;
- The current and anticipated housing demand and supply of market rate and affordable housing units in the area;
- The land use and demographic characteristics of the area and the appropriateness of housing in the area; and
- Whether the Proposed Project is consistent with adopted City and regional housing policies such as the Framework and Housing Elements, HUD Consolidated Plan and CHAS policies, and the adopted Redevelopment Plans, Rent Stabilization Ordinance, and the RTP/SCS.

Loss of affordable housing and displacement of low-income renters is a social and economic impact, which is not a CEQA impact unless it results in an indirect physical impact (Porterville Citizens v City of Porterville). Based on this, an impact from loss of affordable housing and displacement in this EIR will be an impact if it results in a physical impact to the environment, such as from construction of new housing elsewhere. It may also be from transportation or other impacts related to people driving a farther distance. The CEQA Guidelines require a lead agency to consider the reasonably foreseeable indirect environmental consequences of a project’s economic or social impacts. To require an analysis of the indirect physical impacts, the social and economic impacts must be supported by substantial evidence. An EIR would be required to analyze reasonably foreseeable, not speculative impacts, resulting from social and economic impacts (CEB Friends of Davis v City of Davis).

SCAG RTP/SCS data on population, housing, and employment projections are used as a benchmark or a reference point to guide the local planning process. The analysis below compares reasonably expected population, housing, and employment to the 2021 baseline and SCAG’s 2040 projections. If there is potential for a net decrease in residential units or net loss of market-rate or affordable units as a result of the Proposed Project, necessitating the construction of replacement housing elsewhere, then, their impact related to displacement would be considered significant.

PROJECT IMPACTS

Threshold 4.12-1	Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)
-------------------------	---

Impact 4.12-1 **Proposed Project:** The Proposed Project would increase the development capacity of the Project Area in a manner consistent with regional growth projections and the City’s vision. Therefore, it would not induce substantial population growth, either directly or indirectly. This impact would be *less than significant*.

Project Impact

A significant impact for purposes of this threshold is if the Proposed Project induces unplanned growth into an area. The underlying purpose of the Proposed Project is to accommodate forecasted Citywide growth. Growth in the Project Area is not a significant impact if it can be accommodated by existing or planned development, would not require unplanned development the construction of which would result in significant physical impacts, and is consistent with the City's Framework Element, as well as State and Regional policies and regulations.

The Proposed Project would increase the residential development capacity of the Project Area by updating the zoning designations to allow for an increase in the residential intensity of development relative to existing conditions. **Table 4.12-4** summarizes population, housing, and jobs estimates for the Project Area under existing (2021) and 2040 conditions with and without the Proposed Project. The Project 2040 estimates are based on the reasonably anticipated development for the area, rather than the maximum allowable build-out, which would not be realistic and is not supported by past building trends. The Proposed Project's zoning and land use designations establish the basis for where, how, and what type of development can occur in the Project Area through 2040.

Based on the increased development capacity of the Proposed Project, the Project Area would accommodate approximately an additional 51,000 persons (an increase of 850 percent relative to baseline conditions), from 6,000 to 57,000 persons; 18,000 housing units (an increase of approximately 900 percent), from 2,000 to 20,000 units; and approximately an additional 3,000 jobs (an increase of 60 percent), from 5,000 to 8,000 jobs. The Project Area would experience substantial growth in population and housing for the Project and No Project scenarios in 2040. The number of jobs would be slightly lower with the Project 2040 compared to No Project 2040, which is reasonably anticipated with the increase in land with a residential emphasis zoning designation.

TABLE 4.12-4 EXISTING (2021) AND 2040 DEVELOPMENT PROJECTIONS			
	Population	Housing	Jobs
Existing Project Area (2021) /a/	6,000	2,000	5,000
2040 with Project /b/	57,000	20,000	8,000
Change	51,000	18,000	3,000
Percent Change	850%	900%	60%
2040 without Project /b/	36,000	13,000	10,000
Change	30,000	11,000	5,000
Percent Change	500%	550%	100%
Notes: Numbers are rounded to the nearest thousand and percentages are calculated from the rounded values.			
SOURCE: /a/ SCAG Projections - SCAG 2016-2040 RTP/SCS			
/b/ 2040 with and without Project Projections - LADCP 2021a			

The updates to the existing Project Area are intended to provide for a development capacity consistent with long-range SCAG growth projections. The Project Area's 2040 development capacity needs to be sufficient to meet projected population, housing, and employment for the area. Although potential impacts of the Proposed Project are analyzed based on the Project's 2040 reasonably anticipated development against SCAG's 2040 citywide projections, a comparison of population, housing and employment capacity with and without the 2040 Project is presented in **Table 4.12-5** for informational purposes only.

TABLE 4.12-5 COMPARISON OF SCAG AND LADCP PROJECT AREA DEVELOPMENT PROJECTIONS			
	Population	Housing	Jobs
SCAG 2040 Project Area projections	14,000	5,000	9,000
2040 with Project	57,000	20,000	8,000
Would the SCAG 2040 Project Area projections accommodate projected growth with the Project?	Yes	Yes	No
2040 without Project	36,000	13,000	10,000
Would the SCAG 2040 Project Area projections accommodate projected growth without the Project?	Yes	Yes	Yes
Notes: Numbers are rounded to the nearest thousand, and percentages are calculated from the rounded values. SOURCES: SCAG Projections - SCAG 2016-2040 RTP/SCS; 2040 with and without Project Projections - LADCP 2021			

While the Proposed Project is expected to result in population and housing exceeding SCAG forecasts for the Project Area, it would not result in growth exceeding SCAG citywide projections for 2040. **Table 4.12-6** compares the projected Project development capacity to Citywide SCAG projections and evaluates the area’s contribution to citywide growth. As demonstrated in the table, implementation of the Proposed Project would not result in an increase in population, housing, and jobs exceeding projected increases for the City.

As indicated in **Table 4.12-6**, the Project Area would accommodate a proportion of the City’s growth with implementation of the Proposed Project, comprising nine percent of population growth, eight percent of housing growth, and one percent of employment growth. The Project Area’s substantial growth is consistent with historical trends shown in **Tables 4.12-1, -2, and -3**, which indicate that the Proposed Project’s population and housing growth have exceeded Citywide trends in the past decade. The City has discretion in how it allocates growth across the City to meet other objectives and has historically allocated more growth to the Project Area than SCAG, consistent with the City’s General Plan Framework. This allocation is also consistent with SCAG’s 2016-2040 RTP/SCS and 2020-2045 RTP/SCS goal of reducing Vehicle Miles Travelled (VMT) by accommodating a majority of new housing and jobs in areas within half a mile of major transit stops or high-quality transit corridors, as well as SCAG’s objective of generally directing future growth to High Quality Transit Areas (HQTAs).

TABLE 4.12-6 PROJECT CONTRIBUTION TO PROJECTED CITYWIDE GROWTH AND DEVELOPMENT			
	Population	Housing	Jobs
2021 Citywide Baseline	4,047,000	1,454,000	1,913,000
2040 Citywide SCAG Projections	4,609,000	1,690,000	2,169,000
Change	562,000	236,000	256,000
Citywide Percent Change	14%	16%	13%
Existing Project Area (2021)	6,000	2,000	5,000
2040 with Project	57,000	20,000	8,000
Project Change	51,000	18,000	3,000
Percent of Projected Citywide Growth Resulting from Project	9%	8%	1%
Notes: Numbers are rounded to the nearest thousand and percentages are calculated from the rounded values. SOURCES: Citywide baseline and 2040 Citywide SCAG Projections– SCAG 2016 -2040 RTP/SCS; Existing CASP – SCAG 2016-2040 RTP/SCS; Project data - LADCP 2021			

The Proposed Project does not directly entail construction of individual development or infrastructure projects. Instead, it includes policies and policy changes to guide their development. Although an EIR must analyze reasonably foreseeable indirect physical impacts for a project, it is not required to analyze speculative development. There is no major infrastructure projects related to the Proposed Project currently anticipated. Furthermore, impacts to population due to major infrastructure projects will be evaluated by the projects' lead agencies and mitigated, as feasible, through the environmental review process for the individual projects.

The City accommodates for projected levels of population, housing, and employment growth through its Community and Specific Plan updates. Through implementation of the Proposed Project, the land use designations, intensities, and densities of the CASP would be revised to accommodate the SCAG's projected population growth, housing, and employment demand. The Proposed Project would expand the development capacity of the Project Area in a manner consistent with SCAG projections. Therefore, the Proposed Project would not induce substantial unplanned population growth, either directly or indirectly, and impacts would be *less than significant*.

Mitigation Measures

Impacts related to population, housing and employment growth as a result of the Proposed Project are less than significant; therefore, mitigation is not required.

Threshold 4.12-2	Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.
-------------------------	--

Impact 4.12-2 **Proposed Project:** The Proposed Project would accommodate new development and redevelopment projects in the Project Area that could potentially result in some displacement of existing housing units and residents. However, the Proposed Project would establish zoning regulations that are expected to substantially increase the capacity for housing stock in the Project Area and support the provision of affordable housing. In addition, local policies and regulations would require and/or incentivize many future development projects in the Project Area to provide market rate and affordable units. This impact would be *less than significant*.

Project Impact

The Proposed Project would allow for new development and redevelopment projects in the Project Area. However, no property owners would be required to redevelop their property. The Proposed Project does not require any existing housing to be demolished or reduced in order to be consistent with the Project's land use designations and zoning. In effect, existing development on the ground could be maintained and established uses could continue to operate. Future development would be subject to the Proposed Project once effective. With that said, reasonably anticipated development from the Proposed Project is anticipated to result in redevelopment that has the potential to result in the displacement of some existing housing units and residents, including homeless residents, during construction. However, the number of displaced units and residents and locations of any replacement housing, if needed, would be speculative.

The Project Area has approximately 2,000 dwelling units in 2021. Twenty-two percent of the CASP's existing housing stock (471 units) is comprised of single-family homes (including attached and detached homes), while the remainder (1,596 units) is comprised of multi-family residential developments. The number of existing multi-family residential units within the Project Area is summarized in **Table 4.12-7**.

TABLE 4.12-7 MULTI-FAMILY HOUSING STOCK IN THE PROJECT AREA (2021)			
Name	Year Built	Number of Units	Percentage
Puerta Del Sol	2006	165	
Alta Lofts	2010	102	
Subtotal – For Sale (Market Rate)		267	17%
Properties with Less Than 50 Units	--	172	
Lacy Studio Lofts	2008	58	
Llewellyn Apartments	2021	318	
Subtotal – For Rent (Market Rate)		548	34%
William Mead Homes	1942	412	
Camino al Oro	2005	102	
Flores del Valle	2006	146	
Tesoro Del Valle	2006	121	
Subtotal – For Rent (100% Affordable)		781	49%
TOTAL Multi-Family Housing Stock		1,596	100%
SOURCE: LADCP 2021			

With respect to single-family homes in the CASP, the Proposed Project would not change the zoning of such properties in the Project Area, which are predominantly zoned RD1.5 or RD2. In fact, the Proposed Project would amend the CASP map boundaries to exclude from the Specific Plan any properties that have RD1.5 or RD2 zoning. As a result, it is unlikely that redevelopment on those sites, and physical impacts related to displacement and the need to construct replacement housing outside of the Project Area, would occur as a result of the Proposed Project's updated zoning designations. With respect to the existing multi-family buildings in the Project Area, approximately 74 percent of units were constructed within the past 20 years and are likely to have considerable remaining service life, and nearly half of all multi-family units in the Project Area are subject to affordable housing covenants, lowering the likelihood that existing multi-family residential properties in the Project Area would be redeveloped with new structures as a result of the Proposed Project's revised zoning designations. Nonetheless, displacement of some residences is a reasonably foreseeable result of development or redevelopment that could occur under the Proposed Project, should a property owner decide to utilize the full development potential of their site. There may be a lag time between displacement and the development of replacement housing in some instances. However, it would be speculative to attempt to identify how many units and people might be displaced, and what the lag time, if any, might be. In addition, as discussed under Impact 4.12-1 and further below, implementation of the Proposed Project is projected to substantially increase the overall housing stock in the Project Area. Finally, the City has adopted a number of policies, standards, and incentives, including those in the Proposed Project, that are specifically aimed at providing affordable housing in association with new housing development and reducing homelessness. As such, the Proposed Project would not necessitate the construction of replacement housing elsewhere. As identified in Section 4.10, *Land Use and Planning*, of this EIR, the Proposed Project would strengthen the existing CASP's affordable housing requirements, including the recalibration of the CASP's existing incentive zoning system; establish a new Community Benefits Program that incentivizes new publicly-accessible open space and community facilities; include provisions that facilitate the production of new 100% affordable housing and permanent supportive housing projects on public land; increase the zoning capacity for housing in targeted areas; and adopt a modernized zoning system based on the City's new modular Zoning Code. The Proposed Project is projected to

accommodate a substantial net increase in the number of available housing units, especially affordable, mixed-income, and permanent supportive housing units, in the Project Area.

As shown in **Table 4.12-4**, above, the Proposed Project is expected to accommodate an increase in the number of available housing units in the Project Area from approximately 2,000 units to 20,000 units by 2040, an increase of 18,000 units. Based on the Project's potential to increase housing units in the Project Area by approximately 900 percent, it is anticipated that any replacement housing need created by displacement of existing housing would be more than offset through implementation of the Project. Furthermore, the Proposed Project includes specific programs to incentivize the production of affordable housing. The Proposed Project introduces new opportunities for affordable housing in all areas of the CASP that allow residential uses, as well as on publicly-owned land.

Concerns about indirect displacement of people, including those with lower incomes, have been raised in the Project Area, other Plan Areas, and citywide. The rising cost of housing is currently a concern throughout the City, reflective of the shortage of housing in the City and the region as a whole. As population growth continues to outpace the production of housing units, the existing supply of housing is in higher demand which leads to higher rents/prices. Many renters are experiencing financial strain as average rents rise, and would-be homeowners watch as neighborhoods where home prices may have once been within their reach grow prohibitively expensive. While the majority of multi-family rental units in the Project Area is covenanted affordable, this occurrence may result in displacement of renters and may result in the need for people that live in the Project Area to move outside the Project Area or potentially outside of the City. But there is no substantial evidence that there is a reasonable method to predict how many people may potentially be displaced in the Project Area over the Project horizon, including from new investment through redevelopment allowed by the Proposed Project. Additionally, there is no industry standard methodology available to forecast transportation, air, noise, or other impacts associated with people who have moved out of the Project Area. The City has adopted several citywide responses to help relieve pressures on the housing supply (e.g., Affordable Housing Linkage Fee, Accessory Dwelling Units Ordinance, Unapproved Dwelling Unit Ordinance, TOC, etc.) and the State of California has recently passed several state laws to address the housing crisis. Recent state laws such as AB 1482, also set forth requirements for landlords to have a "just cause" in order to terminate a tenancy and limits to annual rent increases

As discussed in the Existing Setting, the City has adopted regulations and policies that require or incentivize the provision of affordable housing in new development projects that apply Citywide. As discussed in Section 4.12.3, *Regulatory Framework*, these policies include the Density Bonus Ordinance (LAMC Section 12.22 A.25) and affordable housing mandates included in Proposition JJJ. The Density Bonus Ordinance would incentivize the provision of affordable and/or senior housing units in new development projects by offering projects that provide these units additional floor area ratios. Proposition JJJ includes a measure requiring new development projects requesting a zone change or general plan amendment in the City to designate a certain percentage of condos and apartments in new residential buildings for low-income tenants. Per the AHLF Ordinance, certain new market-rate residential and commercial developments are required to pay a fee that goes towards funding affordable housing.

Recent state laws such as SB330 also require a right of first refusal for existing lower income tenants, when units are demolished for construction of a new housing project. SB 330 requires 1:1 unit replacement of any units demolished, including the replacement of protected units with the same level of affordability, as well as relocation assistance and no net loss in zoning capacity for housing. The City's Rent Stabilization Ordinance (RSO) would cap increases in rental rates for the dwelling units built on or before October 1, 1978 as well as replacement units under LAMC Section 151.28, so that residents of these units in the Project Area would not likely be indirectly displaced if increased development and improvements to the Project Area raise property values. Furthermore, under the New Zoning Code, proposed development projects

subject to the CASP's Community Benefits Program would be required to replace any lost units with replacement units at an affordable rent.

The Proposed Project is specifically aimed at encouraging affordable, mixed-income, and permanent supportive housing production. Although the number of existing units that might be displaced, if any, by future development cannot be predicted with any degree of certainty, the Proposed Project would substantially increase the overall availability of housing in the Project Area and includes zoning standards, incentives, and/or requirements to support the provision of housing to meet a range of economic and social needs. To that end, it would implement relevant City and regional housing policies as well as those of the RTP/SCS. Future development projects in the Project Area would also be incentivized or required to provide affordable units. Moreover, displacement of housing units likely to occur due to the time lag between demolished units and construction of new units would be temporary and would be offset by the overall net increase in housing under the Proposed Project. Therefore, the Proposed Project is not anticipated to result in the net loss or displacement of housing, necessitating the construction of replacement housing elsewhere. The impact would be *less than significant*.

Mitigation Measures

Impacts related to the displacement of housing or persons as a result of the Proposed Project are less than significant; therefore, mitigation is not required.

CUMULATIVE IMPACTS

Cumulative population and housing impacts consider Citywide growth and development. As indicated in **Table 4.12-6**, Los Angeles is expected to grow substantially in population, housing, and employment through 2040. The City's population is expected to grow from 4,047,000 to 4,609,000 (562,000 residents or 14 percent), the number of households is expected to increase from 1,454,000 to 1,690,000 (236,000 households or 16 percent), and the number of jobs is expected to grow from 1,913,000 to 2,169,000 (256,000 jobs or 13 percent). Citywide growth and development, including in the Project Area, is substantially built-out and most future development in the City is anticipated to occur as infill on vacant or underutilized parcels.

Inducement of Substantial Population Growth

State laws require local governments to regularly assess and plan for future growth. For example, SCAG is required to update its RTP/SCS and accompanying growth projections every four years and the City is required to update its Housing Element, and correspondingly conduct a RHNA, every other RTP/SCS cycle, or every eight years. As discussed under Impact 4.12-1, the Project specifically is intended to accommodate a high proportion of Citywide population, housing, and employment growth projected by SCAG through 2040 in the Project Area because of its proximity to existing and future transit opportunities. Accommodating a high portion of the City's growth in the Project Area would meet both City and SCAG planning objectives related to increasing transit use, reducing regional vehicle miles traveled, and creating more livable communities, but would not cause any exceedance of the overall Citywide growth projection for Los Angeles. Nevertheless, as with the Proposed Project, it is expected that with the City's overall intent is to accommodate sufficient housing to meet SCAG projections, even if some community or specific plan areas accommodate more housing than anticipated by SCAG and others accommodate less. Based on these facts, the Proposed Project would not contribute to cumulatively considerable impacts related to population growth. Cumulative impacts would be *less than significant*.

Displacement of People and Housing

As noted above, the City's intent is to accommodate forecasted housing demand. Through 2040, the City anticipates adding 236,000 housing units. This 16 percent increase as compared to the current citywide housing stock would exceed the 14 percent Citywide population growth over the same time period. As such, although some individual housing units may be displaced as redevelopment of properties occurs throughout the City, the overall effect of implementation of the Project would be to increase the City's housing stock. Thus, although temporary displacement of some individuals could occur, such displacement would not necessitate the construction of new housing beyond what is already planned for and forecast to occur.

As discussed under Impact 4.12-2, implementation of the Proposed Project would accommodate the construction of additional housing, including affordable housing, in an urban center where impacts to many environmental resources can be minimized and would help to offset displacement impacts arising from cumulative development. The Proposed Project is expected to result in a net increase of housing over existing conditions and would allow a variety of new housing types. As noted above, the Proposed Project could result in some temporary displacement of housing units and people due to the time lag between removal and replacement of housing, but this displacement would be offset by the anticipated increases in housing. Therefore, such temporary impacts would not add to other impacts resulting from redevelopment of sites outside the Project Area and permanent displacement of housing and people is not anticipated. Reasonably anticipated development under the Proposed Project has the potential to temporarily displace some people and housing, but the overall effect of the Proposed Project would be a substantial increase in the Project Area housing stock. Overall, the Proposed Project would have a beneficial contribution to any cumulative impacts related to displacement.

Based on the information above, the incremental contribution of the Proposed Project to displacement of people and housing would not be cumulatively considerable. Cumulative impacts would be *less than significant*.

4.13 PUBLIC SERVICES

This section provides an overview of existing public services and evaluates potential environmental impacts resulting from the provision of public service facilities to accommodate development in the Cornfield Arroyo Seco Specific Plan area (or “Project Area”). Public services addressed include fire and emergency services, police protection services, public schools, and libraries; parks are addressed in Section 4.14, *Recreation*.

Fire Protection and Emergency Services

ENVIRONMENTAL SETTING

The Los Angeles Fire Department (LAFD) provides fire prevention, protection, and emergency medical services throughout Los Angeles. LAFD is a full-spectrum life safety agency that provides essential emergency and non-emergency services throughout the 472-square mile jurisdiction within the City. LAFD consists of 3,435 uniformed fire personnel that provide fire prevention, firefighting, emergency medical care, technical rescue, hazardous materials mitigation, disaster response, public education, and community service. LAFD also consists of 381 professional support staff that provides technical and administrative support to the LAFD. A total of 1,018 uniformed firefighters, in addition to 270 firefighter/paramedics are on active duty citywide serving at 106 neighborhood fire stations (LAFD 2018). In January 2015, the LAFD service areas were re-structured into four geographic bureaus that align with the Los Angeles Police Department (LAPD) geographic boundaries: Central, Valley, West, and South Bureaus. With this updated approach, the LAFD, LAPD, and the City’s Emergency Management Department have developed a more unified effort to respond to emergencies. Each designated Bureau Commander is responsible for all LAFD activities in the respective bureaus. In addition, the LAFD has implemented a new emergency medical dispatch card system, known as the Tiered Dispatch System, to reduce call-processing times; and the LAFD Automatic Vehicle Location System, to ensure the nearest emergency resource is dispatched during calls (LAFD 2015a).

The LAFD provides fire prevention, protection, and emergency medical services throughout Los Angeles. The LAFD is organized into groups of fire stations clustered into battalions within larger geographic groups known as bureaus (LAFD 2022a). Each bureau is commanded by a Deputy Chief who oversees and coordinates daily field operations within each bureau’s respective service area.

PROJECT AREA SETTING

The Project Area is in the service area of the Central Bureau but does not contain any fire stations. LAFD Fire Station 1 is located approximately 700 feet east of the Project Area and is a part of LAFD Battalion 2. LAFD Battalion 2 services Northeast Los Angeles and contains eight fire stations. Its service area is comprised of the residential and light industrial areas situated in the hills east of the Los Angeles River and north of the 10 Freeway. Over 760,000 people live in Battalion 2, 1/5th of population in 1/14th of the geographic areas of the City of Los Angeles (LAFD 2022b). LAFD Fire Stations 3, 4, and 2 are located within a mile of the Project Area and LAFD Fire Station 9 is located within 2 miles of the Project Area, all of which are within Battalion 2 boundaries. These stations along with other neighboring fire stations would be able to assist in responding to fire and medical emergencies in the Project Area.

Service Performance Measures

Table 4.13-1 summarizes the performance statistics for stations that serve the Project Area. The fire stations near the Project Area have an average turn-out time standard for fire incidents and EMS incidents, (which begins at dispatch notification and includes turn-out and travel times) of less than eight minutes.

TABLE 4.13-1 LAFD FIRE STATIONS - CENTRAL BUREAU				
Stations in the Project Area				
Fire Station¹	Address	Overall Operational Response Time (min : sec)¹		
		Non-EMS	EMS	Structural Fire
1	2230 Pasadena Ave Los Angeles, CA 90031 (0.5 mi away)	7:48	7:36	5:20
2	1962 East Cesar Chavez Avenue (0.9 mi away)	6:47	7:01	4:46
3	108 North Fremont Avenue	6:10	7:10	4:49
4	450 East Temple Street	6:55	7:16	5:09
9	430 East 7th Street	6:21	6:48	5:18

¹Average overall response time for January –July 2022.
NOTE: Non-EMS = fire and other services; EMS = Emergency Medical Services; task force = fire truck and two engines
SOURCE: 1. LAFD 2022b 2. LAFD 2022c

LAFD's services continue to be based on the community's needs, as determined by on-going evaluations that consider the number of calls and other factors. These evaluations are used to determine the need for reallocation of existing equipment or personnel and/or the acquisition of new equipment, personnel, or new stations. As development occurs, the LAFD reviews EIRs and subdivisions applications for needed facilities. Where appropriate, construction of new facilities is required as a condition of development for individual projects (Los Angeles 2001).

Fire Flow and Response Distance

The adequacy of fire protection for a given area is based on required fire flow, response distance from existing fire stations, and the LAFD's judgment of needs in the area. Personnel and equipment needs for individual fire stations are determined based on the LAFD's annual review of the number of incidents within a station's service area. As the number of incidents increases, the LAFD assigns new staff and equipment as necessary to maintain acceptable service ratios and response times (Los Angeles 2018). The Fire Code specifies required fire flow (measured in gallons per minute from the local water system) and response distance for fire protection services, as discussed in the Regulatory Framework.

The fire flow necessary to contain a fire depends on the existing land use or combination of land uses and the density of the area being served. Consequently, the amount of water necessary for fire protection depends on various factors, including the type of development, occupancy, and the level or intensity of a fire hazard. Maximum response distances also vary with land use and density of development. Response distance relates directly to the linear travel distance (i.e., miles between a station and a site) and the LAFD's ability to successfully navigate through an area's circulation system. The Fire Code specifies maximum response distances allowed between specific locations and engine/truck companies based upon land use and fire flow requirements.

When response distances exceed these requirements, plans for new commercial and residential structures must be reviewed and various fire suppression equipment (e.g., automatic fire sprinkler systems, fire

signaling systems, fire extinguishers, smoke removal systems, and any other fire protection devices) as deemed necessary by the Fire Chief are required to be incorporated in the plans prior to the approval of an occupancy permit. In addition to fire flow requirements, the LAFD requires different types of fire hydrants within a specified distance to deliver the required fire flow, as discussed in the Regulatory Framework.

REGULATORY FRAMEWORK

Federal, state and local laws, regulations, plans, and guidelines that are potentially applicable to the Proposed Project are summarized below.

FEDERAL

Federal Emergency Management Act (FEMA)

FEMA was established in 1979 via executive order and is an independent agency of the federal government. In March 2003, FEMA became part of the U.S. Department of Homeland Security with the mission to lead the effort in preparing the nation for all hazards and effectively manage federal response and recovery efforts following any national incident. FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration.

Disaster Mitigation Act of 2000

Disaster Mitigation Act (42 United States Code [U.S.C.] Section 5121) provides the legal basis for FEMA mitigation planning requirements for state, local, and Indian Tribal governments as a condition of mitigation grant assistance. It amends the Robert T. Stafford Disaster Relief Act of 1988 (42 U.S.C. Section 5121-5207) by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need and creates incentives for state, tribal, and local agencies to closely coordinate mitigation planning and implementation efforts. This Act reinforces the importance of pre-disaster infrastructure mitigation planning to reduce disaster losses nationwide and the streamlining of the administration of federal disaster relief and programs to promote mitigation activities. Some of the major provisions of this Act include:

- Funding pre-disaster mitigation activities
- Developing experimental multi-hazard maps to better understand risk
- Establishing state and local government infrastructure mitigation planning requirements
- Defining how states can assume more responsibility in managing the Hazard Mitigation Grant Program (HMGP)
- Adjusting ways in which management costs for projects are funded

The mitigation planning provisions outlined in Section 322 of this Act establish performance-based standards for mitigation plans and require states to have a public assistance program (Advance Infrastructure Mitigation [AIM]) to develop county government plans. The consequence for counties that fail to develop an infrastructure mitigation plan is the chance of a reduced federal share of damage assistance from 75 percent to 25 percent if the damaged facility has been damaged on more than one occasion in the preceding 10-year period by the same type of event.

Federal Fire Safety Act (FFSA)

The FFSA of 1992 is different from other laws affecting fire safety as the law applies to federal operations, and there is no requirement for local action unless a private building owner leases space to the federal government. The FFSA requires federal agencies to provide sprinkler protection in any building, whether owned or leased by the federal government that houses at least 25 federal employees during their employment.

STATE

California Constitution Article XIII Section 35

Section 35 of Article III of the California Constitution at subdivision (a)(2) provides: “The protection of the public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services.” Section 35 of Article XIII of the California Constitution was adopted by the voters in 1993 under Proposition 172. Proposition 172 directed the proceeds of a 0.50 percent sales tax to be used exclusively for local public safety services. California Government Code Sections 30051-30056 provide rules to implement Proposition 172. Public safety services include fire protection. Section 30056 provides that cities are not allowed to spend less of their own financial resources on their combined public safety services in any given year compared to the 1992-93 fiscal year. Therefore, an agency is required to use Proposition 172 to supplement its local funds used on fire protection, as well as other public safety services. In *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, the court found that, Section 35 of Article XIII of the California Constitution requires local agencies to provide fire services and that it is reasonable to conclude that a lead agency will comply with that provision and ensure that public services are provided. (See *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, 847, stating “the city has a constitutional obligation to provide adequate fire protection services”.)

California Fire Code

Title 24, Part 9 of the California Code of Regulations (CCR), also referred to as the California Fire Code, is part of the California Building Code and establishes standards regarding fire protection and notification systems for residential and commercial buildings. It includes fire safety requirements and regulations, including implementation of fire protection devices, such as fire extinguishers and smoke alarms, installation of sprinklers in all high-rise buildings, establishment of fire resistance standards for fire doors, buildings materials, and types of construction, clearance of debris and vegetation within a prescribed distance from occupied structures in wildfire hazards areas, and fire suppression training. The California Fire Code is applicable to all occupancies in California but can be superseded by local regulations if they are more stringent. Regulations in the California Fire Code are incorporated by reference with amendments in the Los Angeles Building Code, Fire Safety Regulations.

California Governor’s Office of Emergency Services (Cal OES)

In 1970 the State of California passed legislation creating the Cal OES and in 1993, authorized it to prepare a Standard Emergency Management System (SEMS) program (Gov. Code Section 8607; Title 19 CCR Section 2401 et seq.), which sets forth measures by which a jurisdiction should handle emergency disasters. In California, SEMS provides the mechanism by which local government requests assistance. Non-compliance with SEMS could result in the state withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster. Cal OES coordinates the state’s preparation for, prevention of, and response to major disasters, such as fires, floods, earthquakes and terrorist attacks. During an emergency, Cal OES serves as the lead state agency for emergency management in the state. It also serves as the lead agency for mobilizing the state’s resources and obtaining federal resources. Cal OES

coordinates the state response to major emergencies in support of local government. The primary responsibility for emergency management resides with local government. Local jurisdictions first use their own resources and, as they are exhausted, obtain more from neighboring cities and special districts, the county in which they are located, and other counties throughout the state through the statewide mutual aid system (see discussion of Mutual Aid Agreements, below). California Emergency Management Agency (Cal-EMA) maintains oversight of the state's mutual aid system.

California Fire Service and Rescue Emergency Aid System

The LAFD participates in the California Fire Service and Rescue Emergency Mutual Aid System through which the California Governor's Office of Emergency Service (OES), Fire and Rescue Division is responsible for the development, implementation and coordination of the California Fire Service and Rescue Emergency Mutual Aid Plan (Mutual Aid Plan). The Mutual Aid Plan outlines procedures for establishing mutual aid agreements at the local, operational, regional, and State levels, and divides the State into six mutual aid regions to facilitate the coordination of mutual aid. The LAFD is located in Region I. Through the Mutual Aid Plan, the OES is informed of conditions in each geographic and organizational area of the state, and the occurrence or imminent threat of disaster. All OES Mutual Aid Plan participants monitor a dedicated radio frequency for fire events that are beyond the capabilities of the responding fire department and provide aid in accordance with the management direction of the OES (LAFD 2014).

California Vehicle Code

Section 21806 of the California Vehicle Code (CVC) pertains to emergency vehicles responding to Code 3 incidents/calls. This section of the (CVC) states the following:

Upon the immediate approach of an authorized emergency vehicle which is sounding a siren and which has at least one lighted lamp exhibiting red light that is visible, under normal atmospheric conditions, from a distance of 1,000 feet to the front of the vehicle, the surrounding traffic shall, except as otherwise directed by a traffic officer, do the following: (a) (1) Except as required under paragraph (2), the driver of every other vehicle shall yield the right-of-way and shall immediately drive to the right-hand edge or curb of the highway, clear of any intersection, and thereupon shall stop and remain stopped until the authorized emergency vehicle has passed. (2) A person driving a vehicle in an exclusive or preferential use lane shall exit that lane immediately upon determining that the exit can be accomplished with reasonable safety. (b) The operator of every street car shall immediately stop the street car, clear of any intersection, and remain stopped until the authorized emergency vehicle has passed. (c) All pedestrians upon the highway shall proceed to the nearest curb or place of safety and remain there until the authorized emergency vehicle has passed.

Title 8 California Code of Regulations (CCR) Sections 1270 and 6773

In accordance with CCR, Title 8 Section 1270, "Fire Prevention," and Section 6773, "Fire Protection and Fire Equipment," the California Occupational Safety and Health Administration (Cal-OSHA) establishes minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hose sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

California Health and Safety Code Section 13100-13135

California Health Safety Code Section 13100-13135 codifies regulations known as the "Regulations of the State Fire Marshal" and constitutes the Basic Building Design and Construction Standards of the State Fire Marshall. The regulations establish minimum standards for the preservation and protection of life and

property against fire, explosion, and panic through requirements for fire protection and notification systems, fire protection devices, and fire suppression training.

Mutual Aid Agreements

Cal OES developed the Emergency Managed Mutual Aid (EMMA) System in response to the 1994 Northridge Earthquake. The EMMA System coordinates emergency response and recovery efforts along the coastal, inland, and southern regions of California. The purpose of EMMA is to provide emergency management personnel and technical specialist to afflicted jurisdictions in support of disaster operations during emergency events. Objectives of the EMMA Plan is to provide a system to coordinate and mobilize assigned personnel, formal requests, assignment, training and demobilization of assigned personnel; establish structure to maintain the EMMA Plan and its procedures; provide the coordination of training for EMMA resources, including SEMS training, coursework, exercises, and disaster response procedures; and to promote professionalism in emergency management and response. The EMMA Plan was updated in November 2012 and supersedes the 1997 EMMA Plan and November 2001 EMMA Guidance.

LOCAL

City of Los Angeles Charter

Section 520 of the Los Angeles City Charter states that the LAFD's duty is to control and extinguish injurious or dangerous fires and to remove that which is liable to cause those fires. It also requires the LAFD to enforce all ordinances and laws relating to the prevention or spread of fires, fire control, and fire hazards within the City, as well as to conduct fire investigations and protect lives and property in case of disaster or public calamity.

Los Angeles City General Plan

The City's General Plan contains two elements with policies pertaining to fire protection and emergency response. Chapter 9 (Infrastructure and Public Services) of the Framework Element contains general objectives and specific policies to ensure provision of fire protection and emergency response services into the future through adequate planning, funding, data collection, creation of standards, and cooperation with other agencies. The Safety Element of the General Plan identifies existing police, fire, and emergency services and the service needs of the City of Los Angeles in the event of a natural disaster and provides broad goals, objectives, and policies related to the City's response to hazards and natural disasters. The Emergency Operations Organization (EOO) is responsible for implementing the Safety Element. Goals and policies applicable to fire protection and emergency services are summarized in **Table 4.13-2**.

TABLE 4.13-2 RELEVANT GENERAL PLAN FIRE PROTECTION GOALS, OBJECTIVES, AND POLICIES

Framework Element – Infrastructure and Public Services	
Goal 9J	Every neighborhood has the necessary level of fire protection service, emergency medical service (EMS) and infrastructure.
Objective 9.16	Monitor and forecast demand for existing and projected fire facilities and service.
Policy 9.16.1	Collect appropriate fire and population development statistics for the purpose of evaluating fire service needs based on existing and future conditions.
Objective 9.17	Assure that all areas of the City have the highest level of fire protection and EMS, at the lowest possible cost, to meet existing and future demand.
Policy 9.17.2	Identify areas of the City with deficient fire facilities and/or service and prioritize the order in which these areas should be upgraded based on established fire protection standards.

TABLE 4.13-2 RELEVANT GENERAL PLAN FIRE PROTECTION GOALS, OBJECTIVES, AND POLICIES	
Policy 9.17.4	Consider the Fire Department's concerns and, where feasible adhere to them, regarding the quality of the area's fire protection and emergency medical services when developing General Plan amendments and zone changes or considering discretionary land use permits.
Objective 9.19	Maintain the Los Angeles Fire Department's ability to assure public safety in emergency situations.
Policy 9.19.1	Maintain mutual aid or mutual assistance agreements with local fire departments to ensure an adequate response in the event of a major earthquake, wildfire, urban fire, fire in areas with substandard fire protection, or other fire emergencies.
Policy 9.19.3	Maintain the continued involvement of the Fire Department in the preparation of contingency plans for emergencies and disasters.
Safety Element	
Goal 2	A city that responds with the maximum feasible speed and efficiency to disaster events so as to minimize injury, loss of life, property damage and disruption of the social and economic life of the City and its immediate environs.
Objective 2.1	Develop and implement comprehensive emergency response plans and programs that are integrated with each other and with the City's comprehensive hazard mitigation and recovery plans and programs.
Policy 2.1.5	Response: Develop, implement, and continue to improve the City's ability to respond to emergency events. Participate in regularly scheduled disaster exercises to better prepare Police, Fire, Public Works, and other City employees with disaster responsibilities. [All EOO emergency response programs and all hazard mitigation and disaster recovery programs related to protecting and reestablishing communications and other infrastructure, service and governmental operations systems implement this policy.]
Policy 2.1.6	Standards/Fire. Continue to maintain, enforce and upgrade requirements, procedures and standards to facilitate more effective fire suppression and safety. <ul style="list-style-type: none"> A. Enforce peak water supply requirements. B. Enforce minimum roadway widths and clearances for evacuation and fire suppression. C. Maintain special fire-fighting units at the Port of Los Angeles, Los Angeles International Airport, and Van Nuys Municipal Airport capable of responding to special emergencies unique to the operations of those facilities. D. Coordinate with CALFIRE, local fire agencies, fire safety council, private landowners, and other responsible agencies to identify the best method(s) of fuel modifications to reduce the severity of future wildfires, including: Prescribed fire; Forest thinning; Grazing; Mechanical clearing; Hand clearing (piling, burning/chipping); Education; and Defensible space. E. Maintain mutual aid or mutual assistance agreements with local fire departments to ensure an adequate response in the event of a major earthquake, wildfire, urban fire, fire in areas with substandard fire protection, or other fire emergencies.
Goal 3	A city where private and public systems, services, activities, physical condition and environment are reestablished as quickly as feasible to a level equal to or better than that which existed prior to the disaster.
Objective 3.1	Develop and implement comprehensive disaster recovery plans which are integrated with each other and with the City's comprehensive hazard mitigation and emergency response plans and programs.
Policy 3.1.1	Coordination: Coordinate between City departments, County and State agencies, local jurisdictions and with appropriate private and public entities prior to a disaster to plan and establish disaster recovery programs and procedures which will enable cooperative ventures, reduce potential conflicts, minimize duplication and maximize the available funds and resources to the greatest mutual benefit following a disaster. [All EOO recovery programs involving cooperative efforts between entities implement this policy.]

Los Angeles Fire Department (LAFD) Strategic Plan 2018-2020

The LAFD Strategic Plan 2018-2020 focuses on goals and strategic actions to guide the LAFD in the following areas: improving service delivery, implementing advanced technologies, employing sound budgeting practices and enhancing leadership. The plan also addresses the development of an even more professional workforce, promoting a positive work environment, and working to strengthen community relationships to improve preparedness and enhance resiliency during emergency events.

Los Angeles Municipal Code

The Los Angeles Fire Code (LAMC Chapter V, Article 7) incorporates by reference portions of the California Fire Code and the International Fire Code. The City's Fire Code sets forth regulatory requirements pertaining to the prevention of fires; the investigation of fires and life safety hazards; the elimination of fire and life safety hazards in any building or structure (including buildings under construction); the maintenance of fire protection equipment and systems; and the storage, use, and handling of hazardous materials. Specific regulations regarding fire prevention and protection are discussed below.

Section 57.106.5.2 provides that the Fire Chief shall have the authority to require drawings, plans, or sketches as may be necessary to identify: (1) occupancy access points; (2) devices and systems; (3) utility controls; (4) stairwells; and (5) hazardous materials/waste.

Section 57.107.6 requires that the installation, alteration, and major repair of the following be performed pursuant to a permit issued by the Department of Building and Safety: Fire Department communication systems, building communication systems, automatic elevators, heliports, emergency power systems, fire escapes, private fire hydrants, fire assemblies, fire protective signaling systems, pilot lights and warning lights for heat-producing equipment, refrigerant discharge systems, smoke detectors, emergency smoke control systems, automatic sprinkler systems, standpipe systems, and gas detection systems.

Section 57.118 establishes LAFD's fire/life safety plan review and LAFD's fire/life safety inspection for new construction projects.

Section 57.118.1.1 requires that all new high-rise buildings greater than 75 feet in height (measured from the lowest point with fire access) must include fire/life safety reviews by the Department of Building and Safety and LAFD.

Section 57.408 requires the preparation of an Emergency Plan that establishes dedicated personnel and emergency procedures to assist the LAFD during an emergency incident and establishes a drill procedure to prepare for emergency incidents. The Emergency Plan would also establish an on-site emergency assistance center and establish procedures to be followed during an emergency incident. The Emergency Plan must be submitted to the LAFD for approval prior to implementation and must be submitted annually (and revised if required by the LAFD).

Section 57.4704.4.3.1 of the LAMC requires that the Smoke detectors required by Chapter 9 of the LAMC (Building Code) be maintained in dependable operating condition and tested every six months or as required by the Fire Chief. An accurate record of such tests must be kept by the owner, manager, or person in charge of the property, and such records must be open to examination by the Fire Chief.

Section 57.4705.1.6 requires there must be at least one elevator which shall be available for fire EMS and shall have its controls designed so that key switches located in the building control station/fire command center will recall said elevator or elevators to the designated main floors.

Section 57.4705.4 requires each building to have a rooftop emergency helicopter landing facility in a location approved by the Chief.

Section 57.4705.1.6 requires at least one elevator in each bank of elevators to be available for fire emergency service and to have its controls designed so that key switches located in the building control station/fire command center will recall said elevator or elevators to the designated main floor. The elevator or elevators must be interconnected with the standby power.

Section 57.503.1.4 requires an approved, posted fire lane whenever any portion of an exterior wall is more than 150 feet from the edge of a roadway.

Section 57.507.3.1 establishes fire water flow standards, which vary from 2,000 gallons per minute (gpm) in low-density residential areas to 12,000 gpm in high-density commercial or industrial areas, with a minimum residual water pressure of 20 pounds per square inch (psi) remaining in the water system. Site-specific fire flow requirements are determined by the LAFD based on land use, life hazard, occupancy, and fire hazard level.

Section 57.507.3.2 addresses land use-based requirements for fire hydrant spacing and type. Regardless of land use, every first story of a residential, commercial, or industrial building must be within 300 feet of an approved hydrant. The site-specific number and location of hydrants would be determined as part of LAFD's fire/life safety plan review for each development.

Section 57.507.3.3 limits the maximum response distances to an LAFD station based on the type of land use. Applicable distances are based on LAFD's comment letter for each individual project.

LAMC Chapter V, Article 7, Section 57.512.1 provides that response distances, which are based on land use and fire flow requirements and range from 0.75 mile for an engine company to 2 miles for a truck company, shall comply with Section 57.507.3.3. Where a site's response distance is greater than permitted, all structures must have automatic fire sprinkler systems.

City of Los Angeles Proposition F, Q, and J – Facilities Bond

Proposition F, also known as the Fire Facilities Bond, was approved in November 2000 and authorized the issuance of \$532.6 million to finance the construction and rehabilitation of fire stations and animal shelters in the City of Los Angeles. Under Proposition F, new regional fire stations providing training and other facilities at or near standard fire stations must be designed and built on a single site of at least 2 acres. This is to ensure that firefighters in training remain in the service and are available to respond to emergency calls. \$378.6 million was allocated for the construction of 18 new or replacement neighborhood fire/paramedic stations, one regional fire station and training facility, and an emergency air operations/helicopter maintenance facility, for a total of 20 Proposition F projects. Through Proposition F, regional Fire Station 82 (5769 Hollywood Boulevard) was reconstructed and opened in 2012.

Proposition Q, known as the Citywide Public Safety Bond Measure, was approved in March 2002 and allocated \$600 million to renovate, improve, expand, and construct police, fire, 911, and paramedic facilities. Proposition Q also includes renovations to existing LAFD facilities, totaling 80 LAFD facility renovation projects.

In 2006, Measure J amended Proposition F, providing flexibility in the design of new facilities and setting standards for such facilities. Specifically, Measure J allows the following: the development of new regional fire/paramedic stations to be designed and built on one or more properties that are less than two acres; standard fire/paramedic stations to be designed and built on one acre; components to be built on two or more sites within proximity; or facilities to be designed to fit on a single site of less than two acres (Los Angeles 2017).

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the *CEQA Guidelines*, the Proposed Project would have a potentially significant impact if it would result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection.

Consistent with *City of Hayward v. Trustees of California State University* (2015; 242 Cal.App.4th 833), significant impacts under CEQA consist of adverse changes to physical conditions resulting from a project. Potential impacts on public safety services are not an environmental impact that CEQA requires a project applicant to mitigate:

“[T]he obligation to provide adequate fire and emergency medical services is the responsibility of the city.” (Cal. Const., art. XIII, § 35, subd. (a)(2) [“The protection of the public safety is the first responsibility of local government, and local officials have an obligation to give priority to the provision of adequate public safety services.”].) Therefore, while response times and standards for services are discussed herein, they are provided for informational purposes only and to provide an indication of the potential need for new facilities, rather than as thresholds for significance.

The determination of significance shall be made considering whether a project would require the addition of a new fire station or the expansion, consolidation or relocation of an existing facility to maintain service, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection.

METHODOLOGY

The following analysis focuses on determining whether the Proposed Project would result in adverse physical impacts to the environment due to the expansion of existing fire protection facilities or construction of new facilities. Whether additional facilities would be required is determined primarily by considering the adequacy of existing fire protection services, impacts of the Proposed Project on demand for fire protection service, and input from the LAFD. Whether provision of new or expanded facilities would result in substantial adverse environmental effects is evaluated by considering the physical context in which facilities would be built, constraints on the size and number of new and/or expanded facilities, and an analysis of potential environmental impacts that would result from their construction.

As discussed under “Thresholds of Significance,” an impact related to public services would occur if the Proposed Project promotes growth patterns resulting in the need for and/or the provision of new or physically altered fire or emergency response facilities, the construction of which would cause significant environmental impacts in order to maintain service ratios, response times, or other performance objectives. The need for or deficiency in adequate fire and emergency response services in and of itself is not a CEQA impact, but a social or economic impact. (*City of Hayward v. B’d of Trustees* (2015) 242 Cal.App. 4th 833, 843.) To the extent that the Proposed Project causes the need for additional fire and emergency response services that result in the construction of new facilities or additions to existing facilities and the impact from that construction results in a potential impact to the environment, that is a CEQA impact that needs to be assessed in this EIR. Any discussion in this EIR of social or economic impacts that relates solely to the level of fire and life safety services provided to the community, including any existing or future needs and deficiencies, is not determinant on its own of CEQA impacts, absent those social or economic impacts resulting in physical impacts. The ultimate determination of whether there is a significant impact related to

fire and emergency response services is based on whether a significant physical impact would result from the construction of new or expanded fire and emergency response facilities.

PROJECT IMPACTS

Threshold 4.13-1	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection?
-------------------------	--

Impact 4.13-1 **Proposed Project:** The Project would allow for increased development potential that could increase demand for fire protection service in the Project Area. This may result in the need for new or expanded fire protection facilities. The size and location of new facilities is not known at this time but based on the urbanized character of the Project Area, it is anticipated that new or expanded facilities could be built without creating significant environmental impacts; therefore, impacts would be *less than significant*.

Project Impacts

The Proposed Project is an update of the existing CASP, which includes new land use and zoning regulations, incentives, and boundaries, for the purpose of encouraging affordable and mixed-income housing production. Based on the increased development capacity of the Proposed Project, the Project Area would accommodate approximately an additional 50,000 persons (an increase of 837 percent relative to baseline conditions), from 6,000 to 57,000 persons; 18,000 housing units (an increase of approximately 896 percent), from 2,000 to 20,000 units; and approximately an additional 3,000 jobs (an increase of 53 percent), from 5,000 to 8,000 jobs, by the year 2040. The Proposed Project would also update the building form, urban design, open space, parking, conservation, performance, and sign standards of the existing Project Area as necessary to support housing production and amend the existing CASP text with technical revisions that ensure consistency, clarity, and ease of implementation and reflect current and future demographic, regulatory, environmental, and economic conditions. Impacts to fire protection services resulting from construction and operation of new development are discussed below.

Construction

While the Proposed Project would allow for increased residential, commercial, and light industrial development, it would not constitute a commitment to any specific construction. Nevertheless, construction activities associated with reasonably anticipated development of the Project Area would potentially temporarily increase existing demand on fire protection and EMS. Construction activities could potentially expose combustible materials (e.g., wood, plastics, sawdust, coverings, and coatings) to fire risks from machinery and equipment sparks, exposed electrical lines, and chemical reactions in combustible materials and coatings. However, in compliance with Occupational Safety and Health Administration (OSHA) requirements, construction managers and personnel would be trained in emergency response and fire safety operations. In addition, fire suppression equipment (e.g., fire extinguishers) would be maintained on each specific construction site during construction.

Road and lane closures due to construction activities related to individual development projects could temporarily affect travel times of fire and emergency services vehicles. Traffic delays caused by potential closures could impede the ability of emergency vehicles to efficiently move along roadways to their destination. In addition, road closures may result in detours that adversely affect response times. However, individual developers are required to implement construction staging and traffic management plans

consistent with LAFD requirements, if warranted, to ensure emergency access is maintained. Moreover, construction activities facilitated by the Proposed Project would not foreseeably result in the need for expansion of existing fire stations or construction of new fire stations due to their temporary nature. Therefore, construction activity would have a *less than significant* environmental impacts related to fire protection.

Operation

Based on information provided in LAFD's Strategic Plan 2018-2020, the ability to provide adequate fire protection services is dependent on numerous factors including staffing levels, mutual aid agreements, deployment strategies, and technological advances in equipment. LAFD's primary determinant for assessing future service needs is based on their cumulative review and analysis of past incidents. Options available to LAFD include expanding fire prevention services, increasing staffing levels, and adding new fire stations(s) to underserved areas. The projected number of residents, employees and overall anticipated development levels is routinely reviewed by LAFD to assist in determining the future need for emergency services. LAFD determines the need for new fire stations based on the needs assessment that takes into account the complex set of factors discussed above, as well as geographic distribution of physical structures; access to trucks, ambulances, and other equipment; the location of new structures and anticipated response times (LAFD 2018).

Meeting service standards could also be affected by the impact of increased land use intensity and residential density in the Project Area on roadway congestion in and around the Project Area used by fire protection vehicles to access emergency sites. However, there is not a direct relationship between predicted travel delay and emergency response times because California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. Generally, multi-lane arterial roadways allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. The LAFD, in collaboration with Los Angeles Department of Transportation (LADOT), has also developed a Fire Preemption System (FPS) that automatically turns traffic lights to green for emergency vehicles traveling on designated streets in the City.

Existing regulations and policies would partially offset future increases in demand for fire protection service. For example, Project Area developers would be required to comply with current fire code standards, which require new construction to incorporate more dynamic and advanced fire and life safety technologies and fire prevention measures than was previously required. In addition, policy measures in the Proposed Project would encourage use of public transit and alternative modes of transportation, which would generally reduce traffic congestion in the Project Area. Furthermore, LAFD has a constitutional mandate to protect public safety and must respond to changing circumstances and, therefore, would act to maintain response times. As development occurs over the life time of the Proposed Project, it is expected that fire protection service levels will be evaluated and maintained by LAFD. In conformance with California Constitution Article XIII, Section 35, (a)(2), existing policies, procedures and practices related to fire protection and emergency services, LAFD would maintain acceptable emergency response times through the provision of additional personnel and equipment as needed, as well as potentially constructing new or expanding existing fire and emergency response facilities.

The ability of EMS and fire protection services to respond to calls in a timely manner depends primarily on the distance of the station to the incident and the speed at which the emergency vehicles are able to navigate intervening roadways. While growth reasonably anticipated under the Proposed Project would result in higher overall traffic volumes in the Project Area, this would not impede emergency response, since California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. Therefore, EMS and fire protection services response times generally would not change substantially as the population of the Project Area increases.

As discussed in Section 4.12, *Population, Housing, and Employment*, implementation of the Proposed Project would result in an increase in overall housing, population, and employment in the Project Area. An increase in population would foreseeably increase demand for fire or emergency protection facilities. Based on this rising demand and existing facilities that are already over capacity, it is assumed that several facilities would require expansion and at least one new station would need to be built in or near the Project Area to maintain timely response. LAFD is considering the expansion of Fire Station No. 9, located at 430 7th Street, within two miles of the Project Area, Fire Station No. 9 would be demolished and reconstructed as a larger facility. This expansion of this facility would accommodate existing staff and existing resources (Perez 2019). The existing station has not been identified as a historical resource and the site of this facility is surrounded by parking areas and commercial/industrial uses that would not be unusually sensitive to construction or operational noise, lighting, or other impacts associated with facility expansion.

Construction of new fire stations and expansion of existing fire stations to serve the Project Area would occur in an urban center and would be limited in number (possibly one or two new facilities) and size. New facilities would also be required to comply with applicable federal, State, and local regulations and policies discussed in this EIR, such as NPDES permit requirements, the City's Tree Ordinance and Noise Ordinance, and the California Building Code, including CALGreen requirements.

Potential environmental impacts of construction and operation of any new facility, as an allowed land use, have been evaluated throughout this EIR. Construction and operational impacts to air, noise, traffic, as well as other impacts of new developments are discussed throughout this EIR, and they would not be any different for a fire/paramedic station/facility. It is not foreseeable that impacts from the construction of any new stations in the Project Area would have greater or different impacts than those identified in this EIR for construction or operations. Similar to other types of development, the construction of new or expanded fire protection facilities could contribute to the significant historic resource and construction noise impacts identified in sections 4.4, *Cultural Resources*, and 4.11, *Noise*, of this EIR. According to the Los Angeles Bureau of Engineering (BOE), there are four basic configurations for fire stations but the typical standard fire/paramedic station would consist of a 15,250-square foot building on a parcel that is approximately one acre. Although the Fire Department is preparing a Standards of Cover that could result in recommendations for new fire station typologies, including those better suited to dense urban infill. Based on the urban location and the relatively small size of typical facilities, the construction of a new fire facility or expansion of an existing facility would likely qualify for an infill exemption or result in less-than-significant impacts with standard regulatory compliance measures and project specific design features or project specific mitigation measures identified through a project EIR or mitigated negative declaration. It is noted, that the EIR for Van Nuys Station No. 39, certified in 2017, found no unavoidable significant impacts for the construction of a new fire station. To the extent that any significant impacts could result from the unique characteristics of a specific site, those impacts would be speculative at this time. Furthermore, the construction of a new fire facility or expansion of an existing facility would require a project-specific environmental analysis under CEQA to address any site-specific environmental concerns. Therefore, impacts related to fire protection and emergency services would be *less than significant*.

Mitigation Measures

No significant impacts related to fire protection facilities have been identified; therefore, mitigation is not required.

CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable impacts to fire protection services includes the entire City of Los Angeles as well as areas at the City's periphery that could potentially be affected by construction of a new facility at or near the City's corporate boundary. Citywide development through 2040 would add an estimated 293,000 new households, 659,000 new residents, and 345,000 new employees (SCAG 2016).

Cumulative development throughout Los Angeles would increase overall demand for fire protection service and may create the need for more fire fighters and potentially new facilities. However, no new facilities are planned at this time, city-wide (LAFD 2018). Impacts associated with the addition of multiple fire protection facilities throughout the City are speculative since the size, location, and nature of needed new facilities is not known at this time. Nevertheless, the impacts of new facilities would be localized in nature and the addition of multiple new facilities in specific locations may have localized impacts but would not result in significant additive or cumulative impacts (i.e., the addition of multiple fire protection facilities in various parts of the City would not result in additive effects at any given location).

Past development has occurred in accordance with the growth allowed under the City of Los Angeles General Plan, and all development in the City is required to maintain consistency with City of Los Angeles fire protection regulations. Future development in the Project Area, as well as future development occurring within the entire LAFD service area, would be required to comply with all applicable LAFD fire code requirements associated with adequate fire access, fire flows, and number of hydrants as a condition of project approval. Additionally, any development project that would be located at distances that exceed response distance requirements would be required to undergo plan review by the Fire Chief, who would determine the fire suppression measures that the development project would be required to implement. New development would be required to provide upgrades to the water distribution systems serving the LAFD service area in accordance with LAFD and/or Los Angeles Department of Water and Power (LADWP) requirements. As with the code requirements for fire access, fire flows, number of hydrants, and fire suppression measures, these upgrades would be addressed for new development in conjunction with individual project approvals. These requirements would reduce the demand for additional fire services. However, to the extent new or expanded fire and emergency response facilities would be needed, the construction and operation of those facilities would be similar to those addressed in the impact section above and would not be expected to result in new or substantially different impacts from those impacts discussed in Section 4.2 Air Quality, Section 11 Noise, or Section 15 Transportation of this EIR. Without information as to design, location of new or expanded LAFD facilities and their proximity to sensitive receptors, such impacts would be speculative at this time. Similarly, the construction and operation of new fire protection facilities in the Project Area may have localized impacts, but individual facilities would not contribute to any additive cumulative or regional impacts. Therefore, the Proposed Project's incremental contribution related to fire service would not be cumulatively considerable and cumulative impacts would be *less than significant*.

Police Protection

ENVIRONMENTAL SETTING

CITYWIDE SETTING

The Los Angeles Police Department (LAPD) provides police protection services to the entire City of Los Angeles. Similar to the LAFD, the LAPD is comprised of four geographic bureaus (Valley, West, Central, and South) with 21 subdivisions. The LAPD currently employs 10,354 sworn police officers and 3,640 civilian personnel (LAPD 2022a).

The LAPD handles an estimated 2,981,238 telephone calls for service per year and approximately 1,270,278 are non-emergency related. According to the COMPSTAT Citywide Profile, there were 20,096 violent crimes, 62,786 property crimes, and 39,750 arrests in the period from January 1, 2022 to August 20, 2022 (LAPD 2022b).

PROJECT AREA SETTING

The Project Area lies within the operational boundaries of the Los Angeles Police Department (LAPD) Central Bureau. The Central Bureau encompasses a 65-square mile service area with a population of approximately 900,000 residents. The Central Bureau service boundaries include the Los Angeles City limits on the north and east Florence Avenue to the south, and Griffith Park Boundary/Western Avenue to the west. The Central Bureau oversees operations for the following area Divisions (also called Community Police Stations): Central, Hollenbeck, Newton, Northeast, and Rampart, as well as the Central Traffic Division and Central Bureau Homicide Division. The Project Area is primarily covered by the Hollenbeck and Central Divisions while the section north of the Pasadena Freeway / State Route 110 (SR 110) is located within the boundaries of the Northeast Station. The Central, Hollenbeck, and Northeast Divisions each include substations (or "drop-in" centers). These locations were established to better serve the community by providing ease of access to police services in local neighborhoods. The Hollenbeck Division, located east of downtown Los Angeles, provides for a population of roughly 200,000 people and is 15.2 square miles in size. It encompasses the communities of El Sereno, Lincoln Heights, and Boyle Heights. The Central Station is staffed by approximately 400 sworn and civilian members of the LAPD and is responsible for all police operations in downtown Los Angeles. The Central Division has a population of 40,000 people and covers approximately 4.5 square miles including the communities of Chinatown, Little Tokyo, South Park, Central City East, Historic Core, Financial District, Artists' Lofts, Olvera Street, Jewelry District, the Convention Center, the Fashion District, Toy District, and Old Bank District (LAPD 2022c). The Northeast Division is roughly 29 square miles, has a station population of about 250,000 people, and serves the communities of Atwater, Cypress Park, Eagle Rock, East Hollywood, Echo Park, Elysian Park, Elysian Valley, Glassell Park, Griffith Park, Highland Park, Los Feliz, Mt. Washington, and Silverlake. The nearest LAPD substation for the Project Area is the Chinatown Substation at 823 North Hill Street to the south of the Project Area. The Highland Park Police Station at 6045 York Boulevard is to the northeast of the Project Area and the Northeast Station at 3352 North San Fernando Road is north and west of the Project Area are the next closest. The LAPD Robbery-Homicide Division, at 150 North Los Angeles Street, is to the south and west of the Project Area.

Table 4.13-3 summarizes the stations serving the Project Area and includes the current service population and service area for each division. **Table 4.13-4** summarizes current crime statistics for Divisions 1, 11, and 13. Typical crimes include homicide, rape, robbery, aggravated assault, burglary, larceny, motor vehicle theft, and arson.

TABLE 4.13-3 LAPD STATIONS SERVING THE PROJECT AREA

Division/Station	Address	Service Population	Service Area (sq. mi.)
Central Station	251 E. 6 th Street	40,000	4.5
Hollenbeck Station	2111 E. 1st Street	200,000	15.2
Northeast Station	3353 San Fernando Road	250,000	29.0

SOURCE: LAPD 2022c, LAPD 2022d, LAPD 2023d

TABLE 4.13-4 2022 YTD CRIME STATISTICS

Division/Station	Violent Crimes ¹	Property Crimes ²
Central Area	750	2,269
Hollenbeck Area	376	923
Northeast Area	283	1,440

1. Violent crimes include homicide, rape, robbery, and aggravated assault.
2. Property crimes include burglary, motor vehicle theft, burglary/theft from motor vehicle, personal/other theft
SOURCE: LAPD 2023a, LAPD 2023b, LAPD 2023c

Response time represents the period of time elapsed from the initiation of an assistance call to the appearance of a police unit at the scene. The LAPD has a response time goal of seven minutes (Ogaz 2017). Currently, the average citywide response time is 6.1 minutes (SoCal Patch 2017). Unlike fire protection services, police units are most often in a mobile state; therefore, the distance between a police station and a project site is of little relevance. Instead, the number of deployed police officers and their proximity to crimes is more directly related to the response time.

The Central Division, which serves part of the Project Area, is staffed by approximately 400 sworn officers and currently serves a population of approximately 40,000 (LAPD 2022d); thus, there are about 10 police officers per 1,000 persons. This is above the 2015 national average number of officers per 10,000 persons (16.6) for jurisdictions with a population of over 500,000 and higher, and higher than the citywide 2015 average of 24.9 officers per 10,000 people (Governing 2015). The LAPD also uses technology to enhance strategic deployment of field officers in their service area (LAPD 2016), which can help lower average response time. PredPol software predicts the times and places where crimes are most likely to occur based on historic data on the time, location, and type of crimes committed.

REGULATORY FRAMEWORK

STATE

California Penal Code

All law enforcement agencies in California are organized and operated in accordance with the applicable provisions of the California Penal Code. This code sets forth the authority, rules of conduct, and training for peace officers. Under state law, all sworn municipal and county officers are state peace officers.

California Constitution, Article XIII, Section 35

Section 35 of Article III of the California Constitution at subdivision (a)(2) provides: “The protection of the public safety is the first responsibility of local government and local officials have an obligation to give

priority to the provision of adequate public safety services.” Section 35 of Article XIII of the California Constitution was adopted by the voters in 1993 under Proposition 172. Proposition 172 directed the proceeds of a 0.50 percent sales tax to be used exclusively for local public safety services, including police. California Government Code Sections 30051-30056 provide rules to implement Proposition 172. Section 30056 provides that a city is not allowed to spend less of its own financial resources on its combined public safety services in any given year compared to its 1992-93 fiscal year. Therefore, an agency is required to use Proposition 172 to supplement its local funds used on police protection, as well as other public safety services. In *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, the court found that, Section 35 of Article XIII of the California Constitution requires local agencies to provide fire services and that it is reasonable to conclude that a lead agency will comply with that provision and ensure that public services are provided. (See *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, 847 stating “the city has a constitutional obligation to provide adequate fire protection services”.) It is reasonable to analogize that a similar analysis would apply to police services as Section 35 of Article XIII includes a responsibility for cities to give priority to public safety services, which includes police services.

California Vehicle Code, Section 21806

Section 21806 of the California Vehicle Code (CVC) pertains to emergency vehicles responding to Code 3 incident/calls.[1] This section of the CVC states the following:

Upon the immediate approach of an authorized emergency vehicle which is sounding a siren and which has at least one lighted lamp exhibiting red light that is visible, under normal atmospheric conditions, from a distance of 1,000 feet to the front of the vehicle, the surrounding traffic shall, except as otherwise directed by a traffic officer, do the following: (a)(1) Except as required under paragraph (2), the driver of every other vehicle shall yield the right-of-way and shall immediately drive to the right-hand edge or curb of the highway, clear of any intersection, and thereupon shall stop and remain stopped until the authorized emergency vehicle has passed. (2) A person driving a vehicle in an exclusive or preferential use lane shall exit that lane immediately upon determining that the exit can be accomplished with reasonable safety....(c) All pedestrians upon the highway shall proceed to the nearest curb or place of safety and remain there until the authorized emergency vehicle has passed.

Title 13 California Code Regulations (CCR) Division 2 (CHP)

Division 2 of Title 13 of the CCR governs the operations of the California Highway Patrol.

LOCAL

City of Los Angeles General Plan Framework Element

The City of Los Angeles General Plan Framework Element, originally adopted in December 1996 and re-adopted in August 2001, provides a comprehensive vision for long-term growth within the City and guides subsequent amendments of the City’s Community Plans, Specific Plans, zoning ordinances, and other local planning programs.

Chapter 9 of the Framework Element addresses Infrastructure and Public Services. Goal 9I states that every neighborhood should have the necessary police services, facilities, equipment, and manpower required to provide for the public safety of that neighborhood. Related Objectives 9.13 and 9.13.1, which implement Goal 9I, support the monitoring and reporting of police statistics and population projections for the purpose of evaluating existing and future needs. Objective 9.14 calls for adequate police services, facilities, equipment, and personnel to be available to meet existing and future needs. Policies related to Objective 9.14 generally provide guidance for public agencies. Objective 9.15 calls for LAPD services to provide

adequate public safety in emergency situations by maintaining mutual assistance relationships with local law enforcement agencies, state law enforcement agencies, and the National Guard. These goals, objectives, and policies applicable to police protection services are summarized in **Table 4.13-5**.

TABLE 4.13-5 RELEVANT GENERAL PLAN POLICE PROTECTION GOALS, OBJECTIVES, AND POLICIES	
Framework Element – Chapter 9, Infrastructure and Public Services	
Goal 9I	Every neighborhood in the City has the necessary police services, facilities, equipment, and manpower required to provide for the public safety needs of that neighborhood.
Objective 9.13	Monitor and forecast demand for existing and projected police service and facilities.
Policy 9.13.1	Monitor and report police statistics, as appropriate, and population projections for the purpose of evaluating police service based on existing and future needs.
Objective 9.14	Protect the public and provide adequate police services, facilities, equipment and personnel to meet existing and future needs.
Policy 9.14.1	Work with the Police Department to maintain standards for the appropriate number of sworn police officers to serve the needs of residents, businesses, and industries.
Policy 9.14.5	Identify neighborhoods in Los Angeles where facilities are needed to provide adequate police protection.
Policy 9.14.7	Participate fully in the planning of activities that assist in defensible space design and utilize the most current law enforcement technology affecting physical development.
Objective 9.15	Provide for adequate public safety in emergency situations.
Policy 9.15.1	Maintain mutual assistance agreements with local law enforcement agencies, State law enforcement agencies, and the National Guard to provide for public safety in the event of emergency situations.
SOURCE: City of Los Angeles 2001	

City of Los Angeles General Plan Safety Element

The Safety Element of the Los Angeles General Plan addresses natural hazard issues related to Los Angeles Police Department (LAPD) resources (e.g., traffic safety during or following a disaster) and recognizes that most jurisdictions rely on emergency personnel (police, fire, gas, and water) to respond to emergencies.

City of Los Angeles Charter

City of Los Angeles Charter. The City Charter at Section 570 gives the power and the duty to the LAPD to enforce the penal provisions of the Charter, City ordinances, and state and federal laws. The Charter also gives responsibility to the LAPD to act as peace officers and to protect lives and property in case of disaster or public calamity.

Administrative and Municipal Codes

Section 22.240 of the Administrative Code requires the LAPD to adhere to the State standards described in Section 13522 of the California Penal Code for the training of police dispatchers. LAMC Chapter 5 includes regulations, enforceable by the police, related to fire arms, illegal hazardous waste disposal, and nuisances (such as excessive noise), and providing support to the Department of Building and Safety Code Enforcement inspectors and the LAFD in the enforcement of the City's Fire, Building, and Health Codes. The LAPD is also given the power and the duty to protect residents and property, and to review and enforce specific security related mitigation measures in regard to new development.

Los Angeles Police Department (LAPD) Computer Statistics Unit (COMPSTAT) Program.

The LAPD COMPSTAT was created in 1994 and implements the General Plan Framework goal of assembling statistical population and crime data to determine necessary crime prevention actions. This system implements a multi-layer approach to police protection services through statistical and geographical information system (GIS) analysis of growing trends in crime through its specialized crime control model. COMPSTAT has effectively and significantly reduced the occurrence of crime in Los Angeles communities through accurate and timely intelligence regarding emerging crime trends or patterns.

LAPD Guidelines and Plan Review

Projects subject to City review are required to develop an Emergency Procedures Plan to address emergency concerns and practices. The plan is subject to review by LAPD. In addition, projects are encouraged to comply with the LAPD's Design Out Crime Guidelines, which incorporates techniques of Crime Prevention Through Environmental Design (CPTED) and seeks to deter crime through the design of buildings and public spaces. Specifically, projects are recommended to:

- Provide on-site security personnel whose duties shall include but not be limited to the following:
- Monitoring entrances and exits.
- Managing and monitoring fire/life/safety systems.
- Controlling and monitoring activities in parking facilities.
- Install security industry standard security lighting at recommended locations including parking structures, pathway options, and curbside queuing areas.
- Install closed-circuit television at select locations including (but not limited to) entry and exit points, loading docks, public plazas and parking areas.
- Provide adequate lighting of parking structures, elevators, and lobbies to reduce areas of concealment.
- Provide lighting of building entries, pedestrian walkways, and public open spaces to provide pedestrian orientation and to clearly identify a secure route between parking areas and points of entry into buildings.
- Design public spaces to be easily patrolled and accessed by safety personnel.
- Design entrances to, and exits from buildings, open spaces around buildings, and pedestrian walkways to be open and in view of surrounding sites; and
- Limit visually obstructed and infrequently accessed "dead zones."

LAPD Strategic Plan 2019-2021

The Los Angeles Police Department (LAPD) Strategic Plan 2019-2021, LAPD: 2020 & Beyond, is a guiding document reflective of emerging trends, complex issues, and demands of the policing environment. The plan covers the fiscal years 2019-2021 and provides goals and key activities to improve the safety and quality of life for all Angelenos. The intent of the Strategic Plan is to serve as an "organizational blueprint to maximize our workforce potential while providing the highest level of professionalism for those who visit, work, and live in the City of Los Angeles".

The Plan has six goals: (1) Protect Los Angeles; (2) Engage Los Angeles; (3) Improve Organization Accountability; (4) Modernize Technology; (5) Enrich Training; and (6) Maximize Workforce Potential. The goals are then followed by initiatives, key activities associated with each initiative and milestones.

Protecting the City of Los Angeles is the primary function of LAPD. The initiatives under this goal are reduce crime and victimization, reduce gun violence, emphasize preparedness and counter-terrorism, improve traffic safety, increase investigative effectiveness, and support coordinated City efforts to address homelessness.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the *CEQA Guidelines*, the Proposed Project would have a potentially significant impact if it would result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection services.

METHODOLOGY

The following analysis focuses on determining whether the Proposed Project would result in adverse physical impacts to the environment due to the expansion of existing police facilities or construction of new facilities. Whether additional facilities would be required is determined primarily by considering the adequacy of existing police services, impacts of the Proposed Project on demand for police protection facilities, and input provided by the LAPD. The need for or deficiency in adequate police services in and of itself is not a CEQA impact, but a social or economic impact. (*City of Hayward v. B'd of Trustees* (2015) 242 Cal. App. 4th 833, 843). To the extent the Proposed Project causes a need for additional police services and that results in the construction of new facilities or additions to existing facilities, the potential impact to the environment from that construction is a CEQA impact that needs to be assessed in this EIR. Any discussion in this EIR that relates solely to the level of police protection services provided to the residents or users of the Project Area and its surrounding community, including any existing or future needs and deficiencies, is for informational purposes only. The ultimate determination of whether there is a significant impact related to police protection services is based on whether a significant impact will result from the construction of new or expanded police facilities. Whether provision of new or expanded facilities would result in substantial adverse environmental effects is evaluated by considering the physical context in which facilities would be built, constraints on the size and number of new and/or expanded facilities, and an analysis of potential environmental impacts that would result from their construction. Police protection service needs are dependent on the size of the service population and the geographic area served, the number and types of calls for service, and the characteristics of a project and its surrounding community. According to the LAPD, impacts on police protection services are considered significant if the demand for services exceeds the capacity of existing facilities, or if a station area is located outside specified distances from the project area.

To the extent that the Proposed Project results in the need for new police services that will cause the need for new or altered police facilities, the analysis below evaluates the potential need for new facilities and associated potential impacts from the construction of new police protection facilities or the expansion of existing police protection facilities if they could be required.

PROJECT IMPACTS

Threshold 4.13-2	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection?
-------------------------	---

Impact 4.13-2 **Proposed Project:** The Proposed Project would accommodate residential, commercial, and light industrial development in the Project Area, which would increase demand for police services and officers in order to maintain acceptable response times. However, due to existing limited capacity at police stations serving the Project Area, growth under the Proposed Project is anticipated to result in the need for new or expanded police facilities. However, based on the urbanized character of the Project Area, it is anticipated that new or expanded facilities could be built without creating significant environmental impacts; therefore, impacts would be *less than significant*.

Project Impacts

Construction

Construction related to future development within the Project Area would have the potential to temporarily increase the demand on police services. Construction sites can pose a nuisance with respect to vandalism and theft. Road and lane closures due to construction activities related to individual development projects could affect response times of police vehicles. Traffic delays caused by potential closures could impede the ability of police vehicles to efficiently move along roadways to their destination. Additionally, temporary road closures may also result in detours that impact response time. Any development project that will cause temporary road closures is required to submit a plan to LADOT for approval to ensure any impacts are minimized and, if necessary, proper signage and flagmen provided to avoid impacts. Additionally, large projects are required to develop a construction staging and traffic management plan, as necessary, to ensure that emergency access is maintained and the construction sites are secure. Construction activities related to the Proposed Project's reasonably anticipated development is not expected to result in significant impacts to emergency services or response times. Therefore, construction activities for reasonably anticipated development under the Proposed Project would not result in the need for expanding existing police facilities or construction of new police facilities to maintain police service levels and objectives due to the temporary nature of construction. Operation

The Proposed Project would accommodate new residential, commercial, and light industrial development in the Project Area, resulting in an estimated 50,000 persons (an increase of 837 percent relative to baseline conditions), from 6,000 to 57,000 persons; 18,000 housing units (an increase of approximately 896 percent), from 2,000 to 20,000 units; and approximately an additional 3,000 jobs (an increase of 53 percent), from 5,000 to 8,000 jobs, by the year 2040. A larger population could increase demand for LAPD services by increasing the opportunities for crime, though an increase in development intensity and residential density would not necessarily result in a directly proportional increase in crime. An area's crime rate is influenced by many factors, such as police presence, implementation of crime prevention measures, department funding, and socioeconomic factors. To ensure that necessary police services, facilities, and equipment are provided for the public safety needs of all neighborhoods, demand for existing and projected police services and facilities is monitored and forecasted by LAPD in order to maintain standards. Accordingly, as development occurs over the lifetime of the Proposed Project, police protection service levels would continue to be evaluated and maintained by LAPD in accordance with existing policies, procedures and

practices. Individual developments in the Project Area would be required to incorporate design features to deter crime. The LAMC and Los Angeles Building Code (LABC) include recently adopted requirements regarding lighting and/ or security locks and devices for residential uses, as well as outdoor lighting requirements for a variety of uses (e.g., LABC Chapter 67, 1029, 8697) (Los Angeles Department of Building and Safety [LADBS] 2017). Additionally, LAPD would review development project applications to determine the types of design features that the development project would need to incorporate to deter crime, consistent with the techniques of CPTED.

The projected increase in population could also affect the ability to meet service standards as a result of increased roadway congestion. As discussed in Section 4.15, *Transportation and Traffic*, of this EIR, implementation of the Proposed Project would result in land use intensification and an organized and coordinated development pattern that would increase accessibility of destinations while minimizing the related growth in vehicle trips and VMT per capita. While implementation of the Proposed Project could impact segment-level LOS, there is not a direct relationship between predicted travel delay and emergency response times as California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. Designated emergency and disaster routes within the Project Area would be maintained. Generally, multi-lane arterial roadways allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. On congested roadways, multi-lane arterial roadways with continuous center left-turn lanes facilitate emergency access when the thru lanes experience delays. Additionally, as previously mentioned under Existing Setting, various roadways within the Project Area are equipped with FPS, a system that automatically turns traffic lights to green for emergency vehicles traveling on designated streets. Additional demand for police service would need to be accommodated, at least in part, through the hiring of new patrol officers who would require office space and patrol cars. However, due to existing over-capacity issues and the age of existing facilities, it is assumed that replacement and expansion of existing facilities, or construction of new facilities, would be required to maintain adequate police service in the Project Area through 2040. Although the exact types and locations of future new facilities are not known at this time, it is anticipated that new facilities would be community facilities similar to the Central Community Police Station located at 251 E. 6th Street and the Hollenbeck Community Police Station located at 2111 E. 1st Street. Such facilities could generally be accommodated in existing buildings or small new structures and could be developed without new significant environmental impacts beyond those described throughout this EIR. Police protection service levels would continue to be evaluated and maintained by LAPD in accordance with existing policies, procedures and practices as development occurs over the lifetime of the Proposed Project.

Construction of new or expanded police stations would occur in an urban center and would be limited in number and size. New facilities would also be required to comply with applicable federal, State, and local regulations and policies discussed in this EIR, such as NPDES permit requirements, the City's Tree Ordinance and Noise Ordinance, and the California Building Code, including CALGreen requirements.

The environmental impacts of construction and operation of any new facility, as an allowed land use, have been evaluated throughout this EIR. Potential impacts to air, noise, traffic, as well as other impacts of new developments are discussed in the impact sections of this EIR and would not be different for the construction of a LAPD station/facility. It is not foreseeable that impacts from the construction or operation of new or expanded police facilities in the Project Area would have greater or different impacts than those identified in this EIR for construction or operations. It is unlikely, but possible, that, similar to other types of development, the construction of new or expanded police protection facilities could contribute to the significant historic resource and construction noise impacts identified in sections 4.4, *Cultural Resources*, and 4.11, *Noise*, of this EIR. Should new facilities be needed, such facilities are anticipated to be infill developments surrounded by urban uses and would not require new or expanded infrastructure. Based on the urban character of the Project Area, the construction of new police facilities or expansion of an existing

facility would most likely result in a less-than-significant impact and/or possibly qualify for an infill exemption. To the extent that any significant impacts could result from the unique characteristics of a specific project site, those impacts would be speculative at this time. Furthermore, although it is anticipated that needed new community facilities could be developed without significant environmental effects beyond those identified in this EIR, the construction a new LAPD facility or expansion of an existing facility would require project-specific environmental analysis under CEQA to address any site-specific environmental concerns. Therefore, impacts related to police protection services, would be *less than significant*.

Mitigation Measures

No significant impacts related to police facilities have been identified; therefore, mitigation is not required.

CUMULATIVE IMPACTS

The Proposed Project along with cumulative development could create a significant impact on polices services and facilities if the need for additional services and facilities extends beyond existing levels of service resulting in new construction that has a significant impact on the environment. The geographic area to analyze cumulatively impacts to police protection services includes the entire City of Los Angeles as well as areas at the City's periphery that could potentially be affected by construction of a new facility or expansion of an existing facility at or near the City's corporate boundary. Citywide development through 2040 would add an estimated 659,000 new residents, 293,000 new households, and 345,000 new employees (SCAG 2016).

Future needs for police protection are reviewed regularly, including during the budgeting process. As described above, development projects within the City, including the Project Area, would be subject to review upon project submittal of the development application and may be required to provide security features, such as security cameras, private security services, and/or on-site police drop-in facilities that reduce the demand for police service. Future development would also be required to incorporate design elements relative to security, and semi-public and private spaces such as CPTED. These features may include, but not be limited to, access control to buildings, secured parking facilities, walls/fences with key systems, well-illuminated public and semi-public space designed with a minimum of dead space to eliminate areas of concealment, and location of toilet facilities or building entrances in high-foot traffic areas. Development with these design measures should reduce the potential for incidents that will result in demand for police protection services throughout the City. Nevertheless, implementation of the Proposed Project along with cumulative development throughout the City would increase overall demand for police service and may create the need for more officers and potentially new facilities. As discussed above, the provision of police services in the City is based on the community's existing and projected needs as determined by the LAPD. When an evaluation indicates that response times have increased, the acquisition of equipment, personnel, and/or new stations would be considered and procured by the LAPD. However, environmental impacts associated with the construction of new or expanded facilities would not be expected to result in significant environmental effects. As demand for LAPD services increases, LAPD will act to maintain adequate service levels. As discussed, there are no planned facilities at this time. However, in the event the Proposed Project would result in the need for new or expanded LAPD facilities, the construction and operation of new facilities would not be expected to result in new or substantially different impacts from those impacts discussed in other sections of this EIR, such as traffic, air, noise. Such facilities would likely be small neighborhood facilities that could be accommodated in existing buildings or small new structures. Construction of such development would likely not result in new significant impacts and would likely qualify for infill exemptions. Therefore, any potential impacts of new facilities would be localized in nature and the addition of new facilities in specific locations would not result in significant cumulative impacts. To the extent there are site specific conditions that would result in impacts, such impacts would

be speculative at this time. Therefore, the incremental effect of the Proposed Project related to police facilities would not be cumulatively considerable and cumulative impacts would be less than significant.

Schools

ENVIRONMENTAL SETTING

CITYWIDE SETTING

The Los Angeles Unified School District (LAUSD) serves an area totaling 710 square miles, including most of the City of Los Angeles and the entirety or portions of 26 cities and unincorporated areas of Los Angeles County (LAUSD 2022a). LAUSD enrolled 519,586 students in pre-K through 12th grade for the 2020-2021 school year, 23,094 students in other enrollment and 19,244 students in adult education courses (LAUSD 2022a). The District includes 18 primary schools, 436 elementary schools, 77 middle schools, 86 high schools, 54 option schools, 68 Magnet schools, 27 multi-level schools, 12 special education schools, 2 home/hospital schools, 255 K-12 Magnet centers (i.e., Magnet schools within regular campuses), 227 charter schools, and 164 other schools and centers.

LAUSD provides a number of programs that allow residents within LAUSD boundaries to attend schools outside of their residential community (LAUSD 2022b). Magnet schools offer a themed core-curriculum (e.g., business, communication arts, gifted/highly gifted/high ability, liberal arts, and visual and performing arts) and provide bus services for their students to promote greater ethnic and racial integration; the Capacity Adjustment Program (CAP) provides busing when a school reaches capacity and students need to be transported to another school; Permits with Transportation (PWT) provides busing for non-Anglo students to attend in a more integrated environment and vice versa; and Public School Choice/No Child Left Behind (PSC/ NCLB) offers busing for students who attend a Program Improvement School and wish to attend a non-Program Improvement School. Nevertheless, the majority of LAUSD students attend schools within their residential community. Enrollment is categorized as either “actual” or “resident” enrollment. As noted in **Table 4.13-6**, actual enrollment is the number of students actually attending the school at the start of the reported school year, including magnet students and resident enrollment is the total number of students living in the school’s attendance area and who are eligible to attend at the start of the school year, plus any on-site magnet schools.

PROJECT AREA SETTING

LAUSD currently operates 2 elementary schools in the Project Area; Anne Street Elementary located at 126 E. Bloom Street, and Albion Street Elementary located at 322 S. Avenue. In addition, the Project Area lies within a “school choice area” that include an additional 10 schools. These include two elementary schools, one middle school and 7 high schools (LAUSD 2022a). Students residing within the attendance boundaries of any of the schools included in each “zone of choice” may attend any of the schools within that zone. **Table 4.13-6** provides the names, locations and enrollment of LAUSD schools serving the Project Area.

TABLE 4.13-6 PUBLIC SCHOOLS SERVING THE PROJECT AREA - CAPACITY AND ENROLLMENT			
School Name	School Type	Location	2021-2022 Enrollment
Schools Located Within the Project Area			
Albion Street Elementary	Elementary	322 S Avenue 18, Los Angeles, Ca, 9003	152
Anne Street Elementary	Elementary	126 E Bloom St, Los Angeles, Ca, 90012	72
School Choice Schools Service the Project Area			
Contreras Learning Complex ALC	High School	322 Lucas Avenue, Los Angeles, CA 90017	493
Contreras Learning Complex Business & Trade	High School	322 Lucas Avenue, Los Angeles, CA 90017	425
Contreras Learning Complex Social Justice	High School	322 Lucas Avenue, Los Angeles, CA 90017	435
Contreras Learning Complex Global Studies	High School	322 Lucas Avenue, Los Angeles, CA 90017	331
Cortines School of Visual & Performing Arts	High School	450 N Grand Avenue, Los Angeles, CA 90012	1,159
Belmont	High School	1575 W 2nd Street, Los Angeles, CA 90026	642
Roybal Learning Complex	High School	1200 Colton Street, Los Angeles, CA 90026	979
Castelar Street Elementary DL Two-Way Im Mandarin	Elementary	840 Yale Street, Los Angeles, CA 90012	598
Castelar Street Elementary	Elementary	840 Yale Street, Los Angeles, CA 90012	598
Florence Nightingale Middle School	Middle School	3311 N Figueroa Street, Los Angeles, CA 90065	809
Notes: Data is provided for the 2021-2022 School Year.			

Enrollment and capacity data for the public schools serving the Project Area indicates that the Area's schools are already over-burdened. Currently, ten schools and four zones of choice are overcrowded (i.e., have a seating shortage or a safety margin of less than 20 seats). In total, Area schools currently have a deficit of 1,742 seats for middle school students, and a deficit of 279 seats for high school students; there are, however, 530 seats available for Elementary and Pre-K. Seating availability is calculated using residential enrollment numbers, which includes the total number of students eligible to attend a school, rather than actual enrollment numbers. Currently, all schools are able to accommodate actual enrollment.

Projected enrollment and capacity data are also provided in **Table 4.13-6** for a five-year horizon. School capacity is projected to decrease for all schools in five years. This does not indicate a reduction in available school facilities, but rather an anticipated decrease in classroom utilization due to implementation of LAUSD operational goals and availability of budgetary resources to support smaller class sizes. In addition, resident enrollment is expected to decrease based on recent enrollment trends (LAUSD 2017c). Under the future scenario, an additional two elementary schools and one zone of choice would experience overcrowding, resulting in a total of 12 schools and five zones of choice potentially facing seating shortages.

REGULATORY FRAMEWORK

STATE

California Education Code

Educational services and school facilities for the Project are subject to the rules and regulations of the California Education Code, the California Department of Education (CDE) and governance of the State Board of Education (CBE) (Gov. Code Section 33000, et seq.). The CDE is the government agency responsible for public education throughout the State. With the State Superintendent of Public Instruction, the CDE is responsible for enforcing education law and regulations and for continuing to reform and improve public elementary school, secondary school, childcare programs, adult education, and preschool programs. The CDE oversees funding and student testing and achievement levels for all state schools. A sector of the CDE, the SBE is the 11-member governing and policymaking body of the California Department of Education (CDE) that sets Kindergarten through 12th Grade (K–12) education policy in the areas of standards, instructional materials, assessment, and accountability. The State also provides funding through a combination of sales and income taxes. In addition, pursuant to Proposition 98, the State is also responsible for the allocation of educational funds that are acquired from property taxes. Further, the governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement against any construction within the boundaries of the district, for the purpose of funding the construction or reconstruction of school facilities.

Class Size Reduction Kindergarten-University Public Education Facilities Bond Act of 1998.

Proposition 1A, the Class Size Reduction Kindergarten-University Public Education Facilities Bond Act of 1998 (Ed. Code, Section 100400–100405) is a school construction funding measure that was approved by the voters on the November 3, 1998 ballot. This Act created the School Facility Program where eligible school districts may obtain state bond funds.

Senate Bill 50

The Leroy F. Greene School Facilities Act of 1998 (known as the Greene Act), enacted in 1998, is a program for funding school facilities largely based on matching funds. For new school construction, grants provide funding on a 50/50 State and local match basis. For school modernization, grants provide funding on a 60/40 State and local match basis. Districts that are unable to provide some, or all, of the local match requirement and are able to meet the financial hardship provisions may be eligible for additional State funding.

The Greene Act permits the local district to levy a fee, charge, dedication, or other requirement against any development project within its boundaries, for the purpose of funding the construction or reconstruction of school facilities. The Act also sets a maximum level of fees a developer may be required to pay. Pursuant to Government Code Section 65996, the payment of these fees by a developer serves to mitigate all potential impacts on school facilities that may result from implementation of a project to a less-than-significant level.

Open Enrollment Policy (Cal. Educ. Code Sections 48350, et seq.)

The open enrollment policy is a state-mandated policy that enables students located in the LAUSD to apply to any regular, grade-appropriate LAUSD school with designated “open enrollment” seats. Open enrollment seats are granted through an application process that is completed before the school year begins. Under the Open Enrollment Policy, students living in a particular school’s attendance area are not displaced by a student requesting an open enrollment transfer to that school.

REGIONAL

Los Angeles Unified School District

As indicated above, the State is primarily responsible for the funding and structure of the local school districts, and in this case, LAUSD. As LAUSD provides education to students in many cities and County areas, in addition to the City, its oversight is largely a District-level issue. Public schools operate under the policy direction of elected governing district school boards (elected from the local area) as well as by local propositions which directly impact the funding of facility construction and maintenance. Pursuant to the Greene Act, LAUSD collects developer fees for new construction within its boundaries. The LAUSD School Facilities Needs Analysis has been prepared to support the school district's levy of the fees authorized by Section 17620 of the California Education Code. Payment of these fees would be mandatory for the Project Applicant and would fully mitigate any impact upon school services generated by the Project.

LAUSD Strategic Plan 2022-2026

The LAUSD Strategic Plan 2022-2026 (Strategic Plan) represents the LAUSD's framework towards a commitment to 100 percent graduation. In following the Strategic Plan's fundamental strategy, the LAUSD will direct its efforts and resources to recruit, develop, and support principals and teachers in creating a learning environment that ensures 100 percent of students achieve and graduate. The Strategic Plan identified four main goals: (1) Postsecondary Preparedness; (2) Literacy; (3) Numeracy; (4) Social/Emotional Wellness. The five pillars of the Strategic Plan (1) Academic Excellence, (2) Joy and Wellness, (3) Engagement and Collaboration, (4) Operational Effectiveness, and (5) Investing in Staff. Furthermore, the Strategic Plan provides key initiatives to achieve these commitments from which implementation plans will be created. Plans will be structured to include specific action steps, responsibilities, and timelines. As such, the LAUSD will be able to monitor and measure progress and provide accountability during the Strategic Plan's implementation process.

LAUSD Choices Program

LAUSD provides education choices including magnet and permits with transportation (PWT) programs to students residing within the LAUSD boundaries. Students interested in enrolling in LAUSD magnet and PWT programs are required to apply through LAUSD eChoices. Magnet schools under the Choice Program include business, communication arts, center for enriched studies, gifted/highly gifted/high ability, liberal arts, magnet schools assistance program, public service, science/technology/engineering/math, and visual and performing arts.

LOCAL

Los Angeles Citywide General Plan Framework (Framework Element)

Chapter 9, Infrastructure and Public Services of the Framework Element includes goals, objectives, and policies applicable to public schools; these are summarized in **Table 4.13-7**.

TABLE 4.13-7 RELEVANT GENERAL PLAN SCHOOL GOALS, OBJECTIVES, AND POLICIES	
Framework Element – Chapter 9 Infrastructure and Public Services	
Goal 9N	Public schools that provide a quality education for all of the City's children, including those with special needs, and adequate school facilities to serve every neighborhood in the City so that students have an opportunity to attend school in their neighborhoods.
Objective 9.31	Work constructively with the Los Angeles Unified School District to monitor and forecast school service demand based upon actual and predicted growth.
Policy 9.31.1	Participate in the development of, and share demographic information about, population estimates.
Objective 9.32	Work constructively with Los Angeles Unified School District to promote the siting and construction of adequate school facilities phased with growth.
Policy 9.32.1	Work with the Los Angeles Unified School District to ensure that school facilities and programs are expanded commensurate with the City's population growth and development.
Policy 9.32.2	Explore creative alternatives for providing new school sites in the City, where appropriate.
Policy 9.32.3	Work with LAUSD to explore incentives and funding mechanisms to provide school facilities in areas where there is a deficiency in classroom seats.
Objective 9.33	Maximize the use of local schools for community use and local open space and parks for school use.
Policy 9.33.1	Encourage a program of decision-making at the local school level to provide access to school facilities by neighborhood organizations.
Policy 9.33.2	Develop a strategy to site community facilities (libraries, parks, schools, and auditoriums) together.
SOURCE: City of Los Angeles 2001	

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the *CEQA Guidelines*, the Proposed Project would have a potentially significant impact related to schools if it would result in substantial adverse physical impacts associated with the provision of new or physically altered school facilities, or need for new or physically altered school facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for schools.

METHODOLOGY

The following analysis focuses on determining whether the Proposed Project would result in adverse physical impacts to the environment due to the expansion of existing school facilities or construction of new facilities. Whether additional facilities would be required is determined primarily by considering the adequacy of existing school facilities, impacts of the Proposed Project on demand for school facilities, and applicable regulations and policies that would influence future provision of school facilities and allow for mitigation of potential environmental impacts.

Based on the above, for purposes of this EIR, an impact on schools would occur if the Proposed Project promotes growth patterns resulting in the need for and/or the provision of new or physically altered public school facilities (including charter schools), the construction of which would cause significant

environmental impacts in order to maintain service, or other performance objectives. To the extent that the Proposed Project causes impacts to classroom sizes or school service impacts that results in the construction of new facilities or alterations to existing facilities, and the impact from that construction results in a potential impact to the environment, that is a CEQA impact that needs to be assessed in this EIR. Any discussion in this EIR that relates solely to the level of school services provided to the residents of the Project Area, including any existing or future needs and deficiencies, is only relevant to the extent it supports potential impacts from construction to address the deficiency.. The ultimate determination of whether there is a significant impact related to schools is based on whether a significant impact will result from the construction of new or expanded school facilities.

The discussion of impacts to public schools addresses impacts for the Project Area. Public school service needs are dependent on the size of the service population and the geographic area served. This analysis estimates the number of students that would be generated by reasonably anticipated development with the Proposed Project using LAUSD student generation rates and assesses whether existing and planned LAUSD school facilities expected to serve the Project Area would have sufficient available capacity to accommodate the students (LAUSD 2022c). If there would not be sufficient available capacity, the EIR will consider whether new school facilities will be needed, and if foreseeable, whether the construction of the school facilities will result in a significant impact.

PROJECT IMPACTS

Threshold 4.13-3	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service or other performance objectives for public schools?
-------------------------	---

Impact 4.13-3 **Proposed Project:** The Proposed Project would allow for development that would increase the student population of the **Project Area** and may create the need for new or expanded school facilities. However, based on the urbanized character of the **Project Area**, it is anticipated that new or expanded school facilities could be built without creating significant environmental impacts.—Therefore, impacts resulting from the provision of school facilities would be *less than significant*.

Project Impacts

The Proposed Project would accommodate new residential development, resulting in approximately 18,000 new units (an increase of approximately 896 percent) and an additional 50,000 persons (an increase of 837 percent) by the year 2040. Non-residential uses, including commercial, industrial and public facility uses, would result in approximately 13,873,000 square-feet of new development. As summarized in **Table 4.13-8**, residential and non-residential development accommodated by the Proposed Project would result in approximately 7,358 new students by 2040. Of this total, an estimated 3,836 would enroll in elementary school, 1,128 would enroll in middle school, 2,127 would enroll in high school, and 267 would enroll in special day classes.

TABLE 4.13-8 ANTICIPATED STUDENT GENERATION IN THE PROJECT AREA						
	Units	Student Generation				Total Students Generated
		Elementary School (TK-6)	Middle School (7-8)	High School (9-12)	SDC	
Residential ¹	18,024 du	3,520	970	1,930	267	6,687
Non-Residential ²	13,873,000 sf	316	158	197		671
Total Students Generated by the Proposed Project		3,836	1,128	2,127	267	7,358

Note: du = dwelling units; sf = square feet; TK = Transitional Kindergarten; SDC = Specialized Day Care
Totals may not add up due to rounding.

¹ Student generation rates for residential use is based on Level 1 – Developer Fee Justification Study for Los Angeles Unified School District (LAUSD 2022c). Residential Generation Rates: Elementary: 0.1953/du, Middle School: 0.0538/du, High School: 0.1071 /du, SDC: 0.0148/du

² Student generation rates for non-residential use is based on the average of office and retail/service student generation rates for a conservative estimate, taken from the LAUSD Commercial/Industrial Development School Fee Justification Study, September 2010 (LAUSD 2010). Non-residential Generation Rates: Elementary: 0.0228/1,000 sf, Middle School: 0.0114/1,000 sf, High School: 0.0142/1,000 sf. Non-residential uses include commercial, industrial, and public facilities.

As shown in **Table 4.13-6**, above, the Project Area is currently served by a total of nine different public elementary, middle and high schools.

It is reasonably foreseeable that over the 20-year plan horizon the reasonably anticipated development from the Proposed Project would result in the need for and construction of new or expanded schools. If new or expanded schools are determined to be necessary during the life of the Proposed Project, such facilities would occur where allowed under the designated land use and/or in proximity to residential uses. The environmental impacts of the construction and operation of new facilities, as an allowed land use, have been evaluated throughout this EIR. Specifically, the EIR analyzes anticipated effects of the Proposed Project related to air quality, noise, traffic, utilities, and other environmental impact areas. It is not foreseeable that impacts from building new schools or new additions to schools in Project Area would have greater or different impacts than those identified in this EIR for construction or operations. Depending on the location of new schools, if they are determined to be needed, impacts related to particular locations could occur, however such impacts are too speculative to assess without information as to design, location and proximity to the population to be served. LAUSD's Facilities Division monitors growth and school capacity and determines future school needs. Should new facilities be needed, such facilities are anticipated to be infill developments surrounded by urban uses and would not require new or expanded infrastructure. Based on the urban location and size, the construction of new schools or expansion of an existing facility could result in less than significant impacts and or possibly qualify for an infill exemption. To the extent that any significant impacts could result from the unique characteristics of a specific project site, or specific characteristics of a given school (e.g., night lighting, performance spaces), those impacts would be speculative at this time. Furthermore, in the event that LAUSD constructs a new school or physically alter an existing facility, a project-specific environmental analysis would be required under CEQA to address site-specific environmental concerns. However, LAUSD's Program EIR for the School Update Program cites declining enrollment across LAUSD of approximately four percent by 2030 (See Program EIR page 4-3 and 4-4) and this is supported by recent LAUSD data. Additionally, the COVID-19 pandemic has accelerated the declining enrollment due to increases in remote learning. Declining enrollments are also a result of families moving to more affordable areas outside of the City and the growth of charter schools. Additionally, LAUSD has employed several measures to help relieve school capacity. LAUSD employs the LAUSD Choices Program that provides education choices including magnet and PWT programs to students residing within the LAUSD boundaries. Magnet schools under the Choice Program include business, communication arts, center for enriched studies, gifted/highly gifted/high ability, liberal arts, magnet schools assistance program, public service, science/technology/engineering/math, and visual and performing arts. LAUSD also offers the additional school option of independent Charter Schools that

operate through LAUSD. Finally, LAUSD has recently invested in expanding school capacity. LAUSD constructed 131 new school between 2010 and 2014 as part of its New School Construction Program to address overcrowded conditions. Since then, more than 170,000 new seats have been added to the district. Together, these efforts help alleviate schools that are operating at or over capacity. As a result of the declining enrollment and addition of new schools and school options, it is unlikely that LAUSD will need to expand existing schools and/or provide new facilities in order to accommodate the additional students generated by the Proposed Project.

All development in California is subject to California Government Code Section 65995, which allows LAUSD to collect impact fees from developers of new residential and commercial/industrial space. These fees are collected on residential and commercial development and may be used to pay for all of the following: land (purchased or leased) for school facilities, design of school facilities, permit and plan checking fees, construction or reconstruction of school facilities, testing and inspection of school sites and school buildings, furniture for use in new school facilities, and interim school facilities (purchased or leased) to house students generated by new development while permanent facilities are constructed. Such development would assist in funding efforts necessary to alleviate school overcrowding and would ensure that new development under the Proposed Project would bear its fair share of the cost of accommodating additional students. Based on all of the above, impacts from the Proposed Project would be *less than significant*.

Mitigation Measures

No significant impacts related to schools have been identified; therefore, mitigation is not required.

Cumulative Impacts

The geographic area to analyze cumulatively considerable impacts to schools includes the entire school district in which the Proposed Project is located, which is the LAUSD. The LAUSD includes the entire City as well as adjacent areas that are served by LAUSD that could be affected by the construction of new school facilities. Citywide growth through 2040 is projected to add an estimated 659,000 new residents, 293,000 new households, and 345,000 new employees (SCAG 2016).

Cumulative development throughout Los Angeles would increase overall demand for public schools and potentially create a need for new facilities. The impacts of individual schools would generally be localized in nature and would not contribute substantially to any cumulative districtwide impacts. The Proposed Project would contribute to increases in enrollment at LAUSD schools, but impacts related to the development of schools would be primarily restricted to the Project Area. Depending on the design and location of new schools, if they are determined to be needed, construction and operational impacts (such as traffic, noise, and lighting) could occur. However, as LAUSD recently constructed schools throughout the City and is now experiencing declining enrollment, the construction of new schools is not anticipated to be necessary. LAUSD's Facilities Division monitors growth and school capacity and determines future school needs. Appropriate school fees would bear its fair share of the cost of the cost of accommodating additional students generated by individual projects. Any school construction project that would result from cumulative growth would be subject to environmental review. . . . Furthermore, the construction and operation of new or expanded school facilities in the Project Area may have localized impacts, but individual facilities would not contribute to any additive cumulative or regional impacts. Therefore, the incremental effect of the Proposed Project with respect to school capacity or new school construction would not be cumulatively considerable and cumulative impacts would be less than significant.

Libraries

ENVIRONMENTAL SETTING

CITYWIDE SETTING

The Los Angeles Public Library (LAPL) System provides library services to the City of Los Angeles. The Central Library, which is located less than two miles from the boundary of the Project Area, serves as LAPL's headquarters. In addition, the LAPL operates 72 community branches (LAPL 2015). The LAPL collection includes more than 6.5 million items, including digital and print items that are borrowed more than 15 million times a year. The library system also offers an array of other services to the LA community, such as homework help, story-time, professional development services, lecture series, music and arts events, and a summer reading series for kids. In total, LAPL offers more than 18,000 public programs a year (LAPL 2015).

LAPL members have access to materials housed at libraries throughout the LAPL system through the library loan program and can pick up materials at whichever library is most convenient. Every branch library offers free wi-fi and use of computer workstations that provide Internet access; the ability to search the LAPL online catalog; access to subscription databases, word processing and language learning tools, and historic document and photograph collections; and access to specially designed websites for children, teens, and Spanish speakers.

PROJECT AREA SETTING

The Project Area does not contain any community branch libraries. However, the Chinatown Branch Library, located on 639 N Hill Street and the Lincoln Heights Branch Library located at 2530 Workman Street are located less than a mile from the Project Area boundary.

The Chinatown Branch Library attracts people from throughout Southern California due to its extensive collection of Chinese materials (e.g., magazines, newspapers, books, movies) and programs geared to first-generation Chinese Americans or recent immigrants, such as a bi-lingual Chinese citizenship class (Liang 2017). The library houses over 80,000 print items in a 14,500 sf building (Liang 2017).

The Lincoln Heights Branch Library is the second oldest branch library in the Los Angeles Public Library system. Located in the Lincoln Heights section of Los Angeles, California, it was built in the Classical Revival and Italian Renaissance Revival styles in 1916 with a grant from Andrew Carnegie. One of three surviving Carnegie libraries in Los Angeles, it has been designated as a Historic-Cultural Monument and listed on the National Register of Historic Places.

REGULATORY FRAMEWORK

City of Los Angeles General Plan Framework Element

The City's General Plan Framework, adopted in December 1996 and readopted in August 2001, provides general guidance regarding land use issues for the entire City and defines Citywide policies regarding land use, including infrastructure and public services. The City's objectives regarding the provision of adequate library services and facilities to meet the needs of the City's residents are set forth in Objectives 9.20 and 9.21. Objective 9.21 proposes to ensure library services for current and future residents and businesses.

Under the Framework Implementation Programs, Plans and Policies Chapter, Framework Policy 13, the Department of Libraries is charged with the responsibility of updating the Library Master Plan to provide sufficient capacity to correct existing deficiencies as well as meet the needs of future population. The implementation plans and policies set forth in the General Plan Framework were addressed through the 2007 LAPL Branch Facilities Plan (Facilities Plan) (discussed further below).

Los Angeles Public Library (LAPL) Branch Facilities Plan

In 1988, the LAPL Board of Commissioners adopted the *Branch Facilities Plan* to guide the construction, maintenance, and operation of libraries within the City. The Plan is composed of two elements: (1) the Criteria for New Libraries, and (2) the Proposed Project List. The first element sets standards for selection of future library sites and the second lists proposed projects to renovate existing libraries or construct new facilities. According to the current Plan, service criteria are based on floor area required to serve varying amounts of residential population. Current LAPL branch building size standards are presented in **Table 4.13-9**.

TABLE 4.13-9 LAPL BRANCH FACILITIES SITE SELECTION CRITERIA	
Population Served	Size of Facility (square feet)
Above 45,000	14,500
Below 45,000	12,500
Regional Branch	20,000
SOURCE: LAPL 2015	

The Branch Facilities Plan also sets the following site selection criteria:

- When a community reaches a population of 90,000, an additional branch should be considered for the area
- One-story library buildings with interior layouts must be designed to accommodate the disabled, and to have electronic technology, substantial shelving and seating capacities, and have a community meeting room
- Good visibility and street access
- Easily accessible by car, by bus and on foot
- Take into consideration the relative locations of all schools served by the branch
- Take into consideration the relative locations of all neighboring branch libraries

All of the projects identified under the Branch Facilities Plan were completed by October 2008. The Board of Library Commissioners adopted a fully revised Plan on February 8, 2007 with a new Projects List and updated standards.

Proposition 1, a \$53.4 million Branch Libraries Facilities Bond, was approved in 1989. Proposition 1 proposed obtaining new sites for building, renovating, and expanding libraries that were unable to serve the community sufficiently and/or were damaged by the Whittier earthquake. Additional funds were allocated by the Community Development Block Grant Award of federal funds from the California State Library Proposition 85, and from Friends of the Library Groups, totaling \$108 million. A total of 29 libraries were built under the 1989 Bond Program. Proposition DD, or the 1998 Library Facilities Bond, was approved in 1998 and authorized \$178.3 million in bonds for funding the construction, renovation, improvement, or expansion of 32 new branch libraries. In 2011, Measure L increased the allocation of City funds to the

library system. Measure L restored library hours of operation and services which were reduced during the recession, over a period of time without raising taxes. Measure L also funded the opening of the Central Library and eight regional branch libraries on Sundays. Based on the Facilities Plan and the construction funds obtained in the subsequent bond issues, 90% of the library infrastructure was replaced in a fifteen-year period.

The Facility Plan guides the construction of branch libraries and specifies standards for size and features of branch facilities based on population served in each community. Facility needs and population growth projections to the year 2030 are forecasted within the Strategic Plan. Los Angeles Public Library Strategic Plan 2015-2020

The Los Angeles Public Library Strategic Plan 2015–2020 (Strategic Plan) sets forth LAPL’s goals and objectives focused on providing library services within existing library facilities. The goals and objectives discussed in the Strategic Plan focus on community development and program expansion in an effort to increase the number of people who use the library services, increase the number of library card holders, and increase residents’ overall engagement with the library. Through Measure L, approved in March 2011, LAPL would also be able to expand its services, collections and technology. The LAPL Strategic Plan 2015-2020 is a five-year plan to detail expanded programs and services, referred to as Key Activities within the Plan, offered by LAPL.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

According to CEQA Guidelines, Appendix G, the Proposed Project would have a potentially significant impact if it would result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for other public facilities, such as libraries.

METHODOLOGY

The following analysis focuses on determining whether the Proposed Project would result in adverse physical impacts to the environment due to the expansion or construction of new library facilities. Whether additional facilities would be required is determined primarily by considering the adequacy of existing library services, impacts of the Proposed Project on demand for library services, and input provided by LAPL staff.

The need for or deficiency in library facilities to serve the residents or users of the Project Area or the City is not in and of itself a CEQA impact, but a social or economic impact. (*City of Hayward v. B’d of Trustees* (2015) 242 Cal.App. 4th 833, 843). To the extent that the Proposed Project causes a need for the construction of new library facilities or additions to existing facilities, and the impact from that construction results in a potential impact to the environment that is a CEQA impact that needs to be assessed in this EIR. Any discussion in this EIR that relates solely to the level of library services provided to the residents or users of the Plan Area and its surrounding community, including any existing or future needs and deficiencies, is for informational purposes only. The ultimate determination of whether there is a significant impact related to library services is based on whether a significant impact will result from the construction of new or altered library facilities as a result of the implementation of the Proposed Project.

This analysis estimates the number of residents that would be generated by implementation of the Proposed Project and assesses whether existing and planned public libraries expected to serve the Project Area would have sufficient available capacity to accommodate additional users and whether new facilities would need to be constructed, the construction of which would cause significant environmental impacts.

PROJECT IMPACTS

Threshold 4.13-4	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for libraries?
-------------------------	---

Impact 4.13-4 **Proposed Project:** The Proposed Project would increase demand for library facilities. However, the Project Area is well-served by library facilities and would not require the construction of new or expanded facilities. Impacts would be *less than significant*.

Project Impacts

Development under the Proposed Project would add an estimated 50,000 residents and 3,000 employees to the Project Area. Many of the Project Area's future residents and employees would likely use the LAPL system, potentially increasing the number of library facility users. However, 75% of L.A. residents visit the library less than once a month, and 18% have not visited a public library more than once in the last five years (LAPL 2015). Thus, an increase in residents is unlikely to result in a substantial increase in annual visits to library facilities. Demand for library facilities may also be offset over time due to increased use of digital materials available through LAPL's online catalog; circulation of e-media is expected to increase from 2,200,000 in 2014 to 3,000,000 in 2020 (LAPL 2015).

The Project Area is well-served by existing library facilities in the surrounding neighborhoods including the Chinatown branch library and the Lincoln Heights branch library, which are both less than a mile from the Project Area boundary.

The Project Area would accommodate approximately 53,000 persons (residents and employees). Based on the site selection criteria of 90,000 persons per library branch, as identified in the Branch Facilities Plan, the two existing libraries serving the Project Area would accommodate a population up to 180,000 persons. Because development is not expected to cause an exceedance of capacity at existing facilities in the Project Area and is not expected to generate a substantial demand for the unique collections and programs of the community branch libraries serving the Project Area, it is unlikely that expansion or construction of new library facilities would be required.

If new library facilities are determined to be necessary at some point in the future, such facilities would occur where allowed under the designated land use. The environmental impacts of the construction and operation of new facilities, as an allowed land use, have been evaluated throughout this EIR. It is not foreseeable that impacts from building or upgrading libraries in the Project Area would have greater or different impacts than those identified in this EIR for construction or operations. Potential impacts to air, noise, traffic, as well as other impacts of new developments are discussed in the impact sections of this EIR, and they would not be any different for a library facility. The Project Area is urbanized and new facilities would not involve expansion of the urban sphere beyond current boundaries and, thus, there would be no need for new or expanded infrastructure. Therefore, the Proposed Project would not result in adverse physical impacts associated with the provision of new or expanded library facilities. The impact would be *less than significant*.

Mitigation Measures

No significant impacts related to libraries have been identified; therefore, mitigation is not required for the Proposed Project..

CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable impacts to libraries includes the entire City of Los Angeles as well as areas at the City's periphery that could potentially be affected by construction of a new facility at or near the City's corporate boundary. Citywide growth through 2040 is projected add an estimated 659,000 new residents, 293,000 new households, and 345,000 new employees (SCAG 2020).

Cumulative development from the Proposed Project and other cumulative projects throughout Los Angeles would increase overall demand for library facilities and potentially create a need for new facilities. Environmental impacts associated with the construction of new or expanded facilities may have significant environmental effects. Such impacts would be addressed, as necessary, as part of project-level environmental review of individual new or expanded facilities but cannot be predicted with any certainty at this time since the size and locations of new facilities are not currently known. No new library facilities are currently planned in the Project Area. The Branch Facilities Plan will continue to forecast future demand for library facilities throughout the City and strive to provide adequate facilities and related improvements to serve the existing and future population. The impacts of new facilities would be localized in nature and the addition of new facilities in specific locations would not result in significant cumulative impacts. Reasonably anticipated development growth under the Proposed Project could incrementally contribute to this overall cumulative impact by increasing demand for library facilities, but its contribution would not be cumulatively considerable since development facilitated by the Proposed Project would not require the construction of new or expanded facilities. Moreover, as previously discussed, 75 percent of the City's residents visit the library less than once a month, and 18 percent have not visited a public library more than once in the last five years. Furthermore, demand for library facilities may also be offset over time due to increased use of digital materials available through LAPL's online catalog; circulation of e-media is expected to increase from 2,200,000 in 2014 to 3,000,000 in 2020. However, in the event new facilities are determined to be necessary at some point in the future, such facilities would occur where allowed under the designated land use and would be generally consistent with other allowed development analyzed in this EIR. Therefore, the incremental contribution of the Proposed Project with respect to library facilities would not be cumulatively considerable and cumulative impacts would be *less than significant*.

4.14 RECREATION

This section evaluates potential impacts to recreational resources from the updated Cornfield Arroyo Seco Plan (CASP) (or “Proposed Project” or “Project”) in the existing CASP area of Los Angeles (or “Project Area”). Topics addressed include the potential deterioration of existing facilities and necessity for new recreational facilities. Impacts related to recreation are evaluated based on the adequacy of existing and planned facilities and any additional demand generated by future development.

ENVIRONMENTAL SETTING

CITYWIDE EXISTING AND PLANNED PARKS

The City of Los Angeles Department of Recreation and Parks (DRP) owns and operates parks and recreational facilities throughout the City. City park and recreation facilities include over 16,000 acres of parkland with over 559 park sites, including hundreds of athletic fields, 411 playgrounds, 319 tennis courts, 123 recreation centers, over 130 outdoor fitness areas, 59 swimming pools and aquatic centers, 29 senior centers, 27 skate parks, 13 golf courses, 12 museums, 13 dog parks (DRP 2022a). The DRP also maintains 13 lakes, 92 miles of hiking trails, and operates 187 summer youth camps.

In 2012, the DRP launched the 50 Parks Initiative based on findings in the 2009 *Citywide Community Needs Assessment* indicating that park facilities are not equitably distributed across the City and that many communities do not have parks within a reasonable distance. The 50 Parks Initiative seeks to build 50 parks in densely-populated neighborhoods or communities currently lacking sufficient park space and recreational facilities (DRP 2017b).

As discussed further below under Regulatory Framework, the City of Los Angeles Public Recreation Plan states that in order to meet long-range local recreational standards, the City should maintain a minimum of two acres of neighborhood facilities and two acres of community recreational facilities for every 1,000 persons, or a combination of neighborhood and community facilities adding up to four acres. Pocket parks are another type of recreational facility not specifically addressed in the City’s Recreation Plan; however, pocket parks have been used to meet City residents’ recreational needs in urban settings where space and the ability to develop new neighborhood parks are limited.

Park Planning Efforts

2009 Citywide Community Needs Assessment

The Department of Recreation and Parks conducted the *Citywide Community Needs Assessment* as the first step in the preparation of a Citywide Recreation and Parks Master/Strategic Plan and a Five-year Capital Improvement Plan. The Needs Assessment identifies, quantifies, and preliminarily prioritizes the tremendous need for recreation and open space in the City. A high-level review was also performed of the Department’s facilities in an attempt to address the various facilities needing improvements to meet current and future needs, prevent future maintenance problems, and offer positive alternatives to an increasingly dense and urbanized population.

Los Angeles Countywide Comprehensive Parks & Recreation Needs Assessment

The Parks & Recreation Needs Assessment, adopted in May 2016, documents existing parks and recreation facilities in the cities and unincorporated communities of Los Angeles County and uses the data to determine the scope, scale, and location of park needs in Los Angeles County. The Parks & Recreation Needs Assessment also provides a framework for considering parks as key infrastructure; uses a new series of metrics to determine park needs; supports a need-based allocation of funding for parks and recreation; and emphasizes community priorities and deferred maintenance projects.

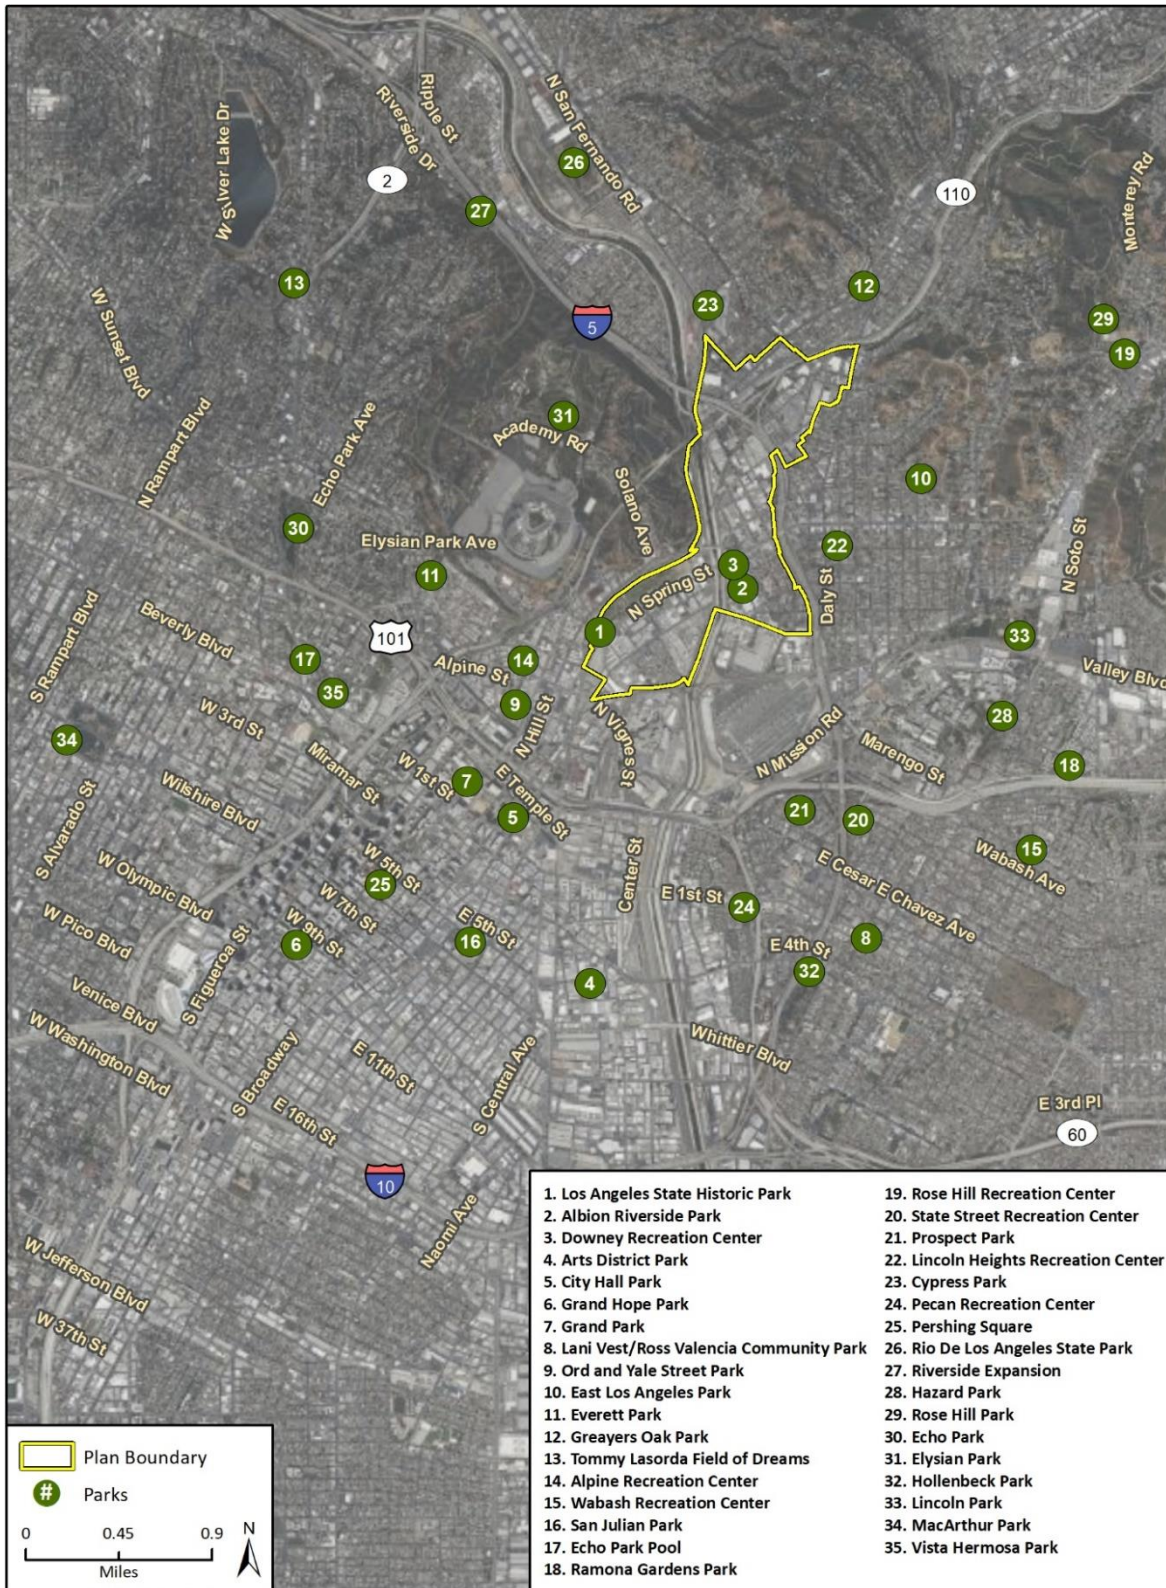

Project Area Existing and Planned Parks

Table 4.14-1 summarizes the parks that would serve the Project Area, including existing parks within and near the Project Area (DRP 2012). There are four parks in the Project Area, of which three are neighborhood parks and one is a state park. In total, parks in the Project Area provide 43.3 acres of park land. An additional eight pocket parks, 16 community parks, four neighborhood parks, one regional park and one state park are located within two miles of the Project Area boundary. These parks provide an additional 939.5 acres of recreational land. **Figure 4.14-1** maps the locations of existing parks in and near the Project Area and shows their location relative to land uses proposed in the Proposed Project. The numbers on the map correspond to the figure numbers assigned to each park in **Table 4.14-1**.

In total, existing parks in and in the vicinity of the Project Area provides 982.8 acres of recreational land. Of this total, community, and neighborhood parks (i.e., non-regional parks) account for 290.8 acres, pocket parks account for 8.1 acres, one regional park (Elysian Park) accounts for 600 acres, and two state parks account for 84 acres. Based on the existing Project Area population of 6,000, the Project Area is currently served by approximately 48.4 acres of neighborhood and community parks per 1,000. Including existing pocket parks there would be about 49.8 acres of non-regional parks per 1,000 residents (see **Table 4.14-2**). The Proposed Project currently exceeds the City's 4 acres per 1,000 residents goal for neighborhood and community facilities.

TABLE 4.14-1 PARKS AND RECREATIONAL FACILITIES WITHIN THE PROJECT AREA AND WITHIN 2 MILES OF THE PROJECT AREA			
Name	Location	Acreage	Park Type
Parks within Project Area			
Los Angeles State Historic Park*	1245 North Spring Street	32.0	State
Albion Riverside Park	1739 N. Albion St.	6.3	Neighborhood

TABLE 4.14-2 EXISTING DEMAND FOR RECREATIONAL FACILITIES			
Non-Regional Park Acreage	Acres per 1,000 Persons	Goal	Meets Goal?
Neighborhood/Community Only	48.4	4 acres of Neighborhood and Community Facilities per 1,000 persons	Yes
Neighborhood, Community & Pocket	49.8		
Acres per 1,000 persons based on the total acreages from Table 4.14-1 and the current Project Area population of 6,000. The City's 4 acres per 1,000 residents goal relates to non-regional parks does not specifically include pocket parks so totals have been provided both with and without pocket parks.			

REGULATORY FRAMEWORK

STATE

Quimby Act

The California State Legislature established the Quimby Act and codified it as California Government Code Section 66477 in 1965. The Quimby Act allows the legislative body of a city or county to establish an ordinance requiring the dedication of land, payment of fees in lieu thereof, or a combination of both, for the provision of parks or recreational facilities as a condition to the approval of a tentative tract map or parcel map. LAMC establishes the Quimby in-lieu fees for subdivisions with 50 units or more and provides guidance for park land dedication in accordance with the Quimby Act. LAMC also establishes a park mitigation fee for residential projects that are not subdivision projects, which are non-Quimby impact fees.

State Public Park Preservation Act of 1971 (PRC Section 5400–5409)

This act provides for no net loss of parkland and facilities by prohibiting cities and counties from acquiring any real property that is in use as a public park for any non-park use unless compensation or land, or both, are provided to replace the parkland acquired.

LOCAL

City of Los Angeles Charter

The City Charter established the Department of Recreation and Parks (RAP) to construct, maintain, operate, and control all parks, recreational facilities, museums, observatories, municipal auditoriums, sports centers and all lands, waters, facilities or equipment set aside or dedicated for recreational purposes and public enjoyment within the City. The Board of Recreation and Parks Commissioners oversees the RAP.

With regard to control and management of recreation and park lands, Section 594(c) of the City Charter provides that all lands set apart or dedicated as a public park shall forever remain for the use of the public inviolate. However, the Board of Recreation and Parks Commissioners may authorize the use of those lands for any park purpose and for other specified purposes.

City of Los Angeles General Plan

Framework Element

The City’s General Plan Framework Element (adopted in December 1996 and readopted in August 2001) (Framework) includes park and open space policies for the provision, management, and conservation of

Los Angeles' open space resources while addressing the outdoor recreation needs of the City's residents and is intended to guide the amendment of the General Plan's Open Space and Conservation Elements.

Chapter 6 and 9 of the City's Framework Element includes objectives and policies applicable to parks, which are summarized in **Table 4.14-3**.

TABLE 4.14-3 RELEVANT GENERAL PLAN PARK GOALS, OBJECTIVES, AND POLICIES	
Framework Element – Chapter 6, Open Space and Conservation	
Policy 6.2.1	Establish, where feasible, the linear open space system represented in the Citywide Greenways Network map, to provide additional open space for active and passive recreational uses and to connect adjoining neighborhoods to one another and to regional open space resources.
Policy 6.2.2	Protect and expand equestrian resources, where feasible, and maintain safe links in major public open space areas such as Hansen Dam, Sepulveda Basin, Griffith Park, and the San Gabriel, Santa Monica, Santa Susanna Mountains and the Simi Hills.
Policy 6.4.1	Encourage and seek to provide for usable open space and recreational facilities that are distributed throughout the City.
Policy 6.4.2	Encourage increases in parks and other open space lands where deficiencies exist, such as South East and South Central Los Angeles and neighborhoods developed prior to the adoption of the State Quimby Act in 1965
Policy 6.4.3	Encourage appropriate connections between the City's neighborhoods and elements of the Citywide Greenways Network.
Policy 6.4.5	Provide public open space in a manner that is responsive to the needs and wishes of the residents of the City's neighborhoods through the involvement of local residents in the selection and design of local parks. In addition to publicly-owned and operated open space, management mechanisms may take the form of locally run private/non-profit management groups and should allow for the private acquisition of land with a commitment for maintenance and public access.
Policy 6.4.6	Explore ways to connect neighborhoods through open space linkages, including the "healing" of neighborhoods divided by freeways, through the acquisition and development of air rights over freeways (such as locations along the Hollywood Freeway between Cahuenga Pass and Downtown), which could be improved as a neighborhood recreation resource.
Policy 6.4.7	Consider as part of the City's open space inventory of pedestrian streets, community gardens, shared school playfields, and privately-owned commercial open spaces that are accessible to the public, even though such elements fall outside the conventional definitions of "open space." This will help address the open space and outdoor recreation needs of communities that are currently deficient in these resources
Policy 6.4.8	Maximize the use of existing public open space resources at the neighborhood scale and seek new opportunities for private development to enhance the open space resources of the neighborhoods.
Policy 6.4.9	Encourage the incorporation of small-scaled public open spaces within transit-oriented development, both as plazas and small parks associated with transit stations, and as areas of public access in private joint development at transit station locations.
Policy 6.4.11	Seek opportunities to site open space adjacent to existing public facilities, such as schools, and encourage the establishment of mutually beneficial development agreements that make privately-owned open space accessible to the public. For example, encourage the improvement of scattered small open spaces for public access in private projects with small branch libraries, child care centers, or decentralized schools.

TABLE 4.14-3 RELEVANT GENERAL PLAN PARK GOALS, OBJECTIVES, AND POLICIES	
Framework Element – Chapter 9, Infrastructure and Public Services	
Policy 9.23.2	Prioritize the implementation of recreation and park project in areas of the City with the greatest existing deficiencies.
Policy 9.23.5	Re-evaluate the current park standards and develop modified standards which recognize urban parks, including multi-level facilities, smaller sites, more intense use of land, public/private partnerships and so on.
Policy 9.23.7	Establish guidelines for developing non-traditional public park spaces like community gardens, farmer's markets, and public plazas.
Policy 9.24.1	Phase the development of new programs and facilities to accommodate projected growth.
SOURCE: City of Los Angeles, The Citywide General Plan Framework, An Element of the City of Los Angeles General Plan, re-adopted 2001.	

Service Systems Element - Public Recreation Plan

As a part of the General Plan’s Service Systems Element, the Public Recreation Plan (PRP) establishes policies and standards related to parks, and recreational facilities in the City. The PRP was adopted in 1980 by the Los Angeles City Council and amended by City Council resolution in March 2016. The amendments modernize the PRP’s recommendations and provide for more flexibility and equity in the distribution of funds used for the acquisition and development of recreational resources. The PRP also addresses the need for publicly accessible neighborhood, community, and regional recreational sites and facilities across the City. The PRP focuses on recreational site and facility planning in underserved neighborhoods with the fewest existing resources and the greatest number of potential users (i.e., where existing residential development generates the greatest demand), as well as areas where new subdivisions, intensification of existing residential development, or redevelopment of “blighted” residential areas creates new demand.

The amended PRP establishes general guidelines for neighborhood, community, and regional recreational sites and facilities that address general service radius and access as well as service levels relative to population within that radius. The PRP also states that the allocation of acreage for community and neighborhood parks should be based on the resident population within that general service radius. Toward this end, the amended PRP recommends the goals of 2.0 acres each of neighborhood and community recreational sites and facilities per 1,000 residents, and 6.0 acres of regional recreational sites and facilities per 1,000 residents. To determine existing service ratios, the RAP commonly uses the geographic area covered by the applicable Community Plan rather than the park service radius. The PRP does not establish requirements for individual development projects.

For a given neighborhood recreational site or facility, the amended PRP does not recommend a specific size, noting only that a school playground may partially serve this function (with up to one-half of its acreage counted toward the total acreage requirement [service level per capita]). The amended PRP does not define a specific service radius for neighborhood recreational sites and facilities, instead recommending that they should generally be within walking distance and not require users to cross a major arterial street or highway for access.

For community recreational sites and facilities, the amended PRP states that facilities may be of any size, but are generally larger than neighborhood parks, and a high school site may be counted toward half the acreage requirement/service level per capita. The amended PRP does not define a specific service radius for community recreational sites and facilities, instead recommending that they should generally be accessible within a relatively short bicycle, bus, or car trip, and easily accessible.

For regional recreational sites and facilities, the amended PRP states that facilities may be large urban recreational sites or smaller sites or facilities that draw visitors from across the City. The amended PRP does not define a specific service radius or further qualify access, stating only that the service radius should be that within a reasonable drive.

Health, Wellness, and Equity Element

The City's Plan for a Healthy Los Angeles, updated in 2021, which also serves as the City's environmental justice element, lays the foundation to create healthier and equitable communities for all Angelenos. As an Element of the General Plan, it provides high-level policy vision, along with measurable objectives and implementation programs, to elevate health as a priority for the City's future growth and development. Chapter 3 of the Plan, Bountiful Parks and Open Spaces, outlines policies and objectives to increase the availability of parks through park funding and allocation, park expansion, the Los Angeles River, park quality and recreation programs, park safety, local partnerships, water recreation, and active spaces. Specifically, the objectives include:

- Increase the number of neighborhood and community parks so that every Community Plan Area strives for 3 acres of neighborhood and community park space per 1000 residents (excluding regional parks and open spaces).
- Increase access to parks so that 75% of all residents are within a ¼ mile walk of a park or open space facility.
- Increase the number of schools (public, private, and charter) that have shared use agreements for community use outside of normal school hours by 25%.
- Increase the miles of the Los Angeles River that are revitalized for natural open space and physical activity, particularly in low-income areas.
- Increase the number of parks that feature or incorporate universally-accessible features.
- Improve the percentage of citywide population meeting physical fitness standards per week so that 50% percent of the population meets physical activity guidelines.

Los Angeles Municipal Code

In September 2016, the City adopted Ordinance No. 184,505, Parks Dedication and Fee Update Ordinance (Park Fee Ordinance). The aim of the Park Fee Ordinance is to increase the opportunities for park space creation and expand the fee program beyond those projects requiring a subdivision map to include a park linkage fee for all net new residential units. The Park Fee Ordinance amends LAMC Sections 12.21, 12.33, 17.03, 17.12 and 17.58, deletes LAMC Sections 17.07 and 19.01, and adds LAMC Section 19.17. The Park Fee Ordinance increases Quimby in-lieu fees, provides a new impact fee for non-subdivision projects, eliminates the deferral of park fees for market rate projects that include residential units, increases the fee spending radii from the site from which the fee is collected, provides for early City consultation for subdivision projects or projects with over 50 units in order to identify means to dedicate land for park space, and updates the provisions for credits against park fees. The Park Fee Ordinance went into effect on January 11, 2017.

LAMC Section 12.21 G requires that all residential developments containing six or more dwelling units on a lot provide, at a minimum, the following usable open space area per dwelling unit: 100 square feet for each unit having less than three habitable rooms, 125 square feet for each unit having three habitable rooms, and 175 square feet for each unit having more than three habitable rooms. LAMC Section 12.21 G also identifies what areas of a project would qualify as usable open space for the purposes of meeting the project's open space requirements.

As stated in LAMC Section 12.21 G, usable open space is defined as areas designated for active or passive recreation and may consist of private and common areas. Common open space areas must be readily accessible to all residents of the site and constitute at least 50 percent of the total required usable open space. Common open space areas can incorporate recreational amenities such as swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, and sitting areas. A minimum of 25 percent of the outdoor common open space area must be planted with ground cover, shrubs, or trees. Indoor recreational amenities can account for up to 25 percent of the usable open space requirements. Private open space is defined in an area that is contiguous to and immediately accessible from an individual dwelling unit, may have a dimension no less than six feet in any direction and must contain a minimum of 50 square feet, of which no more than 50 square feet per dwelling unit can be counted towards the total required usable open space.

LAMC Section 12.33, Park Fees and Land Dedication, authorized under the Quimby Act, requires developers of most residential projects to dedicate land and/or pay in-lieu fees for parks and recreational facilities. Specific requirements are determined based on the type of project and number of units. Under LAMC Section 12.33 D, the area of land within a residential subdivision that is required to be dedicated for parks and recreational uses is determined by the formulas provide therein. Land dedication and in-lieu fee payment are subject to the restrictions set forth in Section 12.33 (i.e., land must be used for park or recreational uses and fees must be used for the acquisition or development of, and not the operation or maintenance of, park land).

LAMC Section 12.33 G, Affordable Housing Exemption, allows new residential dwelling units that are rented or sold to persons or households of very low, low, or moderate income to receive an affordable housing exemption from the park fee and land dedication requirement. An affordable housing unit shall receive an exemption from the requirement for dedication of land for park and recreational purposes and/or payment of the park fee if the affordable housing unit is affordable to a household at or below 120 percent of the area median income. In projects with a mix of market-rate and affordable units, only the affordable housing units shall receive this exemption.

LAMC Section 12.33 H, Credits, allows private recreational areas developed within a project site for use by the particular project's residents to be credited as meeting up to 35 percent of the project's calculated land dedication and/or in-lieu fee requirement. Recreational areas that qualify under this provision of LAMC Section 12.33 H include, in part, indoor recreation areas, gyms, swimming pools, and spas (when the spas are an integral part of a pool complex). Furthermore, in accordance with LAMC Section 12.33 H.2, the recreational areas proposed as part of a project must meet the following standards in order to be credited against the requirement for land dedication: (1) each facility is available for use by all of the residents of a project; and (2) the area and the facilities satisfy the park and recreation needs of a project so as to reduce that project's need for public recreation and park facilities.

LAMC Section 21.10.3, Dwelling Unit Construction Tax, establishes the payment of a dwelling unit construction tax of \$200 per new residential unit. The tax is to be paid to a "Park and Recreational Sites and Facilities Fund" for the acquisition and development of park and recreational sites and facilities. If park and recreation provisions (i.e., fees, improvements, or land dedication) have been made pursuant to LAMC Section 12.33, the fair market value of those provisions is credited against the payment of this tax.

Pursuant to LAMC Sections 17.12 and 17.58, a final subdivision map shall not be approved or recorded, unless a park fee has been paid or land within the subdivision has been dedicated to the City for park or recreational purposes. Park fee rates for residential subdivision and non-subdivision residential projects are identified in LAMC Section 19.17 and adjusted for inflation annually.

Los Angeles Department of Recreation and Parks 2009 Citywide Community Needs Assessment

In 2009, the Department of Recreation and Parks commissioned an update of the last Recreation and Parks Needs Assessment from 1999 as a preliminary step in developing a citywide park master plan and five-year capital improvement plan. The report provides an inventory of existing facilities, defines geographic areas of need and recommended facilities to serve specific populations, and identifies priorities for additional parks and recreation facilities. The report provides a more current assessment of conditions and future needs compared to the PRP, while the PRP recommends the ratios of park acreage per person used in the analysis.

Department of Recreation and Parks 50 Parks Initiative

In response to the 2009 Citywide Community Needs Assessment, the Department of Recreation and Parks developed the 50 Parks Initiative with the purpose of substantially increasing the number of parks and facilities available across the City, with a specific focus on densely populated neighborhoods and communities that lack sufficient open space and recreational services.

Park Proud LA Strategic Plan 2018-2022

The Park Proud LA Strategic Plan (Strategic Plan) is the most recent strategic plan for the Department of Recreation and Parks, effective from 2018 until 2022. The Strategic Plan highlights critical work that needs to be accomplished over the next several years to ensure that the City has an accessible, equitable, and first class park system. The Strategic Plan reflects chief priorities of the RAP, confronts new and existing challenges, and lays the framework to pursue new opportunities. Within the Strategic Plan, there are over two dozen outcomes organized under the following seven high-level priority goals:

- Provide safe and accessible parks.
- Offer affordable and equitable recreation programming.
- Create and maintain world class parks and facilities.
- Actively engage communities.
- Ensure an environmentally sustainable park system.
- Build financial strength and innovative partnerships; and
- Maintain a diverse and dynamic workforce.

ENVIRONMENTAL IMPACTS

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the *CEQA Guidelines*, the Proposed Project would have significant impacts related to parks and recreational facilities if it would:

- Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (Threshold 4.14-1)
- Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment (Threshold 4.14-2)

- Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks. (Threshold 4.14-3)

METHODOLOGY

An impact related to recreation would occur if the Proposed Project promotes growth patterns resulting in:

- The need for and/or the provision of new or physically altered park, the construction of which would cause significant environmental impacts in order to maintain service ratios, response times, or other performance objectives, or
- The increased use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

The need for, or deficiency in, park facilities to serve the residents or users of the Project Area or the City is not in and of itself a CEQA impact, but a social or economic impact (*City of Hayward v. Board of Trustees* (2015) 242 Cal.App. 4th 833, 843). To the extent that the Proposed Project causes a need for additional recreational services and facilities and that results in the construction of new facilities or additions to existing facilities and the impact from that construction results in a potential impact to the environment that is an environmental impact under CEQA that needs to be assessed in this EIR. Additionally, the deterioration of existing recreational facilities and parks caused by the Project is an environmental impact under CEQA that needs to be assessed in the EIR. Any discussion in this EIR of social or economic impacts that relates solely to the level of recreational services provided to the residents or users of the Project Area and its surrounding community, including any existing or future needs and deficiencies, is not determinant on its own of environmental impacts under CEQA, unless those social or economic impacts result in physical impacts. The ultimate determination of whether there is a significant impact related to park/recreational services is based on whether a significant physical impact to the environment would result from the construction of new or altered park/recreational facilities or where existing park and recreational facilities would be substantially physically deteriorated as a result of the implementation of the Proposed Project.

This analysis estimates the number of residents that would be generated by implementation of the Proposed Project and assesses whether existing and planned public parks would have sufficient available capacity to accommodate additional users and whether new facilities would need to be constructed, the construction of which would cause significant environmental impacts; and whether the Proposed Project would result in substantial physical deterioration of park/recreational facilities.

PROJECT IMPACTS

Threshold 4.14-1	Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?
-------------------------	---

Impact 4.14-1 **Proposed Project:** Reasonably anticipated development from the Proposed Project would increase the use of existing park and recreational facilities in and adjacent to the Project Area. However existing parks and recreational facilities would have the capacity to support increased demand due to population growth. Therefore, the Proposed Project would not accelerate the deterioration of existing parks in and around the Project Area and such impacts to existing recreational facilities would be *less than significant*.

Project Impact

The zoning changes of the Proposed Project could reasonably result in the population of the Project Area increasing from approximately 6,000 to approximately 57,000 by 2040. This increase in population would foreseeably increase the use of existing parks and recreational facilities in and near the Project Area, particularly in areas that are designated for residential and mixed use development under the Proposed Project. Existing parks and recreational facilities in or near the Project Area total approximately 982.8 acres. The anticipated increase in population would bring the Project Area's park ratio to approximately 5.1 acres of neighborhood and community parkland per 1000 persons – exceeding the City's 4 acres per 1,000 residents goal for neighborhood and community facilities. Furthermore, the inclusion of state, regional and pocket parks serving the Project Area bring the park ratio to 17.2 acres of parkland per 1000 residents.

Developers of future residential projects in the Project Area would also be required to pay park mitigation fees (for non-subdivision projects) or dedicate land or pay Quimby in-lieu fees (for subdivision projects). Park fee amounts are reviewed and updated annually by the City. Payment of impact fees and the anticipated enhancement or maintenance of facilities with funds provided by these fees would help offset the deterioration of existing recreation facilities. The Proposed Project promotes the provision of publicly accessible open space by offering development incentives for projects in exchange for providing community benefits such as affordable housing, community facilities and open space.

Existing regulations governing development in the City would also provide funding for the provision of new recreational facilities and some would also support the maintenance of existing facilities. Therefore, impacts related to deterioration of existing parks in and around the Project Area would be *less than significant*

Mitigation Measures

None required.

Threshold 4.14-2	Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?
Threshold 4.14-3	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks?

Impact 4.14-2, 4.14-3 **Proposed Project:** Reasonably expected development from the Proposed Project would increase demand for recreational and park facilities that serve the Project Area but would not require construction of new recreational or park facilities. Furthermore, based on the urban nature of the Project Area and the presence of constraints to the development of large park facilities, the construction and operation of new facilities would not be expected to result in significant environmental impacts. Impacts would be *less than significant*.

Project Impact

As discussed under Impact 4.14-1, future Project Area development could result in a population increase within the Project Area by an estimated 50,000 residents by 2040, thereby increasing use and demand for parks and recreational facilities. However existing parks and recreational facilities in and around the Project Area would be able to support this increased demand and would exceed the City's parkland ratio goals.

Furthermore, construction of new or expanded neighborhood or pocket park facilities to serve the Project Area would occur in an urban center. Construction of new parks would be required to comply with applicable federal, State, and local regulations and policies discussed in this EIR, such as NPDES permit requirements, the City's Tree Ordinance and Noise Ordinance, and the California Building Code, including CALGreen requirements.

The 50 Parks Initiative exemplifies the kind of park facilities the City is currently implementing and is likely to continue implementing in the dense urban areas of Los Angeles. Most of the parks are pocket parks less than an acre in size with playground structures and exercise machines. These parks typically include zero or minimal structures and green space, and, because they are intended to serve the local community and be accessible by foot and bike, do not provide parking (Ferguson et al. 2014). The construction and operation of such small-scale facilities would be expected to have minimal environmental impacts. For example, it is anticipated that these parks would be located on vacant lots lacking biological or cultural resources; generate minimal vehicle traffic to the site, which would limit air quality, greenhouse gas, noise, and transportation impacts; and be able to accommodate a limited number of people due to their small size, which would reduce park noise levels.

Potential environmental impacts of construction and operation of any new parks, as an allowed land use, have been evaluated throughout this EIR. Construction and operational impacts to air, noise, traffic, as well as other impacts of new developments are discussed throughout this EIR. It is not foreseeable that impacts from the construction of new or expanded parks in the Project Area would have greater or different impacts than those identified in this EIR for construction or operations. Similar to other types of development, the construction of new or expanded park facilities could contribute to the significant historic resource and construction noise impacts identified in sections 4.4, *Cultural Resources*, and 4.11, *Noise*, of this EIR. Based on the urban location and the limited land available, the construction of a new park facilities would likely qualify for an infill exemption or result in less-than-significant impacts with standard regulatory compliance measures and project specific design features or project specific mitigation measures identified

through a project EIR or mitigated negative declaration. To the extent that any significant impacts could result from the unique characteristics of a specific site, those impacts would be speculative at this time. Furthermore, the construction of a new park facility or expansion of an existing park facility would require a project-specific environmental analysis under CEQA to address any site-specific environmental concerns. Therefore, impacts related to fire protection and emergency services would be *less than significant*.

Mitigation Measures

None required.

CUMULATIVE IMPACTS

The geographic area to analyze cumulatively considerable recreation impacts includes the entire City of Los Angeles and surrounding areas. The *Los Angeles Countywide Comprehensive Park & Recreation Needs Assessment*, published in May 2016 by the Los Angeles County Department of Parks and Recreation (LA County DPR), evaluated recreational needs in Los Angeles County, including the City of Los Angeles (LA County DPR 2016). The report identifies many areas of the City as having a “Very High” park need (average of 0.7 acres per 1,000 residents of park land) or “High” park need (average of 1.6 acres per 1,000 residents). In 2022, DPR completed the Parks Needs Assessment Plus (PNA+) which complements and offers new information not previously included in the 2016 PNA. Specifically, PNA+ includes data about access to regional parks, open space, trails, beaches and lakes, and local parks in rural areas, as well as mapping and analyses related to population vulnerability, environmental benefits, environmental burdens, and priority areas for environmental conservation, environmental restoration, regional recreation, and rural recreation.

Substantial Deterioration of Existing Parks

Future Citywide development is expected to increase the City’s residential population from approximately 3.8 million in 2022 (DOF 2017) to more than 4.6 million persons in 2040 (SCAG 2016), an increase of about 800,000 residents. This increase would exacerbate the existing need for new or expanded recreational facilities over time. In the absence of new parks, the citywide increase in park demand would be expected to accelerate the deterioration of existing parks, which would be a potentially significant cumulative impact.

However, as discussed under Impact 4.14-1, the Proposed Project would result in a less significant impact related to the deterioration of existing parks serving the Project Area since there is adequate space to provide sufficient park acreage to meet the projected increase in demand for parks based on the City’s adopted standards. Therefore, the Proposed Project’s incremental contribution to park deterioration would not be cumulatively considerable and the cumulative impacts related to park deterioration would be *less than significant*.

Construction/Expansion of Parks

With respect to the construction of new parks, the City is currently in the process of constructing new parks and recreational facilities to serve its residents, as exemplified by the 50 Parks Initiative, and is anticipated to continue to do so in the future to meet increasing demand for parks. Expansion or construction of new pocket, neighborhood, community, and regional parks, or other recreational facilities, would have physical impacts to the environment (e.g., emissions of air pollutants, aesthetics impacts, noise impacts) that may be cumulatively significant. Any prediction of the precise impact of these parks is speculative since the size, nature, and location of any new parks are not known at this time. However, as discussed above, because the City is largely developed, the construction of new parks will likely be in the form of pocket parks and infill parks that are unlikely to result in significant impacts.

As discussed under Impacts 4.14-2 and 4.14-3, the Proposed Project would not result in a significant impact on park capacity such that new park construction is required because parks serving the Project Area have capacity to absorb the increase in population in the Project Area that the Proposed Project is anticipated to create. As a result, the Proposed Project would not involve the development of new parks with the potential to result in significant environmental effects. Because the Proposed Project will have the capacity to absorb any increased demand for parks from its implementation, the incremental contribution from the Proposed Project would not be cumulatively considerable and cumulative impacts on park capacity from the Proposed Project in addition to other projects would be *less than significant*.

4.15 TRANSPORTATION

This chapter provides an overview of existing and potential future transportation and mobility conditions in the Cornfield Arroyo Seco Plan (CASP) Area (or “Project Area”). Topics addressed in this chapter include the environmental setting, circulation and mobility systems, regulatory framework, thresholds of significance, methodology, and mitigation measures related to transportation impacts.

ENVIRONMENTAL SETTING

EXISTING ENVIRONMENTAL SETTING

The City of Los Angeles circulation system facilitates travel by multiple modes including walking, bicycling, public transit, and motor vehicles and includes an extensive network of freeways, highways, and local streets (City of Los Angeles 2015a). These transportation networks, services, and systems are described in more detail below.

Project Area Overview

The Project Area is approximately 600 acres located entirely within Los Angeles City Council District One, and is generally bordered by Chinatown to the west, Lincoln Heights to the east, and Cypress Park to the north. The Project Area is located within the original floodplains of the Los Angeles River and Arroyo Seco water bodies which are part of the lower Los Angeles River Watershed. The Project Area is predominantly developed, with transportation infrastructure being a central feature of the Project Area. Interstate 5 (I-5) and State Route-110 (SR-110) bisect the northern portion of the Project Area. Entrances and exits to and from SR-110 are located on the northern perimeter of the Project Area. The analysis evaluates the transportation network within the boundaries of the Project Area as well as the surrounding transportation network that could be potentially impacted by the Proposed Project. For the purposes of the EIR transportation impact analysis, Existing Conditions (baseline) is defined as Year 2021, which corresponds to the date of the release of the Proposed Project’s Notice of Preparation (NOP).

The Proposed Project addresses a mostly industrial area that was zoned and built to land use patterns from the 1940s. There is great need for a transportation network that will better serve all modes of transportation, improve the efficiency of the overall system, and help to transform an under-served and neglected vehicular-oriented industrial and public facility area into a cluster of mixed-use pedestrian oriented neighborhoods.

The Project Area is served by a network of loosely gridded arterials divided by the Los Angeles River and the Golden State Freeway/Interstate Highway 5 (I-5). Rapid and local bus transit lines operate on major and minor arterials. Metro, the primary transit provider in the region, also maintains the Gold (L) Line light rail route that intersects the Project Area as it runs east-west between East Los Angeles and Azusa via Downtown. Pedestrian facilities primarily consist of sidewalks adjacent to roadways and a limited bicycle network. The transportation network in the Project Area is primarily auto- and bus transit-oriented.

Regional Access is provided by I-5, the Pasadena Freeway/State Route 110 (SR-110), and the Santa Ana Freeway (US-101). There are several key boulevards and avenues, as well as collector and local streets.

Highway and Street System

Citywide Highway and Street System

The roadway network in the City includes seven freeways that traverse the approximately 472 square miles of the City's land area and connect the City to its outer regions. They include Interstate 5, 10, 105, 110, 210, 405, and US Highway 101. The City also includes 11 state highways (SR) including SR 1, 2, 47, 60, 90, 103, 110, 118, 134, 170, and 187 (City of Los Angeles 2015a).

The City contains over 7,500 miles of public streets that accommodate motorized vehicles, including private motorized vehicles, taxis, freight vehicles, and transit vehicles. Pedestrian and bicyclist travel are also important components of the local roadway network. A majority of roadways in the City are aligned on a grid system (City of Los Angeles 2015a). Below is a brief description of the types of facilities in the City based on the City's Mobility Plan 2035 and Complete Streets Design Guide (Los Angeles 2015).

- **Boulevard I (Major Highway Class D).** Class I Boulevards are generally defined as having three to four lanes in each direction along with a median turn lane. The width of a Class I Boulevard is usually 100 feet, with a typical sidewalk width of 18 feet and a target operating speed of 35 miles per hour (mph).
- **Boulevard II (Major Highway Class II).** Class II Boulevards are generally defined as having two to three lanes in each direction along with a median turn lane. The width of a Class II Boulevard is usually 80 feet, with a typical sidewalk width of 15 feet and a target operating speed of 35 mph.
- **Avenue I (Secondary Highway).** Class I Avenues typically have one to two lanes in each direction, a roadway width of 70 feet, a sidewalk width of 15 feet and a target operating speed of 35 mph. An Avenue I typically includes streets with a high amount of retail uses and local destinations.
- **Avenue II (Secondary Highway).** Avenue II streets usually have one to two lanes in each direction, with a typical roadway width of 56 feet, a typical sidewalk width of 15 feet and a target operating speed of 30 mph. Such streets are typically located in parts of the City with dense active uses, and a lively pedestrian environment.
- **Avenue III (Secondary Highway).** Avenue III streets are defined to have one to two lanes in each direction, with a roadway width of 46 feet, a sidewalk width of 15 feet, and a target operating speed of 25 mph. This classification was developed to maintain roadway width in older, more historic parts of the City.
- **Collector Street.** Collector Streets generally have one travel lane in each direction, with a roadway width of 40 feet and a sidewalk width of 13 feet. The target operating speed for Collector Streets is 25 mph. Such streets are typically intended for vehicle trips that start or end in the immediate vicinity of the street.
- **Industrial Collector Street.** Industrial Collector Streets vary from normal collector streets in that larger curb returns are incorporated to allow for the wider turning radii of trucks.
- **Local Street Standard.** Local Street Standard roadways typically have one lane in each direction, and are designed to have a 36-foot width, 12-foot sidewalks, and a target operating speed of 20 mph. Such streets are not designed for through traffic; rather, their focus is to allow access to and from destination points. Unrestricted parking is typically available on both sides of the street.
- **Local Street Limited.** Local Street Limited roadways typically have one lane in each direction, and are designed to have a 30-foot width, 10-foot sidewalks, and a target operating speed of 15 mph.

- **Industrial Local Street.** Although similar to the normal local streets, Industrial Local Streets differ primarily in width for the purpose of providing adequate space for trucks to maneuver. The typical roadway width for an Industrial Local Street is 44 feet, with 10-foot sidewalks and a target operating speed of 20 mph.
- **Pedestrian Walkway.** Pedestrian Walkways are designed for pedestrian use but are also appropriate for slow-moving bicyclists. Pedestrian Walkways have a width of 10 to 25 feet.
- **Shared Street.** Shared Streets provide a slow-speed environment where cars, bike, pedestrians, and scooters are able to comfortably utilize the street. Shared Streets have a minimum width of 20 feet with 5-foot buffer zones and a target operating speed of 5 mph.
- **Access Roadway.** Access Roadways are designed to have a width of 20 feet and are limited to private streets only that access no more than four dwelling units and are a maximum of 300 feet in length.
- **One-Way Service Road – Adjoining Arterial Street.** One-Way Service Roads typically have a width of 12 to 18 feet with a 3-foot curb separation from arterial streets.
- **Bi-Directional Service Road – Adjoining Arterial Streets.** Bi-Directional Service Roads typically have a width of 20 to 28 feet with a 3-foot curb separation from arterial streets.
- **Hillside Collector Street.** Hillside Collector Streets vary from normal collector streets in that sidewalks have a width of 5 feet and the target operating speed is 15mph. On-street parking is provided on both sides of the street.
- **Hillside Local Street.** Hillside Local Streets vary from normal local streets in that sidewalks have a width of 4 feet and the target operating speed is 15 mph. On-street parking is provided on both sides of the street.
- **Hillside Street Standard.** Hillside Street Standard roadways typically have one lane in each direction and are designed to have a 28-foot width, 4-foot sidewalks, and a target operating speed of 10 mph. On-street parking is provided on one side of the street.
- **Hillside Street Limited.** Hillside Street Limited roadways typically have one lane in each direction and are designed to have a 20-foot width, 3-foot sidewalks, and a target operating speed of 10 mph. On-street parking is provided on one side of the street.
- **Modified Streets.** Many streets are identified under a specific roadway classification, but with a modification generally due to available width on smaller, historic streets. In these cases, typical number of lanes and traffic volumes are similar to the non-modified versions, but lane widths or available parking may be diminished.
- **Signalized Intersections and Traffic Control Devices.** The City of Los Angeles' Automated Traffic Surveillance and Control (ATSAC) system is a computer-based traffic signal control system that monitors traffic conditions and system performance to allow ATSAC operations to manage signal timing to improve traffic flow conditions. This system allows monitoring and control of the signal from a central Traffic Operations Center at City Hall. The importance of linking to the ATSAC system is the ability to coordinate the signals in relationship with other signals along a travel corridor. Signal coordination minimizes delay due to stops and enhances vehicle flow. Studies by Los Angeles Department of Transportation (LADOT) and independent third parties have shown that the ATSAC system reduces congestion and increases average travel speeds (LADOT 2016a). The Adaptive Traffic Control System (ATCS) is an enhancement to ATSAC and provides fully traffic-adaptive signal control based on real-time traffic conditions. In addition, LADOT staff can manually adjust traffic signals remotely from the department's command center to respond to collisions, weather, special events, and other emergencies. All signalized intersections in the Project Area are currently operating under the City's ATSAC system and ATCS control.

Project Area Highway and Street System

The roadway network in the Project Area ranges from major freeways, such as I-5 and SR-110, to neighborhood-serving local roadways. **Figure 4.15-1**, Existing Roadway Network, displays the roadways within the Project Area and illustrates the classification of roadway facilities. The Project Area contains the following types of facilities based on the City’s Mobility Plan 2035 and Complete Streets Design Guide as described above: Avenue I, Avenue II, Modified Avenue I, Modified Avenue II, Modified Avenue III, Collector, Modified Collector, Local Street, and Modified Local Street.

Existing Transportation Operations

This section presents existing transportation conditions by applying the newly approved method of studying vehicle miles traveled (VMT) to evaluate significant traffic impacts under CEQA. VMT is a measure of the number of miles driven within a defined area and is based on the number of vehicle trips (VT) multiplied by the average trip length in miles for various trip types. To obtain an average VMT per service population, the total VMT is divided by the total population and employees within the area of analysis. The section that follows provides a brief summary of these characteristics for the City of Los Angeles and provides a detailed summary of these characteristics for the Project Area. For more information on the use of VMT as an impact threshold, see the *Environmental Impacts* section.

Citywide Existing Transportation Operations

The City of Los Angeles’ Travel Demand Forecasting Model estimates the mode split of existing (2021) daily trips. It is estimated that nearly 80 percent of daily person trips are made by automobile, over 13 percent by walking, almost 5 percent by transit, and over 1 percent by bicycle.
