TRAFFIC IMPACT STUDY
WEINGART PROJECTS
City of Los Angeles, California
March 13, 2018

1.0 INTRODUCTION

1.1 Traffic Study Overview

This traffic analysis has been conducted to identify and evaluate the potential traffic impacts of the proposed Weingart Projects ("proposed project" herein) on the surrounding street system. The proposed project site is located in the Central City East District of the Central City Community Plan area of the City of Los Angeles, California. The Weingart Projects include two distinct affordable housing projects, Weingart Towers project and San Pedro Tower project, for permanent long-term housing with supportive services designed to enable homeless persons and individuals/families at risk of homelessness to ensure that they remain housed and live as independently as possible. The Weingart Towers project site is bounded by existing commercial development to the north and south, Crocker Street to the east and San Pedro Street to the west. The San Pedro Tower project site is bounded by 6th Street to the north, existing commercial development to the south, Crocker Street to the east and San Pedro Street to the west. The proposed Weingart Projects site and general vicinity are shown in ***Figure 1-1***.

The traffic analysis follows City of Los Angeles (City) traffic study guidelines[1] and is consistent with traffic impact assessment guidelines set forth in the Los Angeles County Congestion Management Program (CMP)[2]. This traffic analysis evaluates potential project-related impacts at seven key intersections in the vicinity of the project site. The study intersections were determined in consultation with City of Los Angeles Department of Transportation (LADOT) staff. The Critical Movement Analysis method was used to determine Volume-to-Capacity ratios and corresponding Levels of Service for all seven study intersections. A review also was conducted of Metro freeway and intersection monitoring stations to determine if a CMP transportation impact assessment analysis is required for the proposed project. In addition, a screening analysis based on the Highway Capacity Manual (HCM) operational analysis methodologies was completed as it relates to the highway system and the ramp intersections under Caltrans jurisdiction.

This study (i) presents existing traffic volumes, (ii) provides existing traffic volumes with the forecast traffic volumes from the proposed project, (iii) determines existing with project-related impacts; (iv) forecasts future cumulative baseline traffic volumes, (v) forecasts future cumulative traffic volumes with the proposed project, (vi) determines future forecast with project-related impacts, and (vii) recommends mitigation measures, where necessary.

1.2 Study Area

Upon coordination with LADOT staff, seven study intersections were identified for evaluation during the weekday morning and afternoon peak hours. The study intersections provide both regional and local access to the study area and define the extent of the boundaries for this traffic impact analysis. Further discussion of the existing street system and study area is provided in Section 4.0.

The general location of the project in relation to the study locations and surrounding street system is presented in *Figure 1–1*. The traffic analysis study area is generally comprised of those locations that have the greatest potential to experience significant traffic impacts due to the proposed project, as defined by the City as Lead Agency under the California Environmental Quality Act (CEQA). In the traffic engineering practice, the study area generally includes those intersections that are:

a. Immediately adjacent or in close proximity to the project site;

b. In the vicinity of the project site that are documented to have current or projected future adverse operational issues; and

c. In the vicinity of the project site that are forecast to experience a relatively greater percentage of project-related vehicular turning movements (e.g., at freeway ramp intersections).

The study intersections selected for analysis were based on the above criteria, the proposed Weingart Projects's calculated peak hour vehicle trip generation, the anticipated distribution of project vehicular trips and existing intersection/corridor operations. LADOT confirmed the appropriateness of the seven study intersections when it entered into a traffic study Memorandum of Understanding (MOU) for the proposed project. The seven study intersections are identified in *Figure 1-1* and in the traffic study MOU, which is attached to this report as ***Appendix A***.

Further, in accordance with the "Freeway Impact Analysis Procedures" agreement[3] between the California Department of Transportation (Caltrans) District 7 and LADOT executed in October 2013 and amended in December 2015, the approved MOU included a freeway impact screening analysis to determine whether further review of the Caltrans freeway system would be required for the proposed project. As noted in the approved MOU, the amount of project-related traffic did not meet the criteria requiring a focused analysis of State Route 101 and Interstate 110 Freeway mainline segments and nearby off-ramps.

[3] The "Freeway Impact Analysis Procedures" agreement executed in October 2013 and amended in December 2015 between Caltrans District 7 and LADOT, requires project applicants to work with Caltrans and prepare a Freeway Impact Analysis utilizing Caltrans' *Guide for the Preparation of Traffic Impact Studies* for land use proposals that meet the established screening criteria.

1.3 Overview of Senate Bill 743

On September 27, 2013, Governor Brown signed Senate Bill (SB) 743 (Steinberg, 2013). Among other things, SB 743 creates a process to change the methodology to analyze transportation impacts under CEQA (Public Resources Code section 21000 and following), which could include analysis based on project vehicle miles traveled (VMT) rather than impacts to intersection Level of Service. On December 30, 2013, the State of California Governor's Office of Planning and Research (OPR) released a preliminary evaluation of alternative methods of transportation analysis. The intent of the original guidance documentation was geared first towards projects located within areas that are designated as transit priority areas, to be followed by other areas of the State. OPR issued other draft discussion documents in March 2015 and January 2016, suggesting some new revisions to the state CEQA Guidelines. OPR has submitted the proposed updates to the CEQA Guidelines to the State's Natural Resources Agency (NRA). Over the coming months, the NRA will conduct a formal administrative rulemaking process on the CEQA Guidelines. That rulemaking process will entail additional public review and may lead to further revisions. OPR then would update the technical advisory as appropriate. OPR has therefore not issued any final revisions to the state CEQA Guidelines to implement the CEQA traffic analysis component of SB 743; thus, the analysis in this study utilizes existing, long-established protocols in accordance with CEQA, the existing state CEQA Guidelines, and the City's CEQA Thresholds Guide. (See Public Resources Code section 21099(b).)

This is also consistent with the current City of Los Angeles traffic impact analysis procedures. In August 2014, Councilmember Mike Bonin introduced a motion directing the Department of City Planning (DCP) and LADOT to begin preparation for the shift to VMT analysis (CF 14-1169). DCP subsequently contracted with an outside consultant to develop the strategy and methodology in order to establish the tools necessary to bring the City into compliance with the state mandate. The City is currently in the process of conducting beta testing of the recommended VMT tools/metrics that will be used to conduct VMT analyses in traffic studies for projects. It is anticipated that in mid to late 2018, City staff will present the CEQA Appendix G environmental checklist update to the City Council, which will likely lead to the adoption of new VMT-based significance thresholds and its subsequent incorporation into the City's CEQA Threshold Guide in late-2018 to early 2019. Following adoption, projects must then comply with the updated transportation evaluation framework, thus bringing the City into compliance with the state mandate. The City's VMT tools/metrics had not been finalized at the time this traffic study was completed for inclusion in the proposed project's Draft EIR. Should the City finalize those tools/metrics prior to the City decisionmakers' consideration of the proposed project's EIR and entitlements, this traffic study may be updated in consultation with LADOT to include a VMT analysis and a determination of whether the proposed project would result in significant impacts based on VMT-based significance thresholds. While any agency can immediately apply the proposed new CEQA Guidelines section (proposed Guidelines section 15064.3), a statewide application of that new section would not be required until January 1, 2020.

2.0 PROJECT DESCRIPTION

2.1 Project Location

The proposed project site is located in the Central City East District of the Central City Community Plan area of the City of Los Angeles, California. The Weingart Projects include two distinct affordable housing projects, Weingart Towers project and San Pedro Tower project, for permanent long-term housing with supportive services designed to enable homeless persons and individuals/families at risk of homelessness to ensure that they remain housed and live as independently as possible. The proposed Weingart Projects site and general vicinity are shown in *Figure 1-1*. An aerial photograph of the existing project sites and general vicinity is contained in ***Figure 2-1***.

The Central City Community Plan[4] area is located south of Sunset Boulevard/Cesar Chavez Avenue, north of the Santa Monica Freeway (Interstate 10), east of the Harbor Freeway (Interstate 110) and west of Alameda Street. It is bordered by the communities of Central City North, Silver Lake-Echo Park, Westlake, Southeast and South Central Los Angeles. The Central City Community Plan area is comprised of nine districts: Civic Center, Bunker Hill, Financial Core, Convention Center/Arena, South Park, Center City/Historic Core, Little Tokyo, Central City East, and South Markets. The Central City area is the historic, political, social, governmental and economic center of the City of Los Angeles. Major rail networks and six major freeways converge and interconnect in this plan area. Refer to ***Figure 2-2*** which shows the Central City Community Plan area and notes the nine districts.

The Central City East district (generally bounded by Third Street, Olympic Boulevard, Los Angeles Street and Alameda Street) contains wholesale and warehousing uses including produce, fish and food processing, the Flower Market, toy import-export industry-related development and a mix of other commercial activities. The area is also a center of social services including alcohol, drug and mental health services. Further, the area includes job training programs, transitional housing, homeless outreach, family and children's services, and aging programs, including various government agencies.

The project sites are well-served by transit and are located less than one mile from Metro's Regional Connector 1st Street portal which is currently under construction, Metro's Little Tokyo Gold Line station, and Metro's Pershing Square Red Line station. The project study area also is served by Metro Bus Lines 17, 18, 51/52/352, 53, 60, 62, 720, 760, Gardena Line 1X, and Montebello Lines 40 and 90.

2.2 Existing Project Site

The Weingart Towers project site, which comprises approximately 0.63 acres, is bounded by existing commercial development to the north and south, Crocker Street to the east and San Pedro Street to the west. A total of three driveways (one driveway on San Pedro Street and two driveways on Crocker Street) is presently provided at the existing Weingart Towers project site, although it

appears that only the northerly driveway on Crocker Street is currently used for vehicular access. The existing Weingart Towers project site is presently occupied by an approximate 7,000 square-foot building that contains the Weingart Café and surface parking spaces. It is noted that although the Weingart Café is a functional restaurant, it serves the homeless and does not operate as a typical restaurant.

The San Pedro Tower project site, which comprises approximately 1.12 acres, is bounded by 6th Street to the north, existing commercial development to the south, Crocker Street to the east and San Pedro Street to the west. A total of three driveways (two driveways on 6th Street and one driveway on Crocker Street) is presently provided at the existing San Pedro Tower project site, although it appears that only the easterly driveway on 6th Street and the Crocker Street driveway are currently used for vehicular access. The existing San Pedro Tower project site is presently occupied by a surface parking lot.

2.3 Proposed Project Description

The Weingart Projects include two distinct affordable housing projects for permanent long-term housing with supportive services designed to enable homeless persons and individuals/families (who qualify for affordable housing at fifty percent [50%] AMI or less) to ensure that they remain housed and live as independently as possible. Summaries of the two projects are provided below:

- The Weingart Towers project is located at 554-562 South San Pedro Street and 555-561 South Crocker Street. This project consists of an 18-story building with 278 dwelling units and a 12-story building with 104 dwelling units (i.e., 382 total dwelling units). Please note that the residential component includes 378 affordable housing dwelling units (302 permanent supportive housing [PSH] units and 76 family units) and 4 manager apartment dwelling units. Additionally, a total of approximately 21,280 square feet of commercial space is planned for this project, including 19,030 square feet of general office space and 2,250 square feet of other commercial space (i.e., considered as retail space for purposes of this analysis), as well as 11,463 square feet of dining room/flex space to provide meals to residents and area homeless during breakfast, lunch and dinner. At other times the dining room/flex space may be used for other ancillary activities for residents and area homeless. Vehicular access to the Weingart Towers project is planned to be provided via a single driveway on Crocker Street. The ground floor site plan for the Weingart Towers project is illustrated in ***Figure 2-3***.

- The San Pedro Tower project is located at 600-628 South San Pedro Street, 611-615 South Crocker Street, and 518-522 East 6th Street. This project consists of a 19-story building with a total of 303 dwelling units and approximately 20,300 square feet of commercial space, including 17,100 square feet of general office space and 3,200 square feet of other commercial space (i.e., retail space for purposes of this analysis). Please note that the residential component includes 298 affordable housing dwelling units (149 PSH units and 149 family units) and 5 manager apartment dwelling units. Vehicular access to the San Pedro Tower project is planned to be provided via a single driveway on San Pedro Street. The ground floor site plan for the San Pedro Tower project is illustrated in ***Figure 2-4***.

2.4 Construction Phasing

It is important to note that the two distinct affordable housing projects presently have different anticipated build-out years. The Weingart Towers project is currently expected to be completed and occupied by the end of year 2025. The San Pedro Tower project is presently expected to be completed and occupied by the end of year 2023. This impact analysis evaluates the combined effects of the two projects assuming build-out in year 2025 in order to address any potential CEQA-related issues associated with project segmentation.

3.0 SITE ACCESS AND CIRCULATION

3.1 Existing Vehicular Site Access

As previously discussed (refer to Subsection 2.2 herein), a total of three driveways (one driveway on San Pedro Street and two driveways on Crocker Street) is presently provided at the existing Weingart Towers project site, although it appears that only the northerly driveway on Crocker Street is currently used for vehicular access. A total of three driveways (two driveways on 6th Street and one driveway on Crocker Street) is presently provided at the existing San Pedro Tower project site, although it appears that only the easterly driveway on 6th Street and the Crocker Street driveway are currently used for vehicular access. The locations of the Weingart Towers site and San Pedro Tower site access points are shown in *Figure 2-1*.

3.2 Proposed Project Vehicular Site Access

The proposed site access for the Weingart Projects is displayed in *Figures 2-3* and *2-4* for the Weingart Towers project and San Pedro Tower project, respectively. Vehicular movements into and out of the Weingart Towers project site will be provided via a single driveway on Crocker Street while vehicular access into and out of the San Pedro Tower project site will be provided via a single driveway on San Pedro Street. Descriptions of the proposed project vehicular site access driveways are provided in the following paragraphs.

- *Weingart Towers Project Site – Crocker Street Driveway*

  The Weingart Towers project site driveway will be located at the southeast corner of the subject site along Crocker Street (i.e., along the easterly property frontage). The planned Weingart Towers project site driveway will be located in essentially the same location as an existing site driveway that is currently inactive (refer to *Figure 2-1* which notes the existing site driveways). One inbound lane and one outbound lane will be provided at this location with gate control equipment located such that no vehicle queuing would extend back out onto the public right-of-way. This project site driveway is planned to accommodate full access (i.e., left-turn and right-turn ingress and egress turning movements) for motorists accessing the project site. The Crocker Street driveway will be constructed to City of Los Angeles design standards.

- *San Pedro Tower Project Site – San Pedro Street Driveway*

  The San Pedro Tower project site driveway will be located at the southwest corner of the subject site along San Pedro Street (i.e., along the westerly property frontage). One inbound lane and one outbound lane will be provided at this location with gate control equipment located such that no vehicle queuing would extend back out onto the public right-of-way. Based on preliminary comments received from LADOT staff, this project site driveway will be restricted to right-turn ingress and egress turning movements for motorists accessing the project site. The San Pedro Street driveway will be constructed to City of Los Angeles design standards.

3.3 Vehicular Site Access Recommendations

It is noted that the project's site access and circulation scheme has been reviewed on a preliminary basis in consultation with LADOT staff. The purpose of the preliminary coordination was to obtain input regarding questions and comments on the vehicular site access schemes for both the Weingart Tower project site and the San Pedro Tower project site. Please note that the preliminary coordination with LADOT staff and subsequent modifications does not constitute formal approval of the project's vehicular site access scheme. The following traffic management measures are recommended to facilitate access to and from the planned project site:

- Install appropriate pavement markings (i.e., stop bar with STOP legend) on both project site exit drive aisles just west and east of the public sidewalks along Crocker Street and San Pedro Street, respectively, to ensure that motorists stop prior to the sidewalk before exiting the site.

- Install No Left-Turn In signing on the exterior of the San Pedro Tower project site driveway entrance to reinforce the restricted right-turn ingress movement for motorists entering the site.

- Install pavement right-turn arrows prior to the stop bar/STOP legend on the San Pedro Tower project exit drive aisle to reinforce the right-turn only movement for motorists exiting the site.

- Install a right-turn only sign at the San Pedro Tower project drive aisle just east of the public sidewalk to reinforce the restricted right-turn egress movement for motorists exiting the site.

- Maintain a graphic on a transportation information display kiosk in the common areas of both the Weingart Towers and San Pedro Tower project sites that display the allowable traffic movements at the site driveways.

3.4 Pedestrian Access

The Central City East District area experiences a high level of pedestrian activity, particularly along the key corridors near the project site, such as 6th Street, Los Angeles Street, and San Pedro Street. Based on the existing level of pedestrian activity in the area, the proximity of the nearby the Federal, State, County and local government offices located nearby in Little Tokyo and the Civic Center area and, more importantly, the future Metro Regional Connector 1st Street/Little Tokyo rail station and portal on the project site, it is anticipated that there will continue to be a high level of pedestrian activity in the area as well as to and from the proposed project site.

The proposed project is designed to encourage pedestrian activity and walking as a transportation mode with a Walkability score for the project site of approximately 93 (Walker's Paradise) out of

100.[5] As indicated in *Figures 2-2* and *2–3*, the proposed project is designed to provide connections to the adjacent public sidewalks and would include site enhancements to promote walkability. Walkability is a term describing the extent to which walking is readily available as a safe, connected, accessible and pleasant mode of transport. There are several criteria that are widely accepted as key aspects of the walkability of urban areas that should be satisfied. The underlying principle is that pedestrians should not be delayed, diverted, or placed in danger. The widely accepted characteristics of walkability are as follows:

- Connectivity: Can people walk from one place to another without encountering major obstacles, obstructions, or loss of connectivity?

- Convivial: Are pedestrian routes friendly and attractive, and perceived as such by pedestrians?

- Conspicuous: Are suitable levels of lighting, visibility and surveillance over its entire length provided, with high quality delineation and signage?

- Comfortable: Are high quality and well-maintained footpaths of suitable widths, attractive landscaping and architecture, shelter and rest spaces provided with a suitable allocation of roadspace to pedestrians?

- Convenient: Is walking a realistic travel choice, partly because of the impact of the other criteria set forth above, but also because walking routes are of a suitable length as a result of land use planning with minimal delays?

A review of the project site location and pedestrian walkway network indicates that these five primary characteristics are accommodated as part of the proposed project. The project site is accessible from nearby public bus and rail transit stops and will be situated less than one mile from Metro's Regional Connector 1st Street portal which is currently under construction, Metro's Little Tokyo Gold Line station, and Metro's Pershing Square Red Line station. The majority of pedestrian access to the project site is envisioned to occur via the existing public sidewalks provided along every street in the Downtown Los Angeles area. The project site is located within Downtown Los Angeles, which offers a wide variety of employment, entertainment, retail and restaurant opportunities.

Proposed project features would include landscaped and lighted pedestrian walkways connecting facilities within each individual site, as well as connections with the adjacent public sidewalks on San Pedro Street, Crocker Street and 6th Street. In addition, street trees and streetscape plantings would be introduced along same public frontages in accordance with the City's standards.

[5] Refer to http://www.walkscore.com/, which generates the walkability score for the project site. Walk Score calculates the walkability of an address by locating nearby stores, restaurants, schools, parks, etc. Walk Score measures how easy it is to live a car-lite lifestyle—not how pretty the area is for walking.

Project signage could include general ground level and wayfinding pedestrian signage around the perimeter of the individual project sites, building identification signs, and other sign types. Wayfinding signs would be located at access points to the on-site amenities and facilities, parking garages, commercial and residential entries, corridors, and elevator lobbies.

3.5 Bicycle Access

Bicycle access to the project site is facilitated by the City's bicycle roadway network. Walk Score also calculates a bike score based on the topography, number and proximity of bike lanes, etc., which generates a bike score for the project site of approximately 63 (Bikeable) out of 100.[6] Existing and proposed bicycle facilities (e.g., Class I Bicycle Path, Class II Bicycle Lanes, Class III Bicycle Routes, Proposed Bicycle Routes, Bicycle Friendly Streets, etc.) identified in the City's 2010 Bicycle Plan are located within an approximate one-mile radius from the project site.[7] It is important to note that the 2010 Bicycle Plan goals and policies have been folded into the Mobility Plan 2035 to reflect a commitment to a balanced, multi-modal viewpoint. The location of the City's bicycle enhanced network (low stress network) in close proximity to the project site and in the surrounding area is shown in ***Figure 3-1***. The location of the City of Los Angeles bicycle lane network in close proximity to the project site and in the surrounding area is illustrated in ***Figure 3-2***.

The Federal and State transportation systems recognize three primary bikeway facilities: Bicycle Paths (Class I), Bicycle Lanes (Class II), and Bicycle Routes (Class III). Bicycle Paths (Class I) are exclusive car free facilities that are typically not located within a roadway area. Bicycle Lanes (Class II) are part of the street design that is dedicated only for bicycles and identified by a striped lane separating vehicle lanes from bicycle lanes. Bicycle Routes (Class III) are preferably located on collector and lower volume arterial streets.

Use of bicycles as a transportation mode to and from the project sites should be encouraged by the provision of ample and safe bicycle parking. The type of spaces and dimensions will be provided based on City Code requirements (refer to Los Angeles Municipal Code Sections 12.21.A.16 and 12.21 A.4(c)), as well as to meet the needs of a variety of bicycles. The bicycle spaces will be provided in a readily accessible location(s). Appropriate lighting will be provided to increase safety and provide theft deterrent during night-time parking. The short-term and long-term bicycle parking requirements of the Los Angeles Municipal Code will be more than satisfied both for the residential and commercial land use components of the proposed project. ***Table 3-1*** summarizes the City's bicycle parking requirements as well as the number of bicycle parking spaces proposed to be provided by the proposed project.

---

[6] Refer to http://www.walkscore.com/, which generates the bike score for the project site. Walk Score calculates the bike score of an address by locating nearby bicycling facilities as well as connections to bus/rail transit routes and stops. Walk Score measures how easy it is to live a car-lite lifestyle—not how pretty the area is for bicycling.

[7] Sources: City of Los Angeles Mobility Plan 2035 (2015), and City of Los Angeles Bicycle Parking Plan; www.labikeplan.org. As noted in the Mobility Plan 2035, the 2010 Bicycle Plan and policies have been folded into the Mobility Plan to reflect a commitment to a balanced, multi-modal viewpoint.

4.0 EXISTING STREET SYSTEM

4.1 Regional Highway System

Regional vehicular access to the project site is provided by the U.S. 101 (Hollywood) Freeway. Additional freeways providing indirect access to the project site include the I-10 (Santa Monica) Freeway and State Route 110/I-110 (Pasadena/Harbor) Freeway. Brief descriptions of the Hollywood Freeway, Pasadena/Harbor Freeway and Santa Monica Freeway are provided in the following paragraphs.

U.S. 101 (Hollywood) Freeway is generally a north-south oriented freeway connecting downtown Los Angeles to the San Fernando Valley within the City of Los Angeles region. In the project vicinity, the U.S. 101 Freeway alignment runs in a northwest to southeast direction. Four mainline travel lanes are provided in each direction on the U.S. 101 Freeway. Within the general project area, on and/or off-ramps are provided at Broadway-Aliso Street, Spring Street, Los Angeles Street, and Alameda Street.

SR-110/I-110 (Pasadena/Harbor) Freeway is a major north-south oriented freeway connecting Pasadena to the north with the San Pedro area to the south. The SR-110/I-110 Freeway generally contains four mainline freeway lanes in each direction in the project vicinity. The Harbor Freeway Transitway located south of the project site and downtown Los Angeles, includes two elevated express lanes in each direction (which requires the use of a FasTrak Flex transponder). Within the general project area, on and/or off-ramps are provided at 3rd Street, 4th Street, 5th Street, and 6th Street.

I-10 (Santa Monica) Freeway is a major east-west oriented freeway connecting Santa Monica to the west to the Inland Empire to the east. The I-10 Freeway generally contains four mainline freeway lanes in each direction along with auxiliary lanes in the Downtown area. Within the general project area in the eastbound direction on the I-10 Freeway, off-ramps are provided at Grand Avenue and Maple Street. In the westbound direction on the I-10 Freeway, off-ramps are provided at Los Angeles Street and Hoover Street/20th Street.

4.2 Roadway Classifications

The City utilizes the roadway categories recognized by regional, state, and federal transportation agencies. There are four categories in the roadway hierarchy, ranging from freeways with the highest capacity to two-lane undivided roadways with the lowest capacity. The roadway categories are summarized as follows:

- *Freeways* are limited-access and high speed travel ways included in the state and federal highway systems. Their purpose is to carry regional through-traffic. Access is provided by interchanges with typical spacing of one mile or greater. No local access is provided to adjacent land uses.

- *Arterial* roadways are major streets (e.g., Boulevard and Avenue designations) that primarily serve through-traffic and provide access to abutting properties as a secondary function. Arterials are generally designed with two to six travel lanes and their major intersections are signalized. This roadway type is divided into two categories: principal and minor arterials. Principal arterials are typically four-or-more lane roadways and serve both local and regional through-traffic. Minor arterials are typically two-to-four lane streets that service local and commute traffic.

- *Collector* roadways are streets that provide access and traffic circulation within residential and non-residential (e.g., commercial and industrial) areas. Collector roadways connect local streets to arterials and are typically designed with two through travel lanes (i.e., one through travel lane in each direction) that may accommodate on-street parking. They may also provide access to abutting properties.

- *Local* roadways distribute traffic within a neighborhood, or similar adjacent neighborhoods, and are not intended for use as a through-street or a link between higher capacity facilities such as collector or arterial roadways. Local streets are fronted by residential uses and do not typically serve commercial uses.

- *Alleys* are common throughout the Downtown area as well as throughout the City. Alleys parallel to major and secondary highways provide an essential service function, enable limitations on curb cuts, and assist traffic flow on arterial streets.

4.3 Local Street System

The list of seven study intersections selected for analysis of potential impacts related to the proposed project was based on consultation with LADOT staff. The list of study intersections is presented in ***Table 4-1*** and the study locations are shown in *Figure 1-1*. All seven study intersections are currently controlled by traffic signals. The existing roadway configurations and intersection controls at the study intersections are displayed in ***Figure 4-1*** and descriptions of the existing roadways (e.g., number of travel lanes, median type, and speed limit) are provided in ***Table 4-2***.

4.4 Transit Services

Extensive public bus and rail transit service is provided within the project study area. Public bus transit service in the immediate project study area is currently provided by Metro, City of Gardena Transit and City of Montebello Bus Lines. Additional public bus transit service in the Downtown Los Angeles area is provided by Foothill Transit, LADOT DASH Transit Service, Orange County Transportation Authority, and Torrance Transit Service. The Metro Red and Gold lines also are provided in close proximity to the project sites. Metro's nearest Purple/Red line station is the Pershing Square station, which is located approximately 0.7 miles west of the project site, while the nearest Metro Gold Line station is situated north of the project sites at the Little Tokyo/1st Street station. Additionally, as noted previously, the project sites are located less than one mile from Metro's Regional Connector 1st Street portal which is currently under construction. Walk Score calculates a transit score based on the number and proximity of bus and rail routes, which generates

Notes:
[1] Roadway classifications obtained from the City of Los Angeles Mobility Plan 2035, Adopted January 20, 2016.
[2] Direction of roadways in the project area: NB-SB - northbound and southbound; and EB-WB - eastbound and westbound.
[3] Number of lanes in both directions of the roadway.
[4] Median type of the road: RMI - Raised Median Island; 2WLT - 2-Way Left-Turn Lane; and N/A-Not Applicable.

a transit score of approximately 95 (Rider's Paradise) out of 100 for the project site.[8] A summary of the existing transit service, including the transit route, destinations and peak hour headways is presented in ***Table 4–3***. The existing public transit routes in the project site vicinity are illustrated in ***Figure 4–2***.

[8] Refer to http://www.walkscore.com/, which generates the transit score for the project site. Walk Score calculates the transit score of an address by locating nearby bus/rail transit routes and stops. Walk Score measures how easy it is to live a car-lite lifestyle—not how pretty the area is for using transit service.

5.0 TRAFFIC COUNTS

Manual counts of vehicular turning movements were conducted at each of the study intersections during the weekday morning (AM) and afternoon (PM) commute periods to determine the peak hour traffic volumes. The manual counts were conducted by an independent traffic count subconsultant (The Traffic Solution) at the study intersections from 7:00 to 10:00 AM to determine the weekday AM peak commute hour, and from 3:00 to 6:00 PM to determine the weekday PM peak commute hour. In conjunction with the manual turning movement vehicle counts, a count of bicycle and pedestrian volumes were also collected during the peak periods. It is noted that all of the traffic counts were conducted when local schools were in session. Traffic volumes at the study intersections show the typical peak periods between 7:00 to 10:00 AM and 3:00 to 6:00 PM generally associated with metropolitan Los Angeles weekday peak commute hours.

The weekday and weekend peak hour manual counts of vehicle movements at the study intersections are summarized in ***Table 5-1***. The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are shown in ***Figures 5-1*** and ***5-2***, respectively. Summary data worksheets of the manual traffic counts at the study intersections are contained in ***Appendix B***.

6.0 CUMULATIVE DEVELOPMENT PROJECTS

The forecast of future pre-project conditions was prepared in accordance with procedures outlined in Section 15130 of the CEQA Guidelines. Specifically, the CEQA Guidelines provide two options for developing the future traffic volume forecast:

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
>
> (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency."

Accordingly, this traffic analysis provides a highly conservative estimate of future pre-project traffic volumes as it incorporates both the "A" and "B" options outlined in the CEQA Guidelines for purposes of developing the forecast.

6.1 Related Projects

A forecast of on-street traffic conditions prior to occupancy of the proposed project was prepared by incorporating the potential trips associated with other known development projects (related projects) in the area (i.e., within an approximate 1.5-mile radius from the project site). With this information, the potential impact of the proposed project can be evaluated within the context of the cumulative impacts of all ongoing development. The related projects research was based on information on file with both LADOT and LADCP. For LADOT, a list of related projects was obtained from LADOT for the approximately 1.5-mile radius from the project site. For LADCP, the research included, but was not limited to, a review of proposed development projects within the Central City and Central City North community plan areas, proposed development projects within an approximate 1.5-mile radius from the project site for which EIRs are being or have been prepared (as shown on the Major Projects section of LADCP's website), and LADCP's bi-weekly case filing reports. In addition, related projects lists from recently approved traffic study MOU and traffic studies in the project vicinity also were reviewed. The list of related projects in the project site area is presented in ***Table 6-1***. The location of the related projects is shown in ***Figure 6-1***.

Traffic volumes expected to be generated by the related projects were calculated using rates provided in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*[9], or they were obtained from other traffic studies recently approved by the City. The related projects' respective traffic generation for the weekday AM and PM peak hours, as well as on a daily basis for a typical weekday, is summarized in *Table 6-1*. The related projects traffic volumes were distributed and assigned to the street system based on the projects' locations in relation to the study intersections, their proximity to major traffic corridors, proposed land uses, nearby population and employment centers, etc. The distribution of the related projects traffic volumes to the study intersections during the weekday AM and PM peak hours are displayed in ***Figures 6-2*** and ***6-3***, respectively.

6.2 Downtown Transit / Infrastructure Projects

Several transit and/or infrastructure projects are proposed or under construction within the greater Downtown Los Angeles area. While the projects discussed below and others like them could be expected to result in greater trip reductions than what occur today, no trip reductions have been assumed in this traffic analysis for existing uses so as to provide a conservative review of potential traffic impacts. Some of the relevant projects are as follows:

Regional Connector Transit Project

As summarized on the Metro website, the Regional Connector project will extend from Metro's Little Tokyo/Arts District Station to the 7th Street/Metro Center in Downtown Los Angeles. This will allow transit passengers to access the Gold, Blue, Expo, Red and Purple lines. The addition will extend 1.9 miles and will serve Little Tokyo, the Arts District, Civic Center, the Historic Core, Broadway, Grand Avenue, Bunker Hill, and Flower Street, as well as the Financial District.

This new extension will provide a one-seat ride for travel across Los Angeles County by allowing passengers to travel between Azusa and Long Beach and between East Los Angeles and Santa Monica without having to transfer lines. The forecast opening year of the Regional Connector Transit project is currently 2021.

Downtown Los Angeles Historic Streetcar Project

The restoration of the Historic Streetcar Service in Downtown Los Angeles is expected to revive a service that previously spanned over 600 miles of the Los Angeles area during the first half of the 1900's. The approved alignments closely follow the early alignments that traversed the historic Downtown core. The service would increase mobility and improve connectivity by linking residential and employment hubs, shopping districts, civic resources, cultural institutions, landmarks and entertainment venues for those who live, work, and visit Downtown. The Historic Streetcar project is also intended to connect patrons to a regional network of transit options including local and regional bus lines, and Metro Rail lines including the Regional Connector Transit project. Based on information contained in the Historic Streetcar project's Environmental Impact Report

(SCH No. 2013011001), which has been certified by the Los Angeles City Council, assuming that the necessary funding is obtained, this project may be completed by 2020.

6.3 Ambient Traffic Growth Factor

Horizon year background traffic growth estimates have been calculated using an ambient traffic growth factor. The ambient traffic growth factor is intended to include unknown related projects in the study area as well as account for typical growth in traffic volumes due to the development of projects outside the study area. Ambient traffic growth in the Downtown Los Angeles area (i.e., included in Regional Statistical Area 23 (RSA 23) that includes Downtown LA), which is presented in the *2010 Congestion Management Program*, indicates existing traffic volumes are expected to increase at an annual rate of approximately 0.20 percent (0.20%) per year between years 2010 and 2025. An annual growth rate of one percent (1.0%) until the year 2025 (i.e., the anticipated project build-out year) was selected for this analysis in consultation with LADOT during the scoping process. Therefore, application of this one percent (1.0%) ambient growth factor in addition to the forecast traffic generated by the related projects allows for a conservative forecast of future traffic volumes in the project study area as incorporation of both (i.e., an ambient traffic growth rate and a detailed list of cumulative development projects) is expected to overstate potential future traffic volumes. The cumulative development projects should already be incorporated as part of the growth rate projection per the adopted, local and regional planning documents (i.e., which account for the future population, housing, and employment [socio-economic data] projections). Further, as described in Section 6.0 herein, CEQA only requires that one of these two approaches be employed in developing the future traffic volume forecasts.

7.0 TRAFFIC FORECASTING METHODOLOGY

In order to estimate the traffic impact characteristics of the proposed project, a multi-step process has been utilized. The first step is trip generation, which estimates the total arriving and departing traffic volumes on a peak hour and daily basis. The traffic generation potential is forecast by applying the appropriate vehicle trip generation equations or rates to the project development tabulation.

The second step of the forecasting process is trip distribution, which identifies the origins and destinations of inbound and outbound project traffic volumes. These origins and destinations are typically based on demographics and existing/anticipated travel patterns in the study area.

The third step is traffic assignment, which involves the allocation of project traffic to study area streets and intersections. Traffic assignment is typically based on minimization of travel time, which may or may not involve the shortest route, depending on prevailing operating conditions and travel speeds. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersection turning movements throughout the study area.

With the forecasting process complete and project traffic assignments developed, the impact of the proposed project is isolated by comparing operational (i.e., Levels of Service) conditions at the selected key intersections using existing and expected future traffic volumes without and with forecast project traffic. The significance of the project's impacts can then be identified based on the current City traffic impact analysis guidelines and the need for site-specific and/or cumulative local area traffic improvements can then be evaluated.

7.1 Project Traffic Generation

Traffic generation is expressed in vehicle trip ends, defined as one-way vehicular movements, either entering or exiting the generating land use. Traffic volumes to be generated by the proposed project were forecast for the weekday AM and PM peak hours, and over a 24-hour period. Generation rates provided in the ITE *Trip Generation Manual* were utilized to forecast project traffic generation for the proposed project. Traffic volumes expected to be generated by the project's general office and commercial (i.e., retail) land use components were based upon the following ITE trip generation average rates:

- ITE Land Use Code 710: General Office Building
- ITE Land Use Code 820: Shopping Center

The kitchen/dining room and flex space planned for the Weingart Towers project will provide meals for residents and area homeless during breakfast, lunch and dinner. At other times this space may be used for other activities. It was deemed appropriate to estimate trips for this space only for service and delivery by selecting and ITE land use category (ITE 110, General Light Industrial) that could approximate these trips.

As the ITE publication does not provide trip rates for a land use such as the project's residential land use component, it was deemed appropriate to forecast the trips expected to be generated by the affordable housing land use component using trip rates recently published by LADOT which are directly applicable to the proposed project. The LADOT trip generation rates for affordable housing projects were published in November, 2016, and developed based on vehicle trip count data collected at affordable housing sites in the City of Los Angeles during year 2016. The LADOT affordable housing trip rates include three different housing type categories: affordable family housing; affordable seniors housing, and affordable special needs and supportive housing. In this instance, both the affordable family and affordable special needs and supportive housing category are directly applicable to the proposed project which will provide housing for permanent long-term tenants with supportive services designed to enable homeless persons and individuals/families at risk of homelessness to ensure that they remain housed and live as independently as possible. LADOT's affordable family and affordable special needs and supportive housing category trip rates are summarized below:

Affordable Family Housing

- Average Daily Trip Rate: 4.08 trips per dwelling unit
- Average AM Peak Hour Trip Rate: 0.50 trips per dwelling unit; 40% inbound and 60% outbound
- Average PM Peak Hour Trip Rate: 0.34 trips per dwelling unit; 55% inbound and 45% outbound

Affordable Special Needs and Supportive Housing

- Average Daily Trip Rate: 1.27 trips per dwelling unit
- Average AM Peak Hour Trip Rate: 0.12 trips per dwelling unit; 44% inbound and 56% outbound
- Average PM Peak Hour Trip Rate: 0.12 trips per dwelling unit; 59% inbound and 41% outbound

The ITE manual contains trip rates for a variety of land uses (including office buildings, shopping centers, condominiums, etc.), which have been derived based on traffic counts conducted at existing sites. However, the traffic count data submitted to ITE is for free-standing sites generally located in suburban locations, which likely do not reflect the trip generation characteristics for projects located in urban areas such as the City of Los Angeles's transit oriented district (TOD) areas. Thus, the trip rates provided in the ITE *Trip Generation Manual* (derived from traffic counts at suburban projects) would be expected to overstate the trip generation potential of projects located within the downtown Los Angeles area, including the proposed Weingart Projects.

For the proposed project, it is reasonable to conclude that its primary land use component (i.e., affordable housing), location in downtown Los Angeles near multimodal corridors, and proximity to rail lines would result in a significant reduction in vehicle trips as compared to the trip forecasts that would otherwise be calculated using the applicable and unadjusted ITE trip rates in a passively managed traffic management condition. An actively managed site could be expected to yield additional trip reductions. Therefore, based on criteria contained in the City's traffic study guidelines and recent downtown Los Angeles project experience, conservative adjustments were made to the project's general office land use component trip generation forecasts to account for transit usage, walkability and internal capture as follows:

- 5 percent (5%) transit adjustment
- 5 percent (5%) walk adjustment
- 5 percent (5%) internal capture adjustment

For the project's commercial (i.e., retail) land use components, a forecast was made of likely pass-by trips that could be anticipated at the site. Pass-by trips are intermediate stops on the way from an origin to a primary trip destination without a route diversion. Pass-by trips are attracted from traffic passing the site on an adjacent street or roadway that offers direct access to the site. The pass-by traffic forecast has been estimated based on existing traffic volumes in the project vicinity and the *LADOT Policy on Pass-by Trips*. Pass-by adjustments have been applied to the weekday AM and PM peak hour traffic volume forecasts, as well as to the daily traffic volume forecasts, for the project's commercial land use components.

In addition to the proposed project trip generation forecasts, forecasts also were made for the existing Weingart Towers project site land use. Although the existing site use (Weingart Café) for this project site is a functional restaurant, it serves the homeless and does not function as a typical restaurant. As such, it was determined appropriate to estimate existing site trips only for service and delivery trips by selecting an ITE land use category (i.e., ITE Code 110, General Light Industrial) that could approximate these trips.

The trip generation rates and forecast of the vehicular trips anticipated to be generated by the proposed project are presented in ***Table 7-1***. As summarized in *Table 7-1*, the proposed project is expected to generate a net increase of 229 trips (120 inbound trips and 109 outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the proposed project is expected to generate a net increase of 197 trips (91 inbound trips and 106 outbound trips). Over a 24-hour period, the proposed project is forecast to generate a net increase of 2,038 trips (1,019 inbound trips and 1,019 outbound trips) during a typical weekday.

[3] The Weingart Projects include two distinct affordable housing projects for permanent long-term housing with supportive services designed to enable homeless persons and individuals/families at risk of homelessness to ensure that they remain housed and live as independently as possible. Summaries of the two projects are provided below:
- Weingart Towers project is located at 554-562 South San Pedro Street and 555-561 South Crocker Street. This project consists of an 18-story building with 278 dwelling units and a 12-story building with 104 dwelling units (i.e., 382 total dwelling units). Please note that the residential component includes 378 affordable housing dwelling units (302 permanent supportive housing units and 76 family units) and 4 manager apartment dwelling units. Additionally, a total of approximately 21,280 square feet of commercial space is planned for this project including 2,250 square feet of retail space and 19,030 square feet of general office space, as well as 11,463 square feet of dining room/flex space.
- San Pedro Tower project is located at 600-628 South San Pedro Street, 611-615 South Crocker Street and 518-522 East 6th Street. This project consists of a 19-story building with 303 dwelling units and approximately 20,300 square feet of commercial space, including 17,100 square feet of general office space and 3,200 square feet of other commercial space (i.e., retail space for purposes of this analysis). Please note that the residential component includes 298 affordable dwelling units (149 permanent supportive housing units and 149 family units) and 5 manager apartment dwelling units.

[4] LADOT trip generation average rates for affordable housing type Special Needs & Supportive Housing.
- Daily Trip Rate: 1.27 trips/dwelling unit; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.12 trips/dwelling unit; 44% inbound/56% outbound
- PM Peak Hour Trip Rate: 0.12 trips/dwelling unit; 59% inbound/41% outbound

[5] LADOT trip generation average rates for affordable housing type Family.
- Daily Trip Rate: 4.08 trips/dwelling unit; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.50 trips/dwelling unit; 40% inbound/60% outbound
- PM Peak Hour Trip Rate: 0.34 trips/dwelling unit; 55% inbound/45% outbound

[6] ITE Land Use Code 220 (Apartment) trip generation average rates.
- Daily Trip Rate: 6.65 trips/dwelling unit; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.51 trips/dwelling units; 20% inbound/80% outbound
- PM Peak Hour Trip Rate: 0.62 trips/dwelling units; 65% inbound/35% outbound

[7] ITE Land Use Code 820 (Shopping Center) trip generation average rates.
- Daily Trip Rate: 42.7 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.96 trips/1,000 SF of floor area; 62% inbound/38% outbound
- PM Peak Hour Trip Rate: 3.71 trips/1,000 SF of floor area; 48% inbound/52% outbound

[8] Source: LADOT policy on pass-by trip adjustments. Pass-by trips are made as intermediate stops on the way from an origin to a primary trip destination without a route diversion. Pass-by trips are attracted from the traffic passing the site on an adjacent street or roadway that offers direct access to the site.

[9] ITE Land Use Code 710 (General Office Building) trip generation average rates.
- Daily Trip Rate: 11.03 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 1.56 trips/1,000 SF of floor area; 88% inbound/12% outbound
- PM Peak Hour Trip Rate: 1.49 trips/1,000 SF of floor area; 17% inbound/83% outbound

[10] Transit, walk and downtown Los Angeles trip adjustments are based on site's proximity to Metro rail and bus transit opportunities and the two project site locations.

[11] The planned kitchen/dining room/flex space will provide meals for residents and area homeless during breakfast, lunch and dinner. At other times this space may be used for other activities. It was deemed appropriate to estimate trips for this space only for service and delivery by selecting an ITE land use category (ITE 110, General Light Industrial) that could approximate these trips.
ITE Land Use Code 110 (General Light Industrial) trip generation average rates.
- Daily Trip Rate: 6.97 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.92 trips/1,000 SF of floor area; 88% inbound/12% outbound
- PM Peak Hour Trip Rate: 0.97 trips/1,000 SF of floor area; 12% inbound/88% outbound

[12] Although the existing site use (Weingart Café) for the Weingart Towers project site is a functional restaurant, it serves the homeless and does not operate as a typical restaurant. It was determined appropriate to estimate existing site trips only for service and delivery trips by selecting an ITE land use category (ITE Code 110, General Light Industrial) that could approximate these trips.
ITE Land Use Code 110 (General Light Industrial) trip generation average rates.
- Daily Trip Rate: 6.97 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.92 trips/1,000 SF of floor area; 88% inbound/12% outbound
- PM Peak Hour Trip Rate: 0.97 trips/1,000 SF of floor area; 12% inbound/88% outbound

7.2 Project Traffic Distribution and Assignment

Project traffic volumes both entering and exiting the site have been distributed and assigned to the adjacent street system based on the following considerations:

- The site's proximity to major traffic corridors (i.e., Los Angeles Street, San Pedro Street, Central Avenue, 4th Street, 5th Street, 6th Street, etc.);
- Expected localized traffic flow patterns based on adjacent roadway channelization and presence of traffic signals;
- Existing intersection traffic volumes;
- Ingress/egress scheme planned for the proposed project, including the restricted right-turn ingress/egress access scheme for the San Pedro Tower project;
- Nearby population and employment centers; and
- Input from LADOT staff.

The general, directional traffic distribution pattern for the proposed project are presented as follows:

- ***Figure 7-1*** – Weingart Towers Residential Component
- ***Figure 7-2*** – Weingart Towers Commercial Component
- ***Figure 7-3*** – San Pedro Tower Residential Component
- ***Figure 7-4*** – San Pedro Tower Commercial Component

The forecast weekday AM and PM peak hour project traffic volumes at the study intersections associated with the proposed project are presented in ***Figures 7-5*** and ***7-6***, respectively. The traffic volume assignments presented in *Figures 7-5* and *7-6* reflect the traffic distribution characteristics shown in *Figures 7-1*, *7-2*, *7-3*, and *7-4* and the project traffic generation forecasts presented in *Table 7-1*. It is noted that the Weingart Towers commercial component trip distribution pattern (i.e., refer to *Figure 7-2*) has been utilized for the existing use on the Weingart Towers project site.

8.0 TRAFFIC IMPACT ANALYSIS METHODOLOGY

The study intersections were evaluated using the Critical Movement Analysis (CMA) method of analysis that determines Volume-to-Capacity (*v/c*) ratios on a critical lane basis consistent with the current City of Los Angeles traffic impact analysis procedures. The overall intersection *v/c* ratio is subsequently assigned a Level of Service (LOS) value to describe intersection operations. Level of Service varies from LOS A (free flow) to LOS F (jammed condition). A description of the CMA method and corresponding Level of Service is provided in ***Appendix C***.

As discussed in Section 1.2, in response to SB 743, the City is currently considering new guidelines and metrics (i.e., VMT-based significance thresholds) for use in determining whether a project's transportation impacts are significant. It is anticipated that in mid to late 2018, City staff will present the CEQA Appendix G environmental checklist update to the City Council, which will likely lead to the adoption of the new VMT-based significance thresholds and its subsequent incorporation into the City's CEQA Threshold Guide in late 2018 to early 2019. Following adoption, projects must then comply with the updated transportation evaluation framework, thus bringing the City into compliance with the state mandate. The City's VMT tools/metrics had not been finalized at the time this traffic study was completed for inclusion in the proposed project's Draft EIR. Should the City finalize those tools/metrics prior to the City decisionmakers' consideration of the proposed project's EIR and entitlements, this traffic study may be updated in consultation with LADOT to include a VMT analysis using the City's VMT tools/metrics and a determination of whether the proposed project results in significant impacts based on VMT-based significance thresholds. While any agency can immediately apply the proposed new CEQA Guidelines section (proposed Guidelines section 15064.3), a statewide application of that new section would not be required until January 1, 2020.

8.1 Impact Criteria and Thresholds

The relative impact of the added traffic volumes forecast to be generated by the proposed project during the weekday AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at the study intersections, without and with the proposed project. The previously discussed capacity analysis procedures were utilized to evaluate the future *v/c* relationships and service level characteristics at each study intersection.

The significance of the potential impacts of project-generated traffic was identified using the traffic impact criteria set forth in LADOT's *Transportation Impact Study Guidelines*, December 2016. According to the City's published traffic study guidelines, the impact is considered significant if the project-related increase in the *v/c* ratio equals or exceeds the thresholds presented in ***Table 8–1***.

Table 8-1 CITY OF LOS ANGELES INTERSECTION IMPACT THRESHOLD CRITERIA		
Final *v/c*	**Level of Service**	**Project-Related Increase in *v/c***
> 0.701 - 0.800	C	equal to or greater than 0.040
> 0.801 - 0.900	D	equal to or greater than 0.020
> 0.901	E or F	equal to or greater than 0.010

The City's Sliding Scale Method requires mitigation of a project's traffic impacts whenever traffic generated by the proposed development causes an increase of the analyzed intersection *v/c* ratio by an amount equal to or greater than the values shown above.

8.2 Traffic Impact Analysis Scenarios

Traffic impacts at the study intersections were analyzed for the following conditions:

[a] Existing conditions.

[b] Existing with project conditions.

[c] Condition [a] plus one percent (1.0%) annual ambient traffic growth through year 2025 and with completion and occupancy of the related projects (i.e., future without project conditions).

[d] Condition [c] with completion and occupancy of the proposed project.

[e] Condition [d] with implementation of project mitigation measures, where necessary.

It should be noted that Condition [b] above is a hypothetical scenario in that it calculates the traffic due to the occupancy of the proposed project in addition to the existing traffic volumes, but changes to existing volumes are expected to occur throughout the project's construction period due to other area projects and regional growth. However, this condition has been prepared to be consistent with the general rule under CEQA that the potential impacts of a development project are to be measured against existing conditions. Condition [d] above analyzes future conditions upon completion and full occupancy of the proposed project, which is expected to occur in 2025.

9.0 TRAFFIC ANALYSIS

The traffic impact analysis prepared for the study intersections using the CMA methodology and application of the City's significant traffic impact criteria is summarized in ***Table 9-1***. The CMA data worksheets for the analyzed intersections are contained in *Appendix C*.

9.1 Existing Conditions

9.1.1 *Existing Conditions*

As indicated in column [1] of *Table 9–1*, all seven study intersections are presently operating at LOS A during the weekday AM and PM peak hours under existing conditions. These operating conditions at the study intersections reflect the one-way travel patterns of the east-west oriented roadways (i.e., 4th Street, 5th Street, 6th Street) which reduce the number of conflicts for critical movements. The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 5–1* and *5–2*, respectively.

9.1.2 *Existing With Project Conditions*

As shown in column [2] of *Table 9–1*, application of the City's threshold criteria to the "Existing With Project" scenario indicates that the proposed project is not expected to create significant impacts at any of the seven study intersections. Less than significant impacts are noted at all seven study intersections. Because there are no significant impacts, no traffic mitigation measures are required or recommended for the study intersections under the "Existing With Project" conditions. The existing with project traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in ***Figures 9–1*** and ***9–2***, respectively.

9.2 Future Conditions

9.2.1 *Future Without Project Conditions*

The future cumulative baseline conditions were forecast based on the addition of traffic generated by the completion and occupancy of the related projects, as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The *v/c* ratios at all of the study intersections are incrementally increased with the addition of ambient traffic and traffic generated by the related projects listed in *Table 6–1*. As presented in column [3] of *Table 9–1*, all seven study intersections are expected to operate at LOS C or better during the weekday AM and PM peak hours with the addition of growth in ambient traffic and related projects traffic under the future without project conditions. The future without project (existing, ambient growth, and related projects) traffic volumes at the study intersections during the weekday AM and PM peak hours are presented in ***Figures 9–3*** and ***9–4***, respectively.

9.2.2 *Future With Project Conditions*

As shown in column [4] of *Table 9–1*, application of the City's threshold criteria to the "Future With Proposed Project" scenario indicates that the proposed project is not expected to create significant impacts at any of the seven study intersections. Incremental, but not significant, impacts are noted at the seven study intersections. Because there are no significant impacts, no traffic mitigation

measures are required or recommended for the study intersections. The future with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in ***Figures 9-5*** and ***9-6***, respectively.

9.3 Freeway Impact Analysis Screening Criteria Review

Pursuant to the "Freeway Impact Analysis Procedures" agreement executed in October 2013 between LADOT and Caltrans District 7, as amended in December 2015, traffic studies may be required to conduct a focused freeway impact analysis in addition to the CMP analysis. If projects meet any of the following criteria, applicants are directed to the Caltrans' Intergovernmental Review (IGR) section for a determination on the need for analysis and, if necessary, the methodology to be utilized for a freeway impact analysis:

- The project's peak hour trips would result in a 1% or more increase to the freeway mainline capacity of a freeway segment operating at LOS E or F (based on an assumed capacity of 2,000 vehicles per hour per lane); or

- The project's peak hour trips would result in a 2% or more increase to the freeway mainline capacity of a freeway segment operating at LOS D (based on an assumed capacity of 2,000 vehicles per hour per lane); or

- The project's peak hour trips would result in a 1% or more increase to the capacity of a freeway off-ramp operating at LOS E or F (based on an assumed ramp capacity of 850 vehicles per hour per lane); or

- The project's peak hour trips would result in a 2% or more increase to the capacity of a freeway off-ramp operating at LOS D (based on an assumed ramp capacity of 850 vehicles per hour per lane).

Freeway mainline segments and off-ramps in the project vicinity that are forecast to receive net new project trips are subject to freeway impact analysis screening. This screening analysis is based solely on the comparisons between the expected net new project-related traffic volumes and the capacity of the subject mainline freeway segments and freeway off-ramps. Thus, cumulative conditions (i.e., related project's traffic volumes and regional growth) are not considered for purposes of the screening analysis. The five (5) mainline freeway segments and five (5) freeway off-ramps selected for screening due to the proposed project are presented in ***Table 9-2***, with the freeway impact analysis screening performed for these facilities also presented therein. The project trips assigned to the freeway facilities are based on the trip distribution percentages presented in *Figures 7-1*, *7-2*, *7-3* and *7-4* and the trip generation forecast presented in *Table 7-1*. Based on this review, the amount of project traffic expected to occur on the freeway system is not expected to meet any of the above listed criteria. Therefore, no further analysis of potential impacts to the freeway system is required.

[1] Pursuant to *Traffic Study Policies and Procedures* , City of Los Angeles Department of Transportation, August 2014, *Agreement Between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures* , October 2013, and per *First Amendment to the Agreement between LADOT and Caltrans District 7 on Freeway Impact Analysis Procedures* , December 15, 2015.

[2] Total Capacity derived from the assumed free-flow capacities shown below: (in vehicles per hour per lane)

Facility Type	Capacity
Mainline Segment	2,000 vphpl
Off-Ramp	850 vphpl

[3] Freeway impact analysis is required if the project would result in an increase of ≥2% of capacity for facilities operating at LOS D, or in an increase of ≥1% of capacity for facilities operating at LOS E/F. For a more conservative screening analysis, all facilities are assumed to be operating at LOS E or F.

9.4 City of Los Angeles High Injury Network Review

Vision Zero is a citywide initiative which prioritizes the safety of pedestrians and bicyclists on public streets, with the understanding that roads which are safe for vulnerable users will be safer for all users, in an effort to eliminate traffic fatalities. Key elements of the policy, such as reducing traffic speeds, are founded on the principles of engineering, education, enforcement, evaluation, and equity. Originating in Sweden, the policy has been adopted in numerous other North American cities, including California cities such as San Francisco and San Diego.

Mayor Eric Garcetti issued Executive Directive No. 10 in August 2015, formally launching the Vision Zero initiative in Los Angeles. Vision Zero is also a stated safety objective in the Mobility Plan 2035, which sets the goal of zero traffic deaths by 2035. Jointly directed by LADOT and the Police Department, Vision Zero takes a multi-disciplinary approach to identifying safety risk factors and implementing solutions on a citywide scale. Using a methodology originally developed by the San Francisco Public Health Department, the Vision Zero Task Force has identified streets where investments in safety will have the most impact in reducing severe injuries and traffic fatalities in the City.[10] These roads are collectively known as the High Injury Network (HIN). The HIN will be reviewed by the LADOT's Vision Zero group for potential engineering re-design as well as educational and enforcement campaigns.

The proposed project is located in the heart of Downtown Los Angeles which is a major focus of the City's Vision Zero Task Force. The project site is situated along the San Pedro Street and 6th Street corridors, both of which are included on the City's HIN. As shown in ***Figure 9-7***, roadways in the immediate vicinity of the proposed project which have been identified on the HIN are noted below:

- Los Angeles Street north of 6th Street
- San Pedro Street
- Central Avenue
- Alameda Street
- 4th Street between San Pedro Street and Alameda Street
- 5th Street west of Stanford Avenue
- 6th Street west of Stanford Avenue
- 7th Street
- 8th Street west of San Pedro Street

[10] Vision Zero Los Angeles 2015-2025, August 2015.

WEINGART TOWERS PROJECT SITE

SAN PEDRO PROJECT SITE

FIGURE 9-7
CITY OF LOS ANGELES HIGH INJURY NETWORK IN PROJECT VICINITY

WEINGART PROJECTS

LINSCOTT, LAW & GREENSPAN, engineers

If a proposed project results in significant traffic impacts at intersections located along a designated HIN, LADOT's Vision Zero group will review those specific locations and immediate vicinity for potential safety enhancements that are consistent with the City's Vision Zero initiative.

10.0 TRANSPORTATION IMPROVEMENT MEASURES

As summarized in Subsections 9.1.2 (Existing With Project Conditions) and 9.2.2 (Future With Project Conditions) herein, application of the City's threshold criteria to the with proposed project scenarios indicates that the proposed project is not expected to create significant impacts at any of the seven study intersections. Because there are no significant impacts, no traffic mitigation measures are required or recommended for the study intersections. However, as noted previously (refer to Subsection 3.1.3 herein), the following site access/transportation management measures are recommended to facilitate vehicular access to and from the planned project sites:

- Install appropriate pavement markings (i.e., stop bar with STOP legend) on both project site exit drive aisles just west and east of the public sidewalks along Crocker Street and San Pedro Street, respectively, to ensure that motorists stop prior to the sidewalk before exiting the site.

- Install No Left-Turn In signing on the exterior of the San Pedro Tower project site driveway entrance to reinforce the restricted right-turn ingress movement for motorists entering the site.

- Install pavement right-turn arrows prior to the stop bar/STOP legend on the San Pedro Tower project exit drive aisle to reinforce the right-turn only movement for motorists exiting the site.

- Install a right-turn only sign at the San Pedro Tower project drive aisle just east of the public sidewalk to reinforce the restricted right-turn egress movement for motorists exiting the site.

- Maintain a graphic on a transportation information display kiosk in the common areas of both the Weingart Towers and San Pedro Tower project sites that display the allowable traffic movements at the site driveways.

In addition to the vehicular site access/traffic management recommendations, it is recommended that the project applicant install and maintain a transportation information display kiosk in a common area at both the Weingart Towers project site and San Pedro Tower project site that also displays the following in order to facilitate and encourage use of public transportation:

- Maps, routes, and schedules for public transit serving the site.

- Materials publicizing internet and telephone numbers for referrals on transportation information.

- Ridesharing promotional material supplied by Metro and/or other publicly supported transportation organizations.

11.0 CONGESTION MANAGEMENT PROGRAM TRAFFIC IMPACT ASSESSMENT

The Congestion Management Program (CMP) is a state-mandated program that was enacted by the California State Legislature with the passage of Proposition 111 in 1990. The program is intended to address the impact of local growth on the regional transportation system.

As required by the 2010 Congestion Management Program, a Traffic Impact Assessment (TIA) has been prepared to determine the potential impacts on designated monitoring locations on the CMP highway system. The analysis has been prepared in accordance with procedures outlined in the *2010 Congestion Management Program*, Los Angeles County Metropolitan Transportation Authority, October 2010.

According to Section D.9.1 (Appendix D, page D-6) of the 2010 CMP manual, the criteria for determining a significant transportation impact is listed below:

> "A significant transportation impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C $\geq$ 0.02), causing or worsening LOS F (V/C > 1.00); if the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C $\geq$ 0.02)."

The CMP impact criteria apply for analysis of both intersection and freeway monitoring locations.

11.1 Intersections

The following CMP intersection monitoring locations have been identified in the project vicinity:

CMP Station	Intersection
No. 43	Alameda Street/Washington Boulevard
No. 44	Alvarado Street/Sunset Boulevard

The CMP TIA guidelines require that intersection monitoring locations must be examined if the proposed project will add 50 or more trips during either the weekday AM or PM peak hours. The proposed project will not add 50 or more trips during either the weekday AM or PM peak hours (i.e., of adjacent street traffic) at CMP monitoring intersections, as stated in the CMP manual as the threshold criteria for a traffic impact assessment. The proposed project is anticipated to contribute less than 50 peak hour vehicle trips during the weekday AM and PM peak hours at the Alameda Street/Washington Boulevard and Alvarado Street/Sunset Boulevard intersections. Therefore, no further review of potential impacts to intersection monitoring locations that are part of the CMP highway system is required.

11.2 Freeways

The following CMP freeway monitoring locations have been identified in the project vicinity:

CMP Station	Location
Seg. No. 1036	US-101 Freeway north of Vignes Street
Seg. No. 1048	I-110 Freeway south of US-101 Freeway
Seg. No. 1049	SR-110 Freeway at Alpine Street

The CMP TIA guidelines require that freeway monitoring locations must be examined if the proposed project will add 150 or more trips (in either direction) during either the weekday AM or PM peak hours. The proposed project will not add 150 or more trips (in either direction) during either the weekday AM or PM peak hours to CMP freeway monitoring locations which is the threshold for preparing a traffic impact assessment, as stated in the CMP manual. The proposed project is anticipated to generate well below the 150 AM or PM peak hour trip threshold at the mainline freeway segments in closest proximity to the above freeway monitoring locations. Therefore, no further review of potential impacts to freeway monitoring locations that are part of the CMP highway system is required.

11.3 Transit Impact Review

As required by the *2010 Congestion Management Program*, a review has been made of the potential impacts of the project on transit service. As discussed in Subsection 4.4 herein, existing transit service is provided in the vicinity of the proposed Weingart projects.

The project trip generation, as shown in *Table 7–1*, was adjusted by values set forth in the CMP (i.e., person trips equal 1.4 times vehicle trips, and transit trips equal 3.5 percent of the total person trips) to estimate transit trip generation. Pursuant to the CMP guidelines, the proposed project is forecast to generate demand for 11 and 10 transit trips during the weekday AM and PM peak hours, respectively. Over a 24-hour period, the proposed project is forecast to generate demand for 100 daily transit trips. The calculations are as follows:

- Weekday AM Peak Hour = $229 \times 1.4 \times 0.035 = 11$ Transit Trips
- Weekday PM Peak Hour = $197 \times 1.4 \times 0.035 = 10$ Transit Trips
- Weekday Daily Trips = $2{,}038 \times 1.4 \times 0.035 = 100$ Transit Trips

As shown in *Table 4–3*, 11 bus transit lines and routes are provided in close proximity to the project site. As outlined in *Table 4–3*, under the "No. of Buses During Peak Hour" column, these 11 transit lines provide services for an average of (i.e., average of the directional number of buses/trains during the peak hours) roughly 139 and 145 buses during the weekday AM and PM peak hours, respectively. Therefore, based on the above calculated weekday AM and PM peak hour trips, this

would correspond to less than one additional transit rider per bus. It is anticipated that the existing transit service in the project area will adequately accommodate the increase of project-generated transit trips. Thus, given the number of project-generated transit trips per bus, no project impacts on existing or future transit services in the project area are expected to occur as a result of the proposed project.

12.0 SUMMARY AND CONCLUSIONS

- ***Project Description*** – The Weingart Projects include two distinct affordable housing projects for permanent long-term housing with supportive services designed to enable homeless persons and individuals/families at risk of homelessness to ensure that they remain housed and live as independently as possible. Summaries of the two projects are provided below:

  - The Weingart Towers project consists of an 18-story building with 278 dwelling units and a 12-story building with 104 dwelling units (i.e., 382 total dwelling units). Please note that the residential component includes 378 affordable housing dwelling units (302 permanent supportive housing units and 76 family units) and 4 manager apartment dwelling units. Additionally, a total of approximately 21,280 square feet of commercial space is planned for this project, including 19,030 square feet of general office space and 2,250 square feet of other commercial space (i.e., considered as retail space for purposes of this analysis), as well as 11,463 square feet of dining room/flex space to provide meals to residents and area homeless during breakfast, lunch and dinner.

  - The San Pedro Tower project consists of a 19-story building with a total of 303 dwelling units and approximately 20,300 square feet of commercial space, including 17,100 square feet of general office space and 3,200 square feet of other commercial space (i.e., retail space for purposes of this analysis). Please note that the residential component includes 298 affordable housing dwelling units (149 permanent supportive housing units and 149 family units) and 5 manager apartment dwelling units.

  - The Weingart Towers project is currently expected to be completed and occupied by the end of year 2025. The San Pedro Tower project is presently expected to be completed and occupied by the end of year 2023. This impact analysis evaluates the combined effects of the two projects assuming build-out in year 2025 in order to address any potential CEQA-related issues associated with project segmentation.

- ***Vehicular Site Access*** – Vehicular movements into and out of the Weingart Towers project site will be provided via a single driveway on Crocker Street while vehicular access into and out of the San Pedro Tower project site will be provided via a single driveway on San Pedro Street. The Weingart Towers project site driveway will be located at the southeast corner of the subject site along Crocker Street and will accommodate full access (i.e., left-turn and right-turn ingress and egress turning movements) for motorists accessing the project site. The San Pedro Tower project site driveway will be located at the southwest corner of the subject site along San Pedro Street and will be restricted to right-turn ingress and egress turning movements for motorists accessing the project site based on preliminary review by LADOT staff. Gate control equipment at the two driveways will be located such that no vehicle queuing would extend back out onto the public right-of-way.

- ***Study Scope –*** A total of seven study intersections were selected for analysis in consultation with LADOT staff in order to determine potential impacts related to the proposed project.

- ***Project Trip Generation*** – The proposed project is expected to generate a net increase of 229 trips (120 inbound trips and 109 outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the proposed project is expected to generate a net increase of 197 trips (91 inbound trips and 106 outbound trips). Over a 24-hour period, the proposed project is forecast to generate a net increase of 2,038 trips (1,019 inbound trips and 1,019 outbound trips) during a typical weekday.

- ***Related Projects*** – The City of Los Angeles Departments of Transportation and Planning were consulted to obtain the list of development projects (related projects) in the area. A total of 161 related projects was identified and considered as part of the cumulative traffic analysis. In addition, an annual growth rate of one percent (1.0%) to the year 2025 (i.e., the anticipated project build-out year) was used for analysis purposes. Therefore, application of this ambient growth factor in addition to the forecast traffic generated by the related projects allows for a conservative forecast of future traffic volumes in the project study area as incorporation of both (i.e., an ambient traffic growth rate and a detailed list of cumulative development projects) is expected to overstate potential future traffic volumes. Further, as described in Section 6.0 above, CEQA only requires that one of these two approaches be employed in developing the future traffic volume forecasts.

- ***Traffic Impact Analysis*** – It is concluded that the proposed project is not expected to create significant impacts at any of the seven study intersections under either the Existing With Project or Future With Project conditions based on the City of Los Angeles thresholds of significance used for evaluating traffic impacts. Because there are no significant impacts, no traffic mitigation measures are required or recommended for the study intersections.

- ***Transportation Improvement Measures*** – While the proposed project is not forecast to create significant impacts at any of the study intersections, site access/transportation management measures are recommended to facilitate vehicular access to and from the planned project sites.

- ***CMP Traffic Assessment*** – The results of the Los Angeles CMP traffic assessment indicate that the proposed project will not adversely affect any CMP arterial monitoring intersections or freeway monitoring locations. Therefore, no improvements/mitigation measures are required.

APPENDIX A

TRAFFIC STUDY MEMORANDUM OF UNDERSTANDING

LADOT

Transportation Impact Study Memorandum of Understanding (MOU)

This MOU acknowledges that the Transportation Impact Study for the following Project will be prepared in accordance with the latest version of LADOT's Transportation Impact Study Guidelines:

I. PROJECT INFORMATION

Project Name: Weingart Projects

Project Address: Please refer to the attached project description for the project site addresses.

Project Description: Please refer to the attached project description.

LADOT Project Case Number: _____ Project Site Plan attached? *(Required)* ■ Yes ☐ No

Refer to Figures 2-3 & 2-4

II. TRIP GENERATION

Geographic Distribution: N 25.00 % S 25.00 % E 25.00 % W 25.00 %

Illustration of Project trip distribution percentages at Study intersections attached? *(Required)* ■ Yes ☐ No

Trip Generation Adjustments *(Exact amount of credit subject to approval by LADOT)* Refer to Figures 7-1, 7-2, 7-3 & 7-4

	Yes	No
Transit Usage	■	☐
Transportation Demand Management	☐	■
Existing Active Land Use	■	☐

2.3 Proposed Project Description

The Weingart Projects include two distinct affordable housing projects for permanent long-term housing with supportive services designed to enable homeless persons and individuals/families at risk of homelessness to ensure that they remain housed and live as independently as possible. Summaries of the two projects are provided below:

- The Weingart Towers project is located at 554-562 South San Pedro Street and 555-561 South Crocker Street. This project consists of an 18-story building with 278 dwelling units and a 12-story building with 104 dwelling units (i.e., 382 total dwelling units). Please note that the residential component includes 378 affordable housing dwelling units (302 permanent supportive housing [PSH] units and 76 family units) and 4 manager apartment dwelling units. Additionally, a total of approximately 21,280 square feet of commercial space is planned for this project, including 19,030 square feet of general office space and 2,250 square feet of other commercial space (i.e., considered as retail space for purposes of this analysis), as well as 11,463 square feet of dining room/flex space to provide meals to residents and area homeless during breakfast, lunch and dinner. At other times the dining room/flex space may be used for other ancillary activities for residents and area homeless. Vehicular access to the Weingart Towers project is planned to be provided via a single driveway on Crocker Street. The ground floor site plan for the Weingart Towers project is illustrated in ***Figure 2-3***.

- The San Pedro Tower project is located at 600-628 South San Pedro Street, 611-615 South Crocker Street, and 518-522 East 6th Street. This project consists of a 19-story building with a total of 303 dwelling units and approximately 20,300 square feet of commercial space, including 17,100 square feet of general office space and 3,200 square feet of other commercial space (i.e., retail space for purposes of this analysis). Please note that the residential component includes 298 affordable housing dwelling units (149 PSH units and 149 family units) and 5 manager apartment dwelling units. Vehicular access to the San Pedro Tower project is planned to be provided via a single driveway on San Pedro Street. The ground floor site plan for the San Pedro Tower project is illustrated in ***Figure 2-4***.

2.4 Construction Phasing

It is important to note that the two distinct affordable housing projects presently have different anticipated build-out years. The Weingart Towers project is currently expected to be completed and occupied by the end of year 2025. The San Pedro Tower project is presently expected to be completed and occupied by the end of year 2023. This impact analysis evaluates the combined effects of the two projects assuming build-out in year 2025 in order to address any potential CEQA-related issues associated with project segmentation.

Table 7-1 (Continued)
PROJECT TRIP GENERATION [1]

[1] Source: City of Los Angeles Department of Transportation (LADOT), November 2016; and ITE "Trip Generation Manual", 9th Edition, 2012.
[2] Trips are one-way traffic movements, entering or leaving.
[3] The Weingart Projects include two distinct affordable housing projects for permanent long-term housing with supportive services designed to enable homeless persons and individuals/families at risk of homelessness to ensure that they remain housed and live as independently as possible. Summaries of the two projects are provided below:
- Weingart Towers project is located at 554-562 South San Pedro Street and 555-561 South Crocker Street. This project consists of an 18-story building with 278 dwelling units and a 12-story building with 104 dwelling units (i.e., 382 total dwelling units). Please note that the residential component includes 378 affordable housing dwelling units (302 permanent supportive housing units and 76 family units) and 4 manager apartment dwelling units. Additionally, a total of approximately 21,280 square feet of commercial space is planned for this project including 2,250 square feet of retail space and 19,030 square feet of general office space, as well as 11,463 square feet of dining room/flex space.
- San Pedro Tower project is located at 600-628 South San Pedro Street, 611-615 South Crocker Street and 518-522 East 6th Street. This project consists of a 19-story building with 303 dwelling units and approximately 20,300 square feet of commercial space, including 17,100 square feet of general office space and 3,200 square feet of other commercial space (i.e., retail space for purposes of this analysis). Please note that the residential component includes 298 affordable dwelling units (149 permanent supportive housing units and 149 family units) and 5 manager apartment dwelling units.

[4] LADOT trip generation average rates for affordable housing type Special Needs & Supportive Housing.
- Daily Trip Rate: 1.27 trips/dwelling unit; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.12 trips/dwelling unit; 44% inbound/56% outbound
- PM Peak Hour Trip Rate: 0.12 trips/dwelling unit; 59% inbound/41% outbound

[5] LADOT trip generation average rates for affordable housing type Family.
- Daily Trip Rate: 4.08 trips/dwelling unit; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.50 trips/dwelling unit; 40% inbound/60% outbound
- PM Peak Hour Trip Rate: 0.34 trips/dwelling unit; 55% inbound/45% outbound

[6] ITE Land Use Code 220 (Apartment) trip generation average rates.
- Daily Trip Rate: 6.65 trips/dwelling unit; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.51 trips/dwelling units; 20% inbound/80% outbound
- PM Peak Hour Trip Rate: 0.62 trips/dwelling units; 65% inbound/35% outbound

[7] ITE Land Use Code 820 (Shopping Center) trip generation average rates.
- Daily Trip Rate: 42.7 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.96 trips/1,000 SF of floor area; 62% inbound/38% outbound
- PM Peak Hour Trip Rate: 3.71 trips/1,000 SF of floor area; 48% inbound/52% outbound

[8] Source: LADOT policy on pass-by trip adjustments. Pass-by trips are made as intermediate stops on the way from an origin to a primary trip destination without a route diversion. Pass-by trips are attracted from the traffic passing the site on an adjacent street or roadway that offers direct access to the site.

[9] ITE Land Use Code 710 (General Office Building) trip generation average rates.
- Daily Trip Rate: 11.03 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 1.56 trips/1,000 SF of floor area; 88% inbound/12% outbound
- PM Peak Hour Trip Rate: 1.49 trips/1,000 SF of floor area; 17% inbound/83% outbound

[10] Transit, walk and downtown Los Angeles trip adjustments are based on site's proximity to Metro rail and bus transit opportunities and the two project site locations.

[11] The planned kitchen/dining room will provide meals for residents and area homeless during breakfast, lunch and dinner. At other times the dining room area maybe used for other activities. It was deemed appropriate to estimate trips for this space only for service and delivery by selecting an ITE land use category (ITE 110, General Light Industrial) that could approximate these trips.
ITE Land Use Code 110 (General Light Industrial) trip generation average rates.
- Daily Trip Rate: 6.97 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.92 trips/1,000 SF of floor area; 88% inbound/12% outbound
- PM Peak Hour Trip Rate: 0.97 trips/1,000 SF of floor area; 12% inbound/88% outbound

[12] Although the existing site use (Weingart Café) for the Weingart Towers project site is a functional restaurant, it serves the homeless and does not operate as a typical restaurant. It was determined appropriate to estimate existing site trips only for service and delivery trips by selecting an ITE land use category (ITE Code 110, General Light Industrial) that could approximate these trips.
ITE Land Use Code 110 (General Light Industrial) trip generation average rates.
- Daily Trip Rate: 6.97 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.92 trips/1,000 SF of floor area; 88% inbound/12% outbound
- PM Peak Hour Trip Rate: 0.97 trips/1,000 SF of floor area; 12% inbound/88% outbound

[1] Pursuant to *Traffic Study Policies and Procedures* , City of Los Angeles Department of Transportation, August 2014, *Agreement Between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures* , October 2013, and per *First Amendment to the Agreement between LADOT and Caltrans District 7 on Freeway Impact Analysis Procedures* , December 15, 2015.

[2] Total Capacity derived from the assumed free-flow capacities shown below: (in vehicles per hour per lane)

Facility Type	Capacity
Mainline Segment	2,000 vphpl
Off-Ramp	850 vphpl

[3] Freeway impact analysis is required if the project would result in an increase of ≥2% of capacity for facilities operating at LOS D, or in an increase of ≥1% of capacity for facilities operating at LOS E/F. For a more conservative screening analysis, all facilities are assumed to be operating at LOS E or F.

APPENDIX C

PROPOSED PROJECT:
CMA AND LEVELS OF SERVICE EXPLANATION
CMA DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS

CRITICAL MOVEMENT ANALYSIS (CMA) DESCRIPTION

Level of Service is a term used to describe prevailing conditions and their effect on traffic. Broadly interpreted, the Level of Service concept denotes any one of a number of differing combinations of operating conditions which may take place as a roadway is accommodating various traffic volumes. Level of Service is a qualitative measure of the effect of such factors as travel speed, travel time, interruptions, freedom to maneuver, safety, driving comfort and convenience.

Six Levels of Service, A through F, have been defined in the 1965 *Highway Capacity Manual*. Level of Service A describes a condition of free flow, with low traffic volumes and relatively high speeds, while Level of Service F describes forced traffic flow at low speeds with jammed conditions and queues which cannot clear during the green phases.

Critical Movement Analysis (CMA) is a procedure which provides a capacity and level of service geometry and traffic signal operation and results in a level of service determination for the intersection as a whole operating unit.

The per lane volume for each movement in the intersection is determined and the per lane intersection capacity based on the Transportation Research Board (TRB) Report 212 (*Interim Materials on Highway Capacity*). The resulting CMA represents the ratio of the intersection's cumulative volume over its respective capacity (V/C ratio). Critical Movement Analysis takes into account lane widths, bus and truck operations, pedestrian activity and parking activity, as well as number of lanes and geometrics.

The Level of Service (abbreviated from the *Highway Capacity Manual*) are listed here with their corresponding CMA and Load Factor equivalents. Load Factor is that proportion of the signal cycles during the peak hour which are fully loaded; i.e. when all of the vehicles waiting at the beginning of green are not able to clear on that green phase.

Critical Movement Analysis Characteristics

Level of Service	Load Factor	Equivalent CMA
A (free flow)	0.0	0.00 - 0.60
B (rural design)	0.0 - 0.1	0.61 - 0.70
C (urban design)	0.1 - 0.3	0.71 - 0.80
D (maximum urban design)	0.3 - 0.7	0.81 - 0.90
E (capacity)	0.7 - 1.0	0.91 - 1.00
F (force flow)	Not Applicable	Not Applicable

SERVICE LEVEL A
There are no loaded cycles and few are even close to loaded at this service level. No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.

SERVICE LEVEL B
This level represents stable operation where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

SERVICE LEVEL C
At this level stable operation continues. Loading is still intermittent but more frequent than at Level B. Occasionally drivers may have to wait through more one red signal indication and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.

SERVICE LEVEL D
This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak hour, but enough cycles with lower demand occur to permit periodic clearance of queues, thus preventing excessive backups. Drivers frequently have to wait through more than one red signal. This level is the lower limit of acceptable operation to most drivers.

SERVICE LEVEL E
This represents near capacity and capacity operation. At capacity (CMA = 1.0) it represents the most vehicles that the particular intersection can accommodate. However, full utilization of every signal cycle is seldom attained no matter how great the demand. At this level all drivers wait through more than one red signal, and frequently through several.

SERVICE LEVEL F
Jammed conditions. Traffic backed up from a downstream location on one of the street restricts or prevents movement of traffic through the intersection under consideration.
