Chapter 1
Introduction

This study presents the traffic impact analysis for the proposed Crossroads Hollywood mixed-use development ("Project") in the *Hollywood Community Plan* (Los Angeles Department of City Planning, 1988) area of the City of Los Angeles (the City). The methodology and base assumptions used in the analysis were established in conjunction with the Los Angeles Department of Transportation (LADOT).

PROJECT LOCATION

The Project Site consists of 29 individual parcels across four city blocks in Hollywood. The Project Site has been grouped into four Project areas referred to as Development Parcels A, B, C, and D. Generally, the Project Site is bounded by Selma Avenue to the north, the Blessed Sacrament Catholic Church and School to the east, Sunset Boulevard to the south, and Highland Avenue to the west. Development Parcel D is located on the northeast corner of Selma Avenue & Las Palmas Avenue. The remaining Development Parcels are located south of Selma Avenue.

The Project Site is located approximately 1.25 miles west of the Hollywood Freeway (US 101), which provides regional transportation between downtown Los Angeles (approximately 5.50 miles southeast) and the San Fernando Valley (approximately 5.0 miles northwest). In the vicinity of the Project Site, the Hollywood community is served by major arterial streets such as Hollywood Boulevard, Sunset Boulevard, Santa Monica Boulevard, Vine Street, and Western Avenue, and secondary arterial streets such as Fountain Avenue, Cahuenga Boulevard, Gower Street, Bronson Avenue, and Wilton Place.

The Project Site is located approximately less than one quarter-mile south of the Los Angeles County Metropolitan Transportation Authority's (Metro) Hollywood/Highland station. This station serves Metro's Red Line subway, which travels between Union Station in downtown Los

Angeles and North Hollywood in the San Fernando Valley at 10 minute intervals throughout the day. Additionally, transit bus service is provided along Sunset Boulevard adjacent to the Project Site by Metro and by LADOT's Downtown Area Shuttle (DASH) service. In the vicinity of the Project Site, there are existing designated bicycle routes traveling east and west along Selma Avenue and north and south along Orange Drive.

EXISTING SITE CONDITIONS

The Project Site is currently developed with various uses, including low-density commercial and office uses in the historic Crossroads of the World, as well as two residential duplexes, three multi-family residential apartment buildings, commercial and office uses, and surface parking lots. Overall, existing uses on-site total approximately 172,573 square feet (sf) of floor area, including a total of 84 residential dwelling units, 79,107 sf of office uses, 26,690 sf of retail uses, and 475 sf of restaurant uses. The Project Site also includes the segment of the Las Palmas Avenue right-of-way located south of Selma Avenue and north of Sunset Boulevard, which would be realigned with implementation of the Project.

PROJECT DESCRIPTION

The Project proposes to redevelop the Project Site with a mixed-use development that would retain, preserve, and rehabilitate Crossroads of the World. Upon buildout, the Project would consist of mixed-use buildings that include up to 950 residential units, 308 hotel rooms, approximately 95,000 sf of office uses, and approximately 185,000 sf of commercial uses, including the rehabilitation of Crossroads of the World. It is anticipated that the 185,000 sf of commercial space would consist of approximately 61,750 sf of retail uses, a 40,000 sf supermarket, and 83,200 sf of restaurant uses.

The conceptual project site plan is shown in Figure 1.

The Project would also provide vehicular and pedestrian circulation improvements, including the establishment of a new pedestrian passageway that would extend diagonally from Sunset Boulevard fronting Crossroads of the World to the intersection of Selma Avenue & McCadden

Place. The Project would realign the segment of Las Palmas Avenue north of Sunset Boulevard to directly align with the segment of Las Palmas Avenue south of Sunset Boulevard, creating a continuous street at Sunset Boulevard and providing improved connectivity and safety.

Parking for the Project would be provided on-site within subterranean garages. Vehicular access to the parking facilities would be provided via one driveway on Selma Avenue, one driveway on Highland Avenue, two driveways on McCadden Place and four driveways on Las Palmas Avenue. Loading areas and a valet drop-off area will also be accessed along Las Palmas Avenue for commercial uses and along McCadden Place and Selma Avenue for hotel uses.

Las Palmas Avenue Realignment Related Improvements

The Project also includes on-site and off-site improvements to the existing sanitary sewer system related to the realignment of Las Palmas Avenue. Specifically, the on-site 30-inch sewer main under Las Palmas Avenue between Selma Avenue and Sunset Boulevard would be removed and replaced with new sewer mains in the following off-site locations:

- Selma Avenue between Las Palmas Avenue and Cassil Place
- Cassil Place between Selma Avenue and Sunset Boulevard
- Sunset Boulevard between Cassil Place and Las Palmas Avenue

New sewer mains would be constructed in accordance with Los Angeles Department of Public Works Bureau of Sanitation requirements. Additionally, a subsurface vacation of Las Palmas Avenue would be required to construct the proposed parking garage in that portion of the Project Site.

TRAFFIC ANALYSIS METHODOLOGY

Study Scope and Analysis Conditions

The scope of analysis for this study was developed in consultation with LADOT, as well as from input received during the public scoping process in November 2015. The base assumptions and technical methodologies (i.e., trip generation, study locations, analysis methodology, etc.) were identified as part of the study approach and were outlined in a Memorandum of Understanding (MOU) dated January 6, 2016, which was reviewed and approved by LADOT. As part of the MOU, a review of the freeway impact analysis screening criteria on the California Department of Transportation (Caltrans) facilities (i.e., ramps and freeway segments) was prepared pursuant to the *First Amendment to the Agreement between LADOT and Caltrans District 7 on Freeway Impact Analysis Procedures* (State of California and City of Los Angeles, December 15, 2015) ("Caltrans Agreement"). A copy of the signed MOU is provided in Appendix A.

This study analyzes the potential Project-generated traffic impacts on the street system in the vicinity of the Project Site as compared to existing conditions at the time the Project's Notice of Preparation (NOP) was issued (October 22, 2015) and projected future conditions at the time the Project is expected to be completed (Year 2022). Potential intersection impacts were evaluated for typical weekday AM (7:00 AM to 10:00 AM) and PM (3:00 PM to 6:00 PM) peak periods. A total of 111 signalized intersections and 12 unsignalized intersections in the vicinity of the Project Site within the Cities of Los Angeles and West Hollywood were selected for detailed traffic analysis. They are listed in Tables 1A and 1B and shown in Figure 2.

This traffic study evaluates the potential for impacts caused by the Project on the street system surrounding the Project Site. Consistent with *Traffic Study Policies and Procedures* (LADOT, August 2014), the following traffic conditions were developed and analyzed as part of this study:

- Existing Conditions (Year 2015) – The analysis of existing traffic conditions provides a basis for the assessment of future traffic conditions. The Existing Conditions analysis includes a description of key area streets and highways, traffic volumes and current operating conditions, and transit service in the Study Area. Intersection turning movement counts were collected in May 2015 and, for the purposes of this analysis, represent existing conditions. Fieldwork (lane configurations and signal phasing) for the analyzed intersections was also collected and reconfirmed in late 2015. Intersection lane

configurations are provided in Appendix B, traffic count worksheets in Appendix C, and level of service (LOS) worksheets in Appendix D.

- Existing with Project Conditions (Year 2015) – This analysis condition projects the potential intersection operating conditions that could be expected if the Project were built under existing conditions. This analysis evaluates the potential Project-related traffic impacts as compared to Existing Conditions.

- Existing with Project with Mitigation Conditions (Year 2015) – This analysis condition projects the potential intersection operating conditions that could be expected if the Project were built under existing conditions, including the effect of any mitigation. In this analysis condition, the Project-generated traffic with mitigation incorporated is added to the Existing Conditions.

- Future without Project Conditions (Year 2022) – This analysis projects the future traffic growth and intersection operating conditions that could be expected as a result of regional growth and related project traffic in the Study Area by year 2022. The Future without Project traffic conditions are projected by adding ambient traffic growth and traffic from related projects to Existing Conditions. This analysis provides the conditions by which the Project impacts are evaluated in the future at full buildout.

- Future with Project Conditions (Year 2022) – This analysis projects the potential intersection operating conditions that could be expected if the Project were built in the projected buildout year. This analysis identifies the potential incremental impacts of the Project at full buildout, prior to mitigation, on projected future traffic operating conditions by adding the Project-generated traffic to the Future without Project traffic forecasts.

- Future with Project with Mitigation Conditions (Year 2022) – This analysis projects the potential intersection operating conditions that could be expected if the Project were built in the projected buildout year, including the effect of any mitigation. In this analysis condition, the Project-generated traffic with mitigation incorporated is added to the Future without Project Conditions.

Signalized Intersection Analysis Methodology

Intersection capacity has been analyzed using the "Critical Movement Analysis (CMA) – Planning" (*Transportation Research Circular No. 212, Interim Materials on Highway Capacity*, Transportation Research Board, 1980) methodology in accordance with the *Traffic Study Policies and Procedures*. The CMA methodology was implemented using LADOT's Calcadb Lite spreadsheet application to analyze intersection operating conditions. The methodology calculates the volume-to-capacity (V/C) ratio, which is used to determine the intersection LOS according to the LOS definitions provided in Table 2. LOS worksheets for each scenario are provided in Appendix D.

The Automated Traffic Surveillance and Control (ATSAC) system represents an advanced system in computer control of traffic signals. It was first put into operation in June 1984 in the Coliseum area of the City to anticipate the expected increase in traffic due to the Summer Olympic Games, and has since been expanded to other parts of the City. The advantages of ATSAC-controlled traffic signals are substantial, including real-time adjustment of signal timing plans to reflect changing traffic conditions, identification of unusual traffic conditions caused by incidents, the ability to implement special purpose short-term signal timing changes in response to incidents, and the ability to identify signal equipment malfunctions quickly. LADOT estimates that implementation of this system improves intersection capacity by an average of 7%.

In addition to ATSAC, the Adaptive Traffic Control System (ATCS) has been implemented in the City. ATCS is a computer-based traffic signal control program that provides fully responsive traffic signal control based on real-time traffic conditions. It automatically adjusts and optimizes traffic signal timing in response to current traffic demands on the entire signal network such that the number of stops and the amount of delay Is minimized along with improved traffic signal coordination throughout the network. LADOT estimates that implementation of this system improves intersection capacity by an additional 3% over those operating under the ATSAC system alone.

Each of the signalized study intersections under LADOT jurisdiction is equipped with both ATSAC and ATCS. In accordance with standard LADOT procedures, a capacity increase of 10% (0.10 V/C adjustment) was applied to each intersection to reflect the benefits of ATSAC and ATCS control. The capacity increases are applied within the Calcadb Lite software and, therefore, are inherent in the analysis results.

Unsignalized Intersection Analysis Methodology

Based on *Traffic Study Policies and Procedures*, the unsignalized intersections were evaluated to determine the need for the installation of a traffic signal. The unsignalized intersections were analyzed using *2010 Highway Capacity Manual* (Transportation Research Board, 2010) (HCM) methodology to determine the overall intersection delay. The HCM methodology calculates the average delay, in seconds, of a vehicle passing through the intersection in any direction. The

average delay is used to determine the intersection LOS according to the LOS definitions provided in Table 2. The analysis worksheets for each scenario are provided in Appendix D.

Pursuant to *Traffic Study Policies and Procedures*, if, based on the estimated delay, the resultant LOS is E or F in the Future with Project Conditions, the intersection should be evaluated for the potential installation of a new traffic signal through a traffic signal warrant analysis. It should be noted that the determination that an unsignalized intersection meets the criteria of a traffic signal warrant does not in itself require the installation of a signal. Rather, the decision on whether a traffic signal should be installed is made by the governing jurisdictions taking into consideration other factors such as distance to adjacent signalized intersections and interruption to traffic flow along the major street.

IMPACT CRITERIA AND SIGNIFICANCE THRESHOLDS

Signalized Intersections

The significance of the potential impacts of Project generated traffic at the signalized study intersections was determined using criteria identified in *Traffic Study Policies and Procedures*. LADOT guidelines indicate that a project is considered to have a significant traffic impact on a signalized intersection if the increase in the V/C ratio attributable to the project exceeds a specific threshold depending on the final intersection LOS. LADOT has developed a sliding scale methodology in which the minimum allowable increase in the V/C ratio attributable to a project decreases as the V/C ratio of the intersection increases:

Intersection Conditions with Project Traffic		**Significant Impact Threshold for Project-related Increase in V/C Ratio**
LOS	**V/C**	
C	0.701 – 0.800	Equal to or greater than 0.04
D	0.801 – 0.900	Equal to or greater than 0.02
E, F	> 0.900	Equal to or greater than 0.01

Source: City of Los Angeles.

The relative impact of the added traffic volumes to be generated by the Project was evaluated based on analysis of existing and future operating conditions at the study intersections, with and

without the Project. According to the methodology of LADOT, no significant impacts are deemed to occur at intersections operating at LOS A or B due to sufficient capacity provided to accommodate Project-related traffic increases with little effect on intersection operations.

Study intersections located within or partially within City of West Hollywood jurisdiction were also analyzed using the following City of West Hollywood significance thresholds. The City of West Hollywood has adopted a sliding scale for determining significant traffic impacts to intersections. The significant impact criteria are based on a minimum allowable increase in delay attributable to a project as the overall LOS of the intersection decreases:

Intersection Conditions with Project Traffic		**Project-Related Increase of Delay (seconds)**
Level of Service	**Intersection Delay (seconds)**	
Signalized Intersection of Two Commercial Corridors		
D	35.1 - 55.0	⩾ 12.0
E or F	> 55.0	⩾ 8.0
Other Signalized Intersection		
D	35.1 - 55.0	⩾ 8.0
E or F	> 55.0	⩾ 5.0

Source: City of West Hollywood

According to the methodology of the City of West Hollywood, no significant impacts are deemed to occur at intersections operating at LOS A, B, or C due to sufficient capacity provided to accommodate Project-related traffic increases with little effect on intersection operations.

Residential Street Segments

As outlined in *Traffic Study Policies and Procedures*, a local residential street shall be deemed significantly impacted based on an increase in the projected average daily traffic (ADT) volumes as follows:

Projected ADT with Project (Final ADT)	Project-Related Increase in ADT
0 to 999	120 trips or more
1,000 to 1,999	12% or more of Final ADT
2,000 to 2,999	10% or more of Final ADT
3,000 or more	8% or more of Final ADT

ADDITIONAL TRAFFIC ANALYSES

Congestion Management Program

An analysis also was conducted according to *2010 Los Angeles County Congestion Management Program* (CMP) (Metro, 2010) guidelines. The CMP is a State-mandated program that serves as the monitoring and analytical basis for transportation funding decisions in the County made through the Regional Transportation Improvement Program (RTIP) and State Transportation Improvement Program (STIP) processes. The CMP requires that a Traffic Impact Analysis (TIA) be performed (1) for all CMP arterial monitoring intersections where a project would add 50 or more trips during either the AM or PM weekday peak hours and (2) all mainline freeway monitoring locations where a project would add 150 or more trips (in either direction) during the AM or PM weekday peak hours. In addition, it requires a review of potential impacts to the regional transit system.

The required CMP analyses were performed, as detailed in Chapter 11, in accordance with the TIA guidelines referenced in the CMP.

Caltrans

Caltrans facilities were evaluated according to the requirements of the Caltrans Agreement. The agreement identifies a series of screening criteria that, if any are met by the Project, require a more detailed analysis of Caltrans facilities. The detailed analysis was conducted using the HCM methodology, in accordance with *Guide for the Preparation of Traffic Impact Studies*

(Caltrans, December 2002) ("Caltrans TIS Guide"). Caltrans does not identify specific incremental criteria by which to measure the significance of impacts to freeway mainline segments or intersections and, therefore, it is not possible to identify whether a specific facility would be significantly impacted under Caltrans criteria. In the absence of specific Caltrans criteria for evaluating impacts, the freeway mainline segments and Caltrans intersections were analyzed for the Project's effect on operating conditions, based conservatively on the CMP significance criteria. The detailed Caltrans analysis is presented in Chapter 11.

State of California Senate Bill No. 743

Senate Bill 743 (SB 743) (Steinberg, 2013), made effective in January 2014, requires the Governor's Office of Planning and Research to change the California Environmental Quality Act (CEQA) guidelines regarding the analysis of transportation impacts. Under SB 743, the focus of transportation analysis will shift from driver delay to reduction of greenhouse gas emissions (GHG), creation of multimodal networks and promotion mixed-use developments. Although originally scheduled to be fully implemented in guidelines by January 1, 2016, an extension has allowed cities more time to establish an analysis methodology.

The Project characteristics (e.g., its location, proximity to transit, access to other nearby destinations, pedestrian connections, bicycle amenities, etc.) would encourage non-auto modes of transportation such as walking, bicycling, carpool, vanpool, transit, etc., and therefore, would reduce vehicle miles traveled (VMT) to the Project Site and associated transportation-related GHG emissions.

The Project Site represents an urban/compact infill location within the Hollywood community of the City of Los Angeles and is located within 1,500 feet of the Metro's Hollywood/Highland light rail transit station, as well as numerous transit lines. .The Project is also located along two major corridors, Sunset Boulevard and Highland Avenue. The location efficiency of the Project Site would result in synergistic benefits that would reduce vehicle trips and VMT. Further, the Project would be located within an area that offers access to other nearby retail and entertainment destinations, including Hollywood & Highland Center an entertainment complex approximately 0.20 miles northwest of the Project Site. The Project Site would also be located within 5.5 miles of Downtown Los Angeles, a primary job center. Access to on-site uses would be provided from

existing pedestrian pathways, as well as adequate bicycle parking for residential and commercial uses. The Project would provide an internal pedestrian network that links to the existing off-site pedestrian network including existing off-site sidewalks. Streets within a half mile of the Project Site are equipped with sidewalks and approximately 25% of the intersections include marked crosswalks and/or countdown signal timers. The combined effects of these factors would reduce the Project's anticipated vehicle trips and VMTs and encourage walking and non-auto forms of transportation, which results in corresponding reductions in transportation-related emissions.

Additional Review and Analysis

In addition to the various intersection analyses and the CMP analysis discussed above, this study includes a review of various other features and conditions related to the proposed Project. These include a review of Project access and circulation, parking requirements and proposed supply, and an analysis of potential traffic impacts associated with the Project's construction.

ORGANIZATION OF REPORT

This report is divided into 15 chapters, including this introduction. Chapter 2 describes the existing circulation system, traffic volumes, and traffic conditions in the Study Area. Chapter 3 forecasts the Future without Project Conditions. Chapter 4 describes the procedure used to forecast Project traffic volumes and distribution through the Study Area. Chapter 5 presents the intersection operating conditions associated with construction of the Project on top of Existing Conditions. Chapter 6 presents the intersection operating conditions associated with construction of the Project on top of Future without Project Conditions (year 2022). Chapter 7 identifies the potential significant traffic impacts, prior to mitigation, of the proposed Project under Existing with Project and Future with Project Conditions. Chapter 8 describes the traffic improvement and mitigation program designed to reduce the impacts of the Project to the extent possible. Chapter 9 presents the intersection operations of the unsignalized intersections and the signal warrant analysis. Chapter 10 presents the regional CMP analysis. Chapter 11 presents the analyses of Caltrans facilities. Chapter 12 describes site access and internal circulation. Chapter 13 presents the analysis of the Project's neighborhood intrusion impacts. Chapter 14 presents the impacts associated with the construction phase of the Project. The

Appendices contain supporting documentation and additional details of the technical analyses, as well as the additional analysis described above.

TABLE 2
LEVEL OF SERVICE DEFINITIONS FOR INTERSECTIONS

Level of Service	**Signalized V/C Ratio** [a]	**Unsignalized Delay (seconds)** [b]	**Definition**
A	0.000 - 0.600	0.0 - 10.0	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	0.601 - 0.700	10.1 - 15.0	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.701 - 0.800	15.1 - 25.0	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.801 - 0.900	25.1 - 35.0	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.901 - 1.000	35.1 - 50.0	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	> 50.0	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.

Notes

[b] *2010 Highway Capacity Manual* (Transportation Research Board, 2010).

Chapter 2
Existing Conditions

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions in the Project Study Area. The Existing Conditions analysis includes an assessment of the existing freeway and street systems, an analysis of traffic volumes and current operating conditions, and an assessment of the existing public transit service, as well as pedestrian and bicycle circulation at the time of the NOP issuance.

STUDY AREA

The Project's traffic analysis Study Area, shown in Figure 2, includes a geographic area that is generally bounded by US 101 to the north, Western Avenue to the east, Beverly Boulevard to the south, and Crescent Heights Boulevard to the west.

A traffic analysis study area generally comprises those intersections with the greatest potential to experience significant traffic impacts due to the project as defined by the City, including intersections that are:

1. Immediately adjacent or in close proximity to the project site
2. In the vicinity of the project site that are documented to have current or projected future adverse operational issues
3. In the vicinity of the project site that are forecast to experience a relatively greater percentage of project-related vehicular turning movements (e.g., at freeway ramp intersections)

The Project's traffic analysis Study Area was established in consultation with the City, based on the above criteria, as well as peak hour Project trip generation, the anticipated distribution of Project traffic, and the existing intersections/corridor operations. It comprises those intersections with the reasonable potential to experience significant traffic impacts due to the Project.

A total of 123 intersections, including 111 signalized and 12 unsignalized, were identified during the MOU process for detailed analysis of the above conditions. The results of the traffic impact analysis detailed in this Traffic Study were reviewed to ensure that all potentially significantly impacted intersections, prior to mitigation, were analyzed, and that the boundary of the Study Area was extended, as necessary, to confirm that there were no significant impacts at or beyond the Study Area periphery. As detailed later in this traffic study, the study intersections on the Study Area periphery are not anticipated to be significantly impacted by the Project and, thus, the analyzed locations are considered to be adequate such that no additional significant impacts are anticipated to occur beyond the traffic analysis Study Area. Figure 2 illustrates the location of the Project Site in relation to the surrounding street system and the 123 study intersections. The existing lane configurations at the analyzed intersections are provided in Appendix B.

EXISTING STREET SYSTEM

The existing street system in the Study Area consists of a regional roadway system including freeways, primary and secondary arterials, and collector and local streets which provide regional, sub-regional, or local access and circulation within the Study Area. These transportation facilities generally provide two to six travel lanes and usually allow parking on either side of the street. Typically, the speed limits range between 25 and 35 miles per hour (mph) on the streets and between 55 and 65 mph on freeways.

Street classifications for roadways within the City of Los Angeles are designated in the *Mobility Plan 2035, An Element of the General Plan* (Los Angeles Department of City Planning, January 2016) (the "Mobility Plan") and the *City of Los Angeles Transportation Element of the General Plan* ("1999 Transportation Element of the General Plan") (Los Angeles Department of City Planning, 1999) previously in effect. The Mobility Plan revised street standards previously outlined in the 1999 Transportation Element of the General Plan in an effort to provide a more enhanced balance between traffic flow and other important street functions including transit routes and stops, pedestrian environments, bicycle routes, building design and site access, etc. The available facilities in the Study Area are defined by the following in the Mobility Plan:

- Freeways are high-volume, high-speed roadways with limited access provided by interchanges that carry regional traffic through and do not provide local access to adjacent land uses.

- Arterial Streets are major streets that serve through traffic, as well as provide access to major commercial activity centers. Arterials are divided into two categories:

    - Boulevards represent the widest streets that typically provide regional access to major destinations and include two categories:

        - Boulevard I provides up to four travel lanes in each direction with a target operating speed of 40 mph

        - Boulevard II provides up to three travel lanes in each direction with a target operating speed of 35 mph

    - Avenues pass through both residential and commercial areas and include three categories:

        - Avenue I provides up to two travel lanes in each direction with a target operating speed of 35 mph

        - Avenue II provides up to two travel lanes in each direction with a target operating speed of 30 mph

        - Avenue III provides up to two travel lanes in each direction with a target operating speed of 25 mph

- Collector Streets are generally located in residential neighborhoods and provide access to and from arterial streets for local traffic and are not intended for cut-through traffic. They provide one travel lane in each direction with operating speed of 25 mph.

- Local Streets are intended to accommodate lower volumes of vehicle traffic and provide parking on both sides of the street. They provide one travel lane in each direction with a target operating speed of 15 to 20 mph. Local streets include two categories:

    - Continuous local streets connect to other streets at both ends

    - Non-continuous local streets lead to a dead-end

The Mobility Plan is currently under litigation that could potentially result in its nullification. In that scenario, the 1999 Transportation Element of the General Plan would once more be in effect. Arterial streets are designated as the following in the 1999 Transportation Element of the General Plan:

- Arterial Streets are major streets that serve through traffic, as well as provide access to major commercial activity centers. Arterials are divided into three categories: Major Class Highway I, Major Class Highway II, and Secondary Highway.
    - Major Highway Class I has average daily traffic (ADT) of more than 50,000.
    - Major Highway Class II is typically spaced one mile apart in a grid system, with an ADT of 30,000 to 50,000.
    - Secondary Highway supplements the through-traffic characteristics of major highways and typically located one mile apart midway between major highways, with an ADT of 20,000 to 30,000.

The street classifications for roadways located within the City of West Hollywood are designated in *West Hollywood General Plan 2035* ("West Hollywood General Plan") (City of West Hollywood, 2011). The following is a brief description of the major streets in the traffic analysis Study Area: The available facilities are defined by the following in the *West Hollywood General Plan*:

- Arterial Streets are roadways that primarily serve regional as well as local vehicular traffic along commercial corridors.
- Secondary/Collector Streets are roadways that generally carry vehicular traffic to and from the residential neighborhood.
- Local Streets are roadways that primarily serve the residential neighborhood.

Primary regional access to the Project Site is provided by US 101. The major arterials providing regional and sub-regional access to the traffic analysis Study Area include Highland Avenue, Hollywood Boulevard, Sunset Boulevard, and Santa Monica Boulevard. The following is a brief description of the major roadways in the traffic analysis Study Area, including their classification under both the Mobility Plan and the 1999 Transportation Element of the General Plan, as well as the West Hollywood General Plan for reference:

Freeways

- US 101 – US 101 generally runs in the northwest-southeast direction and is located approximately 1.25 miles east of the Project Site. In the vicinity of the Study Area, US 101 provides four travel lanes in each direction. Access to and from US 101 is available via interchanges at Cahuenga Boulevard, Highland Avenue, Western Avenue, Franklin Avenue, Gower Street, Hollywood Boulevard, Sunset Boulevard, and Santa Monica Boulevard.

Roadways

- Crescent Heights Boulevard – Crescent Heights Boulevard is a designated Avenue III in the Mobility Plan and was previously a designated Secondary Highway in the 1999 Transportation Element of the General Plan within the City of Los Angeles. Crescent Heights Boulevard is a designated Arterial Street in the West Hollywood General Plan. It travels in the north-south direction, and is located west of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. Unmetered parking is generally available on both sides of the street between Sunset Boulevard and Santa Monica Boulevard. Two-hour metered and unmetered parking is generally provided with AM peak hour restrictions on the west side of the street and PM peak hour restrictions on the east side of the street between Waring Avenue and Beverly Boulevard. Unmetered parking is generally provided with AM peak hour restrictions on the west side of the street and PM peak hour restrictions on the east side of the street between Santa Monica Boulevard and Beverly Boulevard.

- Fairfax Avenue – Fairfax Avenue is a designated Boulevard II north of Melrose Avenue and an Avenue II south of Melrose Avenue in the Mobility Plan and was previously a designated Major Highway Class II in the 1999 Transportation Element of the General Plan within the City of Los Angeles. Fairfax Avenue is a designated Arterial Street in the West Hollywood General Plan. It travels in the north-south direction, and is located west of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. Two-hour unmetered and metered parking (except by parking permit) is generally provided on both sides of the street

- Nichols Canyon Road – Nichols Canyon Road is a designated Collector Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction, and is located northwest of the Project Site. It generally provides two travel lanes, one lane in each direction. On-street parking is generally prohibited within the traffic analysis Study Area.

- Gardner Street– Gardner Street is a designated Avenue III in the Mobility Plan and previously a designated Collector Street in the 1999 Transportation Element of the General Plan within the City of Los Angeles. Gardner Street is a designated Local Street in the West Hollywood General Plan. It travels in the north-south direction, and is located west of the Project Site. It generally provides two travel lanes, one lane in each direction. Two-hour unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Fuller Avenue – Fuller Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan within the City of Los Angeles. Fuller Avenue is also a designated Local Street in the West Hollywood General Plan. It travels in the north-south direction, and is located west of the Project Site. It generally provides two travel lanes, one lane in each direction. Unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Poinsettia Place – Poinsettia Place is a designated Collector Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan within the City of Los Angeles. Poinsettia Place is a designated Local Street in the West Hollywood General Plan. It travels in the north-south direction, and is located west of the Project Site. It

generally provides two travel lanes, one lane in each direction. Two-hour metered and 15-minute unmetered parking is generally provided on the west side of the street and unmetered parking is generally provided on the east side of the street within the traffic analysis Study Area.

- La Brea Avenue – La Brea Avenue is a designated Avenue I in the Mobility Plan and was previously a designated Major Highway Class II south of Hollywood Boulevard and a designated Secondary Highway north of Hollywood Boulevard in the 1999 Transportation Element of the General Plan within the City of Los Angeles. La Brea Avenue is a designated Arterial Street in the West Hollywood General Plan. It travels in the north-south direction, and is located west of the Project Site. It generally provides four to six travel lanes, two to three lanes in each direction, and left-turn lanes at most intersections. Permit-only parking is provided north of Franklin Avenue and one-hour and two-hour metered parking with peak hour restrictions is generally provided on both sides of the street within the traffic analysis Study Area.

- Outpost Drive – Outpost Drive is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located northwest of the Project Site. It generally provides two travel lanes, one in each direction. Parking is not permitted on either side of the street within the traffic analysis Study Area.

- Orange Drive – Orange Drive is a designated Collector Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located west of the Project Site. It generally provides two travel lanes, one lane in each direction. Permit-only parking is provided north of Hollywood Boulevard and one-hour and two-hour metered parking, as well as unmetered parking is generally provided on both sides of the street south of Hollywood Boulevard within the traffic analysis Study Area.

- Highland Avenue – Highland Avenue is a designated Avenue I south of Franklin Avenue and a designated Boulevard II north of Franklin Avenue in the Mobility Plan and was previously a designated Major Highway Class II in the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located adjacent to the western boundary of the Project Site. It generally provides four to six travel lanes, two to three lanes in each direction, and left-turn lanes at most intersections north of Melrose Avenue. One and two-hour metered parking is generally provided on both sides of the street south of Hollywood Boulevard within the traffic analysis Study Area.

- Las Palmas Avenue – Las Palmas Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction, and is located adjacent to the western boundary of a portion of the Project Site. It generally provides two travel lanes, one lane in each direction. One and two-hour metered and unmetered parking is generally provided (except by permit) on both sides of the street within the traffic analysis Study Area.

- Cherokee Avenue – Cherokee Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides two travel

lanes, one lane in each direction. Two-hour metered parking and unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Whitley Avenue – Whitley Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction, and is located east of the Project Site. It generally provides two travel lanes, one lane in each direction. One and two-hour metered and unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Wilcox Avenue – Wilcox Avenue is a designated Avenue III in the Mobility Plan and was previously a designated Collector Street in the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It provides two travel lanes, one lane in each direction. One-hour and two-hour metered and unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Cahuenga Boulevard – Cahuenga Boulevard is a designated Avenue II south of Franklin Avenue and a designated Avenue I north of Franklin Avenue in the Mobility Plan and was previously a designated Secondary Highway south of Franklin Avenue and Major Highway Class II north of Franklin Avenue in the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. Two-hour metered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Vine Street – Vine Street is a designated Avenue II in the Mobility Plan and was previously a designated Major Highway Class II in the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. One-hour and two-hour metered and unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Argyle Avenue – Argyle Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at most intersections. One-hour and two-hour metered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Gower Street – Gower Street is a designated Avenue III in the Mobility Plan and was previously a designated Secondary Highway in the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at most intersections. One-hour metered parking with PM peak hour restrictions is generally available on the west side of the street and one-hour metered parking with AM and PM peak hour restrictions is generally available on the east side of the street between Hollywood Boulevard and Sunset Boulevard. Unmetered parking is generally provided on both sides of the street north of Hollywood Boulevard and south of Sunset Boulevard within the traffic analysis Study Area.

- Beachwood Drive – Beachwood Drive is a designated Collector Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located northeast of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at most intersections. Unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Bronson Avenue – Bronson Avenue is a designated Avenue III in the Mobility Plan, and was previously a designated Secondary Highway in the 1999 Transportation Element of the General Plan. It travels in the north-south direction, and is located east of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at most intersections. Two-hour unmetered parking is generally available on the west side of the street and unmetered parking is generally available on the east side of the street between Franklin Avenue and Yucca Street. Unmetered parking is generally provided on both sides of the street south of Yucca Street within the traffic analysis Study Area.

- Van Ness Avenue – Van Ness Avenue is a designated Collector Street south of US 101 and a Local Street north of US 101 in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at most intersections. Two-hour unmetered parking is generally available on the west side of the street and unmetered parking is generally provided on the east side of the street within the traffic analysis Study Area.

- Wilton Place – Wilton Place is a designated Avenue III in the Mobility Plan and was previously a designated Secondary Highway in the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides two to four travel lanes, one to two lanes in each direction, and left-turn lanes at most intersections. Unmetered parking is generally available on both sides of the street north of Hollywood Boulevard. Unmetered parking with peak hour restrictions is generally provided on both sides of the street south of Hollywood Boulevard within the traffic analysis Study Area.

- Western Avenue – Western Avenue is a designated Avenue III in the Mobility Plan and was previously a designated Major Highway Class II in the 1999 Transportation Element of the General Plan. It travels in the north-south direction and is located east of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. One-hour and two-hour metered and unmetered parking is generally provided on both sides of the street between Franklin Avenue and Sunset Boulevard. One-hour metered parking is generally provided on the west side of the street south of Sunset Boulevard within the traffic analysis Study Area.

- Pilgrimage Bridge – Pilgrimage Bridge is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located north of the Project Site It generally provides two travel lanes, one lane in each direction. On-street parking is prohibited within the traffic analysis Study Area.

- Odin Street – Odin Street is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located north of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at intersections. On-street parking is generally not provided within the traffic analysis Study Area.

- Camrose Drive – Camrose Drive is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located north of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at intersections. Unmetered parking is generally provided on both sides of the street west of Highland Avenue within the traffic analysis Study Area.

- Franklin Avenue – Franklin Avenue is a designated Avenue III west of Cahuenga Boulevard and a designated Avenue II east of Cahuenga Boulevard and was previously a designated Secondary Highway in the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located north of the Project Site. It generally provides two to four travel lanes, one to two lanes in each direction, and left-turn lanes at most intersections. Two-hour unmetered parking (with nighttime prohibitions, except by parking permit) is generally provided on the south side of the street and unrestricted parking is generally provided on the north side of the street between Las Palmas Avenue and Wilcox Avenue. Two-hour unmetered parking with PM peak hour restrictions is generally provided on the north side of the street and unrestricted parking is generally provided on the south side of the street between Cahuenga Boulevard and Ivar Avenue. Both One-hour unmetered and unrestricted curbside parking is generally provided on the south side of the street east of Ivar Avenue.

- Yucca Street – Yucca Street is a designated Local Street west of Cahuenga Boulevard and east of Vine Street and a designated Avenue II between Cahuenga Boulevard and Vine Street in the Mobility Plan and was previously a designated Local Street west of Cahuenga Boulevard and east of Vine Street and a designated a Secondary Highway between Cahuenga Boulevard and Vine Street in the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located north of the Project Site. It generally provides two travel lanes, one lane in each direction, and left-turn lanes at most intersections. Two-hour metered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Hollywood Boulevard – Hollywood Boulevard is a designated Avenue II west of La Brea Avenue and a designated Avenue I east of La Brea Avenue in the Mobility Plan and was previously a designated Secondary Highway west of La Brea Avenue and a designated Major Highway Class II in the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located north of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. One-hour metered parking is generally available on both sides of the street east of La Brea Avenue and unmetered parking with peak hour restrictions is generally provided on both sides of the street west of La Brea Avenue within the traffic analysis Study Area.

- Hawthorn Avenue – Hawthorn Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located north of the Project Site. It generally provides two travel lanes, one lane in each direction. One and two-hour unmetered parking is generally provided (except by permit) on both sides of the street within the traffic analysis Study Area.

- Selma Avenue – Selma Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located adjacent to the northern boundary of the Project Site. It generally provides two travel lanes, one lane in each direction. Two-hour metered parking (with nighttime prohibitions, except by parking permit) is generally provided on both sides of the street between Highland Avenue and Las Palmas Avenue. Two-hour metered parking is generally provided on both sides east of Las Palmas Avenue within the traffic analysis Study Area.

- Sunset Boulevard – Sunset Boulevard is a designated Avenue I in the Mobility Plan and was previously a designated Major Highway Class II in the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located adjacent to the southern boundary of the Project Site. It generally provides four to six travel lanes, two to three lanes in each direction, and left-turn lanes at most intersections. Although parking restrictions are variable, one-hour metered parking with peak hour restrictions is generally provided on both sides of the street within the traffic analysis Study Area.

- Delongpre Avenue – Delongpre Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located south of the Project Site. It generally provides two travel lanes, one lane in each direction. Two-hour unmetered parking with PM peak hour restrictions and unmetered parking is generally provided (except by permit) on both sides of the street near the Highland Avenue intersection.

- Fountain Avenue – Fountain Avenue is a designated Collector Street in the Mobility Plan and was previously a designated Secondary Highway in the General Plan within the City of Los Angeles. Fountain Avenue is a designated Collector Street in the West Hollywood General Plan. It travels in the east-west direction and is located south of the Project Site. It generally provides two to four travel lanes, one to two lanes in each direction, and left-turn lanes at most intersections. Unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Lexington Avenue – Lexington Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan within the City of Los Angeles. Lexington Avenue is also a designated Local Street in the West Hollywood General Plan. It travels in the east-west direction and is located south of the Project Site. It provides two travel lanes, one lane in each direction. Two-hour metered and unmetered parking (except by permit) is generally provided on both sides of the street within the traffic analysis Study Area.

- Santa Monica Boulevard – Santa Monica Boulevard is a designated Avenue I in the Mobility Plan and was previously a designated Major Highway Class II in the 1999 Transportation Element of the General Plan within the City of Los Angeles. Santa

Monica Boulevard is a designated Collector Street in the West Hollywood General Plan. It travels in the east-west direction and is located south of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. Although parking restrictions vary along the corridor, one-hour metered parking with peak hour restrictions is generally provided on both sides of the street within the traffic analysis Study Area.

- Willoughby Avenue – Willoughby Avenue is a designated Local Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction, and is located south of the Project Site. It generally provides two travel lanes, one lane in each direction. Unmetered parking is generally provided on both sides of the street.

- Melrose Avenue – Melrose Avenue is a designated Avenue II in the Mobility Plan and was previously a designated Secondary Highway in the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located south of the Project Site. It generally provides four travel lanes, two lanes in each direction, and left-turn lanes at most intersections. Although parking restrictions vary along the corridor, one and two-hour metered parking on both sides of the street with peak hour restrictions is generally provided within the traffic analysis Study Area.

- Rosewood Avenue – Rosewood Avenue is a designated Collector Street in both the Mobility Plan and the 1999 Transportation Element of the General Plan. It travels in the east-west direction, and is located south of the Project Site. It generally provides two travel lanes, one lane in each direction. Unmetered parking is generally provided on both sides of the street within the traffic analysis Study Area.

- Beverly Boulevard – Beverly Boulevard is a designated Boulevard II in the Mobility Plan and was previously a designated Major Highway Class II in the 1999 Transportation Element of the General Plan. It travels in the east-west direction and is located south of the Project Site. It provides four travel lanes, two lanes in each direction, and left-turn lanes at major intersections. One-hour metered parking is generally provided on both sides of the street west of La Brea Avenue within the Study Area. Unmetered parking is generally provided on both sides of the street between La Brea Avenue and Highland Avenue and on the south side of the street east of Rossmore Avenue within the traffic analysis Study Area.

EXISTING TRANSIT SYSTEM

The Project area is served by bus lines operated by Metro, LADOT DASH, LADOT Commuter Express (CE), and West Hollywood Cityline. Figure 3 illustrates the existing transit service in the Study Area. The following provides a brief description of the bus lines providing service in the Project vicinity:

- Metro Local 2 – Route 2 is a local line that travels from downtown Los Angeles to Pacific Palisades via Sunset Boulevard, with average headways of 10 to 15 minutes during the weekday AM and PM peak hours. This line provides service to Hollywood, West Hollywood, and Westwood and travels along Sunset Boulevard in the vicinity of the Project Site.

- Metro Local 4 – Route 4 is a local line that travels from Santa Monica to downtown Los Angeles via Santa Monica Boulevard, with average headways of 10 to 15 minutes during the weekday AM and PM peak hours. This line provides service to West Los Angeles, West Hollywood, and Echo Park. It travels along Santa Monica Boulevard in the vicinity of the Project Site.

- Metro Local 10 – Route 10 is a local line that travels from downtown Los Angeles to West Hollywood via Temple Street and Melrose Avenue, with average headways of 15 minutes during the weekday AM peak hours and 20 minutes during the weekday PM peak hours. This line provides service to Hollywood. It travels along Melrose Avenue in the vicinity of the Project Site.

- Metro Local 14 – Route 14 is a local line that travels from downtown Los Angeles to Beverly Hills via Beverly Boulevard, with average headways of 10 minutes during the weekday AM and PM peak hours. This line provides service to West Hollywood and travels along Beverly Boulevard in the vicinity of the Project Site.

- Metro Local 156 – Route 156 is a local line that travels from Panorama City to Hollywood via Highland Avenue, Vineland Avenue, and Van Nuys Boulevard, with average headways of 30 to 40 minutes during the weekday AM and PM peak hours. This line provides service to Van Nuys, and North Hollywood. It travels along Highland Avenue in the vicinity of the Project Site.

- Metro Local 175 – Route 175 is a local line that travels from Silver Lake to Hollywood via Hyperion Avenue and Fountain Avenue with average headways of 30 minutes during the weekday AM peak hour and one hour during the weekday PM peak hour. This line provides service to Los Feliz and travels along Fountain Avenue and Western Avenue in the vicinity of the Project Site.

- Metro Local 180/181 – Route 180/181 is a local line that travels from Hollywood to Altadena via Los Feliz Boulevard and Colorado Boulevard with average headways of approximately 35 to 40 minutes during the weekday AM and PM peak hours. This line provides service to Pasadena, Eagle Rock, and Glendale, and travels along Hollywood Boulevard in the vicinity of the Project Site.

- Metro Local 207 – Route 207 is a local line that travels from Hollywood to Athens via Western Avenue with average headways of 10 to 15 minutes during the weekday AM and PM peak hours. This line provides service to the Metro Green Line Crenshaw Station, the Metro Purple Line Wilshire/Western Station, and the Metro Red Line Hollywood/Western Station, and travels along Franklin Avenue and Western Avenue in the vicinity of the Project Site.

- Metro Local 210 – Route 210 is a local line that travels from Hollywood to Redondo Beach via Crenshaw Boulevard with average headways of 15 minutes during the weekday AM and PM peak hours. This line provides service to Torrance, the Metro Green Line Crenshaw Station, and the Metro Expo Line Expo/Crenshaw Station, and travels along Vine Street in the vicinity of the Project Site.

- Metro Local 212 – Route 212 is a local line that travels from the Hollywood/Vine Station to the Hawthorne/Lennox Station via La Brea Avenue with average headways of 15 to 20 minutes during the weekday AM and PM peak hours. This line provides service to Miracle Mile, Baldwin Hills, and Inglewood. It travels along La Brea Avenue in the vicinity of the Project Site.

- Metro Local 217 – Route 217 is a local line that travels from Vermont Avenue & Sunset Boulevard to Fairfax Avenue & Washington Boulevard with average headways of 15 to 20 minutes during the weekday AM and PM peak hours. This line provides service to Los Feliz, Hollywood, and Culver City, and travels along Hollywood Boulevard in the vicinity of the Project Site.

- Metro Local 218 – Route 218 is a local line that travels from Studio City to Beverly Hills via Laurel Canyon Boulevard with average headways of 30 to 35 minutes during the weekday AM and PM peak hours. This line provides service to Mount Olympus and West Hollywood, and travels along Laurel Canyon Boulevard in the vicinity of the Project Site.

- Metro Local 222 – Route 222 is a local line that travels from Sunland to Hollywood via Hollywood Way, Barham Boulevard, and Cahuenga Boulevard with average headways of 40 minutes during the weekday AM and PM peak hours. This line provides service to Sun Valley, Burbank, and Universal City, and travels along Hollywood Boulevard in the vicinity of the Project Site.

- Metro Limited 302 – Route 302 is a limited service line that travels from downtown Los Angeles to Pacific Palisades via Sunset Boulevard with average headways of 10 minutes during the weekday AM and PM peak hours. This line provides service to Hollywood, West Hollywood, and Westwood and travels along Sunset Boulevard in the vicinity of the Project Site.

- Metro Limited 312 – Route 312 is a limited service line that travels from the Hollywood/Vine Station to the Hawthorne/Lennox Station via La Brea Avenue with average headways of 10 minutes during the weekday AM and PM peak hours. This line provides service to Miracle Mile, Baldwin Hills, and Inglewood. It travels along La Brea Avenue in the vicinity of the Project Site.

- Metro Local 656 – Route 656 is a local line that travels from Panorama City to Hollywood via Highland Avenue, Vineland Avenue, and Van Nuys Boulevard, with average headways of 30 to 40 minutes during the weekday AM and PM peak hours. This line provides service to Van Nuys, and North Hollywood. It travels along Highland Avenue in the vicinity of the Project Site.

- Metro Rapid 704 – Route 704 is a rapid line that travels from Santa Monica to downtown Los Angeles via Santa Monica Boulevard, with average headways of 15 minutes during the weekday AM and PM peak hours. This line provides service to West Los Angeles, Century City, and West Hollywood, and travels along Santa Monica Boulevard in the vicinity of the Project Site.

- Metro Rapid 757 – Route 757 is a rapid line that travels from Hollywood to Hawthorne via Western Avenue with average headways of 10 to 15 minutes during the weekday AM and PM peak hours. This line provides service to the Metro Green Line Crenshaw Station, the Metro Purple Line Wilshire/Western Station, and the Metro Red Line Hollywood/Western Station, and travels along Western Avenue in the vicinity of the Project Site.

- Metro Rapid 780 – Route 780 is a rapid line that travels from Washington Boulevard & Fairfax Avenue to Pasadena via Fairfax Avenue and Hollywood Boulevard with average headways of 15 minutes during the weekday AM and PM peak hours. This line provides service to Los Feliz, Glendale, and Eagle Rock, and travels along Hollywood Boulevard in the vicinity of the Project Site.

- LADOT DASH Beachwood Canyon – DASH Beachwood Canyon is a local line that travels from the Metro Red Line Hollywood Station to Beachwood Drive & Westshire Drive with average headways of 25 minutes during the weekday AM and PM peak hours. This line provides service to Beachwood Canyon and Hollywood, and travels along Vine Street in the vicinity of the Project Site.

- LADOT DASH Hollywood – DASH Hollywood is a local line that travels from Argyle Avenue & Hollywood Boulevard to Santa Monica Boulevard & Vermont Avenue via Hollywood Boulevard and Fountain Avenue with average headways of 30 to 35 minutes during the weekday AM and PM peak hours. This line provides service to the Metro Red Line Vermont/Sunset, Vermont/Santa Monica, and Hollywood/Vine Stations, and travels along Sunset Boulevard in the vicinity of the Project Site.

- LADOT DASH Hollywood/Wilshire – DASH Hollywood/Wilshire is a local line that travels from the Metro Purple Line Wilshire/Western Station to the Metro Red Line Hollywood/Vine Station with average headways of 25 to 30 minutes during the weekday AM and PM peak hours. This line provides service to Koreatown and Hollywood, and travels along Gower Street in the vicinity of the Project Site.

- LADOT DASH Larchmont Shuttle – Larchmont Shuttle is a shuttle line that provides mid-day service to Larchmont Village and Paramount Studios, and travels along Melrose Avenue, Larchmont Boulevard, Beverly Boulevard and Wilton Place. It does not provide service during weekday AM and PM peak hours.

- LADOT CE 422 – Route 422 is a commuter express line that travels from Thousand Oaks to downtown Los Angeles, with average headways of 15 minutes during the AM peak hours and 20 minutes during the PM peak hours. It provides service to Westlake Village, Woodland Hills, Sherman Oaks and Hollywood. This line travels along US 101 in the vicinity of the Project Site.

- LADOT CE 423 – Route 423 is a commuter express line that travels from Thousand Oaks to downtown Los Angeles, with average headways of 15 minutes during the AM peak hours and 20 minutes during the PM peak hours. It provides service to Westlake Village, Woodland Hills and the Encino Park & Ride. This line travels along US 101 in the vicinity of the Project Site.

- West Hollywood Cityline – West Hollywood Cityline is a local line that travels within West Hollywood, with average headways of 30 minutes during the weekday AM and PM peak hours. This line travels along Fountain Avenue and La Brea Avenue in the vicinity of the Project Site.

In addition to the bus lines that provide service within the Project Site vicinity, the Metro Red Line subway operates in the Study Area. The Metro Red Line runs between North Hollywood and downtown Los Angeles, connecting with the Metro Orange Line in North Hollywood, the Metro Purple Line at Wilshire Boulevard, the Metro Blue Line and Metro Expo Line in downtown Los Angeles, and the Metro Gold Line at Union Station. In the Project vicinity, the Metro Red Line has stations at Hollywood Boulevard & Highland Avenue and Hollywood Boulevard & Vine Street, approximately less than one quarter-mile and three quarter-miles from the Project Site, respectively.

Table 3 summarizes the transit lines operating in the Study Area for each of the service providers in the region, the type of service (peak vs. off-peak, express vs. local), and frequency of service, as described above. The average frequency of transit service during the peak hour was derived from the number of peak period stops made at the stop nearest the Project Site. Table 4 summarizes the total capacity of the Metro, DASH, and CE transit system (no data was readily available for the West Hollywood Cityline bus system) during the AM and PM peak hours based on the frequency of service of each line and the maximum seated and standing capacity of each bus or train. As shown in Table 4, the Metro, DASH, and CE bus lines within the Study Area currently provide capacity for 3,468 transit trips during the AM peak hour and 3,383 transit trips during the PM peak hour. Additionally, the Metro Red Line provides capacity for an additional 7,644 transit trips during the AM peak hour and 7,620 trips during the PM peak hour. In total, the public transit system in the Study Area has a capacity of approximately 11,112 transit trips during the AM peak hour and 11,003 transit trips during the PM peak hour.

BICYCLE AND PEDESTRIAN NETWORK

Existing Bicycle System

Based on *2010 Bicycle Plan, A Component of the City of Los Angeles Transportation Element* (Los Angeles Department of City Planning, 2010), the existing bicycle system in the Study Area consists of a limited coverage of bicycle lanes (Class II) and bicycle routes (Class III). Bicycle lanes are a component of street design with dedicated striping, separating vehicular traffic from bicycle traffic. These facilities offer a safer environment for both cyclists and motorists. Bicycle routes are identified as bicycle-friendly streets where motorists and cyclists share the roadway and there is no dedicated striping of a bicycle lane. Bicycle routes are preferably located on collector and lower volume arterial streets. The following bicycle facilities are provided along corridors within the Study Area:

Bicycle Lanes (Class II)

- Cahuenga Boulevard between Odin Street and Yucca Street
- Fairfax Avenue between Hillside Avenue and Fountain Avenue
- Bronson Avenue between Fountain Avenue and Santa Monica Boulevard

Bicycle Routes (Class III)

- Orange Drive between Hollywood Boulevard and Willoughby Avenue
- Wilcox Avenue between Cahuenga Boulevard and Willoughby Avenue
- Vine Street between Yucca Street and Wilshire Boulevard
- Argyle Avenue between Franklin Avenue and Selma Avenue
- Van Ness Avenue between Fountain Avenue and La Mirada Avenue
- Odin Street between Highland Avenue and Cahuenga Boulevard
- Franklin Avenue between Argyle Avenue and St. George Street
- Yucca Street between Highland Avenue and Argyle Avenue
- Selma Avenue between Highland Avenue and Bronson Avenue
- Fountain Avenue between La Brea Avenue and Sunset Boulevard
- Willoughby Avenue between Vista Street and Gower Street

Similar to the street designations of the General Plan, the bicycle facilities of *2010 Bicycle Plan* have been re-designated with the adoption of the Mobility Plan. The components of *2010 Bicycle Plan* have been incorporated into the bicycle network of the Mobility Plan, which consists of a Low-Stress Bikeway System and a Bicycle Lane Network. The Low-Stress Bikeway System is comprised of the Bicycle Enhanced Network, the Neighborhood Enhanced Network, and Bicycle Paths. The Bicycle Enhanced Network includes protected bicycle lanes and neighborhood streets. Bicycle lanes could provide infrastructure including cycle tracks, bicycle signals, and demarcated areas to facilitate turns at intersections. Neighborhood streets would typically provide mini-roundabouts, cross-street stop signs, crossing islands at major intersection crossings, improved street lighting, bicycle boxes, and bicycle-only left-turn pockets. The Neighborhood Enhanced Network and Bicycle Paths are relatively unchanged from *2010 Bicycle Plan.*

Existing Pedestrian Facilities

The walkability of existing facilities is based on the availability of pedestrian routes necessary to accomplish daily tasks without the use of an automobile; these attributes are quantified by WalkScore.com and assigned a score out of 100 points. With the various commercial businesses and cultural facilities adjacent to residential neighborhoods of the Hollywood district, the walkability of the Project site is approximately 97 points[1]; this compares to the citywide score of 64 points.

The sidewalks that serve as routes to the Project Site provide proper connectivity and adequate widths for a comfortable and safe pedestrian environment. The sidewalks provide connectivity to pedestrian crossings at intersections within the Study Area. The following signalized intersections provide pedestrian facilities to limit illegal mid-block crossings to the Project Site (all intersections have marked pedestrian crossings on all approaches):

[1] WalkScore.com (www.walkscore.com) rates the Project site (Highland Avenue & Selma Avenue) with a score of 97 of 100 possible points (scores accessed on October 28, 2015 for the Hollywood district). Walk Score calculates the walkability of specific addresses by taking into account the ease of living in the neighborhood with a reduced reliance on automobile travel.

- Highland Avenue & Selma Avenue
- Highland Avenue & Sunset Boulevard
- Las Palmas Avenue & Sunset Boulevard
- Cherokee Avenue & Sunset Boulevard

Each of the listed signalized intersections provides pedestrian phasing, crosswalk striping, and Americans with Disabilities Act (ADA) wheelchair ramps.

Vision Zero

As described in *Vision Zero: Eliminating Traffic Deaths in Los Angeles by 2025* (City of Los Angeles, August 2015), Vision Zero is a traffic safety policy that promotes strategies to eliminate collisions that result in severe injury or death. Vision Zero has identified the High Injury Network, a network of streets based on the collision data from the last five years, where strategic investments will have the biggest impact in reducing death and severe injury. The following streets adjacent to the Project Site have been identified in the High Injury Network:

- Selma Avenue between Schrader Boulevard and Vine Street
- Sunset Boulevard
- Highland Avenue between Franklin Avenue & Santa Monica Boulevard
- Las Palmas Avenue between Sunset Boulevard & Santa Monica Boulevard

EXISTING TRAFFIC VOLUMES AND LEVELS OF SERVICE

This section presents the existing peak hour turning movement traffic volumes for the intersections analyzed in the study, describes the methodology used to assess the traffic conditions at each intersection, and analyzes the resulting operating conditions at each intersection indicating V/C ratios or delay and LOS.

Existing Traffic Volumes

Intersection turning movement counts were conducted at the 123 study intersections during the weekday AM (7:00 AM to 10:00 AM) and PM (3:00 PM to 6:00 PM) peak periods in May 2015 and January 2016, when local schools were in session. The existing intersection peak hour traffic volumes are illustrated in Figure 4. Traffic count worksheets are provided in Appendix C.

Existing Intersection Levels of Service

Table 5 summarizes the weekday AM and PM peak hour LOS results for each of the signalized study intersections under Existing Conditions, accounting for the 10% capacity increase to reflect ATSAC and ATCS control. Based on observations of existing intersection operations, it is recognized that the CMA methodology for individual intersections along major arterials does not in every case account for vehicular queues, pedestrian conflicts, etc. Thus, the calculated average operating conditions may appear better than is observed.

The LOS at 10 of the 111 signalized study intersections presented in Table 5 reflect observed conditions and provide a worst-case analysis of Project impacts. Table 5 indicates that 97 of the 111 signalized study intersections currently operate at LOS D or better during both the AM and PM peak hours. The remaining 14 intersections operate at LOS E or F during at least one of the analyzed peak hours.

The LOS calculation worksheets are provided in Appendix D. The detailed analysis of the 12 unsignalized study intersections is provided in Chapter 9. A supplemental analysis of the intersections located within the jurisdiction of the City of West Hollywood is provided in Appendix E.

						Total Residual Capacity in Peak Hour - Bus Line	**3,468**
Metro	Red	12	762	125	0.16	637	7,644
						Total Residual Capacity in Peak Hour - Rail Line	**7,644**

Notes:

[a] Number of runs in both directions combined during peak hour.

[c] Capacity assumptions based on discussions with agencies:
Metro Regular Bus - 40 seated / 50 seated and standing.
Metro Articulated Bus - 66 seated / 75 seated and standing standing.
M Metro Red Line - 55 seats / car, 6 cars / run during peak periods. Metro assumes a maximum capacity of 230% of seated capacity, or approximately 125 / car.
LADOT DASH - 25 seated / 30 seated and standing.
LADOT Commuter Express Bus - 49 seated
West Hollywood Cityline - 50 seated and standing

[d] Maximum Load is the maximum number of people per bus in the peak direction based on ridership data provided by Metro, July 2015.

[e] Maximum residual capacity in peak hours = (Maximum residual capacity per run) x (number of peak hour runs).

Metro: Los Angeles County Metropolitan Transportation Authority.

Notes

* LOS based on field observations, as the CMA methodology for individual intersections does not in every case account for vehicular queues along corridors, pedestrian, conflicts, etc., and thus, the calculated average operating conditions may appear better than is observed.

[a] Intersections located within the City of West Hollywood were also analyzed using HCM 2010 methodology, per City of West Hollywood guidelines, and is provided in Appendix F.

Chapter 3
Future without Project Conditions

Estimates of future traffic conditions both with and without the Project, representing cumulative conditions, were developed to evaluate the potential impacts of the Project on the local street system. This discussion details the assumptions used to develop the Future without Project Conditions in year 2022, which corresponds to the Project buildout year.

The existing traffic volumes were factored by an annual ambient growth rate to approximate regional growth and development. In addition to the ambient growth, for purposes of providing a conservative analysis of potential cumulative traffic impacts, the traffic generated by related projects was also added to estimate the Future without Project traffic conditions.

CEQA GUIDELINES REGARDING FUTURE TRAFFIC CONDITIONS

The forecast of Future without Project Conditions was prepared in accordance with procedures outlined in Section 15130 of *Guidelines for Implementation of the California Environmental Quality Act*, *Chapter 3, Title 14, California Code of Regulations* (California Natural Resources Agency, amended July 27, 2007) ("*Guidelines*"). Specifically, two options are provided for developing the cumulative traffic volume forecast:

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
>
> "(B) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency."

As described in detail below, this analysis includes traffic growth both from related present and future development projects that are proposed, approved, or under construction (the "Related Projects") in accordance with option "A" above and from regional growth projections (i.e., ambient growth) in accordance with option "B" above. Given that the ambient growth factor discussed below likely includes some traffic growth resulting from the Related Projects, the traffic analysis provides a highly conservative estimate of Future without Project traffic volumes.

AMBIENT TRAFFIC GROWTH

Existing traffic is expected to increase as a result of regional growth and development outside the Study Area. The CMP provides general growth factors based on regional modeling. As shown in Exhibit D-1 of the CMP, the Central Los Angeles area is estimated to experience a total regional growth in traffic of 0.70% between the years of 2015 and 2020, which equates to an ambient growth factor of approximately 0.15% per year. However, based on discussions with LADOT through the MOU process, a conservative ambient growth factor of 1% per year compounded annually was applied to adjust the existing traffic volumes to reflect the effects of the regional growth and development by year 2022. The total adjustment applied over the seven-year period was 7.21%. This growth factor conservatively accounts for increases in traffic due to potential projects not yet proposed or projects outside the traffic analysis Study Area.

RELATED PROJECTS

In accordance with the CEQA requirements in *Guidelines*, this study also considers the effects of the Project in relation to the Related Projects. The list of Related Projects is based on information provided by the Department of City Planning and LADOT, as well as recent studies of projects in the area. The Related Projects are detailed in Table 6 and shown in Figure 5. Though the buildout years of many of these Related Projects are uncertain and may be well beyond the buildout year of the Project, and notwithstanding that some may never be approved or developed, they were all considered as part of this traffic study and conservatively assumed to be completed by the Project buildout year 2022.

For example, the Paramount Pictures Studios Master Plan and the NBCUniversal Evolution Plan were included; however, they have anticipated buildout years of 2038 and 2030, respectively, and substantial construction will not likely begin nor be completed by the Year 2022 buildout year of the Project. Therefore, the traffic growth due to the development of Related Projects considered in this analysis is highly conservative and, by itself, substantially overestimates the actual traffic volume growth in the Hollywood area that would likely occur in the next seven years prior to Project buildout. With the addition of the 1% per year ambient growth factor previously discussed, the Future without Project cumulative condition is even more conservative.

Using these conservative assumptions, the potential traffic impacts of the Project were evaluated within the context of the worst-case cumulative impact of all prospective development. The development of estimated traffic volumes added to the Study Area as a result of Related Projects involves the use of a three-step process: trip generation, trip distribution, and trip assignment.

Trip Generation

Trip generation estimates for the Related Projects were provided by LADOT or were calculated using a combination of previous study findings and the trip generation rates contained in *Trip Generation, 9th Edition* (Institute of Transportation Engineers [ITE], 2012). Table 6 summarizes the Related Project trip generation for typical weekdays, including daily trips, AM peak hour trips, and PM peak hour trips. These projections are very conservative in that they do not in every case account for either the trips generated by the existing uses to be removed or the likely use of other travel modes (transit, bicycle, walk, etc.) Further, they do not account for the internal capture trips within a multi-use development, nor the interaction of trips between multiple related projects within the Hollywood area, in which one Related Project serves as the origin for a trip destined for another Related Project.

Trip Distribution

The geographic distribution of the traffic generated by the Related Projects is dependent on several factors. These include the type and density of the proposed land uses, the geographic distribution of the population from which the employees/residents and potential patrons of the

proposed developments are drawn, and the location of these projects in relation to the surrounding street system. These factors are considered along with logical travel routes through the street system to develop a reasonable pattern of trip distribution.

Trip Assignment

The trip generation estimates for the Related Projects were assigned to the local street system using the trip distribution pattern described above. Figure 6 shows the peak hour traffic volumes associated with these Related Projects at the study intersections. These volumes were then added to the existing traffic volumes after adjustment for ambient growth through the projected buildout year of 2022. As discussed above, this is a conservative approach as many of the Related Projects may be reflected in the ambient growth rate. These volumes represent the Future without Project Conditions (i.e., existing traffic volumes added to ambient traffic growth and Related Project traffic growth) and are shown in Figure 7 for the 123 study intersections.

FUTURE IMPROVEMENTS

Future Roadway Improvements

The analysis of future conditions accounted for roadway improvements that were funded and reasonably expected to be implemented prior to the buildout of the proposed Project. These roadway improvements result in changes to the physical configuration at the study intersections. Other proposed traffic/trip reduction strategies such as the proposed creation of a Hollywood Transportation Management Organization (TMO) and Transportation Demand Management (TDM) programs for individual buildings and developments were conservatively omitted from the Future Conditions analysis. The following roadway improvements were included in the Future Conditions analysis:

Intersection #47, Bronson Avenue & Hollywood Boulevard. As part of the approved Sunset Bronson Studios Project, Bronson Avenue will be restriped to provide a right-turn lane in the northbound direction and a left-turn lane in the southbound direction at the intersection with Hollywood Boulevard. This measure would require the removal of approximately nine parking

spaces on Bronson Avenue. This improvement and associated lane configurations are assumed in the Future without Project Conditions.

Intersection #75, Bronson Avenue & Sunset Boulevard. As part of the approved Sunset Bronson Studios Project, Bronson Avenue will be restriped to provide a right-turn lane in the northbound direction at the intersection with Sunset Boulevard. This measure would require the removal of approximately four parking spaces on Bronson Avenue. This improvement and associated lane configurations are assumed in the Future without Project Conditions.

Future Bicycle System

As proposed in *2010 Bicycle Plan* and the Mobility Plan, the bicycle system in the Study Area will be expanded to create a more integrated network.

The three components of the bicycle network designated in *2010 Bicycle Plan* include the Backbone, the Neighborhood Network, and the Green Network. Class II bicycle lanes will be added to high volume corridors to form the Backbone of the network, while in-road bikeways in lower volume and collector streets will form the Neighborhood Network through the implementation of Class II bicycle routes and bicycle-friendly streets. The Green Network consists of dedicated bicycle paths that connect the City's open spaces. The following bicycle facilities are proposed within the Study Area in *2010 Bicycle Plan.*

Bicycle Lanes: Fairfax Avenue, La Brea Avenue, Highland Avenue, Wilcox Avenue, Cahuenga Boulevard, Cole Avenue, Vine Street, Bronson Avenue, Van Ness Avenue, Wilton Place, Western Avenue, Pilgrimage Bridge, Los Feliz Boulevard, Yucca Street, Hollywood Boulevard, Sunset Boulevard, Fountain Avenue, Santa Monica Boulevard, and Beverly Boulevard.

Bicycle Routes/Bicycle-Friendly Streets: Odin Street, Laurel Avenue, Edinburgh Avenue, Gardner Street, Vista Street, Martel Avenue, Formosa Avenue, Orange Drive, Las Palmas Avenue, Cherokee Avenue, Argyle Avenue, El Centro Avenue, Vista Del Mar Avenue, Gower Street, Larchmont Boulevard, Lucerne Boulevard, Van Ness Avenue, Bronson Avenue, St. Andrews Place, Franklin Avenue, Hawthorn Avenue, Yucca Street, Dix Street, Carlos Avenue,

Selma Avenue, Delongpre Avenue, Lexington Avenue, Waring Avenue, Rosewood Avenue, and Elmwood Avenue.

None of these proposed bicycle facilities is definitively scheduled for implementation and, therefore, each is not assumed in the future analysis.

As detailed in the Mobility Plan, the Bicycle Enhanced Network designates Highland Avenue south of Hollywood Boulevard, Cahuenga Boulevard north of Hollywood Boulevard, and Hollywood Boulevard for priority planned bicycle lanes. The Bicycle Lane Network would include priority planned bicycle lanes on Franklin Avenue between La Brea Avenue and Highland Avenue and on Highland Avenue north of Franklin Avenue, and planned bicycle lanes on Highland Avenue between Franklin Avenue and Hollywood Boulevard, on Sunset Boulevard and on Santa Monica Boulevard. Similar to *2010 Bicycle Plan,* these improvements have not been definitively scheduled for implementation and were, therefore, not assumed in the future analysis.

FUTURE WITHOUT PROJECT INTERSECTION LEVELS OF SERVICE

Table 7 summarizes the weekday AM and PM peak hour LOS results for each of the signalized study intersections under Future without Project Conditions. Table 7 indicates that 79 of the 111 signalized study intersections are projected to operate at LOS D or better during both the weekday AM and PM peak hours. The remaining 32 intersections would operate at LOS E or F during at least one of the analyzed peak hours.

The LOS calculation worksheets are provided in Appendix D. The detailed analysis of the 12 unsignalized study intersections is provided in Chapter 9.

Notes

* LOS based on field observations, as the CMA methodology for individual intersections does not in every case account for vehicular queues along corridors, pedestrian, conflicts, etc., and thus, the calculated average operating conditions may appear better than is observed.

[a] Intersections located within the City of West Hollywood were also analyzed using HCM 2010 methodology, per City of West Hollywood guidelines, and is provided in Appendix F.

Chapter 4
Project Traffic

This chapter describes the assumptions and methodology used in developing the traffic volumes associated with the proposed Project within the Study Area.

PROJECT DESCRIPTION

As stated, the Project proposes to redevelop the Project Site with a mixed-use development that would retain, preserve, and rehabilitate Crossroads of the World. Upon build-out, the Project would consist of mixed-use buildings that include up to 950 residential units, 308 hotel rooms, approximately 95,000 sf of office uses, and approximately 185,000 sf of commercial uses (consisting of approximately 61,750 sf of retail uses, a 40,000 sf supermarket, and 83,200 sf of restaurant uses), including the rehabilitation of Crossroads of the World.

Vehicular access to the parking facilities would be provided via driveways on Selma Avenue, Highland Avenue, McCadden Place and Las Palmas Avenue.

The Project also proposes vehicular circulation improvements, including the realignment of Las Palmas Avenue adjacent to the Project Site north of Sunset Boulevard. The segment north of Sunset Boulevard would be aligned with the segment south of Sunset Boulevard to create a continuous street at Sunset Boulevard. As part of the improvement, the southbound approach would be restriped to provide one left-turn lane and one shared through/right lane.

PROJECT TRIP GENERATION

The number of trips expected to be generated by the Project was estimated using rates published for apartments, condominiums, hotel, office, shopping center, supermarket, quality restaurant, and high-turnover restaurant in *Trip Generation, 9th Edition*. These rates are based

on surveys of similar land uses at sites around the country and are provided as both daily rates and AM and PM peak hour rates. They relate the number of vehicle trips traveling to and from the Project Site to the size of development of each land use.

Appropriate trip generation reductions to account for public transit usage, trips shared between the different uses within the Project, and pass-by trips were made in consultation with LADOT. The Project is located within one quarter-mile of the Metro Red Line Hollywood/Highland station and a Rapid Bus line stop; therefore, a 15% transit adjustment was applied to the Project, per *Traffic Study Policies and Procedures*. A 5% and 10% internal capture reduction was applied to the retail (shopping center and supermarket) and restaurant (high-turnover restaurant and quality restaurant) trip generation estimates, respectively, to account for person trips made between the different uses of the Project without using an off-site road system. The retail and restaurant trip generation estimates were also reduced by 40% and 20% (as allowed by *Traffic Study Policies and Procedures)*, respectively, to account for Project trips made by drivers passing on an adjacent roadway and stopping on the way from an origin to another destination. The pass-by trips are not new trips to the Study Area.

After accounting for the adjustments above and the removal of the existing uses detailed in Table 8A, the Project is anticipated to generate 15,005 net new weekday trips, including 879 AM peak hour trips (371 inbound, 508 outbound) and 1,283 PM peak hour trips (745 inbound, 538 outbound), as summarized in Table 8B.

PROJECT TRIP DISTRIBUTION

Similar to the trip distribution of traffic for the Related Projects described in Chapter 3, the geographic distribution of trips generated by the Project is dependent on the location of residential and employment centers from which patrons of the Project would be drawn, characteristics of the street system serving the Project Site, the level of accessibility of the routes to and from the Project Site, existing intersection traffic volumes, the Project ingress/egress availability based on the proposed site access and circulation scheme, and the location of the proposed driveways, as well as input from LADOT staff. Given the various mix in land uses included in the Project, distinct distribution patterns were developed for each land use (e.g., hotel, residential, commercial).

Based on these considerations, traffic entering and exiting the Project was assigned to the surrounding street system. The general trip distribution patterns for each land use are shown in Figures 8 to 12.

PROJECT TRIP ASSIGNMENT

The Project trip generation estimates summarized in Table 8b and the trip distribution patterns shown in Figures 8 to 12 were used to assign the Project-generated traffic through the study intersections. Figure 13 illustrates the combined Project-only traffic volumes at the study intersections during typical weekday AM and PM peak hours.

[a] Source: *Trip Generation, 9th Edition*, Institute of Transportation Engineers, 2012.
[b] The Project site is located within a 1/4 mile of the Metro Red Line Hollywood Highland station and a RapidBus stop, therefore a 15% transit adjustment was applied, per *Traffic Study Polices and Procedures* (LADOT, August 2014).
[c] Hotel trip rates includes ancillary conference/meeting rooms, a lobby lounge and bar, rooftop bar and lounge, guest amenities, as well as retail and restaurant space. However, the retail and restaurant uses within the hotel were considered separately and included in the total retail and restaurant square footage to provide a conservative analysis.
[d] Shopping center includes retail, restaurant, and recreational uses.
[e] Internal capture adjustments account for person trips made between distinct land uses within a mixed-use development without using an off-site road system (e.g., hotel guests visiting retail/restaurant uses).
[f] Pass-by adjustments account for Project trips made as an intermediate stop on the way from an origin to a primary trip destination without route diversion.
[g] See Table 3-A for calcuation of the Existing Use trip generation.

Chapter 5
Existing with Project Conditions

This chapter describes the results of the analysis of intersection operating conditions associated with the Project when compared to Existing Conditions. The analysis corresponds with the Existing Conditions data and analysis presented in Chapter 2. The Existing with Project Conditions reflect Existing Conditions with the addition of Project traffic.

EXISTING WITH PROJECT TRAFFIC VOLUMES

The Project-only AM and PM peak hour traffic volumes described in Chapter 4 and shown in Figure 13 were added to the Existing AM and PM peak hour traffic volumes shown in Figure 4. The resulting volumes are illustrated in Figure 14 and represent Existing with Project Conditions after development of the Project under Existing Conditions.

EXISTING WITH PROJECT INTERSECTION LEVELS OF SERVICE

Table 9 summarizes the results of the Existing with Project Conditions during the weekday AM and PM peak hours for the 111 signalized study intersections. As shown in Table 9, 96 of the 111 signalized study intersections are expected to continue to operate at LOS D or better during both the AM and PM peak hours under Existing with Project Conditions. The remaining 15 intersections operate at LOS E or F during at least one of the peak hours.

The detailed analysis of the 12 unsignalized study intersections is provided in Chapter 9.

Notes

* LOS based on field observations, as the CMA methodology for individual intersections does not in every case account for vehicular queues along corridors, pedestrian, conflicts, etc., and thus, the calculated average operating conditions may appear better than is observed.

[a] Intersections located within the City of West Hollywood were also analyzed using HCM 2010 methodology, per City of West Hollywood guidelines, and is provided in Appendix F.

Chapter 6
Future with Project Conditions

This chapter describes the results of the analysis of intersection operating conditions associated with the Project when compared to future cumulative (Future without Project) conditions. The analysis year of 2022 corresponds to the anticipated buildout year of the Project. All future cumulative traffic growth (i.e., ambient and related project traffic growth) and transportation infrastructure improvements described in Chapter 3 are incorporated into this analysis.

FUTURE WITH PROJECT TRAFFIC VOLUMES

The Project-only AM and PM peak hour traffic volumes described in Chapter 4 and shown in Figure 13 were added to the Future without Project AM and PM peak hour traffic volumes shown in Figure 7. The resulting volumes are illustrated in Figure 15 and represent Future with Project Conditions after development of the Project in the year 2022.

FUTURE WITH PROJECT INTERSECTION LEVELS OF SERVICE

Table 10 summarizes the results of the Future with Project Conditions during the weekday AM and PM peak hours for the 111 signalized study intersections. As shown in Table 10, 78 of the 111 signalized study intersections continue to operate at LOS D or better during both the AM and PM peak hours under Future with Project Conditions. The remaining 33 intersections operate at LOS E or F during at least one of the peak hours.

The detailed analysis of the 12 unsignalized study intersections is provided in Chapter 9.

Notes

* LOS based on field observations, as the CMA methodology for individual intersections does not in every case account for vehicular queues along corridors, pedestrian, conflicts, etc., and thus, the calculated average operating conditions may appear better than is observed.

[a] Intersections located within the City of West Hollywood were also analyzed using HCM 2010 methodology, per City of West Hollywood guidelines, and is provided in Appendix F.

Chapter 7
Traffic Impact Analysis

The relative impact of the added Project traffic volumes during the peak hours was evaluated based on analysis of both existing and future operating conditions at the study intersections without and with the Project. The previously discussed significance criteria and thresholds summarized in Chapter 1 were then used to determine the significance of a traffic impact caused by the Project on the study intersection, prior to any Project mitigation or trip reduction measures.

EXISTING WITH PROJECT SIGNIFICANT IMPACTS, BEFORE MITIGATION

The Existing with Project Conditions during the weekday AM and PM peak hours are shown in Table 9. Of the 111 signalized study intersections, the Project is expected to result in significant impacts at 12 intersections in year 2015 prior to Project mitigation. The incremental increases in V/C ratios at the remaining 99 intersections would be less than significant under Existing with Project Conditions. The 12 significantly impacted locations and affected peak hours are:

13. Highland Avenue & Franklin Avenue (North) (AM and PM peak hours)
16. Cahuenga Boulevard & Franklin Avenue (AM peak hour)
35. La Brea Avenue & Hollywood Boulevard (AM and PM peak hours)
37. Highland Avenue & Hollywood Boulevard (AM and PM peak hours)
42. Cahuenga Boulevard & Hollywood Boulevard (AM and PM peak hours)
44. Vine Street & Hollywood Boulevard (AM and PM peak hours)
63. La Brea Avenue & Sunset Boulevard (AM and PM peak hours)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)
95. Cahuenga Boulevard & Santa Monica Boulevard (PM peak hour)
96. Vine Street & Santa Monica Boulevard (PM peak hour)

FUTURE WITH PROJECT SIGNIFICANT IMPACTS, BEFORE MITIGATION

The Future with Project Conditions during the weekday AM and PM peak hours are shown in Table 10. Of the 111 signalized study intersections, the Project is expected to result in significant impacts at 22 intersections in year 2022 prior to Project mitigation. The incremental increases in V/C ratios at the remaining 89 intersections would be less than significant during the peak hours by Project traffic under Future with Project Conditions.

The 22 impacted locations and affected peak hours are:

13. Highland Avenue & Franklin Avenue (North) (PM peak hour)
16. Cahuenga Boulevard & Franklin Avenue (AM and PM peak hours)
35. La Brea Avenue & Hollywood Boulevard (AM and PM peak hours)
37. Highland Avenue & Hollywood Boulevard (AM and PM peak hours)
42. Cahuenga Boulevard & Hollywood Boulevard (AM and PM peak hours)
44. Vine Street & Hollywood Boulevard (AM and PM peak hours)
63. La Brea Avenue & Sunset Boulevard (AM and PM peak hours)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
66. Las Palmas Avenue & Sunset Boulevard (PM peak hour)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)
74. Gower Street & Sunset Boulevard (PM peak hour)
76. Van Ness Avenue & Sunset Boulevard (PM peak hour)
81. La Brea Avenue & Fountain Avenue (AM peak hour)
85. Vine Street & Fountain Avenue (PM peak hour)
91. La Brea Avenue & Santa Monica Boulevard (AM and PM peak hours)
92. Highland Avenue & Santa Monica Boulevard (AM and PM peak hours)
95. Cahuenga Boulevard & Santa Monica Boulevard (AM and PM peak hours)
96. Vine Street & Santa Monica Boulevard (AM and PM peak hours)
97. Gower Street & Santa Monica Boulevard (AM and PM peak hours)
99. Van Ness Avenue & Santa Monica Boulevard (PM peak hour)
101. Western Avenue & Santa Monica Boulevard (PM peak hour)

Chapter 8
Traffic Mitigation Program

This chapter describes the traffic mitigation measures that have been considered in order to mitigate the significant traffic impacts at study intersections associated with construction of the Project and to improve traffic operations in the Project vicinity. The various guidelines, methods, and assumptions mandated by LADOT, wherever applicable, have been used in the preparation of this analysis.

The various mitigation measures described in this chapter relate to the significant traffic impacts previously described with respect to both the Existing with Project (year 2015) and the Future with Project (year 2022) analyses presented in Chapter 7. As described in that chapter, under the Existing with Project Conditions, before mitigation, the Project is expected to result in significant traffic impacts at the following 12 signalized intersections:

13. Highland Avenue & Franklin Avenue (North) (AM and PM peak hours)
16. Cahuenga Boulevard & Franklin Avenue (AM peak hour)
35. La Brea Avenue & Hollywood Boulevard (AM and PM peak hours)
37. Highland Avenue & Hollywood Boulevard (AM and PM peak hours)
42. Cahuenga Boulevard & Hollywood Boulevard (AM and PM peak hours)
44. Vine Street & Hollywood Boulevard (AM and PM peak hours)
63. La Brea Avenue & Sunset Boulevard (AM and PM peak hours)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)
95. Cahuenga Boulevard & Santa Monica Boulevard (PM peak hour)
96. Vine Street & Santa Monica Boulevard (PM peak hour)

The Project is expected to result in significant traffic impacts in the Future with Project Conditions, before mitigation, at the following 22 signalized intersections:

13. Highland Avenue & Franklin Avenue (North) (PM peak hour)
16. Cahuenga Boulevard & Franklin Avenue (AM and PM peak hours)
35. La Brea Avenue & Hollywood Boulevard (AM and PM peak hours)
37. Highland Avenue & Hollywood Boulevard (AM and PM peak hours)
42. Cahuenga Boulevard & Hollywood Boulevard (AM and PM peak hours)
44. Vine Street & Hollywood Boulevard (AM and PM peak hours)
63. La Brea Avenue & Sunset Boulevard (AM and PM peak hours)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
66. Las Palmas Avenue & Sunset Boulevard (PM peak hour)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)
74. Gower Street & Sunset Boulevard (PM peak hour)
76. Van Ness Avenue & Sunset Boulevard (PM peak hour)
81. La Brea Avenue & Fountain Avenue (AM peak hour)
85. Vine Street & Fountain Avenue (PM peak hour)
91. La Brea Avenue & Santa Monica Boulevard (AM and PM peak hours)
92. Highland Avenue & Santa Monica Boulevard (AM and PM peak hours)
95. Cahuenga Boulevard & Santa Monica Boulevard (AM and PM peak hours)
96. Vine Street & Santa Monica Boulevard (AM and PM peak hours)
97. Gower Street & Santa Monica Boulevard (AM and PM peak hours)
99. Van Ness Avenue & Santa Monica Boulevard (PM peak hour)
101. Western Avenue & Santa Monica Boulevard (PM peak hour)

TRANSPORTATION MITIGATION MEASURES

The mitigation program for the Project includes the following major components:

1. Implementation of a TDM program for the Project Site to promote peak period trip reduction

2. Transit system improvements, including the provision of new buses to increase public transit along a key corridor within the Study Area

3. Transportation Systems Management (TSM) improvements, including signal controller updates and installation of closed circuit television (CCTV) at key intersections within the Study Area

4. Specific intersection improvements, including physical mitigations and signal phasing enhancements

These mitigation measures are consistent with the City's policies and procedures that support improvements that reduce greenhouse gas emissions by reducing the use of single-occupant vehicle trips, encourage developers to construct transit and pedestrian-friendly projects with safe and walkable sidewalks, and promote other modes of travel.

TDM PROGRAM

The TDM program outlined below details a set of strategies proposed for the Project designed to reduce peak hour vehicular traffic to and from the Project Site. It is a comprehensive program of design features, transportation services, education programs, and incentive programs intended to reduce the impact of traffic from residents, employees and visitors to the Project Site during the most congested time periods of the day. The Project shall develop and implement a TDM program to promote non-automobile travel, reduce the use of single-occupant vehicle trips, etc. The TDM program would be subject to review and approval by the City (Department of City Planning and LADOT). The strategies in the TDM program can include, but are not necessarily limited to, the following:

- Transportation Information Center, educational programs, kiosks and/or other measures
- Promotion and support of carpools and rideshare
- Bicycle amenities such as racks and showers
- Guaranteed ride home program
- Flexible or alternative work schedules
- Incentives for using alternative travel modes
- Parking incentives and administrative support for formation of carpools/vanpools
- On-site TDM coordinator
- Mobility hub support

- Contribution to the City's Bicycle Plan Trust Fund for implementation of bicycle improvements in the Project area
- Participation as a member in the future Hollywood Community TMO, when operational

TDM Program Strategies

The following provides further information and description of the TDM program strategies.

Educational Programs. A key component of a successful TDM program is to make employers and employees at the Project Site aware of the various programs offered. To this end, a transportation management coordinator (TMC) on the building management staff would reach out both to employers and employees directly to promote the benefits of TDM.

In addition to the various TDM programs described below, the TMC would reach out to employers to promote flexible or alternative work schedules and telecommuting options with statistics and examples of businesses that have successfully implemented such programs. These programs have the ability to reduce peak hour trip generation by allowing employees to arrive for and leave from work outside of the typical AM and PM peak commuting hours.

Transportation Information Center. A Transportation Information Center is a centrally-located commuter information center where project employees, tenants, and patrons can obtain information regarding commute programs, and individuals can obtain real-time information for planning travel without using an automobile. A Transportation Information Center would support orientation for new employees and provide information about transit schedules, commute planning, rideshare, telecommuting, and bicycle and pedestrian plans.

Project Design Features to Promote Bicycling and Walking. A significant and growing number of people in the City prefer to ride bicycles or walk to their employment given sufficient facilities to make the commute feel safe and convenient. The Project would incorporate features for bicyclists and pedestrians, such as exclusive access points, secured bicycle parking facilities or a bicycle valet system, or a bicycle sharing or rental program. Additionally, the Project Site would be designed to be a friendly and convenient environment for pedestrians.

It should be noted that *2010 Bicycle Plan* and Mobility Plan identify numerous streets within the Study Area as sites for future bicycle lanes and bicycle routes as described in Chapter 3. The Project would contribute a one-time fixed fee to be deposited into the City's Bicycle Plan Trust Fund to implement bicycle improvements in the Hollywood area.

Online Ridematching and Carpool/Vanpool Program. The TMC would provide a ride-matching service to match interested employees with carpools and vanpools. Carpools/vanpools provide the potential for employees to come to work relaxed and/or work during the commute and reduce the number of vehicle trips to and from the Project Site.

Guaranteed Ride Home (GRH). A GRH program is a program that assures transportation service to individuals who commute without their personal automobiles. This program overcomes one of the primary objections of those who could choose alternative modes of transportation, which is how to get home or to a child's school in the case of an emergency. The GRH program would cover all employees participating in the carpool/vanpool program or using transit to and from the Project Site in the event of personal or family emergencies. The individual would be reimbursed for a taxi ride or short-term car rental. A support service such as GRH is an important part of TDM implementation that assures an individual he or she will not be "stuck" depending on a ridesharing or transit schedule in the event of an emergency.

Short-Term Car Rentals. The Project would partner with short-term car rental services such as Zip-Car or Car-to-Go, which would provide vehicles available to users for hourly rentals at strategic locations within the Hollywood area. Similar to the GRH program, this service offers assurance to users of alternative modes of transit that they have options should the need arise to leave at an unscheduled time. Short-term car rentals can be used to travel to business meetings, lunch, or in emergencies, and can provide the source of emergency transportation for those using the GRH program.

Incentives for Using Alternative Travel Modes. The Project TMC would incorporate various incentives for use of its programs. For example, eligible employees could be provided with discounted monthly transit passes for Metro rail and bus service. Carpool and vanpool users could be offered preferential load/unload areas or convenient designated parking spaces. Those who choose not to drive their own cars and park them at the Project Site could receive a "parking cash-out" subsidy. Unbundled parking is a program wherein parking spaces are rented

or sold separately from the building space, which allows for a separate charge for parking and the flexibility to vary the number of spaces rented. Unbundling parking is an essential first step toward getting people to understand the economic cost of parking. Without unbundled parking, tenants and homeowners often assume that parking is free.

Mobility Hub Support. The Project would support existing and/or future efforts by LADOT to provide first-mile and last-mile service for transit users through the mobility hub program. Mobility hubs, typically located at or near public transit centers, would provide amenities such as, but not limited to, bicycle parking and rentals, shared vehicle rentals (e.g., Zip-Car), and transit information. The Project would provide space for similar amenities at the Project Site to complement future mobility hubs in the Study Area.

Hollywood Community TMO. The Hollywood community is a strong candidate for alternative modes of transportation, including convenient walking and bicycling, carpooling and vanpooling, use of public transit, short-term automobile rentals, etc. At present, there is no organization to administrate these options to the public. A TMO is an organization that helps to promote these services to a community by providing information about available public transportation options and matching people into ridesharing services. The developers of various approved projects in the Hollywood Area, along with LADOT and stakeholders, have proposed to initiate a Hollywood TMO. Many of the strategies described above could be enhanced through participation in the Hollywood TMO. Should the Hollywood TMO become operational, the Project would become a member of and participate in the TMO. The Hollywood TMO's services could replace some of the in-house TDM services where applicable, such as matching services for multi-employer carpools and vanpools (for example, ridesharing registries by which users can find people to share in a carpool or vanpool are much more effective with a larger pool of potential candidates).

Project Trip Reduction from the TDM Program

The combined effect of the various strategies implemented as part of the TDM program would result in a reduction in peak hour trip generation by offering services, actions, specific facilities, etc., aimed at encouraging use of alternative transportation modes (e.g., transit, bus, walking, bicycling, carpool, etc.). *Trip Generation Handbook, 3rd Edition* (Institute of Transportation

Engineers, August 2014) provides a summary of research of TDM programs at many different employers. At places that had the most comprehensive programs, including both economic incentives (e.g., transit passes, etc.) and support services, the programs resulting in an average 24% reduction in commuter vehicles. Thus, as an achievable but conservative estimate, an overall TDM trip reduction credit of 15% was assumed on the office space included in the Project and a credit of 10% was assumed on the residential, hotel, commercial, and supermarket uses within the Project. The overall Project trip reduction due to TDM would be less than 12% of the peak hour trips (approximately 12.5% of AM gross peak hour trips and 12.2% of PM gross peak hour trips).

Table 11 summarizes the estimated trip reduction during the peak hours. As shown, the TDM program is expected to result in a reduction of 1,730 daily trips, including 110 during the AM peak hour and 154 during the PM peak hour. The Project, when fully built and occupied and with implementation of the TDM program, would generate a total of 13,275 daily trips, including 769 during the AM peak hour (317 inbound, 452 outbound) and 1,129 during the PM peak hour (662 inbound, 465 outbound). The trip generation estimates with peak hour trip reductions from the TDM program were assigned through the study intersections using the trip distribution patterns illustrated in Figures 8 to 12. The Project-only AM and PM peak hour traffic volumes, after implementation of the TDM program as part of the Project's mitigation, are shown in Figure 16.

TRANSIT SYSTEM IMPROVEMENTS

Transit system improvements are aimed at enhancing and improving service of the overall transit system in serving the Hollywood community. Improving connectivity between the existing service and developments is also a goal that the improvements have been designed to achieve. An analysis was conducted to determine potential transit improvements to the existing transportation system serving the Project Site. As described in Chapter 2, there are several transit lines that currently serve the Study Area. The Project Applicant shall establish and contribute $650,000 to a trust fund to be administered by LADOT for the implementation of alternative transportation modes (e.g., transit buses, shuttles, shelters, and/or other enhancements) along highways, collectors and paths servicing the Hollywood community. The funding may include purchase and/or operation of additional transit services (e.g., buses,

shuttles, expanded operation hours, etc.) to further enhance usage of the transit system as an alternative to automobile trips.

For the purposes of this study, it was assumed that the transit system improvements would be focused along the Hollywood Boulevard and Santa Monica Boulevard corridors (Metro Route 4 and the LADOT DASH-Hollywood routes). Should the Project's financial contribution be allocated to supplement the current Metro and LADOT DASH bus service, approximately 42 and 25 vehicles, respectively, could be removed from the street system during the weekday AM and PM peak hours, assuming a capacity of 50 riders on a Metro bus and 30 riders on a LADOT DASH bus with average vehicle occupancy (AVO) of 1.2 persons per vehicle.

TSM IMPROVEMENTS

As part of the mitigation program, the Project would contribute up to $500,000 toward TSM improvements within the Hollywood-Wilshire District that may be considered to better accommodate intersection operations and increase intersection capacity throughout the Study Area. LADOT has determined that TSM improvements could improve traffic operations and increase intersection capacity by approximately 1% along a corridor. The TSM improvements would target the Franklin Avenue, Hollywood Boulevard, Sunset Boulevard, Santa Monica Boulevard, and Highland Avenue corridors. Potential TSM improvements include the following:

Signal Controller Upgrades

Many study intersections within the City currently operate with the Type 170 signal controller and newer controllers (Type 2070) provide for enhanced and real-time operation of traffic signal timing. LADOT recommends traffic signal controller upgrades to a Type 2070 Controller, as well as 322 cabinets to replace the existing aging cabinets, to provide system-wide benefits.

Closed Circuit Television Cameras

The TSM improvements include funding for the installation of CCTV cameras and the necessary infrastructure (including fiber optic and interconnect tubes). An integral part of the real-time operation of the traffic signal timings, the strategic placement of CCTV cameras at key intersections provides LADOT with the ability to monitor traffic operations and respond instantly to incidents that delay vehicles and transit service.

System Loops

The potential TSM improvements include funding the installation of system loops at signalized intersections within the identified corridors. A system loop is an advance detector loop that is embedded in the street pavement. These loops identify traffic volume and lane occupancy and are used to determine the appropriate signal timing parameters. These loops give LADOT the ability to extend the green time for an approach so that groups of vehicles generally do not have to stop when travelling along synchronized-signal corridors. They are located at an appropriate distance from the intersection so that a vehicle just upstream of the loop can comfortably decelerate to a stop when the yellow signal is displayed.

SPECIFIC INTERSECTION IMPROVEMENT MEASURES

Intersection improvements designed to alleviate the significant impacts of the Project consist of physical improvements (such as minor widening) and signal phasing enhancements. Widening and/or other improvements to the intersections would be designed to meet the requirements of LADOT, the City of Los Angeles Bureau of Engineering, and/or Caltrans, based on the jurisdiction responsible for the intersections.

The intersection improvements discussed below were considered at study intersections where the Project would result in a significant traffic impact that would not be mitigated to a level of insignificance with the implementation of the TDM, TSM, and transit system improvements.

Proposed Physical Improvement Measures

The following is a description of the feasible proposed intersection mitigation measure:

66. Las Palmas Avenue & Sunset Boulevard. Although implementation of the TDM program, transit system improvements, and TSM improvements would reduce the traffic impact identified at this intersection, the impact would still remain significant without additional physical improvement measures. The significant traffic impact at this intersection could be mitigated and reduced to less than significant levels by widening and restriping along Sunset Boulevard to provide an exclusive westbound right-turn lane. The resulting westbound approach would consist of one left-turn lane, three through lanes, and one right-turn lane. This improvement cannot be accommodated within the existing right-of-way and would require widening along the Project frontage and removal of up to six on-street metered parking spaces on the north side of Sunset Boulevard between Las Palmas Avenue and Highland Avenue. Due to the loss of public on-street metered parking spaces, the improvement is not practical or desirable. Should this improvement be determined to be infeasible during the design process, the impact at the intersection would remain and be considered significant and unavoidable. A conceptual plan of the improvement is provided in Appendix F.

Physical Improvement Measures Reviewed, But Not Recommended

Additional intersection improvements were proposed; however, they were not recommended by LADOT and, therefore, would not be implemented as part of the mitigation program.

37. Highland Avenue & Hollywood Boulevard. Although implementation of the TDM program, transit system improvements, and TSM improvements would reduce the traffic impact identified at this intersection, the impact would still remain significant without additional physical improvement measures. The traffic impact at this intersection could be mitigated to less than significant levels by widening and restriping along Hollywood Boulevard to provide an additional westbound through lane. The resulting westbound approach would consist of one left-turn lane, three through lanes, and one right-turn lane. However, this improvement cannot be accommodated within the existing right-of-way, and would require substantial acquisition of private property and removal of on-street metered parking spaces. Due to the lack of available

roadway width, and given the physical constraints of the existing intersection geometry, this improvement is not practical or desirable. The addition of roadway capacity and through travel lanes would also be inconsistent with the street standards and goals of Mobility Plan 2035. Thus, the impact would be considered significant and unavoidable.

63. La Brea Avenue & Sunset Boulevard. Although implementation of the TDM program and TSM improvements would reduce the traffic impact identified at this intersection, the impact would still remain significant without additional physical improvement measures. The significant traffic impact at this intersection could be mitigated by widening and restriping along Sunset Boulevard to provide an exclusive eastbound right-turn lane. The resulting eastbound approach would consist of one left-turn lane, three through lanes, and one right-turn lane. However, this improvement cannot be accommodated within the existing right-of-way, and would require substantial acquisition of private property. Due to the lack of available roadway width, and given the physical constraints of the existing intersection geometry, this improvement is not practical or desirable. Thus, the impact would be considered significant and unavoidable.

65. Highland Avenue & Sunset Boulevard. Although implementation of the TDM program, transit system improvements, and TSM improvements would reduce the traffic impact identified at this intersection, the impact would still remain significant without additional physical improvement measures. The significant traffic impact at this intersection could be mitigated by widening and restriping along Highland Avenue to provide an exclusive southbound right-turn lane. The resulting southbound approach would consist of one left-turn lane, three through lanes, and one right-turn lane. However, this improvement cannot be accommodated within the existing right-of-way, and would require substantial acquisition of Hollywood High School property. Due to the lack of available roadway width and given the physical constraints of the existing intersection geometry, this improvement is not practical or desirable. Thus, the impact would be considered significant and unavoidable.

70. Cahuenga Boulevard & Sunset Boulevard. Although implementation of the TDM program and TSM improvements would reduce the traffic impact identified at this intersection, the impact would still remain significant without additional physical improvement measures. The significant traffic impact at this intersection could be mitigated by widening and restriping along Cahuenga Boulevard to provide an exclusive northbound right-turn lane. The resulting northbound approach would consist of one left-turn lane, two through lanes, and one right-turn lane.

However, this improvement cannot be accommodated within the existing right-of-way, and would require substantial acquisition of private property. Due to the lack of available roadway width and given the physical constraints of the existing intersection geometry, this improvement is not practical or desirable. Thus, the impact would be considered significant and unavoidable.

72. Vine Street & Sunset Boulevard. Although implementation of the TDM program and TSM improvements would reduce the traffic impact identified at this intersection, the impact would still remain significant without additional physical improvement measures. The significant traffic impact at this intersection could be mitigated by widening and restriping along Sunset Boulevard to provide an exclusive eastbound right-turn lane. The resulting eastbound approach would consist of one left-turn lane, three through lanes, and one right-turn lane. However, this improvement cannot be accommodated within the existing right-of-way, and would require substantial acquisition of private property and removal of on-street parking spaces. Due to the lack of roadway width and given the physical constraints of the existing intersection geometry, this improvement is not practical or desirable. Thus, the impact would be considered significant and unavoidable.

MITIGATION EFFECTIVENESS

The components of the Project's mitigation program described above would result in peak hour trip reductions from the implementation of the TDM program and the additional transit service, as well as operational improvements as a result of the TSM improvements and specific intersection improvements. The effectiveness of the proposed traffic mitigation program was analyzed by applying the appropriate trip generation reductions and capacity enhancements from the implementation of the mitigation measures. This results in the Existing with Project with Mitigation and Future with Project with Mitigation Conditions. The intersections were analyzed using the methodology described in Chapter 1.

The Project-only with Mitigation traffic volumes illustrated in Figure 16 were added to the Existing AM and PM peak hour traffic volumes shown in Figure 4, resulting in the Existing with Project with Mitigation (year 2015) traffic volumes, illustrated in Figure 17. The Project-only with Mitigation traffic volumes illustrated in Figure 16 were added to the Future without Project AM

and PM peak hour traffic volumes shown in Figure 7, resulting in the Future with Project with Mitigation (year 2022) traffic volumes, illustrated in Figure 18.

EXISTING WITH PROJECT WITH MITIGATION CONDITIONS

Table 12 summarizes the results of the Existing with Project with Mitigation Conditions during the weekday AM and PM peak hours for the study intersections. It also shows the remaining significant impacts after implementation of all of the mitigation measures discussed in this chapter. As shown in Table 12, after mitigation, five study intersections would remain significantly impacted after mitigation:

37. Highland Avenue & Hollywood Boulevard (AM and PM peak hours)
63. La Brea Avenue & Sunset Boulevard (PM peak hour)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)

FUTURE WITH PROJECT WITH MITIGATION CONDITIONS

Table 13 summarizes the results of the Future with Project with Mitigation Conditions during the weekday AM and PM peak hours for the study intersections. It also shows the resulting significant impacts after implementation of all of the mitigation measures discussed in this chapter. As shown in Table 13, the following five study intersections would remain significantly impacted by Project traffic after mitigation:

37. Highland Avenue & Hollywood Boulevard (AM peak hour)
63. La Brea Avenue & Sunset Boulevard (AM and PM peak hours)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)

ksf: 1,000 square feet
du: dwelling units
[a] See Table 8b for calculation of Project trip generation.
[b] Hotel trip rates includes ancillary conference/meeting rooms, a lobby lounge and bar, rooftop bar and lounge, guest amenities, as well as retail and restaurant space. However, the retail and restaurant uses within the hotel were considered separately and included in the total retail and restaurant square footage to provide a conservative analysis.
[c] Shopping center includes retail, restaurant, and recreational uses.
[d] See Table 8A for calcuation of the Existing Use trip generation.

Notes

* LOS based on field observations, as the CMA methodology for individual intersections does not in every case account for vehicular queues along corridors, pedestrian, conflicts, etc., and thus, the calculated average operating conditions may appear better than is observed.

[a] Intersections located within the City of West Hollywood were also analyzed using HCM 2010 methodology, per City of West Hollywood guidelines, and is provided in Appendix F.

Notes

* LOS based on field observations, as the CMA methodology for individual intersections does not in every case account for vehicular queues along corridors, pedestrian, conflicts, etc., and thus, the calculated average operating conditions may appear better than is observed.

[a] Intersections located within the City of West Hollywood were also analyzed using HCM 2010 methodology, per City of West Hollywood guidelines, and is provided in Appendix F.

Chapter 9
Unsignalized Intersection Analysis

As described in Chapter 1, the 12 unsignalized study intersections were analyzed using the HCM methodology to determine the overall intersection delay under both Existing and Future Conditions. Based on *Traffic Study Policies and Procedures,* if based on the estimated overall intersection delay, the unsignalized intersection is projected to operate at LOS E or F under Future with Project Conditions, a signal warrant analysis should be conducted to evaluate for the potential installation of a new traffic signal. The signal warrant analysis, if necessary, would follow the guidelines set forth in *Manual of Policies and Procedures* (LADOT, December 2008) and *California Manual on Uniform Traffic Control Devices* (Caltrans, 2012) (California MUTCD).

INTERSECTION LEVELS OF SERVICE

Tables 14 and 15 summarize the weekday AM and PM peak hour delay and corresponding LOS for the 12 unsignalized intersections under Existing and Future Conditions.

As shown in Table 14, 10 of the 12 unsignalized study intersections are anticipated to operate at LOS D or better during the both the AM and PM peak hours under both Existing and Existing with Project Conditions. The remaining two unsignalized intersections are anticipated to operate at LOS F during at least one of the analyzed peak hours.

Also shown in Table 15, eight of the 12 unsignalized intersections are anticipated to operate at LOS D or better during both the AM and PM peak hours under both Future without Project and Future with Project Conditions. The remaining four unsignalized intersections are anticipated to operate at LOS E or F during at least one of the analyzed peak hours. Therefore, further traffic signal warrant analyses were conducted.

SIGNAL WARRANT ANALYSIS

Of the 12 unsignalized study intersections, the following four intersections operate at LOS E or F under Future with Project Conditions, and were therefore subject to a signal warrant analysis to determine whether the projected volumes at the intersections warrant the installation of a traffic signal control:

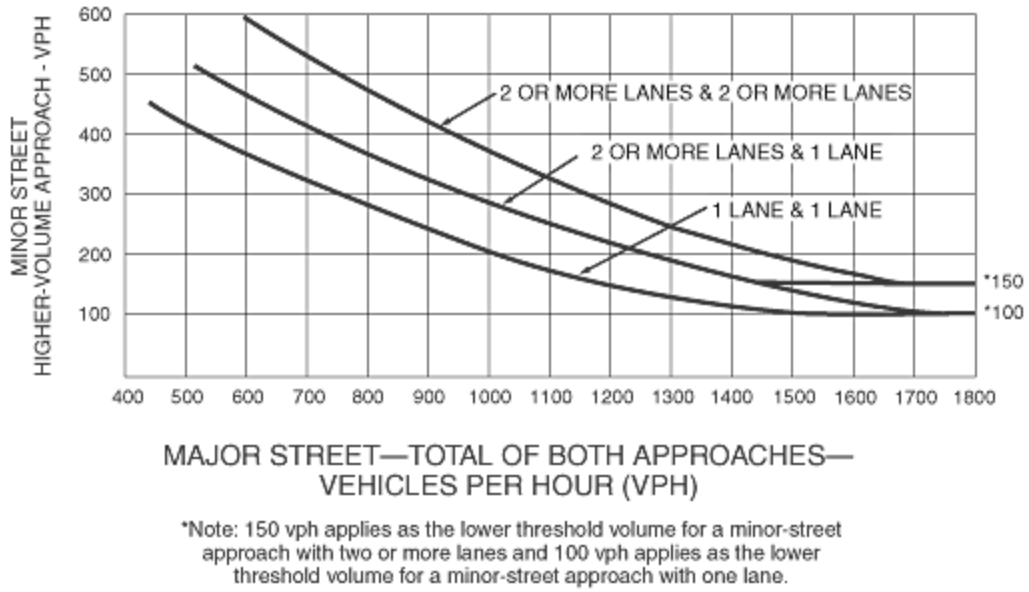
US-1. Cahuenga Boulevard & US 101 Southbound Off-Ramp (AM Peak Hour)
US-5. Gower Street & US 101 Southbound Off-Ramp/Yucca Street (AM Peak Hour)
US-8. Las Palmas Avenue & Selma Avenue (AM and PM Peak Hours)
US-11. Wilton Place & US 101 Northbound Off-Ramp/Harold Way (AM Peak Hour)

The intersections were analyzed according to Warrant 3 (peak hour). The following methodologies, as quoted from the California MUTCD, were used to evaluate signal warrants at the intersection:

Warrant 3, Peak-Hour Vehicular Volume Warrant

Signal Warrant 3 is intended for use at a location where traffic conditions are such that for a minimum of one hour of an average day, the minor-street traffic suffers undue delay when entering or crossing the major street. Combined volumes for both approaches of the major street are included while only the volume from the higher minor street approach is included. At an intersection with a high volume of left-turn traffic from the major street, the analysis may include the major street left-turn volumes plus the minor street approach volume as the total "minor street" volume. The warrant is satisfied if traffic volumes for any one hour of an average day exceed the plotted lines shown in the following figure.

Figure 4C-3. Warrant 3, Peak Hour



*Note: 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold volume for a minor-street approach with one lane.

Table 16 summarizes the results of the signal warrant analysis for the four unsignalized intersections. Detailed signal warrant worksheets are available in Appendix G. As shown, the unsignalized intersection of Gower Street & US 101 Southbound Off-Ramp/Yucca Street meets the minimum peak hour traffic volume threshold of Warrant 3 under Existing and Future Conditions, with and without addition of Project traffic, and Las Palmas Avenue & Selma Avenue meets the minimum peak hour traffic volume threshold of Warrant 3 under Existing with Project and Future with Project Conditions. The remaining two unsignalized intersections do not meet the minimum peak hour traffic volume threshold of Warrant 3.

The satisfaction of the warrant threshold alone, however, does not in itself dictate the requirement of the installation of a traffic control signal. That decision is made by LADOT, which would consider additional factors such as spacing with adjacent intersections, interruption of traffic flow on the major streets, etc.

Chapter 10

Congestion Management Program Analysis

This chapter presents an analysis of the regional transportation facilities in the vicinity of the Project Site, in accordance with the procedures outlined in the CMP.

TRAFFIC IMPACT ANALYSIS GUIDELINES

The CMP requires that TIAs be performed on three types of facilities:

- Arterial Intersections
- Mainline Freeway Segments
- The Public Transit System

The CMP identifies specific arterial and freeway mainline locations for analysis.

Arterial Monitoring Intersection TIA Guidelines

The CMP requires that a TIA be performed for all CMP arterial monitoring intersections where a project would add 50 or more trips during either the weekday AM or PM peak hours. A detailed analysis is not required if the project adds fewer than 50 trips to an arterial monitoring intersection. The CMP analysis uses the same CMA methodology as used in earlier chapters for City intersections to determine intersection V/C ratio and LOS. A significant impact requiring mitigation occurs if project traffic causes an incremental increase in intersection V/C ratio of 0.02 or greater to a facility projected to operate at LOS F (V/C > 1.00) after the addition of project traffic.

Mainline Freeway Monitoring Location TIA Guidelines

The CMP requires that a TIA be performed for all CMP mainline freeway monitoring locations where a project would add 150 or more trips (in either direction) during the weekday AM or PM peak hours. A detailed analysis is not required if the project adds fewer than 150 trips to a mainline freeway monitoring location (in either direction) during either the weekday AM or PM peak hour. The CMP analysis uses a demand-to-capacity (D/C) ratio to determine facility LOS based on capacity identified in Appendix A of the CMP. Similar to arterial monitoring intersections, a significant impact requiring mitigation occurs if project traffic causes an incremental increase in freeway segment D/C ratio of 0.02 or greater to a facility projected to operate at LOS F (D/C > 1.00) after the addition of project traffic.

Transit Impact Review Guidelines

The CMP requires that a transit system analysis be performed to determine whether a project would increase transit ridership beyond the current capacity of the transit system.

ARTERIAL MONITORING STATION ANALYSIS

The CMP identifies the following two arterial monitoring intersections within the Study Area:

- Santa Monica Boulevard & Western Avenue (1.75 miles southeast of the Project Site)
- Santa Monica Boulevard & Highland Avenue (0.50 miles south of the Project Site)

AM and PM peak hour traffic for these intersections were based on the Project trips illustrated in Figure 13.

Based on this methodology, the number of peak hour Project trips expected at each arterial monitoring intersection is as follows:

Intersection	Peak Hour Trips		Requires CMP Analysis?
	AM	PM	
Western Avenue & Santa Monica Boulevard	59	77	Yes
Highland Avenue & Santa Monica Boulevard	96	130	Yes

The Project would add more than 50 peak hour trips at each of the arterial monitoring intersections within the Project Study Area. Therefore, further analysis of the CMP arterial monitoring intersections is required.

As shown in Table 17, before mitigation, both arterial monitoring intersections operate at LOS F during the Future with Project Conditions. Although the intersection of Santa Monica Boulevard & Western Avenue operates at LOS F during both the AM and PM peak hours under Future with Project Conditions, as shown in Table 17, the addition of Project traffic would not result in an increase in V/C ratio of 0.02 or more. Therefore, the intersection would not be significantly impacted based on CMP criteria. The addition of Project traffic results in an increase in V/C ratio of 0.02 or greater during both the AM and PM peak hours at the intersection of Highland Avenue & Santa Monica Boulevard. Thus, the intersection would be significantly impacted under CMP criteria. As described in Chapter 7 the intersection would also be significantly impacted based on LADOT criteria, and would be reduced to a level of less than significance with implementation of the Project's mitigation package, which includes the TDM program, additional transit service on Santa Monica Boulevard, and TSM improvements.

FREEWAY SEGMENT ANALYSIS

The CMP identifies one mainline freeway monitoring location within the vicinity of the Project Site. The monitoring location is on US 101 south of Santa Monica Boulevard, approximately two miles southeast of the Project Site. At this location, the Project is projected to add a total of 66 southbound trips and 52 northbound peak hour trips during the AM peak hour and 58 southbound trips and 73 northbound trips during the PM peak hour. Although the Project would

not add 150 trips in either direction during either peak hour to the CMP mainline freeway monitoring location, further CMP analysis was conducted.

As shown in Tables 18 and 19, although the freeway mainline segment would operate at LOS F in the southbound direction under both Existing with Project and Future with Project Conditions, the addition of Project traffic would not cause the D/C ratio to increase by 0.02. Therefore, the Project would not result in a significant impact on US 101 south of Santa Monica Boulevard based on CMP criteria.

REGIONAL TRANSIT IMPACT ANALYSIS

Section B.8.4 of the CMP provides a methodology for estimating the number of transit trips expected to result from a proposed project based on the number of vehicle trips. This methodology assumes an average vehicle occupancy factor of 1.4 in order to estimate the number of person trips to and from the Project and guidance regarding the percentage of Project person trips that may use public transit to travel to and from the Project Site depending on the mix of uses and proximity to transit. Based on the assumptions in the trip generation estimates shown in Table 8B, a 15% transit/walk adjustment was applied to account for the use of non-auto travel modes (e.g., rail, light-rail, bus, bicycle, walk, etc.) For the purposes of this analysis, all the transit/walk trip estimates from Table 8B were conservatively assumed to travel via public transit.

As shown in Table 8B, accounting for the existing use credit but prior to mitigation and trip reduction adjustments, the Project is estimated to generate 1,304 AM peak hour trips and 2,030 PM peak hour trips. Assuming an AVO of 1.4, the Project's vehicle trips result in an estimated increase of 1,826 person trips during the AM peak hour and 2,842 person trips during the PM peak hour. Using the 15% mode split, the Project would generate approximately 274 net new transit trips in the AM peak hour and 426 net new transit trips in the PM peak hour.

As detailed in Chapter 2, the Hollywood area is served by numerous established transit routes. The Project is also located within walking distance to the Red Line station at Hollywood/Highland and in close proximity to other local and regional transit lines, as well as a wide diversity of land uses within reasonable walking distance. The total capacity of the

analyzed transit lines within the Study Area during the AM and PM peak hours is approximately 11,112 and 11,003 trips, respectively. The Project's AM and PM peak hour person trips by transit are projected at 274 and 426 trips, respectively, or approximately less than 4% of the available capacity during AM and PM peak hours. As detailed in Table 4, the Project Site is served by numerous Rapid and local bus lines, local LADOT DASH service, as well as the Metro Red Line. Although the Project (and other related projects) will cumulatively add transit ridership, the Project Site, greater Hollywood area and Study Area are served by a vast amount of transit service. As such, although maximum ridership may currently exceed capacity along a specific local route (e.g., Metro Local 2/302, LADOT DASH Hollywood Wilshire) during both the AM and PM peak hours, overall, the total transit capacity of the numerous bus lines and Metro lines can accommodate the Project's transit trips. Therefore, the Project would not exceed regional transit capacity and transit impacts would be less than significant. Furthermore, it is assumed that public transit providers would add additional service when required in order to accommodate cumulative demand in the region. Therefore, cumulative impacts on public transit would be less than significant.

TABLE 17
CMP ARTERIAL MONITORING INTERSECTION

Notes

[a] Auxiliary lanes and high-occupancy vehicle (carpool) lanes are not counted toward number of lanes.

[b] Capacity reflects a lane capacity is 2,000 vehicles per hour per lane.

[c] Future without Project traffic volumes reflect the Existing traffic volumes (Table 11) added to ambient traffic growth and Related Projects traffic growth

[d] Future with Project traffic volumes reflect Future Without Project traffic volumes plus the Project traffic volume.

[e] Change in demand to capacity (D/C) ratio based on Future With Project D/C ratio - Future Without Project D/C ratio.

[f] Significant impact based on freeway segment analysis as outlined in Appendix D, subsection D.8.3 and corresponding significance thresholds outlined in subsection D.9.1 of *2010 Congestion Management Program,* (Metro, 2010). As described therein, an impact if deemed significant if the change in D/C ratio >= 0.02, causing or worsening LOS F (D/C >= 1.0).

Chapter 11
Caltrans Analysis

This chapter presents an analysis of Caltrans facilities, including freeway mainline segments, Caltrans intersections, off-ramp queuing, on-ramp capacity, and freeway ramp sections to provide further information to the decision makers. The analysis follows the guidelines found in the Caltrans TIS Guide as required. As detailed in the MOU, the Project exceeds the screening thresholds identified in the Caltrans Agreement at freeway off-ramps. Thus, further consultation with Caltrans and analyses of Caltrans facilities were conducted. The screening analysis is included in the MOU provided in Appendix A.

ANALYZED FACILITIES

As shown in Table 20, the analyses conducted on Caltrans facilities included freeway mainline segments, signalized and unsignalized ramp intersections, intersections along Santa Monica Boulevard under Caltrans jurisdiction, off-ramp queuing, on-ramp capacity, and freeway ramp sections.

Eight freeway mainline segments on US 101 were analyzed using HCM methodology to determine density, speed, and LOS. In the absence of specific Caltrans significance thresholds for analyzing impacts to freeway mainline segments, the segments were also analyzed for the Project's effect on operating conditions, which was classified based on the measured flow past a designated point compared to the estimated capacity of that section of the freeway. Capacity is calculated by multiplying the lane capacity by the number of lanes in each segment. In accordance with Caltrans guidelines, the lane capacity is assumed to be 2,000 vehicles per hour per freeway mainline lane (vphpl). No additional capacity is assumed for auxiliary lanes linking on-ramps and off-ramps. The LOS definitions for freeway mainline segments are presented in Table 21 and 22.

Twenty signalized and eight unsignalized intersections located at freeway ramps or along Santa Monica Boulevard and under partial Caltrans jurisdiction were analyzed using HCM methodology to identify average vehicle delay and LOS.

Nine freeway off-ramps were analyzed for ramp queue lengths using the Synchro software to estimate queues. The ramp volumes at six freeway on-ramps were reviewed. A total of 13 freeway on- and off-ramps were analyzed using the appropriate HCM Merge, Diverge, or Weaving Segment methodology depending on the configuration of the ramps.

Appendix H contains the LOS worksheets for each type of analysis.

IMPACT THRESHOLDS

The Caltrans TIS Guide states that Caltrans' target LOS is "at the transition between LOS C and LOS D," which is generally interpreted to mean in the lower half of the range of LOS D (where the LOS is determined based on the freeway mainline density or the intersection delay). When that threshold has already been exceeded, the existing condition (or projected future condition) should be maintained with the addition of Project traffic.

However, Caltrans does not identify specific incremental criteria by which to measure the significance of impacts to freeway mainline segments or intersections, and therefore it is not possible to identify whether a specific facility would be significantly impacted under Caltrans criteria. In the absence of specific Caltrans criteria for evaluating impacts, the freeway mainline segments and Caltrans intersections were analyzed for the Project's effect on operating conditions, based conservatively on the CMP significance criteria presented in Chapter 10. As described in Chapter 10, a significant impact requiring mitigation occurs if project traffic causes an incremental increase in intersection V/C ratio of 0.02 or greater to a facility projected to operate at LOS F (V/C > 1.00) after the addition of project traffic.

Improvements to Caltrans freeway facilities tend to be beyond the feasibility of any individual project to implement, therefore, Appendix B of the Caltrans TIS Guide provides a methodology to identify a project's proportionate share of the future traffic growth on the Caltrans freeway

facilities. The proportionate share is calculated as the Project's percentage of the total projected traffic growth on a freeway mainline segment up to year 2035.

FREEWAY MAINLINE SEGMENTS

Eight freeway mainline segments on US 101 were analyzed using the HCM methodology.

Year 2015 Conditions

Existing freeway volumes were collected using Caltrans' recently published traffic count data (*2014 Traffic Volumes on California State Highways,* Caltrans, 2015) and are summarized in Table 23. The data consists of the annual average daily traffic (AADT) volumes, as well as the two-way peak hour percent of AADT factor ("K factor") and the percent traffic in the peak direction factor ("D factor"), which were used to develop peak hour volumes. Table 24 summarizes the results of the HCM analysis for Existing Conditions, Existing with Project Conditions and Existing with Project with Mitigation Conditions for year 2015.

Tables 25 to 27 summarize the Existing, Existing with Project and Existing with Project with Mitigation operating conditions based on the capacity, peak hour volume, and LOS for each of the freeway mainline segments. As shown in Tables 26 and 27, based conservatively on CMP significance criteria, the Project would not significantly impact any of the freeway mainline segments as it would not increase the V/C ratio by 0.020 or more that worsens an LOS F condition.

Year 2022 Conditions

Traffic volumes were projected for year 2022 to reflect the Project buildout year and are summarized in Table 23. The existing traffic volumes were increased by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. Table 28 summarizes the results of the HCM analysis for Future without Project Conditions, Future with Project Conditions and Future with Project with Mitigation Conditions for year 2022.

Tables 29 to 31 summarize the Future without Project, Future with Project and Future with Project with Mitigation operating conditions based on the capacity, peak hour volume, and LOS for each of the freeway mainline segments. As shown in Tables 30 and 31, based conservatively on CMP significance criteria, the Project would not significantly impact any of the freeway mainline segments as it would not increase the V/C ratio by the 0.020 or more that worsens an LOS F condition.

Year 2035 Conditions

Traffic volumes were projected for year 2035 to reflect a 20-year horizon and for fair-share calculation purposes and are summarized in Table 23. The existing traffic volumes were increased by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. Table 32 summarizes the results of the HCM analysis for Future without Project Conditions, Future with Project Conditions and Future with Project with Mitigation Conditions for year 2035.

Tables 33 to 35 summarize the Future without Project, Future with Project and Future with Project with Mitigation operating conditions based on the capacity, peak hour volume, and LOS for each of the freeway mainline segments. As shown in Tables 34 and 35, based conservatively on CMP significance criteria, the Project would not significantly impact any of the freeway mainline segments as it would not increase the V/C ratio by 0.020 or more that worsens an LOS F condition. Additionally, implementation of the Project's mitigation program further reduces the Project traffic on the freeway mainline segments.

Proportionate-Share

As described previously, the Project alone would not result in significant impacts at any of the analyzed freeway mainline segments, but would contribute to the cumulative future traffic volumes. Table 36 summarizes the calculation of the Project's proportionate share of projected future year 2035 traffic added to each of the freeway mainline segments based on the Appendix B of the Caltrans TIS Guide. As previously noted, the proportionate share is calculated as the

Project's percentage of the total projected traffic growth on a freeway mainline segment over the next 20 years (to year 2035). It should be noted that the Project's proportionate share of future traffic growth on the freeway mainline would be further reduced with implementation of the mitigation program. Thus, the analysis is conservative.

INTERSECTIONS

As described in Chapter 2, a total of 111 intersections, primarily located in the City of Los Angeles (some are partially located within City of West Hollywood) are analyzed as part of the traffic study according to the significance thresholds established by the lead agency (City of Los Angeles). As shown in Table 20, this Caltrans analysis focuses on the 10 signalized freeway ramp locations and eight unsignalized freeway ramp locations associated with US 101. In addition, 10 signalized intersections are located along Santa Monica Boulevard, a Caltrans facility within the City of Los Angeles.

Overview

As described in Chapter 7, in response to significant impacts identified using City of Los Angeles significance criteria, the Project would implement various mitigation measures that would improve operations at the study intersections, including the intersections within partial Caltrans jurisdiction. The Project would implement a TDM program and participate in the Hollywood TMO, which will reduce ambient traffic and Project traffic throughout the Study Area, and generally improve intersection operating conditions. The Project would fund TSM improvements at key intersections along corridors, including several of the Caltrans intersections. Other mitigation measures include additional transit system improvements (e.g., transit buses, shuttles, shelters, and/or other enhancements) to further enhance usage of the transit system as an alternative to automobile trips. The transit system improvements would be focused on increasing service along the Metro Route 4 and the LADOT DASH-Hollywood routes, which include Santa Monica Boulevard. As shown in Chapter 8, the mitigation measures would reduce Project-related vehicular traffic and improve intersection operating conditions. Caltrans does not have specific criteria to determine significance of incremental changes in intersection operations. Therefore, for purposes of this analysis, the significance of the traffic-

related impacts is based on the Lead Agency's (City of Los Angeles) significance thresholds and analyses presented in Chapters 1 through 10.

The intersections under Caltrans jurisdiction were further analyzed using the HCM methodology according to Caltrans TIS Guidelines and implemented using the Synchro software. Actual signal timing based on current timing charts provided by LADOT (which operates the signals) was incorporated into the analysis. Table 37 summarizes the LOS definitions for signalized and unsignalized intersections.

Caltrans has not published a specific significance threshold that defines a significant impact for signalized or unsignalized intersections. However, as described below and detailed in Tables 38 to 43, several signalized and unsignalized intersections are projected to operate at LOS E or F during the AM and/or PM peak hours and the Project potentially increases the delay at those intersections.

Year 2015 Conditions

The analysis of year 2015 conditions was conducted using available traffic count data from year 2015, provided in Appendix C. Table 38 summarizes the results of the signalized HCM analysis for Existing Conditions, Existing with Project Conditions and Existing with Project with Mitigation Conditions for year 2015. Table 39 summarizes the results of the unsignalized HCM analysis for Existing, Existing with Project and Existing with Project with Mitigation Conditions for year 2015.

Year 2022 Conditions

The year 2022 traffic volumes were developed by increasing the existing traffic volumes with both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3.

Table 40 summarizes the results of the signalized HCM analysis for Future without Project conditions, Future with Project conditions and Future with Project with Mitigation conditions for year 2022. Table 41 summarizes the results of the unsignalized HCM analysis for Future

without Project Conditions, Future with Project Conditions and Future with Project with Mitigation Conditions for year 2022.

Year 2035 Conditions

The year 2035 traffic volumes were developed by increasing the existing traffic volumes with both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3.

Table 42 summarizes the results of the signalized HCM analysis for Future without Project conditions, Future with Project conditions and Future with Project with Mitigation conditions for year 2035. Table 43 summarizes the results of the unsignalized HCM analysis for Future without Project Conditions, Future with Project Conditions and Future with Project with Mitigation Conditions for year 2035.

OFF-RAMP QUEUES

Nine off-ramps from US 101 were analyzed to determine whether the length of the ramps were sufficient to accommodate vehicle queue lengths. The queue lengths were estimated using Synchro, which reports the 95th percentile queue length, in feet, for each approach lane on the off-ramp.

The assessment of the off-ramps include a review of the vehicle queue length as compared to the total available queuing capacity of the ramp to determine whether the vehicle queue would extend beyond the length of the ramp onto the mainline. To this end, the queuing analysis looks at two separate components of ramp capacity: the first is the length of each approach lane to the intersection, and the remaining length of the ramp, behind any approach lane delineation lines, to the gore point where the ramp diverges from the freeway mainline. The queue may exceed the striped length of a given approach lane, as long as there is sufficient additional queuing capacity on the ramp, it will not spill over onto the mainline.

Year 2015 Conditions

The analysis of year 2015 conditions was conducted using available traffic count data from year 2015. Table 44 summarizes the results of the queuing analysis for Existing Conditions and Existing with Project Conditions for year 2015. As shown in Table 44, the US 101 Southbound Off-Ramp at Cahuenga Boulevard would have queues exceeding the available storage on the ramp during the AM peak hour, with and without Project traffic. The queue lengths at the remaining eight off-ramps would not exceed the capacity of the approach lanes or the ramps. The Project would not substantially worsen queuing at any location.

Year 2022 Conditions

The year 2022 traffic volumes were developed by increasing the existing traffic volumes by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. Table 45 summarizes the results of the queuing analysis for Future without Project Conditions and Future with Project Conditions for year 2022. As shown in Table 45, the US 101 Southbound Off-Ramp at Cahuenga Boulevard would have queues exceeding the available storage on the ramp during the AM peak hour, with and without Project traffic. The queue lengths at the remaining eight off-ramps would not exceed the capacity of the approach lanes or the ramps. The Project would not substantially worsen queuing at any location. By comparison, implementation of the Project's mitigation program will further reduce the Project-related traffic on the off-ramps. Therefore, this analysis is conservative.

Year 2035 Conditions

The year 2035 traffic volumes were developed by increasing the existing traffic volumes by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. Table 46 summarizes the results of the queuing analysis for Future without Project Conditions and Future with Project Conditions for year 2035. As shown in Table 46, the following off-ramp locations

would have queues that exceed the available storage on the ramp, with and without Project traffic:

Q-3. US 101 Southbound Off-Ramp at Hollywood Boulevard (AM and PM peak hours)
Q-5. US 101 Southbound Off-Ramp at Cahuenga Boulevard (AM peak hour)
Q-7. US 101 Southbound Off-Ramp at Gower Street (AM peak hour)

The queue lengths at the remaining six off-ramps would not exceed the capacity of the approach lanes or the ramps. The Project would not substantially worsen queuing at any location. It should be noted that implementation of the Project's mitigation program will further reduce the Project-related traffic on the off-ramps. Therefore, this analysis is conservative.

ON-RAMP CAPACITY

Six on-ramps were analyzed to determine the existing or projected volumes as compared to the ramp capacity.

Year 2015 Conditions

The analysis of year 2015 conditions was conducted using available traffic count data from year 2015. Table 47 summarizes the results of the on-ramp analysis for Existing Conditions and Existing with Project Conditions for year 2015. As shown in Table 47, the Project would not substantially increase the on-ramp volumes at any of the six analyzed on-ramps during either the AM or PM peak hours.

Year 2022 Conditions

The year 2022 traffic volumes were developed by increasing the existing traffic volumes by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. Table 48 summarizes the results of the on-ramp analysis for Future without Project Conditions and Future

with Project Conditions for year 2022. As shown in Table 48, the Project would not substantially increase the on-ramp volumes at any of the six analyzed on-ramps during either the AM or PM peak hours. It should be noted that implementation of the Project's mitigation program will further reduce the Project-related traffic on the freeway on-ramps. Therefore, this analysis is conservative.

Year 2035 Conditions

The year 2035 traffic volumes were developed by increasing the existing traffic volumes by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. Table 49 summarizes the results of the on-ramp analysis for Future without Project Conditions and Future with Project Conditions for year 2035. As shown in Table 49, the Project would not substantially increase the on-ramp volumes at any of the six analyzed on-ramps during either the AM or PM peak hours. It should be noted that implementation of the Project's mitigation program will further reduce the Project-related traffic on the freeway on-ramps. Therefore, this analysis is conservative.

FREEWAY RAMP SECTIONS

Freeway ramp sections were analyzed using the HCM 2010 methodology procedures. Ramp junctions are the connection points between interchange ramps and the freeway mainline. In some cases, ramp junctions between successive interchanges are connected by an auxiliary lane. This configuration is referred to as a weaving section and is analyzed using the same LOS criteria as ramp junctions. HCM 2010 defines LOS for weaving sections based on the density of freeway traffic in the ramp junction influence area as described in Table 50.

Year 2015 Conditions

Existing freeway volumes were collected using Caltrans' recently published traffic count data. As shown in Table 51, 10 of the 13 freeway ramps' merge, diverge, and weaving sections are

projected to operate at LOS E or F during at least one of the analyzed peak hours under Existing Conditions, with and without Project traffic. The remaining three freeway ramps' merge and diverge sections are projected to operate at LOS D or better during the analyzed peak hours under Existing Conditions, with and without Project traffic.

Year 2022 Conditions

Traffic volumes were projected for Year 2020 to reflect the Project buildout year. The existing traffic volumes were increased by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. As shown in Table 52, 11 of the 13 freeway ramps' merge, diverge, and weaving sections are projected to operate at LOS E or F during at least one of the analyzed peak hours under Future Conditions, with and without Project traffic. The remaining two freeway ramps' diverge sections are projected to operate at LOS D or better during the analyzed peak hours under Future Conditions, with and without Project traffic. It should be noted that implementation of the Project's mitigation program will further reduce the Project-related traffic on the freeway. Therefore, this analysis is conservative.

Year 2035 Conditions

Traffic volumes were projected for Year 2035 to reflect a 20-year horizon. The existing traffic volumes were increased by both ambient growth (assumed to be 1% per year) and Related Project traffic, in the same manner as Future without Project traffic volumes were developed for year 2022 in Chapter 3. As shown in Table 53, 11 of the 13 freeway ramps' merge, diverge, and weaving sections are projected to operate at LOS E or F during at least one of the analyzed peak hours under Future Conditions, with and without Project traffic. The remaining two freeway ramps' diverge sections are projected to operate at LOS D or better during the analyzed peak hours under Future Conditions, with and without Project traffic. It should be noted that implementation of the Project's mitigation program will further reduce the Project-related traffic on the freeway. Therefore, this analysis is conservative.

TABLE 21
FREEWAY SEGMENT LEVEL OF SERVICE DEFINITIONS - DENSITY

Level of Service	Description	Density [a]
A	Free-flow speeds prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	≤ 11
B	Free-flow speeds are maintained. The ability to maneuver with the traffic stream is only slightly restricted.	> 11 and ≤ 18
C	Flow with speeds at or near free-flow speeds. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver.	> 18 and ≤ 26
D	Speeds decline slightly with increasing flows. Freedom to maneuver with the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort.	> 26 and ≤ 35
E	Operation at capacity. There are virtually no usable gaps within the traffic stream, leaving little room to maneuver. Any disruption can be expected to produce a breakdown with queuing.	> 35 and ≤ 45
F	Represents a breakdown in flow and oversaturated conditions.	> 45

Notes

Source: *2010 Highway Capacity Manual* (Transportation Research Board, 2010) and Caltrans.

[a] Density is defined in vehicles per mile per lane and describes the proximity to other vehicles and is related to the freedom to maneuver within the traffic stream (*2010 Highway Capacity Manual,* Transportation Research Board, 2010).

TABLE 22
FREEWAY SEGMENT LEVEL OF SERVICE DEFINITIONS - OPERATING CONDITIONS

Level of Service	Volume/Capacity Ratio	Flow Conditions
A	0.00 - 0.35	Highest quality of service. Free traffic flow, low volumes and densities. Little or no restriction on maneuverability or speed.
B	0.36 - 0.54	Stable traffic flow, speed becoming slightly restricted. Low restriction on maneuverability.
C	0.55 - 0.77	Stable traffic flow, but less freedom to select speed, change lanes, or pass. Density increasing.
D	0.78 - 0.93	Approaching unstable flow. Speeds tolerable but subject to sudden and considerable variation. Less maneuverability and driver comfort.
E	0.94 - 1.00	Unstable traffic flow with rapidly fluctuating speeds and flow rates. Short headways, low maneuverability and low driver comfort.
F(0)	1.01 - 1.25	Forced traffic flow. Speed and flow may be greatly reduced with high densities.
F(1)	1.26 - 1.35	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.
F(2)	1.36 - 1.45	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.
F(3)	> 1.45	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.

Notes

OVERFLOW: Traffic demand exceeds the available capacity of the freeway mainline segment .

[a] Mean speed measured in miles per hour (mph).

[b] Methodology from *2010 Highway Capacity Manual* (Transportation Research Board, 2010).

[c] Measured in vehicles per mile per lane (v/m/l) for freeways with a free-flow speed of 55 mph.

Notes:
[a] The capacity of an auxiliary lane was assumed to be 1/2 of a freeway mainline lane.
[b] Lane capacity is 2,000 vehicles per hour per lane based on specifications in the screening criteria.
[c] An ambient growth rate of 1% per year was applied to the most recent traffic volume data from recent Caltrans published volume data from *2014 Traffic Volumes on California State Highways* (Caltrans, 2015) to reflect Existing year 2015 traffic conditions.

Notes

OVERFLOW: Traffic demand exceeds the available capacity of the freeway mainline segment .

[a] Mean speed measured in miles per hour (mph).

[b] Methodology from *2010 Highway Capacity Manual* (Transportation Research Board, 2010).

[c] Measured in vehicles per mile per lane (v/m/l) for freeways with a free-flow speed of 55 mph.

Notes

OVERFLOW: Traffic demand exceeds the available capacity of the freeway mainline segment .

[a] Mean speed measured in miles per hour (mph).

[b] Methodology from *2010 Highway Capacity Manual* (Transportation Research Board, 2010).

[c] Measured in vehicles per mile per lane (v/m/l) for freeways with a free-flow speed of 55 mph.

TABLE 37
CALTRANS INTERSECTION LEVEL OF SERVICE DEFINITIONS

Level of Service	Description	Delay [a]	
		Signalized Intersections	Unsignalized Intersections
A	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.	≤ 10	0.0 - 10.0
B	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.	> 10 and ≤ 20	10.1 - 15.0
C	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.	> 20 and ≤ 35	15.1 - 25.0
D	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.	> 35 and ≤ 55	25.1 - 35.0
E	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.	> 55 and ≤ 80	35.1 - 50.0
F	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.	> 80	> 50.0

Notes

Source: *2010 Highway Capacity Manual* (Transportation Research Board, 2010).

[a] Measured in seconds.

[a] Expressed in feet.

[b] 95th Percentile queue results per SYNCHRO 8 (Methodology from *2010 Highway Capacity Manual*, Transportation Research Board, 2010). SYNCHRO 8 queue results expressed in number of vehicles. Vehicle length is assumed to be 25 feet.

[c] The right-turn from the off-ramp is a channelized free right-turn.

[d] Intersection has a free-flow off-ramp to Sunset Boulevard in the westbound direction.

[a] Expressed in feet.

[b] 95th Percentile queue results per SYNCHRO 8 (Methodology from 2010 Highway Capacity Manual, Transportation Research Board, 2010). SYNCHRO 8 queue results expressed in number of vehicles. Vehicle length is assumed to be 25 feet.

[c] The right-turn from the off-ramp is a channelized free right-turn.

[d] Intersection has a free-flow off-ramp to Sunset Boulevard in the westbound direction.

TABLE 50
RAMP SEGMENT LEVEL OF SERVICE DEFINITIONS

Level of Service	Description	Density [a]
A	Unrestricted operations	≤ 10
B	Merging and diverging maneuvers noticeable to drivers	> 10 and ≤ 20
C	Influence area speeds begin to decline	> 20 and ≤ 28
D	Influence area turbulence becomes intrusive	> 28 and ≤ 35
E	Turbulence felt by virtually all drivers	> 35
F	Ramp and freeway queues form	Demand Exceeds Capacity

Source: *2010 Highway Capacity Manual* (Transportation Research Board, 2010).

[a] Measured in passenger cars per mile per lane (pc/mi/ln) for freeways with a free-flow speed of 55 mph.

Chapter 12
Site Access and Internal Circulation

This chapter summarizes the site access and internal circulation of the Project Site.

PROJECT SITE ACCESS AND CIRCULATION

Vehicles

Parking for the Project would be provided on-site within subterranean parking garages. Vehicular access to the subterranean garages would be provided via full access driveways (right and left-turn ingress and egress movements) along Selma Avenue, McCadden Place and Las Palmas Avenue. A secondary hotel driveway accommodating right-turn only egress movements would be provided on Highland Avenue. A truck loading area would be accessed via a driveway on Las Palmas Avenue for commercial uses and a driveway on McCadden Place for hotel uses. The driveways would be designed in accordance with LADOT standards. The Project also proposes the realignment of Las Palmas Avenue at Sunset Boulevard.

Pedestrians and Bicycles

As previously described, the Project is located in a neighborhood with a high amount of pedestrian activity that also rates highly for general walkability. Consistent with this rating, pedestrian patronage is anticipated at the Project. The Project proposes to establish a new pedestrian passageway that would extend diagonally from the southeast corner of Sunset Boulevard fronting Crossroads of the World to the intersection of McCadden Place & Selma Avenue. The pedestrian passageway would be linked through landscaped public walkways and connect the entire Project Site while promoting access from Sunset Boulevard, Las Palmas Avenue, Selma Avenue, and McCadden Place. Although various criteria are used to gauge walkability, the guiding principle is based on maintaining a direct and safe path of travel with

minimal obstructions for all pedestrians. To that end, the Applicant proposes to retain all existing sidewalks and pedestrian crosswalks adjacent to the Project Site.

Visitors, patrons and employees arriving by bicycle would have the same access opportunities as pedestrian visitors. In order to facilitate bicycle use, bicycle parking spaces would be provided on-site, consistent with the Bicycle Parking Ordinance, *Los Angeles Municipal Code* (City of Los Angeles, December 31, 2015) (LAMC) Section 12.21 A16(a)(2).

OPERATIONS OF ADJACENT INTERSECTIONS

The following five analyzed intersections are located adjacent to the Project Site and provide access to the Project driveways:

- Unsignalized Intersection 7. McCadden Place & Selma Avenue
- Unsignalized Intersection 8. Las Palmas Avenue & Selma Avenue
- Unsignalized Intersection 9. McCadden Place & Sunset Boulevard
- Signalized Intersection 54. Highland Avenue & Selma Avenue
- Signalized Intersection 66. Las Palmas Avenue & Sunset Boulevard

The detailed analyses of these intersections are provided in Chapters 5, 6 and 9. As shown in Tables 14 and 15, the unsignalized intersections at McCadden Place & Selma Avenue and McCadden Place & Sunset Boulevard are anticipated to operate at a LOS D or better during both the AM and PM peak hours under Existing with Project and Future with Project Conditions. The intersection at Las Palmas Avenue & Selma Avenue is anticipated to operate at LOS D and E during the AM and PM peak hours, respectively, under Existing with Project Conditions, and LOS E and F during the AM and PM peak hours, respectively, under Future with Project Conditions. Based on the signal warrant analysis outlined in Chapter 10, the installation of a traffic signal at this intersection is warranted based on the Existing with Project and Future with Project Conditions peak hour traffic volumes. However, the satisfaction of a traffic signal warrant does not in itself require the installation of a traffic control signal.

As shown in Table 12 and 13, the signalized intersection of Highland Avenue and Selma Avenue is anticipated to operate at LOS A during both the AM and PM peak hours under Existing with Project and Future with Project Conditions, and the signalized intersection at Las Palmas Avenue & Sunset Boulevard is anticipated to operate at LOS A and LOS B during the AM and PM peak hour, respectively, under Existing with Project Conditions and LOS A and LOS D during the AM and PM peak hour, respectively, under Future with Project Conditions. As mentioned in Chapter 8, this intersection resulted in a significant traffic impact, prior to mitigation in the PM peak hour. With implementation of the mitigation program, which includes installation of a westbound right-turn lane on Sunset Boulevard, the intersection operations improves and the impact is reduced to less than significant levels.

REVIEW OF LAS PALMAS AVENUE

As previously noted, the Project also proposes the realignment of Las Palmas Avenue at Sunset Boulevard. The intersection is currently offset, with the street segment north of Sunset Boulevard lying east of the street segment south of Sunset Boulevard. The improvement would shift Las Palmas Avenue north of Sunset Boulevard to the west to create a four-legged intersection, thus providing improved connectivity and safety for all users.

As shown in the site plan highlighted in Figure 1, Las Palmas between Selma Avenue and Sunset is planned to consist of a 36-foot roadway width within a 60-foot right-of-way width. The roadway width will accommodate one travel lane in each direction with a center two-way left-turn lane to facilitate turning movement into and out of the proposed Project driveways. At the intersections with Selma Avenue and Sunset Boulevard, it is anticipated that Las Palmas Avenue approaches (northbound approach at Selma Avenue and southbound approach at Sunset Boulevard) will provide enough width to accommodate two lanes (e.g., one left-turn lane and one shared through/right-turn lane).

Chapter 13

Residential Street Segment Analysis

This section presents an analysis of potential residential street segment impacts in the vicinity of the Project, in accordance with the methodology and guidelines identified in the *L.A. CEQA Thresholds Guide: Your Resource for Preparing CEQA Analyses in Los Angeles* ("*L.A. CEQA Thresholds Guide*") (City of Los Angeles, 2006) and *Traffic Study Policies and Procedures*.

RESIDENTIAL STREET SEGMENT SELECTION CRITERIA

L.A. CEQA Thresholds Guide identifies significance thresholds with regard to neighborhood intrusion/residential street segment impacts based on the increase in project trips on a local residential street. *L.A. CEQA Thresholds Guide* offers recommended thresholds for neighborhood intrusion impacts based on the addition of project traffic on the future traffic conditions of neighborhood streets, as follows:

> *A project would normally have a significant neighborhood intrusion impact if project traffic increases the average daily traffic (ADT) volume on a local residential street in an amount equal to or greater than the following:*
>
> - *ADT increase $\geq$ 16% if final ADT < 1,000*
> - *ADT increase $\geq$ 12% if final ADT $\geq$ 1,000 and < 2,000*
> - *ADT increase $\geq$ 10% if final ADT $\geq$ 2,000 and < 3,000*
> - *ADT increase $\geq$ 8% if final ADT $\geq$ 3,000*
>
> *"Final ADT" is defined as total projected future daily volume including project, ambient, and related project growth.*

Traffic Study Policies and Procedures provides a more stringent significance threshold of 120 project trips, as outlined below, and was used for this analysis. Hence, for any neighborhood in which traffic could be increased by 120 trips per day or more on any local residential streets, a potentially significant impact by the Project, prior to mitigation, is identified.

METHODOLOGY FOR DETERMINATION OF IMPACT

Traffic Study Policies and Procedures identifies an analysis methodology and threshold criteria for potential neighborhood traffic intrusion impacts, based on the addition of project traffic on the future traffic conditions of neighborhood streets. Four conditions must be met to create the conditions under which there could be a significant impact on local streets in a neighborhood:

1. The proposed project is a non-residential development and not a school.

2. The arterial is sufficiently congested, such that motorists traveling on the arterial may opt to divert to a parallel route through a residential street; the congestion level of the arterial can be determined based on the estimated LOS under project conditions of the study intersections; LOS E and F are considered to represent congested conditions. The majority of vehicles on an arterial corridor tend to remain on that corridor even under congested conditions, as only a small portion of motorists are inclined to seek alternative routes. Therefore, for the purposes of this analysis, corridors to which the Project may add 1,200 or more daily trips were examined, assuming that at most, only 10% of these trips, or 120 trips, may shift to alternative routes on average across a 24-hour period (the proportion that may shift could be higher than 10% during congested peak periods of the day but much less than 10% or almost none during uncongested non-peak periods of the day).

3. The project is projected to add a significant amount of traffic to the congested arterial that can potentially shift to an alternative route; project traffic would need to exceed the daily minimum significance thresholds below:

Projected ADT with Project (Final ADT)	Project Related Increase in ADT
0 to 999	120 or more
1,000 to 1,999	12% or more of final ADT
2,000 to 2,999	10% or more of final ADT
3,000 or more	8% or more of final ADT

4. There must be available local neighborhood street(s) providing a parallel route of travel.

If one or more of these factors is absent, significant neighborhood traffic impacts would not be anticipated.

RESIDENTIAL STREET SEGMENT ANALYSIS

The neighborhood intrusion impact analysis was conducted for the Existing with Project (year 2015) and Future with Project (year 2022) Conditions. It should be noted that the Project would implement the TDM program described in Chapter 8 as part of the project design features, which reduces Project trip generation. However, to maintain a conservative analysis, potential neighborhood intrusion impacts were assessed based on full Project trip generation without consideration of the TDM program.

The factors used in projecting a neighborhood impact analysis are assessed below.

Arterial Corridors Meeting Project Trip Threshold

As discussed in Chapter 4 and shown in Table 8b, the Project is expected to generate a net total of 14,833 daily trips on a typical weekday before implementation of the TDM program and other mitigation measures. Figures 8 to 12 show Project trip distribution percentages for signalized and unsignalized intersections, respectively. Based on LADOT policy, any arterial corridor projected to increase by 1,200 or more daily trips from Project traffic would meet the condition for assessing neighborhood intrusion impacts. This would represent 8.1% of the total daily traffic to and from the Project Site. The arterial corridors that have 1,200 or more trips added to them by the Project before implementation of the TDM program and mitigation measures are:

- Highland Avenue between Odin Street and Santa Monica Boulevard
- Hollywood Boulevard between Las Palmas Avenue and Wilcox Avenue
- Sunset Boulevard between Gardner Street and Van Ness Avenue

Intersections Operating at LOS E or F along Affected Corridors

Several intersections along the affected corridors are projected to operate at LOS E or F under Existing with Project or Future with Project Conditions.

Existing with Project Conditions (Year 2015). Table 9 shows the intersection LOS for Existing with Project Conditions. As it shows, the following seven study intersections on the corridors identified above are projected to operate at LOS E or F during at least one analyzed peak hour:

12. Highland Avenue & Franklin Avenue (South) (AM and PM peak hours)
13. Highland Avenue & Franklin Avenue (North) (AM and PM peak hours)
37. Highland Avenue & Hollywood Boulevard (AM and PM peak hours)
63. La Brea Avenue & Sunset Boulevard (AM and PM peak hours)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)

Future with Project Conditions (Year 2022). Table 10 shows the intersection LOS for Future with Project Conditions. As it shows, the following eight study intersections on the corridors identified above are projected to operate at LOS E or F during at least one analyzed peak hour:

12. Highland Avenue & Franklin Avenue (South) (AM and PM peak hours)
13. Highland Avenue & Franklin Avenue (North) (AM and PM peak hours)
37. Highland Avenue & Hollywood Boulevard (AM and PM peak hours)
63. La Brea Avenue & Sunset Boulevard (AM and PM peak hours)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hours)
70. Cahuenga Boulevard & Sunset Boulevard (AM and PM peak hours)
72. Vine Street & Sunset Boulevard (AM and PM peak hours)
74. Gower Street & Sunset Boulevard (PM peak hour)

Based on the locations of these intersections and LADOT policy, both Highland Avenue between Odin Street and Santa Monica Boulevard and Sunset Boulevard between Gardner Street and Van Ness Avenue were examined for the potential for use of alternative routes through residential neighborhoods.

Availability of Parallel Local Streets

LADOT policy specifies the identification of viable cut-through routes on local residential streets in order for a neighborhood intrusion impact to be found. The affected corridors identified above were examined for the availability of parallel local streets that could be used as a cut-through route to avoid arterial congestion:

On Highland Avenue between Odin Street and Sunset Boulevard

- Orange Drive is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the west between Odin Street and Sunset Boulevard. Orange Drive is primarily stop-controlled at intersections with other local residential streets, but provides signal control at intersections with Franklin Avenue, Hollywood Boulevard, and Sunset Boulevard.

- Las Palmas Avenue is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the east between Franklin Avenue and Sunset Boulevard. Las Palmas Avenue is primarily stop-controlled at intersections with other local residential streets but provides signal control at intersections with Hollywood Boulevard and Sunset Boulevard.

- Cherokee Avenue is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the east between Franklin Avenue and Selma Avenue. Cherokee Avenue is primarily stop-controlled at intersections with other local residential streets, but provides signal control at intersections with Hollywood Boulevard.

- Whitley Avenue is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the east between Franklin Avenue and Hollywood Boulevard. Whitley Avenue is primarily stop-controlled at intersections with other local residential streets, but provides signal control at intersections with Hollywood Boulevard and Franklin Avenue.

On Highland Avenue between Sunset Boulevard and Santa Monica Boulevard

- Orange Drive is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the west between Sunset Boulevard and Santa Monica Boulevard. Orange Drive is primarily stop-controlled at intersections with other local residential streets, but provides signal control at intersections with Sunset Boulevard, Fountain Avenue, and Santa Monica Boulevard.

- Mansfield Avenue is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the west between Sunset Boulevard and Santa Monica Boulevard. Mansfield Avenue is stop-controlled at all intersections between Sunset Boulevard and Santa Monica Boulevard.

- McCadden Place is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the east between Sunset Boulevard and Santa Monica Boulevard. McCadden Place is stop-controlled at all intersections between Sunset Boulevard and Santa Monica Boulevard.

- Las Palmas Avenue is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the east between Sunset Boulevard and Santa Monica. Las Palmas is primarily stop-controlled at intersections with other local residential streets, but provides signal control at intersections with Sunset Boulevard and Santa Monica Boulevard.

- Cherokee Avenue is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the east between Sunset Boulevard and Lexington Avenue. Cherokee Avenue is primarily stop-controlled at intersections with other local residential streets, but provides signal control at the intersection with Sunset Boulevard.

- Seward Avenue Street is a potential alternative route to Highland Avenue. It parallels Highland Avenue to the east between Sunset Boulevard and Santa Monica Boulevard. Seward Avenue is primarily stop-controlled at intersections with other local residential streets, but provides signal control at the intersection with Sunset Boulevard.

<u>On Sunset Boulevard between Gardner Street and Van Ness Avenue</u>

- Selma Avenue is a potential alternative route to Sunset Boulevard. It parallels Sunset Boulevard to the north between Highland Avenue and Gower Street. Selma Avenue is primarily stop controlled at intersections with other residential local streets, but provides signal control at intersections with Highland Avenue, Wilcox Avenue, Cahuenga Boulevard, and Vine Street.

- Hawthorn Avenue is a potential alternative route to Sunset Boulevard. It parallels Sunset Boulevard to the north between Curson Avenue and McCadden Place. Hawthorn Avenue is primarily stop-controlled at intersections with other residential local streets, but provides signal control at its intersection with La Brea Avenue.

- Delongpre Avenue is a potential alternative route to Sunset Boulevard. It parallels Sunset Boulevard to the south between Formosa Avenue and Gower Street. Delongpre Avenue is primarily stop-controlled at intersections with other residential local streets, but provides signal control at intersections with Highland Avenue, Wilcox Avenue, Cahuenga Boulevard, and Vine Street.

- Lexington Avenue is a potential alternative route to Sunset Boulevard. It parallels Sunset Boulevard to the south between Formosa Avenue and Bronson Avenue. Lexington Avenue is primarily stop-controlled at intersections with other residential local streets, but provides signal control at intersections with La Brea Avenue, Highland Avenue, and Vine Street.

Summary of Potential Neighborhood Intrusion Impacts

On the basis of the analysis above, three neighborhoods were identified according to LADOT criteria that may be subject to significant neighborhood intrusion impacts by Project-generated cut-through traffic under Existing or Future Conditions. These neighborhoods are the areas bounded by the following:

1. Franklin Avenue to the north, Highland Avenue to the east, Sunset Boulevard to the south, and La Brea Avenue to the west.
2. Franklin Avenue to the north, Cahuenga Boulevard to the east, Sunset Boulevard to the south, and Highland Avenue to the west.
3. Sunset Boulevard to the north, La Brea Avenue to the east, Santa Monica Boulevard to the south, and Gardner Street to the west.
4. Sunset Boulevard to the north, Highland Avenue to the east, Santa Monica to the south, and La Brea Avenue to the west.
5. Sunset Boulevard to the north, Vine Street to the east, Santa Monica Boulevard to the south, and Highland Avenue to the west.
6. Sunset Boulevard to the north, Van Ness Avenue to the east, Santa Monica Boulevard to the south, and Vine Street to the west.

NEIGHBORHOOD INTRUSION MITIGATION MEASURES

The neighborhood intrusion analysis presented above identified those neighborhoods that might be susceptible to neighborhood intrusion impacts (cut-through traffic) as a result of the Project. However, it is not possible to predict with a reasonable degree of certainty whether such neighborhood intrusion traffic will occur at a level sufficient to result in a significant adverse impact in any of the identified neighborhoods as the changes in traffic patterns are based on a number of factors, including individual driver perception of the likely reduction in travel time on alternative routes (neighborhood streets). Nor is it possible to predict in which neighborhoods or on which streets within each neighborhood any such potentially significant neighborhood intrusion traffic impacts might occur. In addition, because of the fact that such assessments cannot be made at this time, it also cannot be specifically determined to what degree feasible mitigation measures would lessen or eliminate such potentially significant impacts or determine

what neighborhood measures the local community would prefer over the potentially significant neighborhood traffic intrusions.

A potentially significant neighborhood traffic intrusion impact on a particular residential neighborhood can only be determined after a project or portions of a project are completed and operating. Prior to a project becoming operational it is virtually impossible to quantify potential impacts. Once a project is operational, a neighborhood can be re-assessed to determine if any impacts are occurring, the nature of the impacts, and whether those impacts can be addressed through a Neighborhood Traffic Management Plan.

LADOT has developed a process over many years to assess the nature of the impacts, and a range of traffic measures designed to address potentially significant impacts. The LADOT process is an iterative one through which the impacted neighborhood is included in the process to help assess which traffic calming options are preferred by the community at issue, to balance the relative desirability of the options, and ultimately to let the community itself make the decision whether to implement the traffic calming measures. In some neighborhoods, the potential significant impact never materializes. In locations where a significant impact does occur, the community may decide to implement traffic calming measures that reduce the impact to below the level of significance and, in other neighborhoods, the measures themselves are considered to be undesirable and so the community prefers not to implement them and the neighborhood intrusion traffic impact remains significant and unmitigated.

There is a range of traffic calming measures that can be implemented that have been shown to reduce neighborhood intrusion traffic to a point of insignificance. Those measures can include non-restrictive traffic control measures such as traffic circles, speed humps, roadway narrowing (e.g., raised medians and traffic chokers), landscaping features, roadway striping changes (e.g., bicycle lanes or parking striping to reduce the perceived width of the roadway), stop signs, new sidewalks, and new pedestrian amenities. Traffic calming measures can also include more restrictive physical/operational improvements such as turn restrictions, cul-de-sacs, traffic diverters, street blockers, and signal metering, but those more restrictive measures themselves have the potential to divert traffic to another residential street.

Table 54 presents a list of typical neighborhood improvement measures. The table also identifies the effects of each of the proposed improvements in terms of cut-through traffic

reduction, speed reduction, directional control, noise, safety emergency response time, and the relative cost of implementation of these measures. As shown in the table, while most of the improvements would also help in speed reduction, noise reduction, and increased safety, these improvements may also result in an increase in emergency response time.

The traffic calming measures listed in Table 54 have been used in various communities and have been proven to be effective at reducing neighborhood intrusion impacts by reducing or eliminating neighborhood intrusion traffic and/or improving the appearance of a neighborhood. For example, turn restrictions limit the ability of vehicles to move from the main arterial to the alternative neighborhood streets during peak hours; cul-de-sacs and street closures cut off the ability to connect to the main corridors; and speed humps and stop signs slow the travel time on neighborhood streets which eliminates the incentive to divert from the main corridor.

However, traffic calming measures are also sometimes considered undesirable to a neighborhood because they may alter the neighborhood's character or annoy residents (e.g., having to stop at multiple intersections, reduced lanes, etc.) Whether such measures are helpful or undesirable overall depends on each community's preferences and so it is inherently subjective unless and until a specific neighborhood intrusion impact is observed and studied, measures are developed to address the traffic intrusion, and the community is consulted and polled to determine the community's wishes. If the community does not support the mitigation actions, then they are deemed to be infeasible and will not be imposed upon a community that does not want them.

Due to the uncertainties surrounding the potential significantly impacted areas, including the uncertainty over whether any such impact would even occur, in an abundance of caution, for purposes of this analysis, the potential neighborhood intrusion impact is considered significant. A Neighborhood Traffic Management Plan process, by which the intrusion impact can be identified and mitigated in the future by any of the identified potentially impacted communities desiring the measures, has been incorporated into the mitigation for neighborhood intrusion impacts. However, because it is possible that a significant impact may occur and that one or more neighborhoods might determine that it does not want to implement the mitigation actions, it is not possible to determine now whether such a potential neighborhood intrusion impact would be fully mitigated. Accordingly, it is conservatively concluded that with the identified

mitigation, the potentially significant impact would not be fully mitigated. As a further step, this impact is treated as significant even after the implementation of all feasible mitigation measures.

Accordingly, the following mitigation measure is recommended to provide mechanisms for the development of Neighborhood Traffic Management Plan(s) in the potentially impacted neighborhoods:

> The Applicant or its successors would fund and coordinate implementation of LADOT's Neighborhood Traffic Management Plan process for the Project, in an amount up to $500,000. Eligible communities shall include the residential neighborhoods within the boundaries listed below:
>
> 1. Franklin Avenue to the north, Highland Avenue to the east, Sunset Boulevard to the south, and La Brea Avenue to the south.
>
> 2. Franklin Avenue to the north, Cahuenga Boulevard to the east, Sunset Boulevard to the south, and Highland Avenue to the west.
>
> 3. Sunset Boulevard to the north, La Brea Avenue to the east, Santa Monica Boulevard to the south, and Gardner Street to the west.
>
> 4. Sunset Boulevard to the north, Highland Avenue to the east, Santa Monica to the south, and La Brea Avenue to the west.
>
> 5. Sunset Boulevard to the north, Vine Street to the east, Santa Monica Boulevard to the south, and Highland Avenue to the west.
>
> 6. Sunset Boulevard to the north, Van Ness Avenue to the east, Santa Monica Boulevard to the south, and Vine Street to the west.

A detailed explanation of the Neighborhood Traffic Management Plan process is included in Appendix I.

TABLE 54
TYPICAL NEIGHBORHOOD IMPROVEMENT MEASURES

Improvement	Effectiveness						Cost	
	Traffic Volume Reduction	Speed Reduction	Directional Control	Noise	Safety	Emergency Response Time	Implementation	Maintenance
Roadway Narrowing - Center Median	Yes	Yes	Yes	Reduction	Improvement	No Effect	High	Low
Roadway Narrowing - Reduced Lane Width	Possible	No	No	Reduction	Possible Improvement	No Effect	Low - Moderate	Low

Chapter 14
Construction Impact Analysis

This chapter summarizes the construction schedule and construction impact analysis for the Project, including the realignment of Las Palmas Avenue and related improvements. The construction impact analysis relates to the temporary impacts that may result from the construction activities of the Project, which may include safety, operational, or capacity impacts, and was performed in accordance with *L.A. CEQA Thresholds Guide: Your Resource for Preparing CEQA Analyses in Los Angeles* (City of Los Angeles, 2006).

TYPES OF CONSTRUCTION IMPACTS

The *L.A. CEQA Thresholds Guide* identifies four types of in-street construction impacts. Each of the four types of impacts refers to a particular population that could be inconvenienced by construction activities. The four types of impacts and related populations are:

1. Temporary traffic impacts – potential impacts on vehicular travelers on roadways
2. Temporary loss of access – potential impacts on vehicular and pedestrian access
3. Temporary loss of bus stops or rerouting of bus lines – potential impacts on bus travelers
4. Temporary loss of on-street parking – potential impacts on parkers

The factors used to determine the significance of a project's impacts involve the likelihood and extent to which an impact might occur, the potential inconvenience caused to a population, and consideration for public safety. Traffic impacts from construction activities could occur as a result of the following types of activities:

- Increases in truck traffic associated with export or import of fill materials and delivery of construction materials

- Increases in automobile traffic associated with construction workers traveling to and from the Project Site
- Reductions in existing street capacity or on-street parking from temporary lane closures necessary for the construction of roadway improvements, utility relocation, and drainage facilities
- Blocking existing vehicle or pedestrian access to other parcels fronting streets

The impact of construction traffic (including haul trucks) would be a lessening of the capacities of access streets and haul routes due to slower movements and larger turning radii of trucks.

PROPOSED CONSTRUCTION SCHEDULE

The Project is anticipated to be constructed in phases over a period of approximately 48 months, with completion anticipated in the year 2022. The construction period would include subphases of site demolition, excavation and grading, foundations, and building construction, as well as activity associated with the realignment of Las Palmas Avenue. Peak haul truck activity occurs during excavation and grading, and peak worker activity occurs during building construction. These two subphases of construction were studied in greater detail.

LAS PALMAS AVENUE REALIGNMENT RELATED IMPROVEMENTS

As previously detailed, the realignment of Las Palmas Avenue includes on-site and off-site improvements to the existing sanitary sewer system related to the realignment. The on-site 30-inch sewer main under Las Palmas Avenue between Selma Avenue and Sunset Boulevard would be removed and rerouted with new sewer mains in the following locations:

- Selma Avenue between Las Palmas Avenue to Cassil Place
- Cassil Place between Selma Avenue and Sunset Boulevard
- Sunset Boulevard between Cassil Place to Las Palmas Avenue

The sewer lines currently run under the roadways. Therefore, to reroute the sewer mains to Sunset Boulevard and Selma Avenue, on-street parking spaces would be temporarily removed

during construction to provide an additional travel lane to accommodate traffic rerouted by the closure of the center travel lanes. The rerouting of the sewer mains to Cassil Place would require complete closures of the segment during daytime hours only, as to not disturb the adjacent residents.

EXCAVATION AND GRADING PHASE

The peak period of truck activity during construction would occur during excavation and grading of the Project Site. Based on projections compiled for the Project, approximately 707,500 cubic yards (CY) of material would be excavated and removed from the Project Site over this 126-workday period. That equates to approximately 5,600 CY of material exported each workday, requiring 400 haul trucks per work day based on an anticipated haul truck capacity of 14 CY each. It is also expected during this period that there would be an average of 20 delivery trucks per day. Thus, up to 840 daily truck trips (420 inbound, 420 outbound) are forecast to occur during the excavation and grading period, with approximately 106 trips per hour (53 inbound, 53 outbound) uniformly over a typical eight-hour workday.

Transportation Research Circular No. 212 defines PCE for a vehicle as the number of through moving passenger cars to which it is equivalent based on the vehicle's headway and delay-creating effects. Table 8 of *Transportation Research Circular No. 212* and Exhibit 16.7 of the HCM suggest a passenger car equivalency (PCE) of 2.0 for trucks. Assuming a PCE factor of 2.0, the 840 truck trips would be equivalent to 1,680 daily PCE trips. The 106 hourly truck trips would be equivalent to 212 PCE trips (106 inbound, 106 outbound) per hour. In addition, during this period a maximum of 30 construction workers would work at the Project Site. Assuming minimal carpooling amongst those workers, an average vehicle occupancy (AVO) of 1.135 persons per vehicle was applied, as provided in *CEQA Air Quality Handbook* (South Coast Air Quality Management District, 1993). Therefore, 30 workers would result in a total of 24 vehicle trips to and from the Project Site on a daily basis.

With the implementation of the Construction Management Plan, which is described in more detail later in this chapter, it is anticipated that almost all haul truck activity to and from the Project Site would occur outside of the AM and PM peak hours. In addition, as discussed in more detail in the following section, worker trips to and from the Project Site would also occur

outside of the peak hours. Further, construction-related trips are anticipated to be fewer than the trips associated with the existing uses of the Project Site that would be removed from the Study Area during construction. Therefore, no peak hour construction traffic impacts are expected during the excavation and grading phase of construction.

Haul trucks would travel on approved truck routes designated within the City. Given the Project Site's proximity to US 101, haul truck traffic would take the most direct route to the appropriate freeway ramp. It is anticipated that outbound traffic would travel on Highland Avenue to access US 101 northbound or on Sunset Boulevard to access US 101 southbound. Inbound traffic would take the reverse route from US 101.

BUILDING CONSTRUCTION PHASE

The traffic impacts associated with construction workers depends on the number of construction workers employed during various phases of construction, as well as the travel mode and travel time of the workers. In general, the hours of construction typically require workers to be onsite before the weekday AM commuter peak period and allow them to leave before or after the PM commuter peak period (i.e., arrive at the site prior to 7:00 AM and depart before 4:00 PM or after 6:00 PM). Therefore, most, if not all, construction worker trips would occur outside of the typical weekday commuter peak periods.

The estimated number of construction workers each day depends on the phase of construction. According to construction projections prepared for the Project, the building subphase of construction would employ the most construction workers, with a cumulative average of approximately 144 workers per day for all components of the building (i.e., framing, plumbing, elevators, inspections, finishing). However, since the different building components would not be constructed or installed simultaneously this cumulative estimate overstates the number of workers that would be expected on the peak construction day. Furthermore, on most of the estimated 450 workdays to complete the Project, there would be far fewer workers than on the peak day. Therefore, the estimate of 144 workers per day used for the purposes of this analysis represents a higher-than-expected estimate.

Assuming an AVO of 1.135 persons per vehicle, 144 workers would result in a total of 127 vehicles that would arrive and depart from the Project Site each day. The estimated number of daily trips associated with the construction workers is approximately 154 (127 inbound and 127 outbound trips), but nearly all of those trips would occur outside of the peak hours, as described above. Further, construction-related trips are anticipated to be fewer than the trips associated with the existing uses of the Project Site that would be removed from the Study Area during construction. As such, the building phase of Project construction is not expected to cause a significant traffic impact at any of the study intersections.

During construction, adequate parking for construction workers would be secured in the vicinity of the Project Site. Restrictions against workers parking in the public right-of-way in the vicinity of (or adjacent to) the Project Site will be identified as part of the Construction Management Plan. Construction parking may require the temporary use of offsite parking areas for materials storage and truck staging.

POTENTIAL IMPACTS ON ACCESS, TRANSIT, AND PARKING

Construction activities are expected to be primarily contained within the Project Site boundaries. However, it is expected that construction fences may encroach into the public right-of-way (e.g., sidewalk and roadways) adjacent to the Project Site. As illustrated in Figure 19, adjacent to the Project Site, the curb lanes on Highland Avenue and Sunset Boulevard will be used intermittently throughout the construction period for equipment staging, concrete pumping, etc., resulting in the removal of one peak hour travel lane and off-peak hour on-street metered parking spaces. McCadden Place adjacent to the Project Site would be partially closed, with the removal of on-street parking and one travel lane, and Las Palmas Avenue between Selma Avenue and Sunset Boulevard would be completely closed during a portion of the construction period, which would result in temporary traffic shifts to adjacent streets (i.e., Highland Avenue and Wilcox Avenue). Temporary traffic controls would be provided to direct traffic around any closures as required in the Construction Management Plan. For the purposes of providing a conservative analysis, all lane and road closures were assumed to occur simultaneously. It was also assumed that all existing uses at the Project Site would not be in operation during construction. Thus, the traffic volumes associated with the existing uses were removed from the Study Area. The impacts associated with the lane closures and traffic shifts detailed above, as

well as the removal of traffic generated by the existing uses, are shown in Table 55, and the LOS worksheets are provided in Appendix J. As shown, the construction activities would result in temporary significant and unavoidable impacts at the following intersections:

37. Highland Avenue & Hollywood Boulevard (PM peak hour)
65. Highland Avenue & Sunset Boulevard (AM and PM peak hour)

The use of the public right-of-way along Highland Avenue, McCadden Place, Las Palmas Avenue, Selma Avenue, and Sunset Boulevard would require temporary rerouting of pedestrian traffic as the sidewalks fronting the Project Site would be closed. The Construction Management Plan would include measures to ensure pedestrian safety along the affected sidewalks and temporary walkways (e.g., use of directional signage, maintaining continuous and unobstructed pedestrian paths, and/or providing overhead covering).

There are no bus stops adjacent to the Project Site and, therefore, no temporary impacts to transit are expected. Parking is allowed adjacent to the Project Site on Highland Avenue, McCadden Place, Las Palmas Avenue, Selma Avenue, and Sunset Boulevard, so the construction fences could result in the temporary loss of up to four metered parking spaces on Highland Avenue, eight on-street parking spaces on McCadden Place, 32 on-street parking spaces on Las Palmas Avenue, including 18 metered spaces, 20 on-street parking spaces on Selma Avenue, including three metered spaces, and seven on-street metered parking spaces on Sunset Boulevard.

Project construction is not expected to create hazards for roadway travelers, bus riders, or parkers, so long as commonly practiced safety procedures for construction are followed. Such procedures and other measures (e.g., to address temporary traffic control, lane closures, sidewalk closures, etc.) have been incorporated into the Construction Management Plan. The construction-related impacts associated with access and transit are anticipated to be less than significant, and the implementation of the Construction Management Plan described below would further reduce those impacts.

CONSTRUCTION MANAGEMENT PLAN

A detailed Construction Management Plan, including street closure information, a detour plan, haul routes, and a staging plan, would be prepared and submitted to the City for review and approval. The Construction Management Plan would formalize how construction would be carried out and identify specific actions that would be required to reduce effects on the surrounding community. The Construction Management Plan shall be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site, and shall include, but not be limited to, the following elements, as appropriate:

- Advance notification of adjacent property owners and occupants, as well as nearby schools, of upcoming construction activities, including durations and daily hours of construction.
- Prohibition of construction worker parking on adjacent residential streets.
- Temporary pedestrian and vehicular traffic controls during all construction activities adjacent to Selma Avenue, Sunset Boulevard, Highland Avenue, and McCadden Place to ensure traffic safety on public right of ways. These controls shall include, but are not limited to, flag people trained in pedestrian and student safety.
- Temporary traffic control during all construction activities adjacent to public rights-of-way to improve traffic flow on public roadways (e.g., flag men).
- Scheduling of construction activities to reduce the effect on traffic flow on surrounding arterial streets.
- Construction-related vehicles shall not park on surrounding public streets.
- Safety precautions for pedestrians and bicyclists through such measures as alternate routing and protection barriers as appropriate, including along all identified LAUSD pedestrian routes to nearby schools.
- Scheduling of construction-related deliveries, haul trips, etc., so as to occur outside the commuter peak hours to the extent feasible, and so as to not impede school drop-off and pick-up activities and students using LAUSD's identified pedestrian routes to nearby schools.
- Coordination with public transit agencies to provide advanced notifications of stop relocations and durations.
- Provide advanced notification of temporary parking removals and duration of removals.
- Provide detour plans to address temporary road closures during construction.

Notes

* LOS based on field observations, as the CMA methodology for individual intersections does not in every case account for vehicular queues along corridors, pedestrian, conflicts, etc., and thus, the calculated average operating conditions may appear better than is observed.

Appendix A

Memorandum of Understanding

TRAFFIC STUDY - MEMORANDUM OF UNDERSTANDING (MOU)

This MOU acknowledges that the traffic study for the following project will be prepared in accordance with the latest version of LADOT's Traffic Study Policies and Procedures:

Project Name: Crossroads Hollywood

Project Address: 1540-1552 Highland Avenue; 6700-6760 Selma Avenue; 6663-6675 Selma Avenue; 1543-1553 McCadden Place; 1542-46 McCadden Place; 1501-1573 Las Palmas Avenue; 1500-1570 Las Palmas Avenue; 1600-1608 Las Palmas Avenue; 6665-6713 ½ Sunset Boulevard, Los Angeles, California, 90028

Project Description: The Project would integrate the Crossroads of the World site into a mixed-use development that would include 950 residential units, 308 hotel rooms, approximately 95,000 square feet of office uses, and approximately 185,000 square feet of commercial (retail/restaurant) uses. **(See Figure 1)**

Geographic Distribution:

Residential:	N 24 %	S 39 %	E 16 %	W 21 %
Hotel:	N 24 %	S 33 %	E 20 %	W 23 %
Office:	N 37 %	S 28 %	E 16 %	W 19 %
Retail/Restaurant:	N 30 %	S 29 %	E 21 %	W 20 %
Supermarket:	N 25 %	S 28 %	E 23 %	W 24 %

Attach graphic illustrating project trip distribution percentages at the studied intersections **(See Figures 3A-3E)**

Trip Generation Rate(s): ITE 9th Edition / Other ITE 9th Edition, 2012
Attach trip generation table with a description of the proposed land uses, ITE rates, estimated morning and afternoon peak hour volumes (ins/outs/totals), proposed trip credits, etc. **(See Tables 3A & 3B)**

	in	out	total
AM Trips	381	498	879
PM Trips	733	548	1,281

Project Buildout Year: 2022 Ambient or CMP Growth Rate: 1.0 % Per Yr.

Related Projects: (to be researched by the consultant and approved by LADOT) **(See Table 4 and Figure 4)**

Subject to Freeway Impact Analysis in addition to CMP Analysis: x YES ___NO **(See Tables 5-6)**
(freeway analysis screening filter should be included in this MOU; selecting "yes" implies that at least one criteria was satisfied)

Study Intersections **(See Table 1-2 and Figure 2)**
(Subject to LADOT revision after initial impact analysis)

Trip Credits: (Exact amount of credit subject to approval by LADOT)

	Yes	No
Transit Usage	x	
Transportation Demand Management		x
Existing Active Land Use	x	
Previous Land Use	x	
Internal Trip	x	
Pass-By Trip	x

[a] Source: *Trip Generation, 9th Edition*, Institute of Transportation Engineers, 2012.
[b] The Project site is located within a 1/4 mile of the Metro Red Line Hollywood Highland station and a RapidBus stop, therefore a 15% transit adjustment was applied, per *Traffic Study Polices and Procedures* (LADOT, August 2014).
[c] Pass-by adjustments account for Project trips made as an intermediate stop on the way from an origin to a primary trip destination without route diversion.

ksf: 1,000 square feet
du: dwelling units
[a] Source: *Trip Generation, 9th Edition*, Institute of Transportation Engineers, 2012.
[b] The Project site is located within a 1/4 mile of the Metro Red Line Hollywood Highland station and a RapidBus stop, therefore a 15% transit adjustment was applied, per *Traffic Study Polices and Procedures* (LADOT, August 2014).
[c] Hotel trip rates includes ancillary conference/meeting rooms, a lobby lounge and bar, rooftop bar and lounge, guest amenities, as well as retail and restaurant space. However, the retail and restaurant uses within the hotel were considered separately and included in the total retail and restaurant square footage to provide a conservative analysis.
[d] Shopping center includes retail, restaurant, and recreational uses.
[e] Internal capture adjustments account for person trips made between distinct land uses within a mixed-use development without using an off-site road system.
[c] Pass-by adjustments account for Project trips made as an intermediate stop on the way from an origin to a primary trip destination without route diversion.
[g] See Table 3-A for calcuation of the Existing Use trip generation.

Notes
[a] Auxiliary lanes and high-occupancy vehicle (carpool) lanes are not counted toward number of lanes.
[b] Lane capacity is 2,000 vehicles per hour per lane based on specifications in the screening criteria.
[c] An ambient growth rate of 1% per year was applied to the most recent traffic volume data from recent Caltrans published volume data from *2014 Traffic Volumes on California State Highways* (Caltrans, 2015) to reflect Existing year 2015 traffic conditions.

Intersection 49 - US-101 Northbound Ramps/Van Ness Avenue & Hollywood Boulevard

Future without Project Conditions (Year 2022) - AM Peak Hour

1) Critical volume calculation for eastbound/westbound traffic on Hollywood Boulevard

Eastbound Lefts: 143 and

Westbound Throughs: $\frac{1,186}{2}$ = 593 or

Westbound Rights: 847 or

Eastbound Throughs: $\frac{1,040}{2}$ = 520

Critical Volume #1 (CV1): **990**

2) Critical volume calculation for northbound traffic exiting US-101

Northbound Lefts: 480 * 0.55 = 264 or

Northbound Throughs + Rights: 1 + 161 = 162

Critical Volume #2 (CV2): **264**

3) Critical volume calculation for southbound traffic on Van Ness Avenue

Southbound Lefts: 12 or

Southbound Rights: 109

Critical Volume #3 (CV3): **109**

Critical Volume: 990 + 264 + 109 = **1,363**

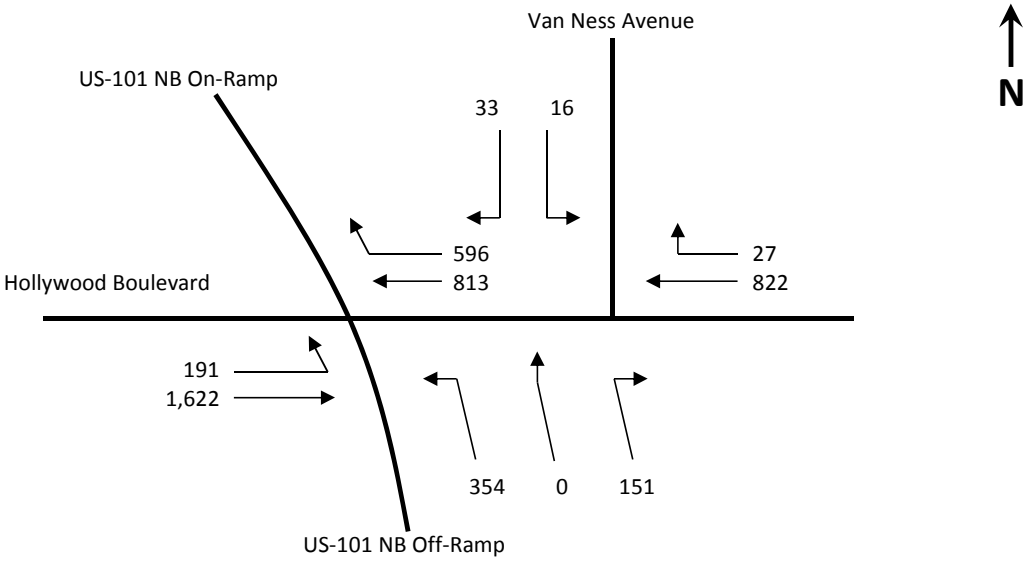
Intersection V/C: $\frac{1,363}{1,425}$ = **0.956**

ATSAC/ATCS Credit: 0.10

Final intersection V/C: 0.856 **Intersection LOS: D**

Intersection 49 - US-101 Northbound Ramps/Van Ness Avenue & Hollywood Boulevard

Future without Project Conditions (Year 2022) - PM Peak Hour



1) Critical volume calculation for eastbound/westbound traffic on Hollywood Boulevard

Eastbound Lefts: 191 and

Westbound Throughs: $\frac{813}{2}$ = 407 or

Westbound Rights: 596 or

Eastbound Throughs: $\frac{1,622}{2}$ = 811

Critical Volume #1 (CV1): **811**

2) Critical volume calculation for northbound traffic exiting US-101

Northbound Lefts: 354 * 0.55 = 195 or

Northbound Throughs + Rights: 0 + 151 = 151

Critical Volume #2 (CV2): **195**

3) Critical volume calculation for southbound traffic on Van Ness Avenue

Southbound Lefts: 16 or

Southbound Rights: 33

Critical Volume #3 (CV3): **33**

Critical Volume: 811 + 195 + 33 = **1,039**

Intersection V/C: $\frac{1,039}{1,425}$ = **0.729**

ATSAC/ATCS Credit: 0.10

Final intersection V/C: 0.629 **Intersection LOS: B**
