1. Summary

1.1. Executive Summary

Certified Environments, Inc. (CEI) has conducted a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Standard E 1527-05 of the **945 W. 8th Street** (the subject property), Los Angeles, CA. Any exceptions to, or deletions from, this practice are described in Section 2.4 of this report.

The subject property is currently undeveloped. There are no structures present at the subject property therefore no asbestos-containing materials (ACM), lead-based paint, lead in drinking water, and radon gas issues are currently identified.

Description of the Subject Property

Property Summary	
Parcel Shape	Rectangular
Site Area	Not Provided
Type of vegetation	Grass-covered
Percent of site covered by vegetation	80
Surface Water Bodies	None
Type of Area	Commercial
Site Accessed Via	8th Street from the south
Primary Properties that are Adjoining the Site	Commercial

Recognized Environmental Conditions

A recognized environmental condition is defined by ASTM Standard E 1527-13 as "*the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions.*"

This assessment has revealed no evidence of recognized environmental conditions in connection with the subject property.

Historical Recognized Environmental Conditions

A historical recognized environmental condition is defined by ASTM Standard E 1527-13 as "*an environmental condition, which in the past would have been considered a recognized environmental condition, but which may not be considered a recognized environmental condition currently.*"

This assessment has revealed no evidence of historical recognized environmental conditions in connection with the subject property except for the following:

No additional investigation or remedial action is recommended at this time.

Although no known environmental concerns were identified in this assessment of the subject property, there is always the potential for unforeseen or abandoned underground storage tanks/drums or contaminated soil. Prior to any substantial excavation of the property, it is recommended to conduct a limited subsurface study to identify any abandoned UST's tanks or drums not identified in the available records reviewed in this assessment. Some limited soil investigation is also recommended prior to excavation for foundations and/or a subterranean parking garage.

This summary is not to be used alone. The report must be read in its entirety.

1.2. Phase I Environmental Site Assessment Summary Table

945 W. 8th Street
Los Angeles, CA 90017

Year Built: N/A
Current Use: Undeveloped Land
First Known Developed Use and Date: Triangular structure, and a dwelling / Circa 1890

Item	Concern	Action	Cost	Section
Adjoining Properties	LOW	N/A		3.4
Federal and State Databases	LOW	N/A		4.1
Interviews and User Provided Information	LOW	N/A		4.2
Historical Use Information	LOW	N/A		4.3
Hazardous Substances	LOW	N/A		5.3
Waste Generation	LOW	N/A		5.4
Storage Tanks (UST/AST)	LOW	N/A		5.5
Polychlorinated Biphenyls (PCBs)	LOW	N/A		5.6
Asbestos	LOW	N/A		5.9
Radon	LOW	N/A		5.10

2. Introduction

2.1.Purpose

The purpose of this Phase I ESA is to provide a professional opinion, to the extent feasible pursuant to the processes prescribed herein, on the presence of recognized environmental conditions in connection with the subject property and to recommend whether further investigation is required. This project was performed in accordance with the order given by Brookfield Property Partners, (the Client) to Certified Environments, Inc. (CEI), dated March 6, 2017.

2.2.Scope of Work

This assessment was conducted in accordance with the American Society for Testing and Materials (ASTM) Standard E 1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.*

The subject property is currently undeveloped. There are no structures present at the subject property therefore no asbestos-containing materials (ACM), lead-based paint, lead in drinking water, and radon gas issues are currently identified.

2.3. Methodology Used

This assessment included a records review, a site reconnaissance, interviews, and a report. The following items were specifically addressed:

- **Federal and State Environmental Regulatory Review** - Research and review of available information was conducted regarding the environmental status of the site and surrounding properties from federal and state environmental regulatory databases. A complete list of databases searched is included in Attachment I of this report.

- **Previous Environmental Assessments** - Previously conducted Phase I ESA reports were reviewed to help identify the likelihood of past uses having led to recognized environmental conditions in connection with the subject property.

- **Aerial Photographs** - Aerial photographs were reviewed to assess past uses of the subject property and adjoining properties.

- **Historic Topographic Maps** - Historic topographic maps were reviewed to assess historic uses of the subject property and adjoining properties.

- **Historic Fire Insurance Maps** - Fire insurance maps were reviewed to assess past uses of the subject property and adjoining properties.

- **Review of Physical Settings Maps and Records** - CEI reviewed reasonably ascertainable physical settings maps and other sources of information referenced herein to obtain information regarding the topographic, hydrologic, geologic, and hydrogeologic characteristics of the subject property.

- **Environmental Site Assessment Report** - This report represents the findings from the studies of the items described above and provides conclusions and recommendations based on the information gathered above and provided by the Client.

2.4. Limitations and Use of the Report

This Phase I Environmental Site Assessment was conducted using the Scope of Work approved by the Client and in accordance with ASTM guidelines for the performance of Phase I Environmental Site Assessments. No other warranties, either expressed or implied, are made by CEI. CEI's evaluations, analyses, and opinions should not be taken as representations regarding the subsurface conditions or the actual value of the subject property.

Factual information and documentation concerning the subject property provided by the Client, its representatives, and any regulatory agencies consulted are assumed to be complete and correct. CEI's conclusions are based upon such factual information and documentation and on our observations of site conditions, as they existed on the date of the site survey.

The following services were not included within the Scope of Work for this assessment: acquiring permits; locating buried utilities; surveying for line and grade; preparing quantity and cost estimates; preparing detailed plans and specifications; preparing waste characterization and treatment schemes; conducting comprehensive asbestos, lead-based paint, and radon surveys; conducting lead in drinking water testing; sampling site soils and groundwater; performing indoor air quality inspections; conducting wetlands assessments; or performing services not specifically defined herein. These services may be provided by CEI as an expansion of our services, upon request.

CEI can make no assumptions regarding the potential environmental impact of conditions in any areas that were inaccessible at the time of the site visit. Except as otherwise specified herein, no physical or invasive testing was performed.

The subject property is currently undeveloped. There are no structures present at the subject property therefore no asbestos-containing materials (ACM), lead-based paint, lead in drinking water, and radon gas issues are currently identified.

CEI obtained environmental agency database information from Environmental Data Resources, Inc. (EDR) of Shelton, Connecticut. The databases usually present the location of the entities by street address. In many cases, this is the only reasonable means by which we may locate a database entry; the actual proximity of an entry to the subject property may not be accurately indicated by the street address given. The actual locations of selected database entries were verified in the field.

This report is expressly and exclusively for the sole use and benefit of the Client identified in Section 2.1 of this report and is not for the use or benefit of, nor may it be relied upon by, any other person or entity without the advance written consent of CEI.

3. Site Description

3.1. Site Location

- **Site Name**

  945 W. 8th Street.

- **Site Address**

  The subject property is located at 945 W. 8th Street in the City of Los Angeles, County of Los Angeles, State of California, in zip code 90017.

- **Zoning Designation**

  The subject property is located in the C2-4D (Commercial) zoning district.

- **Tax Map Designation**

  According to the Los Angeles County Office of the Assessor Parcel Viewer website, the subject property is identified as Assessor ID #: 5144-009-079 and 080.

  A copy of the Los Angeles County Office of the Assessor Parcel Viewer Property Information and tax map is included in Attachment A of this report.

- **Site Location Map and Site Plan**

  A site location map and a site plan are included in Attachment A of this report.

3.2. Site and Vicinity Characteristics

Site Characteristics	
Parcel Shape	Rectangular
Site Area	56,220
Type of vegetation	Grass-covered
Percent of site covered by vegetation	80
Surface Water Bodies	None
Type of Area	Commercial
Site Accessed Via	8th Street from the south
Primary Properties that are Adjoining the Site	Commercial

3.3. Current Uses of the Subject Property

- **Current Ownership**

  The subject property is currently owned by Maguire Properties – 755 S. Figueroa, LLC and is managed by Brookfield.

- **Description of Operational Activities**

  The subject property consists of undeveloped, grass-covered land.

3.4. Current Uses of the Adjoining Properties

The properties adjoining the site are primarily residential. The current uses of the adjoining properties are summarized in the following table:

Uses Of Adjoining Properties	
Direction	**Property Use**
North	Commercial
East	Commercial
South	Commercial
West	Commercial

CEI's site reconnaissance did not reveal evidence of any recognized environmental conditions in connection with the current uses of the adjoining properties. In addition, no violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for the adjoining properties in any of the databases reviewed for this assessment.

3.5. Physical Setting Sources

The following physical setting sources were reviewed to provide information about the topographic, hydrologic, geologic, and/or hydrogeologic characteristics of the subject property.

3.5.1. Topography and Hydrology

The subject property is located on the United States Geological Survey (USGS) 7.5Minute "Hollywood, CA" Topographic Quadrangle (1994).

According to the USGS quadrangle, the topography of the subject property is generally flat, with an average elevation of approximately 260 feet above mean sea level. Topographic slopes in the general vicinity of the subject property are towards the south.

The subject property and surrounding vicinity are depicted as being located within the

municipal limits with no site details provided.

The nearest surface water body is the Los Angeles River, which is located approximately two miles to the east.

A copy of the topographic map is included in Attachment C of this report.

The subject property did not appear o accept storm water drainage from off-site sources. Surface drainage on the subject property discharges into the municipal storm water system.

Evidence of marshy areas or vegetation typical of wetlands was not observed on the subject property.

3.5.2. Soils

According to the U.S. Department of Agriculture Natural Resources Conservation Service's Web Soil Survey of Los Angeles County, CA (2012), no soil data is available for the subject property.

However, soil at the subject property can be classified as the Urban Land Association. This association is located mainly in urbanized areas and consists of areas where the surface is covered by buildings, parking lots, or other impervious structures.

Urban land soils may consist of cut and/or fill areas that vary greatly in depth and drainage. The fill areas consist of soil, gravel, broken cement, asphalt, rock, and other material from urban construction. The permeability of these soils is variable.

3.5.3. Geology

Information concerning the geology of the subject property was obtained from the USGS Ground Water Atlas of the United States, California region (1995).

The subject property is located within the Basin and Range physiographic province, which is characterized by a series of low, north/south-trending mountain ranges and intervening valleys; the ranges and valleys were created by faulting that resulted in the formation of horst and graben structures. Basin floors are flat and filled with thick deposits of alluvium, lake sediments, and evaporites.

3.5.4. Hydrogeology

Information regarding groundwater was obtained from the USGS Ground Water Atlas of the United States (1995). The principal aquifers in the site area are the Coastal Basin Aquifers, which consist of continental deposits of sand and gravel that may be interbedded with confining units of fine-grained material, such as silt and clay.

Information regarding groundwater was obtained from the USGS Ground Water Atlas of the United States. The principal aquifers in the site area are the Los Angeles/Orange County Coastal Basins aquifers. The Los Angeles/Orange County coastal plain basin is a structural basin formed by folding of the consolidated sedimentary, igneous, and metamorphic rocks that underlie the basin at great depths. Although the subsurface structure of the basin is complex, two major northwest-trending troughs, which are separated for most of their length by an uplifted and faulted structural zone, contain the sediments that compose the aquifer system. These sediments are as thick as 30,000 feet in some areas.

The coastal plain aquifer system is made up of as many as 11 locally named aquifers. Each consists of a distinct layer of water-yielding sand and gravel usually separated from other sand and gravel beds by clay and silt confining units. A layer of clay and silty clay of marine and continental origin, which is at or near the land surface over most of the basin, is a competent confining unit where it does not contain large amounts of sand and gravel. This confining unit ranges from less than one foot to about 180 feet in thickness.

Freshwater is contained within deposits that range in age from Holocene to late Pliocene. The main freshwater body extends from depths of less than 100 to about 4,000 feet. At greater depths, the water is saline and unpotable. The freshwater body is thickest near the axis of the troughs where water-yielding sediments reach their greatest thickness and thinnest where these sediments overlie anticlines or become thin at the margins of the aquifer system.

Ground-water flow directions have been altered by withdrawals in the basin. Rapid urban development and the accompanying increase in withdrawals resulted in severe declines in water levels that began in the early 1900's. As a consequence, ground-water gradients near the coast reversed from seaward to landward in some areas in the 1920's, and saltwater intrusion was detected in 1932. Virtually the entire coastline was affected by the 1950's. The hydraulic gradient is now (1995) primarily from recharge areas toward withdrawal centers, rather than toward the ocean. Withdrawals in the deeper aquifers also have created a downward hydraulic gradient over much of the basin. Large expanses of the basin surface have been urbanized, thus decreasing the potential for direct recharge to the aquifer system and increasing the potential for saltwater intrusion.

No evidence of dry wells, irrigation wells, injection wells, water supply wells, monitoring wells, or abandoned wells were observed on the subject property.

Shallow groundwater flow generally follows topography. Based on the surface topography, CEI estimates that the groundwater flow direction in the site area may be similar to surface drainage patterns; i.e., to the south. However, it must be noted that precise groundwater depths and flow directions can only be determined through the installation and survey of groundwater monitoring wells. Actual local groundwater depths and flow directions can be influenced by such factors as topography, underground structures, seasonal fluctuations, soil and bedrock geology, production wells, and dewatering operations.

According to Los Angeles County Department of Water and Power Water Quality Report (2016) the groundwater in the vicinity of the subject property is a source of drinking water.

No evidence of dry wells, irrigation wells, injection wells, water supply wells, monitoring wells, or abandoned wells was observed on the subject property.

No oil or gas wells were observed on the subject property.

4. Records Review

4.1. Federal and State Regulatory Research

CEI obtained an environmental database report from Environmental Data Resources, Inc. (EDR) of Shelton, Connecticut. Delineated in the table below is a listing of federal and state database searches conducted by CEI for the subject property as well as the neighboring area for sites that may have an environmental impact on the subject property. Detailed information on listed sites of concern is discussed further under the appropriate headings following the table. An explanation of the acronyms used and databases searched in this section can be found in Attachment I.

The following table is a summary of the federal and state databases searched as required by ASTM E 1527-13, for the subject property as well as the neighboring area for sites that may have, or may have had, a negative environmental impact on the subject property.

DATABASE	SEARCH DISTANCE	SUBJECT PROPERTY LISTED	PROPERTIES WITHIN SEARCH RADIUS LISTED	*NUMBER OF SITES THAT POSE A POTENTIAL RISK TO THE SUBJECT PROPERTY
FEDERAL NPL	1.0-mile	NO	NONE	NONE
FEDERAL CERCLIS	0.5-mile	NO	2	NONE
FEDERAL CERCLIS NFRAP	Subject property/ adjoining properties	NO	NONE	NONE
FEDERAL CORRACTS TSD	1.0-mile	NO	NONE	NONE
FEDERAL RCRA TSD	0.5-mile	NO	NONE	NONE
FEDERAL RCRIS	Subject property/ adjoining properties	NO	2	NONE
FEDERAL ERNS	Subject property	NO	NONE	NONE
STATE SPL	1.0-mile	NO	NONE	NONE
STATE SCL	0.5-mile	NO	NONE	NONE
SWF/LF	0.5-mile	NO	NONE	NONE
LUST	0.5-mile	NO	27	NONE

DATABASE	SEARCH DISTANCE	SUBJECT PROPERTY LISTED	PROPERTIES WITHIN SEARCH RADIUS LISTED	*NUMBER OF SITES THAT POSE A POTENTIAL RISK TO THE SUBJECT PROPERTY
UST	Subject property/ adjoining properties	NO	NONE	NONE

*The potential to impact the subject property was based on several factors including, but not limited to: closure status by regulatory agencies, distance from the subject property, estimated direction of groundwater flow, soil/geologic factors, urban setting, and other reasonable factors. CEI notes that according to ASTM E 1527, Section 7.121, the search distance may be reduced at the discretion of the environmental professional based on the previously mentioned factors.

The database search generated the following information on sites within ASTM radius guidelines that may potentially impact the subject property:

Federal CERCLIS Listing: This database is a compilation of sites that the EPA has investigated or is currently investigating for a release or threatened release of hazardous substances.

Two CERCLIS facilities were identified within a 0.5-mile radius of the subject property. Both of the sites are located at distances exceeding 0.2-mile from the subject property and are topographically cross-gradient, and therefore, do not pose an environmental concern to the subject property.

Federal RCRA Generator Listings: The EPA's Resource Conservation and Recovery Act (RCRA) Program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA generator database is a compilation by the EPA of reporting facilities that generate hazardous waste.

- *Target Store T2776 (located at 725 South Figueroa Street, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as a large quantity generator of Ignitable Waste, Corrosive Waste, Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Selenium, Silver, 2-4-Dichlorophenoxyacetic Acid, Benzene, M-Cresol, Cresol, Methyl Ethyl Ketons, 1,2-Benzenediol, Nicotine & Salts, 1,2,3-Propanetriol, 2-Propane, Acetaldehyde, Benzenebutanoic Acid, Chloroform, 2H-1,3,2-Oxazaphosphorin-2amine, formaldehyde, cyclohexane, lphenylanine, phenol, reserpine, carbaryl 1-naphthalenol and reactive waste in 2016 (CAL EPA ID #: CAD981673783). No violations or other adverse data suggesting any releases or non- compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

- *CVS Pharmacy (located at 735 South Figueroa Street, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as a large quantity generator of Ignitable Waste, Corrosive Waste, Chromium, Mercury, Selenium, Silver, M-Cresol, Acetaldehyde, chloroform, formaldehyde, cyclohexane, phenol, 1,3-benzenediol, and selenium in 2010 (CAL EPA ID #: CAR000261909). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

California Leaking Storage Tanks (LUSTs): This database contains an inventory of reported LUST incidents.

- Twenty-seven LUST facilities were identified within a 0.5-mile radius of the subject property. Two of the cases within 0.2-miles from the subject property have been awarded "case closed" and do not pose a risk to the subject site. The remaining twenty-five sites are at distances exceeding 0.2-mile from the subject property. These sites do not appear to pose a risk to the subject property.

EDR Historic Cleaners Database: The EDR Historic Cleaners Database is a database that tracks the past uses as cleaners.

- *Sloan Dry Cleaners (formerly located at 735 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed under the Historic Dry Cleaners Database from 1999 to 2010. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Clothes Cleaners Pressers and Dryers (formerly located at 1010 West 7th Street, several parcels to the west, and perceived as cross gradient to the subject site)* is listed under the Historic Dry Cleaners Database from 1924 to 1937. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Dill G (formerly located at 1026 West 7th Street, several parcels to the west, and perceived as cross gradient to the subject site)* is listed under the Historic Dry Cleaners Database from in 1929. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Kelley F F (formerly located at 1028 West 7th Street, several parcels to the west, and perceived as cross gradient to the subject site)* is listed under the Historic Dry Cleaners Database in 1933. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Frank Harry (formerly located at 715 Francisco Street, Across West 7th Street, and perceived up/ cross gradient to the subject site)* is listed under the Historic Dry Cleaners Database in 1924. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

EDR Historic Auto Stations Database: The EDR Historic Auto Stations Database is a database that tracks the past uses as auto repair/servicing facility.

- *Bookmeyer Herman (formerly located at 1000 West 8th Street, across west 8th Street, to the south, and perceived as down gradient to the subject site)* was listed under the Historic Auto Stations Database from 1937 to 1942. No violations or other adverse data suggesting any

releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

- *Spitz Isadore (formerly located at 1000 Wilshire Boulevard, across West 7th Street, to the north, and perceived as up gradient to the subject site)* is listed under the Historic Auto Stations Database from 1937 to 1942. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

HAZNET Database: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. Data are from manifests submitted without correction, and therefore may contain some invalid values for data elements such as generator ID, TSD ID, Waste Category, and Disposal Method.

- *Brookfields Properties, Inc. (located at 725 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as manifesting off-specification, aged or surplus organics in 2011 (CAL EPA I.D# CAD0082522405). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Ernst and Young Plaza C/O Brookfield (located at 725 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as manifesting off-specification, aged or surplus organics, Liquids with Ph <= 2 in 2015 (CAL EPA I.D# NVT330010000). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *EYP Realty, LLC (located at 725 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as manifesting unspecified organic liquid mixture, paint sludge, unspecified organic liquid mixture, and unspecified oil-containing waste (CAL EPA I.D# CAD0082522405). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Multi Camera Photo Lab, Inc. (located at 735 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as manifesting photochemical/ photo processing waste from 1995 to 1998 (CAL EPA I.D# CAD981402522). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Esthetic Dentistry Dental Group (located at 735 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as manifesting unspecified aqueous solution in 2010 (CAL EPA I.D# CAD008364432). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.
- *Ann Taylor (located at 735 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as manifesting oxygenated solvents in 2008 (CAL EPA I.D# TXD077603371). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

- *Eye Realty LLC (located at 735 South Figueroa, adjacent to the east, and perceived as cross gradient to the subject site)* is listed as manifesting contaminated soil from site clean-up and waste oil and mixed oil in 2011 (CAL EPA I.D# CAT080013352). No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

Historic Underground Storage Tanks (HIST USTs): The Hazardous Substance Storage Container Database is a historical listing of UST sites.

- *Ralkph De Fay (formerly located at 946 West 8th Street, Across West 8th Street, to the southwest, and perceived as down/cross)* is listed as have utilized three underground storage tanks. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

Above Ground Storage Tank List (AST): A listing of aboveground storage tank petroleum storage tank locations.

- *FIGAT 7 Street (located at 735 South Figueroa Street, adjacent to the east, and perceived as cross)* is listed as utilizing one above ground storage tank. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

California Underground Storage Tanks (USTs): This database lists registered USTs that are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA) and must be registered with the state department responsive for administering the UST program.

- *Citycorp Plaza (located at 725 South Figueroa Street, adjacent to the east, and perceived as cross)* is listed as utilizing one active under ground storage tank. According to a previous Phase-I Environmental Site Assessment (Certified Environments, Inc. 2010) a 4,000-gallon diesel UST was used with an emergency generator on the site. On May 8, 2011 the UST was removed and the City of Los Angeles Fire Department awarded a "No further Action" letter to the site. No violations or other adverse data suggesting any releases or non-compliance with environmental regulations are listed for this facility in any of the databases reviewed for this assessment.

4.2. User Provided Information

The following information relating to the subject property was provided to CEI to help identify the possibility of recognized environmental conditions in connection with the subject property.

4.2.1. Freedom of Information Act Requests

CEI submitted a Freedom of Information Act (FOIA) request regarding storage tanks, chemical spills, or any other environmental responses or concerns at the subject property to the following governmental agency to obtain information indicating recognized environmental conditions in connection with the site:

Request	Name/Title/Government Agency
FOIA	Los Angeles Fire Department

Any pertinent information will be forwarded to the Client upon receipt.

A copy of the FOIA request is included in Attachment G of this report.

4.2.2. User Provided Information

Client provided CEI with a completed pre-survey questionnaire.

4.3. Historical Use Information

The following is a summary of the historical uses of the subject property and surrounding properties as determined by CEI's research of the referenced historical sources.

4.3.1. Past Uses of the Subject Property

ASTM E 1527-13 states that *"all obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier."*

The past uses of the subject property, as determined by a review of aerial photographs, fire insurance maps, historical topographic maps, city directories, and prior environmental site assessments are summarized in the following table:

Past Uses Of The Subject Property	
Years	**Property Use**
Sometime before 1890 to sometime before 1906	A cross-shaped structure, and a dwelling
Sometime before 1906 to sometime before	Structures, and a roadway

Past Uses Of The Subject Property	
Years	**Property Use**
1950	
Sometime before 1950 to sometime before 1955	Auto parking, apartments, 7th Place, and Ralph's Grocery Co.

Sometime before 1989 to present	Vacant land, walkway between structure and parking garage

CEI's review of historical information did not reveal evidence of any recognized environmental conditions in connection with the subject property.

4.4.2 Past Uses of Adjoining Properties

According to the historical information reviewed for this assessment, the adjoining properties were developed for residential structures in the early 1900's. Around the early 1950's, the adjoining properties were developed for residential and commercial structures.

CEI's site reconnaissance and review of historical information did not reveal evidence of any recognized environmental conditions in connection with the adjoining properties.

4.4.3 Aerial Photographs

CEI reviewed aerial photographs obtained from EDR to assess prior uses of the subject property and adjoining properties. The results of the aerial photograph review are summarized in the following table:

Aerial Photograph Review					
Year/ Scale	**Subject Property**	**North**	**East**	**South**	**West**

Aerial Photograph Review					
Year/ Scale	**Subject Property**	**North**	**East**	**South**	**West**
1928	Structures, and a roadway	Parking lot	Structures	Parking lots	Structure
1938	Structures, and a roadway	Parking lot	Structures	Parking lots	Structure
1947	Parking lot, structures, and a roadway	Parking lot	Structures	Parking lots	Structure
1956	Parking lot, structures, and a roadway	Parking lot	Structures	Parking lots	Structure
1965	Parking lot, structures, and a roadway	Parking lot	Structures	Parking lots	Structure
1976	Parking lot, structure, and a roadway	Parking lot	Structures	Parking lots	Structure
1989	Vacant land, walkway between structure and parking garage	Access roadway to parking Garage	Structures	Parking lots	Structure
1994	Vacant land, Walkway between structure and parking garage	Access roadway to parking Garage	Structures	Parking lots	Structure
2005	Vacant land, Walkway between structure and parking garage	Access roadway to parking Garage	Structures	Parking lots	Structure

CEI's aerial photograph review did not reveal evidence of any recognized environmental conditions in connection with the subject property or adjoining properties.

Copies of the aerial photographs are included in Attachment D of this report.

4.4.4 Fire Insurance Maps

The Sanborn fire insurance map collection consists of a uniform series of large-scale maps, dating from 1867 to the present and depicting the commercial, industrial, and residential sections of some twelve thousand cities and towns in the United States, Canada, and Mexico. The maps were designed to assist fire insurance agents in determining the degree of hazard associated with a particular property, and therefore, show the size, shape, and construction of dwellings, commercial buildings, and factories as well as firewalls, locations of windows and doors, sprinkler systems, and types of roofs. The fire insurance maps also indicate widths and

names of streets, property boundaries, building use, and house and block numbers.

CEI reviewed fire insurance maps obtained from EDR to assess prior uses of the subject property and adjoining properties. The results of the fire insurance map review are summarized in the following table:.

Fire Insurance Review					
Year	**Subject Property**	**North**	**East**	**South**	**West**
1890	A cross-shaped structure, and a dwelling	Undeveloped	A dwelling and a shed	Undeveloped	A dwelling
1906	Apartments, Potter's Park Avenue, Good Samaritan Hospital	Apartments, Good Samaritan Hospital	Flats and Apartments	Dwellings and Lodging	Flats and Apartments
1950	Auto parking, Apartments, 7th Place Ralph's Grocery Co.	Auto parking	Garage	Auto parking	Medical/ Dental Bldg, Apartments, Dance Hall
1955	Auto parking, Apartments, 7th Place	Auto parking	Garage	Auto parking	Medical/ Dental Bldg, Dance Hall
1958	Auto parking, Apartments, 7th Place	Auto parking	Garage	Auto parking	Medical/ Dental Bldg, Dance Hall
1963	Auto parking, Apartments, 7th Place	Auto parking	Garage	Auto parking	Medical/ Dental Bldg, Dance Hall
1970	Auto parking, Apartments, 7th Place	Auto parking	Garage	Auto parking	Medical/ Dental Bldg

CEI's fire insurance map review did not reveal evidence of any recognized environmental conditions in connection with the subject property or adjoining properties.

Copies of the fire insurance maps are included in Attachment E of this report.

4.4.5 Historical Topographic Maps

CEI reviewed available historical topographic maps to assess prior uses of the subject property. The results of the topographic map review are summarized in the following table:

Historic Topographic Map Review

Year/Scale	Subject Property	North	East	South	West
1953	*	*	*	*	
1966	*	*	*	*	
1972	*	*	*	*	
1981	*	*	*	*	
1994	*	*	*	*	

*Structures and other improvements are not typically depicted for properties located within municipal boundaries.

CEI's historic topographic map review did not reveal evidence of any recognized environmental conditions in connection with the subject property or adjoining properties.

Copies of the topographic maps are included in Attachment C of this report.

5. Site Reconnaissance

On March 16, 2017, Mr. Zachary Fisk of CEI conducted a site reconnaissance to examine the subject property and surrounding area for recognized environmental conditions. Mr. Fisk was escorted by Michael Starkey, Assistant Security Director of the subject property.

The weather conditions at the time of the survey were sunny with temperatures in the mid to upper 70-degree Fahrenheit range. Visibility was unimpaired.

5.1. Methodology

The site reconnaissance consisted of walking the perimeter and interior area of the subject property.

Photographs of the subject property were taken to document existing site conditions and are included and described in Attachment B of this report.

5.2. Building Construction and Utilities

- **Building Construction**

  The subject property is currently undeveloped. There are no structures present at the subject property.

- **Utilities**

No utilities are supplied to the site.

- **Potable Water Supply**

According to the Los Angeles County Department of Water and Power Water Quality Report (2016), the potable water supply meets county, state, and federal drinking water standards.

A copy of the water quality report is included in Attachment H of this report.

5.3. Chemicals in Connection with Identified Uses

No hazardous substances or activities involving the use of hazardous substances were observed on the subject property on the date of the site survey. In addition, the regulatory records review and interviews did not reveal evidence of operations involving the use of hazardous substances or petroleum products at the site.

5.4. Waste Generation, Storage, and Disposal

Hazardous Waste

No evidence that hazardous wastes are generated, treated, stored, or disposed at the subject property was observed on the date of the site survey. In addition, the regulatory records review and interviews did not reveal evidence of any activities involving the production of hazardous wastes at the site.

5.5. Storage Tanks

No visual evidence that would indicate the existence of past or present underground storage tanks (USTs) and/or aboveground storage tanks (ASTs) or equipment that would require the use of USTs and/or ASTs was observed by CEI on the subject property on the date of the site survey. Additionally, the interviews, historical information review, and regulatory database review conducted for this assessment did not reveal evidence of past or present USTs and/or ASTs on the site.

5.6. Polychlorinated Biphenyls

Polychlorinated biphenyls (PCBs) are organic chemical compounds that were used extensively in electrical equipment from the late 1920s until the EPA banned their manufacture in 1978. Since PCBs are good insulators and are non-flammable, they were widely used as coolants and lubricants in oil-filled electrical equipment such as electrical transformers and capacitors, hydraulic elevators, and hydraulic service bay lifts. The subject property was investigated for the presence of equipment that could contain PCBs. Per ASTM E 1527-13 and the Client's scope of work, the site survey did not include the investigation of light ballasts, which could also contain PCBs.

The subject property is currently undeveloped. There are no structures present at the subject property. No potential PCB-containing equipment was observed on the subject property on the date of the site survey.

5.7. Indications of Solid Waste Disposal

CEI did not observe evidence of any dumping or direct burial activity (such as filled areas, mounds, or depressions) on the subject property at the time of the site survey.

5.8. Other Conditions of Concern

CEI also examined the subject property for evidence of the following environmental concerns:

Condition of Concern	Not Observed	Observed	Concern
Chemical/Petroleum Odors	X		N/A
Pools of Liquid	X		N/A
Stains or Corrosion	X		Low
Unidentified Containers	X		N/A
Pits, Ponds, or Lagoons	X		N/A
Stained Soil or Pavement	X		N/A
Stressed Vegetation	X		N/A
Stains or Corrosion	X		N/A

5.9. Asbestos

The subject property is currently undeveloped. There are no structures present at the subject property therefore no asbestos-containing materials (ACM), lead-based paint, lead in drinking water, and radon gas issues are currently identified.

5.10. Radon

The subject property is currently undeveloped. There are no structures present at the subject property therefore no radon gas issues are currently identified

6. Findings, Conclusions, and Recommendations

Certified Environments, Inc. (CEI) has conducted a Phase I ESA in conformance with the scope and limitations of ASTM Standard E 1527-13 of the Hyde Park Village (the subject property). Any exceptions to, or deletions from, this practice are described in Section 2.4 of this report.

The subject property is currently undeveloped. There are no structures present at the subject property therefore no asbestos-containing materials (ACM), lead-based paint, lead in drinking water, and radon gas issues are currently identified.

Recognized Environmental Conditions

This assessment has revealed no evidence of recognized environmental conditions in connection with the subject property.

Historical Recognized Environmental Conditions

This assessment has revealed no evidence of historical recognized environmental conditions in connection with the subject property except for the following:

No additional investigation or remedial action is recommended at this time

Although no known environmental concerns were identified in this assessment of the subject property, there is always the potential for unforeseen or abandoned underground storage tanks/drums or contaminated soil. Prior to any substantial excavation of the property, it is recommended to conduct a limited subsurface study to identify any abandoned UST's tanks or drums not identified in the available records reviewed in this assessment. Some limited soil investigation is also recommended prior to excavation for foundations and/or a subterranean parking garage.

This summary is not to be used alone. The report must be read in its entirety.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2006. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 332 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

Environmental Site Assessment

Pre-Survey Questionnaire (PSQ) for Vacant Land

CEI

INSTRUCTIONS – The following questionnaire is necessary to complete the required due diligence process for the assessment of the property. Property management is requested to review and answer Environmental questions contained in this document.

If an attachment is available to respond to the question, please label the document and note the number in the appropriate box. Please complete **all** requested sections of this PSQ and submit all available information and materials to CEI prior to our site visit. This will allow us to review the information before the site visit and minimize questions and time required for such during the walk through survey of the property.

GENERAL INFORMATION	RESPONSE
1. Property Name	
2. Property Use	
3. Address	
4. County and Local Jurisdiction (city, town, village, township, etc.)	
5. Term of the Loan	_____ Years
6. What is the reason for the Assessments?	Financing / Acquisition
8. Provide a site plan	
9. Provide a copy of the applicable tax map	
10. Give the Lot #, Block #, Parcel #, or other property I.D. #, etc. as indicated on your Tax Bill and provide a copy	
11. What is the property zoning classification? Is the use conforming or special exception, if known?	
12. What is the FEMA flood hazard zone, if known?	
13. Legal name of owner or ownership group and contact	
14. Name of management company and property manager	
15. Date when the property was first developed, if applicable	
21. Site Area (SF or acres)	

23. Provide utility providers names and phone #s at the subject property:

Domestic Water _____ Natural Gas _____

Sanitary Sewer _____ Telephone _____

Storm Sewer _____

ENVIRONMENTAL QUESTIONNAIRE

1. Has the purchase price of the property been reduced due to environmental impairment? If so, please provide an explanation for the reduced price. _____
   _____
   _____
2. Are there any environmental liens currently recorded against the subject property? If so, please provide an explanation. _____
   _____
3. Do you have any specialized knowledge of any recognized environmental conditions in connection with the property? If so, please provide an explanation. _____
   _____
   _____
4. Please provide a description of the past uses of the subject property. _____
   _____
   _____
5. Are there any dry wells, irrigation wells, injection wells, water supply wells, monitoring wells, or abandoned wells on the subject property? If so, please provide all pertinent information regarding the wells (description, construction details, analytical testing results, permits, etc.) _____
   _____
   _____
6. Is there or has there ever been a septic system used at the subject property? If so, please provide all pertinent information regarding the system (description, construction details, analytical testing results, permits, etc.)
   _____
   _____
7. Do you have any knowledge of the following operations, currently or historically, at the subject property, if so, please explain and provide any pertinent documentation:

   a) Chemical manufacturing/storage _____

   b) Dry cleaning: YES ☐ NO ☐ Don't Know ☐ **(Drop-off only)** ☐
      - Is the system a Closed Loop System: YES ☐ NO ☐ Don't Know ☐
      - On what floor level is the dry cleaning machine located _____

   c) Petroleum storage (USTs/ASTs):
      - Number of USTs/ASTs, Size of USTs/ASTs: _____
      - Are the USTs/ASTs registered and what is there purpose:_____

   d) Automobile uses (service, storage, disposal, etc.) _____

   e) Electronic assembly or manufacturing _____

   f) Landfill _____

   g) Printing facility _____

   h) Any other facility that potentially utilized hazardous materials and/or generated hazardous waste
      _____

Re: 945 W. 8th Street, (Mostly vacant lot w/ Covered Walkway Connecting parking to Target Retail Store) @ Los Angeles, CA, 90017

Dear Sir or Madam,

We are requesting the date of the last fire inspection at the above referenced property address as well as information about past or present fire code violations (if any) and a copy of the last Reg-4 (if applicable) or Annual Life/Safety Inspection, and the last 5-Year wet Fire Sprinkler Inspection (if applicable).

Additionally, please provide any documents on file regarding underground storage Tanks (UST), Leaking Underground storage Tanks (LUST), and Hazardous Materials (HAZMAT) associated with the Subject Address.

This request is in part to a due diligence protocol established by the Subject Property's commercial mortgage holder.

Please email any pertinent documents from the records research to architect@zacharyfisk.com or mail via US Post Office at the P.O. Box listed below.

Please notify us if an additional research fee applies. If you have any questions, please do not hesitate to email or call me.

Thank You,

Zachary Fisk

Water Quality in Los Angeles

A Message from Albert Gastelum

Director of Water Quality

In Los Angeles, having easy access to safe, clean tap water is something that can be taken for granted easily. More often than not, the water flows from the tap without incident and you need not worry about it at all. But recent headlines about failed water systems in Flint, MI and Corpus Christi, TX have shed light on how valuable safe drinking water truly is, no matter where you might live, and just what it entails to produce high quality water. Understandably, these headlines led LADWP customers to ask questions about the quality and safety of their tap water. We at LADWP are pleased to engage in these conversations and share the facts about LA's drinking water.

LADWP's mission and promise is to continue providing safe and reliable drinking water to all our customers. All of our efforts in the field, at our treatment facilities and at our laboratories, guarantee that the water served to you meets all drinking water standards. We take great pride in the fact that LA's water is the safest, most reliable and affordable for our customers at half a penny per gallon. In 2016, we supplied nearly 160 billion gallons of safe, clean drinking water to to more than four million Angelenos. Over the 12-month period, our water quality team collected nearly 40,000 water samples throughout the city and conducted more than 140,000 water quality tests for compliance as well as for research and operational improvements. We tested for more than 200 regulated and unregulated contaminants and constituents of interest such as sodium and hardness.

As we move forward with our daily efforts, we seek innovative and proven technologies to improve our operational effectiveness and delivery of safe water. In 2016, we employed new technology that changed the conventional, and wasteful, flushing approach to cleaning distribution pipes by utilizing technology to achieve the same water quality improvement result without the water waste.

Ensuring that the water that comes into your home or business surpasses all state and US drinking water regulations is our highest priority at LADWP. We value your trust as we strive to increase the reliability of our water system and to continue providing the highest quality water for you and your family.

Investing in Reliability, Water Quality and LA's Water Future

A Message from Richard Harasick

LADWP Senior Assistant General Manager, Water System

With the recent rate proposal approved and implemented in early 2016, LADWP is firing on all cylinders continuing to build LA's water future while providing the highest quality water to all of our customers. Every day, our team of dedicated employees ensures that we meet our reliability and service commitments to our customers while we work to reduce our reliance on imported water, and repair our aging infrastructure.

Over a year ago, we broke ground on a project in the Northeast San Fernando Valley to replace a 90-year-old pipe. The Foothill Trunk Line is one of the city's longest, and LADWP is upsizing a three-mile section with a 54-inch diameter pipe and earthquake resistant ductile iron pipe where the project crosses known earthquake faults. This is just one of many pipe replacement projects underway throughout the city. In fiscal year 2015-16, our crews replaced more than 32 miles, surpassing our fiscal year goal. This year, we expect to replace another 35 miles. Based on past experience, we know that the pipe replacement program has a direct correlation to decreasing the number of leaks in our system over the last decade. In fact, LADWP's leak rate is 17 for every 100 miles, better than the national industry average of 25 per 100 miles.

LADWP is also continuing to pursue conservation, recycled water, groundwater replenishment and stormwater capture programs in order to improve our overall water supply reliability. We concluded 2016 by meeting the Mayor's target for water use at 104 gallons per capita per day. We also joined forces with the Los Angeles County Flood Control District in the summer to begin the work of enhancing the 150-acre Tujunga Spreading Grounds in Sun Valley. This important project will help increase our stormwater capture capacity to enhance local water supplies and recharge the local aquifer right here in our backyard.

Rest assured we are investing your rates in improvements that will last into the next century. All of the research we have conducted through the years has meant the continued pursuit and implementation of innovative and cutting-edge technology at the forefront of water quality treatment: shade balls to protect water quality at our open air reservoir; a state-of-the-art ultraviolet disinfection facility that treats water to meet federal drinking water standards; and groundwater basins replenished with recycled water, complete with a high-tech online monitoring system.

Every step we have taken in the past century has helped transform us into the 21st century water system that we are today. We are proud of all the work we have done and continue to do to strengthen our infrastructure to secure a sustainable water future.

Water Quality in the News

Water quality is always a topic of interest. Occasionally, some aspect of water quality or water safety will make the news. The articles below include topics covered in 2016. For more information, visit www.ladwp.com/waterquality.

Health Advisory Established by US EPA for Two Fluorinated Compounds

In May 2016, the US Environmental Protection Agency (US EPA) established a Health Advisory for two fluorinated organic chemicals that may be found in drinking water: perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS).

The advisory level of drinking water for the combined presence of PFOA and PFOS is 70 parts per trillion. A part per trillion is analogous to one ounce in 7.5 billion gallons of water. This health advisory level offers a margin of protection to the public from potential adverse health effects resulting from exposure to PFOA and PFOS in drinking water over a lifetime of consumption.

LADWP conducted special monitoring for all of its source water for six fluorinated chemicals, including PFOA and PFOS in 2013 and 2014 as part of the US EPA's third unregulated contaminant rule (UCMR3). No fluorinated chemicals were detected. Our water sources are not subject to contamination by fluorinated chemicals; testing confirms this observation.

US EPA Health Advisories are not regulations, but are intended to provide technical guidance to states, public water agencies and public health officials on health effects, analytical methodologies, and treatment technologies associated with drinking water contaminants that are not regulated.

If you are concerned about the potential of fluorinated chemicals in your water, you may want to consider a point-of-use (POU) water treatment device. A study by the Minnesota Department of Health rates 11 POU devices as effective in removing fluorinated chemicals from drinking water.

Harmful Algal Blooms and Algal Toxins

In May 2015, the US EPA issued a Health Advisory for two algal toxins: microcystin and cylindrospermopsin. In June 2016, the US Centers for Disease Control set up the One Health Harmful Algal Bloom System to collect data on the occurrence of harmful algal blooms.

Algae are simple plants that can range in size from microscopic to giant kelp. The group of plants known as algae include a bacterium called cyanobacteria. Cyanobacteria are commonly referred to as blue-green algae. Needing only sunlight, carbon dioxide, and just a few nutrients to grow, microscopic algae and cyanobacteria can grow very quickly forming vast masses called algal blooms. When algal blooms occur, they can grow extremely fast. Algal blooms may appear as green tinted water or floating mats.

Most algae are harmless and important to marine and freshwater ecosystems; however cyanobacteria can produce toxins, which can adversely affect humans and animals. Exposure to or ingestion of water containing cyanobacteria or "cyanotoxins" can result in allergic reactions, headache, nausea, cramps, fever and vomiting. In extreme cases, health effects can result in respiratory arrest, seizures, or kidney and liver failure. For many years, LADWP has monitored routinely for microcystin along the Los Angeles Aqueduct system and have only detected microcystin once.

Lead and Drinking Water in LA

The high level of lead in the drinking water of Flint, MI has raised public awareness, and some concern, about lead and other drinking water contaminants. LADWP is in accordance with state and federal drinking water standards for all contaminants, including lead.

Lead is commonly found throughout our environment – in the air, in the soil, and in homes with old lead-based paints. Fortunately, lead is not found in any of the city's water sources. LADWP has participated in the federal Lead and Copper Rule (LCR) sampling program since 1991 and has taken steps to eliminate lead in our distribution system. Los Angeles has and continues to be in compliance with the lead and copper regulation, based on residential sampling. Even so, LADWP has an approved corrosion control plan to further minimize lead exposure at the tap.

LADWP most recently conducted LCR residential sampling in 2015. To find the LCR results, see Table I (cont'd) on page 14.

The LCR sampling program targets single family residences which were built from 1982-1987 that have copper pipes plumbed with lead solder. Customers with qualifying homes that participate in the sampling program will get their tap water tested for lead and copper at no cost. Customers who think their home may qualify can participate in LADWP's next round of LCR sampling. Contact Mr. Tom Dailor at (213) 367-0921.

In Los Angeles, the main source of lead in drinking water is household plumbing, primarily in homes built before 1986 where lead solder was used to join copper pipes. In 1986, federal law banned the use of lead-based solder in drinking water systems, including household plumbing. So homes built after that year are not expected to contain lead solder in the plumbing. The amount of time water remains in home plumbing will determine how much lead could potentially leach into the tap water. The longer water remains in the pipes, the more likely lead can be detected.

If you are concerned about lead in your water, you may wish to have your water tested. Please see "Water Quality at Home" on page 9 of this report for more information on lead testing and filter systems. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is also available from the Safe Drinking Water Hotline or at www.epa.gov/lead.

Shade Balls for Water Quality and Water Conservation

LADWP has increased the use of shade balls in our open air reservoirs over the past few years. The safe and beneficial use of shade balls is significant in improving drinking water quality and conserving water. Water quality is enhanced by reducing the amount of chlorine used to control algae and has the added benefit of reducing the formation of disinfection byproducts. Water conservation is achieved with shade balls by reducing the amount of evaporation in our open reservoirs. The money saved in treatment costs and prevented water loss makes the safe and effective use of shade balls a win-win for our customers. For more information on shade balls, see www.ladwp.com/waterquality>Fact Sheets & Brochures>Shade Ball Facts.

Where Does LA Get the Water It Needs?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

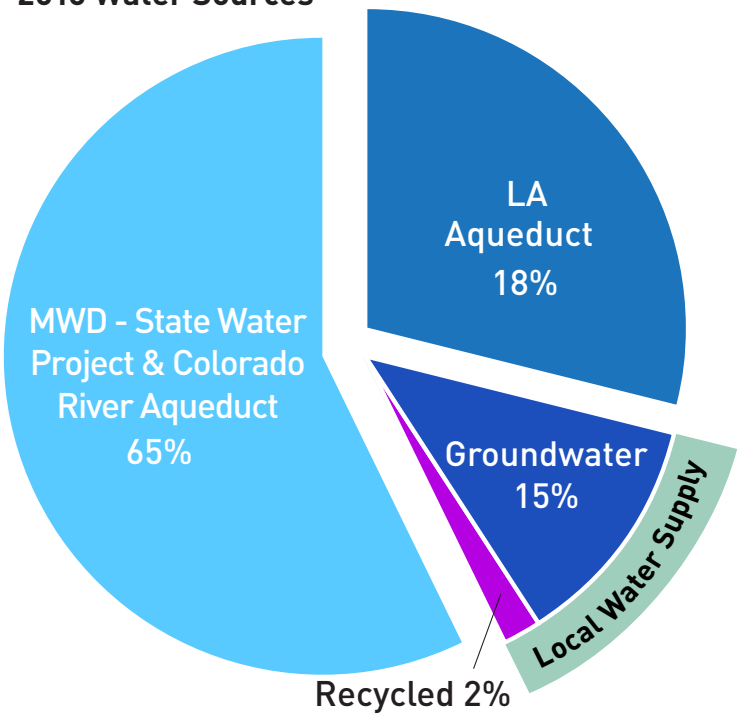
- Microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants that can be naturally-occurring or be the result of oil and gas production and mining activities.

LA's Water Sources

In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (US EPA) and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the US EPA's Safe Drinking Water Hotline (800) 426-4791.

2016 Water Sources



Important Notice

Chloramine Disinfectant
Chloramine requires different treatment for certain water uses. If you maintain a pond or aquarium, you must provide adequate treatment to remove both the chlorine and ammonia as both are toxic to fish. For more information, please visit www.ladwp.com/waterquality or call (800) DIAL-DWP.

Regulatory Compliance
How do we measure up?

Meeting the highest federal and state standards for the city's drinking water guides our water operations. We are investing in major infrastructure projects to meet drinking water regulations, such as the Long Term 2 Enhanced Surface Water Treatment Rule (LT2). Our major efforts to comply with the regulation include addressing the five remaining uncovered treated water reservoirs, constructing an ultraviolet (UV) treatment facility to meet the LT2 requirements for Los Angeles Reservoir, and continuing to find new ways to reduce disinfection byproducts without compromising public safety.

Notice of Violations of Drinking Water Regulations

LADWP works around the clock to ensure that the drinking water we deliver to our customers is of the highest quality and meets all safety regulations. Water quality is our highest priority at each of the City's water treatment facilities and treatment protocols are followed hundreds of times each day, year-round. In 2016 however, we experienced a momentary lapse in treatment at the 99th Street Wells Water Treatment Facility, and failed to notice a malfunctioning turbidity meter at the Los Angeles Aqueduct Filtration Plant (LAAFP). The two events are summarized below. We take these lapses seriously and have implemented additional steps to ensure continuous treatment. The State enforcement actions can be found at http://www.swrcb.ca.gov/drinking_water/programs/DWPEnforcementActions.shtml, under PWS number 1910067.

Groundwater Rule Treatment Violation

In January 2016, a six-hour lapse in treatment at the 99th Street Wells Water Treatment Facility resulted in a violation of the Groundwater Rule. The 99th Street facility treats water served to customers in the Green Meadows and Watts neighborhoods. An automated alarm sounded to alert the water treatment operator, but it was missed, resulting in delayed response. When the problem was discovered at approximately 1:00 a.m., LADWP staff responded to the site and fixed the treatment equipment. Public notification was issued to all customers served by the facility. More safeguards are in place to prevent this from happening again. For complete details, visit www.ladwp.com/waterquality/Tier2TreatmentViolation or call (213) 367-0921.

Surface Water Treatment Rule Monitoring Violation

On June 16, 2016 the State Water Resources Control Board, Division of Drinking Water issued a citation to LADWP for failing to adequately monitor its drinking water supply for turbidity.

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether your drinking water meets health standards. During a 12-hour period on March 4, 2016, we did not monitor for turbidity at one of the 24 individual turbidity meters at the LAAFP, and therefore, could not be sure of the quality of your drinking water during that time. The monitoring failure was the result of an equipment malfunction and operator error.

The Surface Water Treatment Rule and Safe Drinking Water Act require that we monitor continuously for turbidity at each of the 24 filters at the LAAFP. Automated turbidimeters with alarm settings are used for continuous monitoring. In the event of a meter malfunction or maintenance lapse, turbidity samples must be collected and analyzed manually every four hours.

During the March 4 incident, a meter malfunction did not trigger an alarm because the alert level had been set too low. The malfunction was not discovered for 12 hours or properly reported by water treatment operators. In addition, only one sample was collected and analyzed during the period.

The meter was repaired on March 4 and operational changes have been implemented to prevent a re-occurrence.

Turbidity has no health effects. However, high levels of turbidity can interfere with disinfection and provide a medium for microbial growth. Turbidity may indicate the presence of disease-causing organisms. These organisms include bacteria, viruses, and parasites that can cause symptoms such as nausea, cramps, diarrhea, and associated headaches.

We do not believe that the turbidity monitoring error compromised the safety of the water supply because:

- Source water quality and quantity were stable during the period.
- Treatment chemical residuals were normal.
- The other 23 filters were operating properly.
- LAAFP has a multiple barrier treatment scheme (filtration, UV disinfection, chlorine, and ozone) which provides added protection against potential pathogens.

The March 4, 2016 incident did not pose a health risk to our customers, and there is nothing you need to do at this time. Since this incident, LADWP has continued to monitor the turbidity of the water at LAAFP, and has continuously met the requirements of the Surface Water Treatment Rule and Safe Drinking Water Act. LADWP is notifying

all customers in accordance with state drinking water notification regulations. Complete details are available on www.ladwp.com/waterquality/Tier3MonitoringViolation. Questions regarding the citation or our response should be directed to Ms. Melinda Rho, LADWP Manager of Regulatory Planning and Compliance at melinda.rho@ladwp.com.

Please share this information with all the other people who drink this water, especially those who may not have received this public notice directly (for example, people in apartments, nursing homes, schools, and businesses).

Assessment Programs for Surface and Groundwater Sources

Surface Supply: In 2015, we completed a new assessment of the Owens Valley and Mono Basin watersheds that supply the Los Angeles Aqueduct. These sources are most vulnerable to geothermal activities that release naturally occurring arsenic into creeks that feed the Owens River. Other activities that impact water quality in these watersheds are livestock grazing, wildlife, and unauthorized public use of storage reservoirs. The impact to water quality from these activities is deemed to be minimal. Regular monitoring for Cryptosporidium and Giardia indicates that their presence is infrequent and at very low levels.

Groundwater Supply: Assessment for groundwater sources in the San Fernando and Sylmar Basins was updated in 2013. Assessment for groundwater sources in the Central Basin was completed in March 2002 but will be updated within the next 12 months. Located in highly urbanized areas, the local wells within these aquifers are most vulnerable to the following activities: dry cleaning, chemical processing and storage, fertilizer and pesticide storage, metal finishing, and septic systems. The local groundwater supplies are managed with treatment and blending of water from other sources to ensure compliance with drinking water standards. A copy of the surface water and groundwater assessments can be obtained by contacting Tom Dailor of LADWP Water Quality Regulatory Affairs at (213) 367-0921.

Purchased Supplies: The Metropolitan Water District of Southern California (MWD) updated the sanitary survey of the Colorado River watershed in 2010. The Colorado River Aqueduct supply is considered to be most vulnerable to recreation, urban, and stormwater runoff, increasing urbanization in the watershed and wastewater. The California Department of Water Resources (DWR) updated the State Water Project sanitary survey in 2011. The State Water Project supply is considered to be most vulnerable to urban and storm water runoff, wildlife, agriculture, recreation, and wastewater. A copy of the assessments can be obtained by contacting MWD at (800) 354-4420.

Safeguarding Our Surface Water

Administered by the State Water Resources Control Board, Division of Drinking Water (SWRCB-DDW), the Surface Water Treatment Rule (SWTR) is a set of drinking water regulations that establish specific treatment requirements for surface water to reduce the risk of waterborne diseases. In Los Angeles, the SWTR also applied to four of 10 uncovered reservoirs: Lower Stone Canyon, Encino, and Upper and Lower Hollywood. We successfully met the compliance deadlines and treatment requirements for all four reservoirs.

The last update to the SWTR is the Long Term 2 Enhanced Surface Water Treatment Rule (LT2). This rule protects treated water reservoirs from microbiological contamination by requiring one of three actions: 1) covering, 2) removing from service, or 3) providing additional treatment. LT2 applies to the six remaining uncovered reservoirs: Los Angeles, Upper Stone Canyon, Santa Ynez, Ivanhoe, Silver Lake, and Elysian.

On March 31, 2009, a compliance agreement for LT2 was executed between LADWP and SWRCB-DDW. We are working diligently to bring all reservoirs into compliance as quickly as possible, but no later than the dates specified in the compliance agreement.

Santa Ynez Reservoir was removed from service in November 2010 for the installation of a floating cover and was placed back in service as a covered reservoir in May 2011.

Silver Lake and Ivanhoe Reservoirs. Silver Lake Reservoir was officially removed from service on December 31, 2013. An extension for additional work necessary to isolate Ivanhoe Reservoir has been granted due to unexpected delays in the commissioning of Headworks East Reservoir, which replaces Ivanhoe's storage capacity. Headworks East Reservoir came online in December 2014 and the construction of Headworks West Reservoir began in 2015. The Headworks Reservoir complex will provide the necessary system reliability when completed in late 2018 to allow Ivanhoe Reservoir to be removed from service.

Upper Stone and Elysian Reservoirs. In January 2012, the Board approved the Final Environmental Impact Report for a floating cover on Upper Stone Canyon Reservoir and followed with a similar action in April 2012 for the Elysian Reservoir. After much deliberation, the Board approved the most practical and cost-effective solutions for each reservoir: floating covers which will save LADWP customers over $100 million. Upper Stone Canyon's final design was completed and the construction bid was issued in September 2016; Elysian Reservoir was removed from service in December 2015 and construction of the Elysian Reservoir cover is expected to be complete by February 2018.

Go to www.ladwp.com/waterquality to learn more about water quality projects and issues.

Los Angeles Reservoir. Los Angeles Reservoir will remain in service. The "shading" of the reservoir was completed in 2015 when the last of nearly 100 million shade balls were deployed to control disinfection byproducts and algae. A new ultraviolet (UV) treatment plant will be built to meet new disinfection requirements for the water leaving the reservoir. Design of the UV facility has been completed and construction is expected to begin in 2017; it will be completed in 2022.

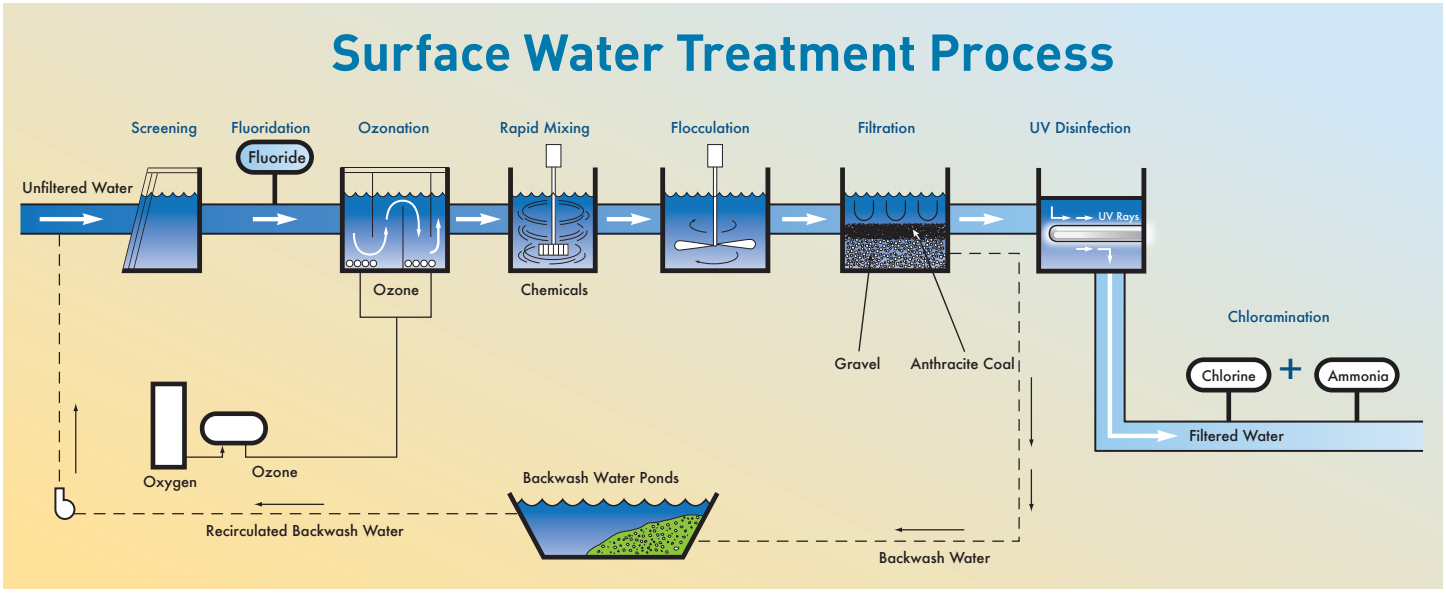
Water Treatment Process

Surface Water Treatment

LADWP water comes from four different sources—three are from surface water sources like lakes and rivers and the other is groundwater from local wells and springs. The taste and appearance of surface water can vary seasonally and groundwater generally contains more minerals. All these factors make for different tasting water. Despite these variations, LADWP water meets all drinking water standards for health and aesthetics. All water coming from the Los Angeles Aqueduct, the State Water Project and the Colorado River Aqueduct is filtered and treated to ensure safe drinking water for Los Angeles.

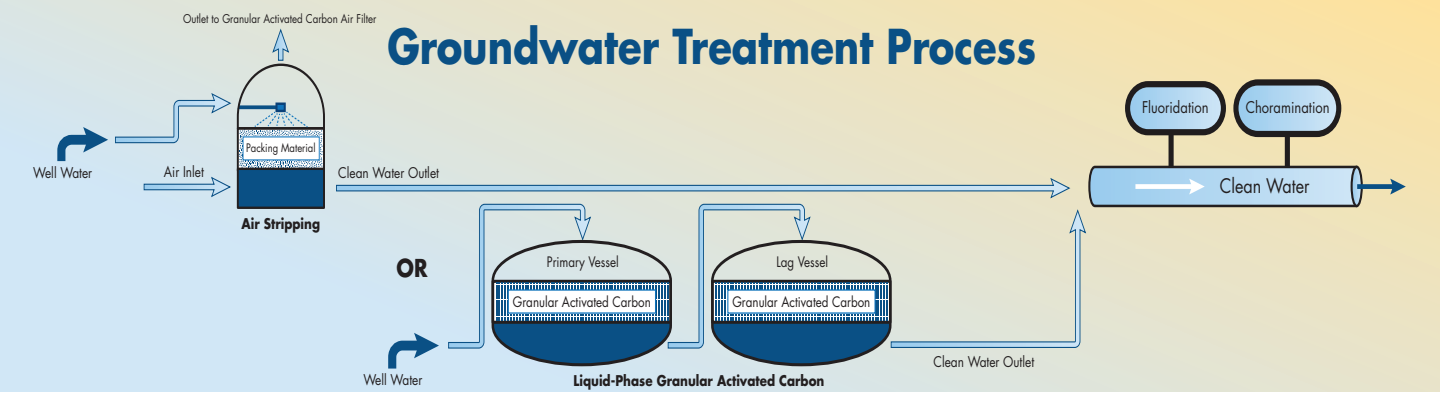
Water from the Los Angeles Aqueduct and the State Water Project is treated at the Los Angeles Aqueduct Filtration Plant as follows:

Water flows into the filtration plant by gravity and travels through screens to remove environmental debris such as twigs and dead leaves. Fluoride is adjusted to the optimal level to promote oral health by strengthening tooth enamel. Ozone, a super-charged oxygen molecule and a powerful disinfecting agent is injected into the water to help particles clump together and to improve the water's taste and appearance. Treatment chemicals are quickly dispersed into the water to make fine particles called "floc." A six-foot-deep filter composed of crushed coal over gravel removes the floc and previously added chemicals. In May 2014, we commissioned a new advanced process at the filtration plant, the Dr. Pankaj Parekh Ultraviolet (UV) Disinfection Facility, which replaces ozone as the primary disinfectant for surface water. The water goes through UV purification which has been identified as one of the most effective methods of drinking water treatment by the US EPA. Then chlorine and ammonia are added during the final step to ensure lasting disinfection and to protect the water as it travels through the city's large distribution system to your tap.



Groundwater Treatment

The city has vast groundwater supplies in the San Fernando and Central Basins. We pump from the clean parts of the basins and disinfect groundwater with chlorine and ammonia as a safeguard against microbial pathogens. As a standard practice, the City of Los Angeles has been disinfecting all groundwater sources since the 1920s. Some areas in the San Fernando Basin have been contaminated as a result of industrial activities. Since discovering man-made contaminants in the San Fernando Basin groundwater wells, we continuously monitor and ensure that the groundwater meets drinking water quality standards by minimizing the substances by treatment or blending. The treatment process currently in place for groundwater treatment is shown below. To recover the use of all water in the San Fernando Basin and to expand our local water supplies for emergency and drought, we are designing a comprehensive treatment facility to remove groundwater contaminants. To date, we have completed the initial characterization and source assessment of the San Fernando Basin and have begun the initial design phase. Future facilities may use state-of-the-art processes like advanced oxidative process, ultraviolet, and biological treatment. Our goal is for this treatment system to be fully operating by year 2022.



Water Quality at Home

Q: Is there lead in my water?

A: No. The water we deliver to you has no lead. We test the water regularly and find no detectable amounts of lead in any of our water sources or only trace amounts in the distribution system. To see the results of our most recent lead and copper analyses, see page 14.

However, there are two potential sources of lead in tap water. The most common source of lead is your faucet. Some manufacturers previously used metal alloys that contain a significant amount of lead. When water remains in the faucet, without being used for several hours, lead from the faucet can dissolve into the water. Then, when you turn the faucet on, the water that comes out for the first 20 or 30 seconds may contain lead. Similarly, copper pipes joined with lead-based solder in your plumbing system, is another potential source of lead. This source should not be significant if your home was built after 1990, because lead-based solders were banned in the United States in 1986.

If you would like to test the water in your home or business, services are available from private laboratories for a fee. A lead test usually costs around $50. You can obtain references for qualified laboratories by contacting the California State Water Resources Control Board, Laboratory Accreditation Program at (916) 323-3431.

Here are a few simple steps you can follow to minimize your exposure to lead from your faucet:

- If a faucet has not been used for more than six hours, let the cold water run for about one minute before using the water for cooking or drinking. You may want to capture and use this water for irrigation.
- Do not use hot tap water for cooking or drinking. Lead dissolves more readily from pipes that carry hot water.
- Periodically (approximately every three months) remove the faucet aerator, let the hot water run for 30 seconds to flush out debris, clean the aerator and reinstall.
- If you replace a faucet, select a new one that complies with the provisions of the National Sanitary Foundation (NSF) ANSI 61 Standard. Compliance is usually identified on the package.

If you determine there is lead in your tap water, a list of a list of NSF-certified lead-free water faucets and plumbing materials is available by contacting the NSF Consumer Affairs or (800) 673-6275 or by going to www.NSF.org. Also, check that any faucet you are planning to purchase is NSF-approved. If you choose a water filter, you should follow the installation and maintenance instructions very carefully. An improperly installed or poorly maintained filter can adversely affect the quality of your water.

TIP! To get the freshest, best tasting tap water, fill a container from a well-used faucet and store it in the refrigerator.

2016 Drinking Water Quality Monitoring Results

Tables I-III list the results of water tests performed by LADWP and MWD from January to December 2016. LADWP tests for over 200 substances. These tables include only substances with values that are detected.

How to Read the Tables

The substances found in the water served in your area are listed as follows:

- For **San Fernando Valley Area** – water test results are under the Los Angeles Aqueduct Filtration Plant, the Northern Combined Wells, and MWD Jensen Filtration Plant columns
- For **Western Los Angeles Area** – water test results are under the Los Angeles Aqueduct Filtration Plant column
- For **Central Los Angeles Area** – water test results are under the Los Angeles Aqueduct Filtration Plant and the Southern Combined Wells columns
- For **Harbor/Eastern Los Angeles Area** – water test results are under the MWD Jensen, Weymouth, and Diemer Filtration Plants columns

Some substances are reported on a citywide basis as required by the State Water Resources Control Board - Division of Drinking Water [SWRCB-DDW].

Abbreviations

ACU = apparent color unit
CFU/mL = colony-forming unit per milliliter
< = less than the detection limit for reporting purposes
µg/L = micrograms per liter (equivalent to ppb)
µS/cm = microSiemens per centimeter
mg/L = milligrams per liter (equivalent to ppm)
NTU = nephelometric turbidity units
NA = not applicable
NR = not reported
NT = not tested
NUM/100 mL = number per 100 milliliter
% = percentage
pCi/L = picoCuries per liter
TON = threshold odor number

Unregulated Contaminant Monitoring Rule

The Unregulated Contaminant Monitoring Rule (UCMR) is a special program developed by the U.S. Environmental Protection Agency (US EPA) that requires public water systems to survey up to 30 selected contaminants of emerging concern (CECs) once every five years. LADWP conducted the Third UCMR (UCMR3) monitoring in 2013 and 2014. Values in this report reflect the sum of all tests. We are required to report the data for five years. Results indicate that most of the contaminants were not detected at the very low detection levels (MRL) required by US EPA for UCMR3 analyses. Of the contaminants that were detected (see Table IV below), chlorate and strontium were in significant, but expected concentrations.

LADWP routinely tests for and detects chlorate in the distribution system. Chlorate is a disinfection byproduct of chlorination. It is unregulated, although the State Water Resources Control Board, Division of Drinking Water (SWRCB-DDW) has set a notification level of 800 mg/L. UCMR3 test results for chlorate were much lower, ranging from not detected to 296 mg/L.

The element strontium is highly abundant on Earth as a cation (Sr+2) and its chemistry is quite similar to the calcium cation (Ca+2). In fact, strontium (as ranelic acid) is used to treat osteoporosis. Strontium in drinking water has no adverse health effects below 4,000 µg/L, the health-based Advisory Level recommended by US EPA. Strontium levels in the LADWP's treated water sources were much lower, ranging from 225-934 µg/L.

Terms Used in the Tables

Compliance: A drinking water standard based on the health risk (primary standards) and aesthetic (secondary standards) exposure of a contaminant to consumers. For example, bacteria and nitrate have strict limits that must be met at all times due to the acute effects they can cause. Other standards, like small amounts of disinfection by-products and man-made chemicals, have standards that are based on a lifetime of exposure because the risk to consumers is very low. Compliance with most standards is based on an average of samples collected within a year. This allows for some fluctuation above and below the numerical standard, while still protecting public health.

Federal Action Level (AL): Concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow. ALs are set by U.S. Environmental Protection Agency (US EPA).

Federal Minimum Reporting Level (MRL): Lowest level of a contaminant which can be detected in drinking water using analytical methods established by the US EPA. Data reported in Table IV reflect MRLs.

Maximum Contaminant Level Goal (MCLG): Level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the US EPA.

Maximum Residual Disinfectant Level (MRDL): Highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): Level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the beneficial use of disinfectants to control microbial contaminants. MRDLGs are set by US EPA.

Notification Level (NL): Health-based advisory level established by SWRCB-DDW for chemicals in drinking water that lack MCLs.

Table I

Calendar Year 2016 Water Quality Monitoring Results

Health-based Primary Drinking Water Standards (MCLs) Substances Detected in Treated Water

Substances	Major Sources in Our Drinking Water	Units	Meet Primary Standard (YES / NO)	State Primary Standard MCL or (MRDL)	State PHG or Federal (MCLG)
Aluminum	Erosion of natural deposits; residue from surface water treatment processes	µg/L	YES	1000	600
Arsenic	Erosion of natural deposits	µg/L	YES	10	0.004
Barium	Erosion of natural deposits	µg/L	YES	1000	2000
Bromate (b)	By-product of ozone disinfection; formed under sunlight	µg/L	YES	10	0.1
Chromium, Hexavalent	Industrial discharge; erosion of natural deposits	µg/L	YES	10	0.02
Fluoride	Erosion of natural deposits; water additive that promotes strong teeth	mg/L	YES	2	1
Gross Alpha Particle Activity (c)	Naturally present in the environment	pCi/L	YES	15	0
Gross Beta Particle Activity (c)	Naturally present in the environment	pCi/L	YES	50	0
Nitrate (as N) (d)	Erosion of natural deposits; runoff and leaching from fertilizer use	mg/L	YES	10	10
Nitrate + Nitrite (as N)	Erosion of natural deposits; runoff and leaching from fertilizer use	mg/L	YES	10	10
Selenium	Erosion of natural deposits	µg/L	YES	50	30
Tetrachloroethylene (PCE)	Discharge from factories, dry cleaners, metal degreasing sites such as auto shops	µg/L	YES	5	0.06
Trichloroethylene (TCE)	Discharge from metal degreasing sites and other factories	µg/L	YES	5	1.7
Turbidity (e)	Soil runoff	NTU	YES	TT, >95%	none
Uranium (c)	Erosion of natural deposits	pCi/L	YES	20	0.43

(a) Values reflect Highest Running Annual Average (HRAA). HRAA is the highest of all Running Annual Averages (RAAs). RAA is a calculated average of all samples collected within a 12-month period, which may include test data from the previous calendar year. HRAA may be higher than the range, which is based on the test data in the reported calendar year.

(b) Bromate is tested in water treated with ozone. Bromate has also been found in water treated with chlorine in some LADWP reservoirs that have elevated bromide levels and are exposed to sunlight. Metropolitan Water District of Southern California (MWD) tests for bromate at the Diemer and Jensen Filtration Plants, which use ozone.

(c) Radiological monitoring is performed in cycles of varying frequencies. LADWP conducted all radiological analyses in 2016 for samples collected at the Los Angeles Aqueduct Filtration Plant, Northern Combined Wells and Southern Combined Wells blend points. MWD conducted all radiological analyses in 2014 for samples collected at the Weymouth, Diemer, and Jensen Treatment Plants.

Primary Drinking Water Standard (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Public Health Goal (PHG): Level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (OEHHA).

Secondary Maximum Contaminate Level (SMCL): Highest level a constituent allowed in drinking water that may affect the taste, odor or appearance. SMCLs are set by the US EPA.

State Detection Limit (DLR): A detected contaminant at or above its detection level for reporting purposes. DLRs are set by the SWRCB-DDW. Data reported in Tables I through III reflect DLRs.

State Maximum Contaminant Level (MCL): Highest level of a contaminant allowed in drinking water. Primary MCLs are set as close to the Public Health Goals (PHGs) or Maximum Contaminant Level Goals (MCLGs) as is economically and technologically feasible. For certain contaminants, compliance with MCL is based on the average of all samples collected throughout the year.

Treatment Technique (TT): Required process intended to reduce the level of a contaminant in drinking water. For example, the filtration process is a treatment technique used to reduce turbidity (cloudiness in water) and microbial contaminants from surface water. High turbidities may be indicative of poor or inadequate filtration.

Los Angeles Aqueduct Filtration Plant		Northern Combined Wells		Southern Combined Wells		MWD Weymouth Plant		MWD Diemer Plant		MWD Jensen Plant

(d) In 2015, SWRCB-DDW revised the reporting method for nitrate. Previously, nitrate data was expressed as "Nitrate (as NO3)," which has an MCL of 45 mg/L. Nitrate data is now expressed as nitrogen or "Nitrate (as N)," which has an equivalent MCL of 10 mg/L. The MCL for nitrate has not changed.

(e) Turbidity is a measure of the cloudiness of water and is a good indicator of water quality and filtration performance. High turbidity can hinder the effectiveness of disinfectants. The Primary Drinking Water Standard for turbidity (included in this table) at water filtration plants is less than or equal to 0.3 NTU in at least 95 percent of the measurements taken in any month and shall not exceed 1.0 NTU at any time. The reporting requirement for treatment plant turbidity is to report the highest single measurement in the calendar year (listed under "range") as well as the lowest monthly percentage of measurements that are less than or equal to 0.3 NTU. The percentage is listed under "average."

Table 1 - (cont'd) Health-based Primary Drinking Water Standards (MCLs) Substances Detected in Treated Water and Reported on City-wide Basis

Substances	Major Sources in Our Drinking Water	Units	Meets Primary Standard (YES/NO)
Bromate (uncovered reservoirs)	By-product of ozone disinfection; formed under sunlight	µg/L	YES
Chlorine Residual, Total	Drinking water disinfectant added for treatment	mg/L	YES
Copper (at-the-tap) AL = 1300 (f)	Internal corrosion of household water plumbing systems	µg/L	YES
Fluoride	Erosion of natural deposits; water additive that promotes strong teeth	mg/L	YES
Haloacetic Acids (Five) (HAA5)	By-product of drinking water disinfection	µg/L	YES
Lead (at-the-tap) AL = 15 (f)	Internal corrosion of household water plumbing systems	µg/L	YES
Total Coliform Bacteria	Naturally present in the environment	% Positives	YES
Total Trihalomethanes (TTHM)	By-product of drinking water chlorination	µg/L	YES

(a) Values reflect Highest Running Annual Average (HRAA). HRAA is the highest of all Running Annual Averages (RAAs). RAA is a calculated average of all samples collected within a 12-month period, which may include test data from the previous calendar year. HRAA may be higher than the range, which is based on the test data in the reported calendar year.

(f) At-the-tap monitoring of lead and copper is conducted every three years as required by the federal Lead and Copper Rule. A system is out of compliance if the federal Action Level is exceeded in more than 10-percent of all samples collected at the customers' tap. The most recent monitoring was conducted in 2015. Although the City's treated water has little or no detectable lead, studies were conducted and corrosion control implementation started. A small corrosion control facility utilizing zinc-orthophosphate (temporarily out of service for upgrades) has been in operation in the Watts area since the 1990's. Corrosion control was introduced to the Western Los Angeles area in 2010 and to the Hollywood area in 2015. Corrosion control will be expanded to the rest of the City by 2020.

Table II

Calendar Year 2016 Water Quality Monitoring Results

Aesthetic-based Secondary Drinking Water Standards (SMCLs) Substances Detected in Treated Water

Substances	Major Sources in Drinking Water	Units	Meets Secondary Standard (YES/NO)	State Secondary MCL	Los Angeles Aqueduct Filtration Plant	
					Average	Range
Aluminum	Erosion of natural deposits; residue from some surface water treatment processes	µg/L	YES	200	<50	<50
Chloride	Runoff/leaching from natural deposits; seawater influence	mg/L	YES	500	80	62 – 90
Color, Apparent (unfiltered)	Naturally-occurring organic materials	ACU	YES	15	3	<3 – 4
Manganese NL = 500	Leaching from natural deposits	µg/L	YES	50	<20	<20
Odor	Naturally-occurring organic materials	TON	YES	3	<1	<1
Specific Conductance	Substances that form ions when in water; seawater influence	µS/cm	YES	1600	538	360 – 780
Sulfate (as SO4)	Runoff/leaching from natural deposits	mg/L	YES	500	66.9	50.4 – 81.9
Total Dissolved Solids (TDS)	Runoff/leaching from natural deposits	mg/L	YES	1000	335	192 – 358
Turbidity (d)	Soil runoff	NTU	YES	5	<0.1	<0.1 – 0.1
Zinc	Run off/leaching from natural deposit	µg/L	YES	5000	<50	<50

(a) Values reflect Highest Running Annual Average (HRAA). HRAA is the highest of all Running Annual Averages (RAAs). RAA is a calculated average of all samples collected within a 12-month period, which may include test data from the previous calendar year. HRAA may be higher than the range, which is based on the test data in the reported calendar year.

Table I

State Primary Standard MCL or (MRDL)	State PHG / [MRDLG] or Federal (MCLG)	Average	Range
10	0.1	HRAA = 6 (a)	Range = <1 – 5
(4)	[4]	HRAA = 2 (a)	Range = 1.8 – 2.3
TT	300	90th Percentile value = 579	Number of samples exceeding AL = 1 out of 103
2	1	Average = 0.7	Range = 0.7
60	none	HLRAA = 17 (g)	Range = 4 – 18
TT	0.2	90th Percentile value = 6.3	Number of samples exceeding AL = 3 out of 103
5% of monthly samples are coliform positive	0	Highest monthly % positive samples = 1.8 %	Range = % positive samples 0 – 1.8
80	none	HLRAA = 50 (g)	Range = 15 – 52

(g) The federal Stage 2 Disinfectant/Disinfection Byproducts Rule (DBPR) requires compliance monitoring and reporting for haloacetic acids (HAAs) and total trihalomethanes (TTHMs) based on a locational running annual average (LRAA) of established monitoring locations. The value for the location with the Highest Locational Running Annual Average (HLRAA) for HAAs and TTHMs in 2016 is reported.

Table II

General Information

This annual Drinking Water Quality Report (also known as a Consumer Confidence Report) is required by the California State Water Resources Control Board, Division of Drinking Water (SWRCB-DDW) and is prepared in accordance with their guidelines. The report is available both online at www.ladwp.com/waterqualityreport or you can call (800) DIAL-DWP to request a copy be mailed to you. LADWP, the largest municipal utility in the nation, was established more than 100 years ago. The utility now provides a reliable and safe water and electric supply to the city's more than 4 million residents and businesses.

LADWP is governed by a five-member Board of Water and Power Commissioners, appointed by the Mayor and confirmed by the City Council. The Board meets regularly on the first and third Tuesdays of each month at 10:00 a.m.

Meetings are held at:

Los Angeles Department of Water and Power
111 North Hope Street, Room 1555H
Los Angeles, CA 90012-2694

The meeting agenda is available to the public on the Thursday prior to the week of the meeting. You can access the Board agenda at www.ladwp.com/board or by calling (213) 367-1351.

For general information about LADWP, call (800) DIAL-DWP (1-800-342-5397) or visit www.ladwp.com.

For questions regarding this report, please contact Mr. Nathan Aguayo at (213) 367-4941, Nathan.Aguayo@ladwp.com or call the water quality hotline at (213) 367-3182.

Want to know more about your drinking water and related regulations?

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

Copyright 2017 by Environmental Data Resources, Inc. All rights reserved. Reproduction in any media or format, in whole or in part, of any report or map of Environmental Data Resources, Inc., or its affiliates, is prohibited without prior written permission.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 10/10/2016 has revealed that there are 2

SEMS sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 3 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 9 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA-CESQG site within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/31/2016 has revealed that there are 40 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 27 LUST sites within approximately 0.5 miles of the target property.

SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the SLIC list, as provided by EDR, has revealed that there are 7 SLIC sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 13 UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 36 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 07/15/2016 has revealed that there is 1

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2015 has revealed that there are 38 HAZNET sites within approximately 0.125 miles of the target property.

HIST CORTESE: The sites for the list are designated by the State Water Resource Control Board [LUST], the Integrated Waste Board [SWF/LS], and the Department of Toxic Substances Control [CALSITES]. This listing is no longer updated by the state agency.

A review of the HIST CORTESE list, as provided by EDR, and dated 04/01/2001 has revealed that there are 15 HIST CORTESE sites within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 48 EDR Hist Auto sites within approximately 0.25 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 70 EDR Hist Cleaner sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site History:	There is a State Water Board closure Order for this case issued 1/28/2015. The State Water Board needs confirmation that the corrective action wells and wastes have been removed from the site in order to close the case. Once confirmation has been received State Water Board can issue a Uniform Closure Letter and close the case. Attempts to reach the RP have failed. gwl 4/14/2016.

Potential Media Affected:	Indoor Air, Aquifer used for drinking water supply, Soil, Soil Vapor
Potential Contaminants of Concern:	Tetrachloroethylene (PCE)
Site History:	The Westin Bonaventure Hotel (Site) is located in the central downtown Los Angeles area and is bordered by Figueroa Street on the northwest, 4th Street on the northeast, Flower Street on the southeast, and 5th Street on the southwest. The Site consists of approximately 3.5 acres and is occupied by a 500,000 square-foot building with 36 stories consisting of guest rooms, retail space, meeting rooms, offices, and subterranean parking. Laundry services, including a dry cleaning system, are located in a basement area measuring approximately 25 feet by 25 feet. Previous investigations completed at the Site detected concentrations of tetrachloroethene up to 1,610 micrograms per kilogram (a%g/kg) in soil and up to 87.5 micrograms per liter (a%g/L) in groundwater. The Site was issued a

WESTIN BONAVENTURE HOTEL (Continued) **S104566310**

"No Further Action" letter on Novemeber 15, 2011.

Registry ID: 110009548891

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource

PACIFIC BELL (Continued) **1000250339**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

JEFFERSON NEW ELEMENTARY SCHOOL NO. 7 (Continued) **S107736506**

Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 12/17/2003
Comments: DTSC approved the Supplemental Site Investigation (SSI) and determined neither an actual or a potential release of hazardous material, nor the presence of naturally occurring hazardous material indicated at the site pose a threat to human health or the environment under any land use. Therefore, DTSC concurred that no further environmental investigation or cleanup was required at this site, and approved the SSI. Cert site, Cert RA-RAC apprvd.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Environmental Oversight Agreement
Completed Date: 02/10/2000
Comments: LAUSD MASTER OVERSIGHT AGREEMENT (DOCKET NO. HSA-A 99/00-051) EXECUTED ON 2/10/00. As part of the Master Oversight Agreement between DTSC and the Los Angeles Unified School District (LAUSD), DTSC will provide oversight for a Preliminary Endangerment Assessment (PEA) for the proposed Jefferson New Elementary School No. 27 site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Certification
Completed Date: 12/09/2003
Comments: DTSC has determined that all appropriate response actions have been completed, that all acceptable engineering practices were implemented and that no further removal/remedial action is necessary and certified the site.

Completed Document Type: Supplemental Site Investigation Workplan
Completed Date: 02/08/2006
Comments: DTSC provided comments to FSI TM on 1/27/2006. Revised FSI TM received on 2/2/2006. DTSC conditionally approved FSI TM.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 11/03/2005
Comments: Areas A & B sampled for potential fill material. No Further Action determination for Areas A & B only.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 03/17/2006
Comments: DTSC concurs with Supplemental Site Investigation that further action is required for lead and arsenic.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 06/05/2006

CENTRAL LOS ANGELES MIDDLE SCHOOL NO. 4 (Continued) **S105628499**

Comments:	No written or verbal comments received during 30-day public comment period. DTSC approves RAW for implementation.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Supplemental Site Investigation Report
Completed Date:	04/10/2006
Comments:	FSI Report approved for further action, for arsenic and lead.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	07/05/2006
Comments:	DTSC approves the RACR. 377.5 tons of arsenic and lead contaminated soil was excavated and transported offsite for disposal at Clean Harbors Environmental Services, Inc. in Buttonwillow, CA. Confirmation samples show all contamination has been removed.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Other Report
Completed Date:	06/22/2001
Comments:	RP provided report for background information (see RP - Final).
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	03/11/2002
Comments:	DTSC issued a Preliminary Endangerment Assessment determination, requiring further action at the proposed school site. Further Action for Lead and Asbestos only.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Supplemental Site Investigation Report
Completed Date:	05/30/2002
Comments:	DTSC approved the Supplemental Site Investigation and determined that remediation is required at the proposed school site. Lead and Asbestos only for older structures that may contain lead based paint.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Supplemental Site Investigation Report
Completed Date:	10/02/2003
Comments:	Addendum for LBP. Approved SSI for NFA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/05/2016

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/05/2016

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 09/14/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Certified Environments Inc.
A Better Way to Due Diligence ™

ATTACHMENT J

C O R P O R A T E R E S U M E

Certified Environments, Inc. (CEI) was founded in 1992 and is a national assessment firm providing property condition reports, environmental site assessments, construction management and environmental remediation oversight for property Owners and major Wall Street investment banks and purchasers of real estate.

Since 1992, when the firm started as a construction inspection, material testing, engineering and geotechnical firm, CEI has expanded its services to provide specialized assessments for property acquisition by many of the largest Real Estate Investment Trusts. CEI has had the opportunity of inspecting some of the largest and best known addresses in the nation including: the US Bank Tower, Wells Fargo Center and Gas Company tower in Los Angeles, The Landmark building in San Francisco, the USX tower, The First Union building in Philadelphia, The Woolworth, GM Building in NYC, including The White House, the Pentagon, historic register properties, and thousands of properties of varying types and sizes.

CEI has assessed in excess of $50B of commercial real estate for Wall Street Investment bankers and Office, Hotel, Shopping Center and Apartment REITs.

CEI's clients are Wall Street investment banks, real estate investment trusts (REITs), conduit lenders, large retail chains, developers, property owners, asset managers and law firms. Among others, they include:

- AIMCO
- Arbor National
- Asia Bank
- Bank of America
- Bear Stearns
- Charles E. Smith Companies
- CIBC
- CitiGroup
- Commerzbank
- CW Capital
- Column / Credit Suisse
- Deutsche Banc
- J.P. Morgan/Chase
- First Industrial
- First Union
- GE Capital
- General American Life
- GMAC Commercial
- Lehman Brothers
- Lend Lease Mortgage
- Love Funding
- Macerich Company
- Maguire Partners
- Merrill Lynch
- NCB
- Prime Capital
- Prudential
- Riggs National Bank
- RBS Greenwich Capital
- Simon Group
- Situs Companies
- SunTrust Bank
- UBS / Warburg
- Vornado Real Estate Trust
- Wells Fargo
- Westminster Capital

CEI provides due diligence services for the real estate community for various types of transactions, including *commercial mortgage backed securitizations, equity investing, loan origination, refinancing and foreclosure, mergers and acquisitions.*

Additional information about CEI is contained on its website @ www.ceiworld.com

GREGORY F. PAULAY
Principal

CURRENT DUTIES/EXPERIENCE

Mr. Paulay is currently a principal at the company Certified Environments, Inc., and brings more than twenty five years of experience in engineering management, construction cost estimating and project management, and remediation of environmentally impaired real estate. He has overseen and inspected more than 100 million square feet of property condition and environmental assessments Nationwide and consults with law firms, major REITs, property Owners, and major lending institutions.

Mr. Paulay worked as an estimator and project manager with Tishman Construction in New York City. He was then hired by MPC & Associates of Washington DC, a subsidiary of the law firm, Arnold & Porter, as a construction management consultant for the renovation and construction of University housing projects.

As a Project Executive for building owners, construction companies, and others in the analysis of construction related issues, he has developed project budgets for large and small-scale projects, and performed forensic consultation for law firms for building related and environmental matters. Mr. Paulay has prepared construction schedules, identified payment milestones, selected contractors, qualified subcontractor bids, coordinated with government agencies, and negotiated change orders as an owner representative. In addition, he has been directly responsible for the review and approval of lender payments for construction projects valued in excess of $500M.

Between the years of 1990 - 1992, Mr. Paulay was a partner of an international construction material testing, geotechnical engineering, drilling and environmental assessment, and remediation company with more than 18 offices nationwide and in Europe. The firm was responsible for all aspects of construction inspection and material testing for more than 25 million square feet of commercial construction including high-rise office buildings located in New York, Massachusetts, New Jersey, and Maryland. Mr. Paulay founded CEI in 1992 and the company performed construction controlled inspections and operated an Army Corps Certified Materials Testing Laboratory for concrete, masonry and soils. The company provided critical structures testing for various building departments for new construction projects in Maryland, DC and Virginia. Since 1995, Mr. Paulay has overseen and reviewed more than 2,000 property condition and environmental site assessment reports nationwide.

Mr. Paulay has had security clearance authorization at the following facilities: *The White House* (Bush and Clinton Administrations); *Department of Defense* (Pentagon renovation); *Department of Justice* (Headquarters renovation); *NASA Headquarters* (Building renovations and construction of new headquarters); *Secret Service and government office space located at the New Executive Office Building; Veterans Affairs Building* (Headquarters renovation); *General Services Administration* (Headquarters renovation); and the *National Security Administration* (various building renovation projects).

Mr. Paulay is a former member of the ASTM E50.02 committee for the Property Condition Assessments standard. He has extensive experience performing and advising lenders and rating agencies on capital reserve studies for retail, commercial office, apartment, condominium and cooperative housing properties. Mr. Paulay provides expert witness services and has provided technical support to law firms on a wide range of construction and environmental matters.

EDUCATION/CERTIFICATIONS

Graduate School of Architecture, Planning and Preservation of Columbia University: Coursework in Construction Management and Real Estate Finance.
Columbia University, BA Economics (1985)
State University of New York, WCC, Associate of Applied Science, Civil Engineering (1982)
Commonwealth of Virginia – Class A Contractor License Examination (1991)
EPA Accredited Asbestos Building Inspector (current)
EPA Accredited Asbestos Project Designer (current)

EPA Accredited NYS Project Monitor (current)
EPA Accredited NYS Air Monitoring Technician (current)
National Registry for Environmental Professionals (1995) inactive status
Certified Troxler Nuclear Density and Moisture Gauge Operator

Mr. Paulay is currently an EPA accredited Asbestos Inspector with more than 20 years experience in the management of more than 500 asbestos abatement projects. He has previously obtained EPA accreditations for: Management Planner, Project Designer, NlOSH 582 Airborne Sampling and Evaluation Techniques, Certified Asbestos PLM Microscopist and HUD lead-Based Paint Assessor, lead abatement supervisor training and mold inspection.

DRAFT

TREE REPORT

755 S. Figueroa St. (945 W. 8th Street)
Los Angeles, CA 90017

SUMMARY

This Tree Report was prepared at the request of the property owner, Maguire Properties - 755 S. Figueroa, LLC, c/o Brookfield Property Partners. The owner is preparing to re-develop this lot, also known as the Development Parcel, with a multi-use complex. The Unified Development Site is compromised of the Development Parcel and the adjacent properties located within the same block.

DRAFT

PROTECTED TREES, URBAN FORESTRY DIVISION

This property is under the jurisdiction of the City of Los Angeles and guided by the Native Tree Protection Ordinance No. 177,404. **Protected Trees** are defined by this ordinance as Oaks (*Quercus* sp) indigenous to California but excluding the scrub oak (*Quercus dumosa*); Southern California black walnut (*Juglans californica* var. californica); Western sycamore *(Platanus racemosa)* and California bay laurel (*Umbellularia californica*) trees with a diameter at breast height (DBH) of four inches (4") or greater.

There are NO trees on this property that would be considered protected within the City of Los Angeles Native Tree Protection Ordinance.

8" DIAMETER AND GREATER NON-PROTECTED TREES, DEPARTMENT OF CITY PLANNING

The Department of City Planning requires the identification of the location, size, type and condition of all existing trees on the Development Parcel with a **DBH of 8 inches (8") or greater**. These trees will be identified as **Non-Protected Trees.**

At this time, I observed twenty (20) **Non-Protected Trees** on the Development Parcel. All of these trees will be impacted by the proposed construction and are recommended for removal and replacement to the satisfaction of the City of Los Angeles Department of City Planning.

8" DIAMETER AND GREATER NON-PROTECTED TREES AND LOS ANGELES CITY STREET TREES, UNIFIED DEVELOPMENT SITE

I inventoried an additional one hundred and seventeen (117) trees adjacent to the Development Parcel for the purposes of this report. This collection of off-site trees within the Unified Development Site includes Non-Protected Trees with DBH of 8 inches (8") or greater and City of Los Angeles street trees. These trees are included in the Summary of Field Inspections in Appendix C and will not be impacted by the proposed construction.

ASSIGNMENT

The Assignment included a field observation and inventory of the trees on the Development Parcel. A Tree Location Plot Map is included in Appendix A. Photographs of the subject trees are included in Appendix B.

TREE CHARACTERISTICS AND SITE CONDITIONS

Detailed information with respect to size, condition, species and recommendations are included in the Summary of Field Inspections in Appendix C. The trees are numbered on the Tree Location Map in Appendix A.

DRAFT

IMPACT ANALYSIS AND SPECIFIC RECOMMENDATIONS

Non-Protected Trees, Development Parcel

The proposed construction for this project will require extensive re-development of the Development Parcel. All trees on site will be impacted and are recommended for removal. Replacement of these trees with DBHs of 8" or greater will be to the satisfaction of the City of Los Angeles Department of City Planning.

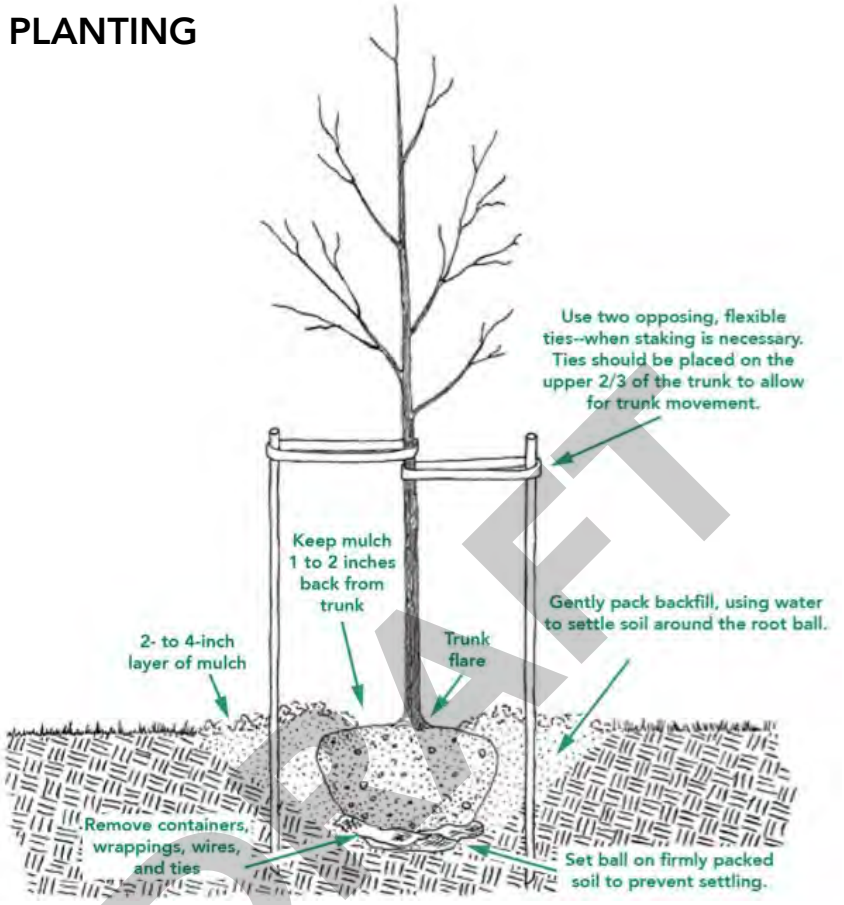
Non-Protected Trees and City of Los Angeles Street Trees, Unified Development Site

Trees #21 - #117 are outside of the development parcel construction zone and will not be impacted by the proposed construction.

New tree planting guidelines are provided below.

GENERAL RECOMMENDATIONS

NEW TREE PLANTING



DRAFT

The ideal time to plant trees and shrubs is during the dormant season, in the fall after leaf drop or early spring before budbreak. Weather conditions are cool and allow plants to establish roots in the new location before spring rains and summer heat stimulate new top growth. Before you begin planting your tree, be sure you have had all underground utilities located prior to digging.

If the tree you are planting is balled or bare root, it is important to understand that its root system has been reduced by 90 to 95 percent of its original size during transplanting. As a result of the trauma caused by the digging process, trees commonly exhibit what is known as transplant shock. Containerized trees may also experience transplant shock, particularly if they have circling roots that must be cut. Transplant shock is indicated by slow growth and reduced vigor following transplanting. Proper site preparation before and during planting coupled with good follow-up care reduces the amount of time the plant experiences transplant shock and allows the tree to quickly establish in its new location. Carefully follow nine simple steps, and you can significantly reduce the stress placed on the plant at the time of planting.

NEW TREE PLANTING, continued

1. Dig a shallow, broad planting hole. Make the hole wide, as much as three times the diameter of the root ball but only as deep as the root ball. It is important to make the hole wide because the roots on the newly establishing tree must push through surrounding soil in order to establish. On most planting sites in new developments, the existing soils have been compacted and are unsuitable for healthy root growth. Breaking up the soil in a large area around the tree provides the newly emerging roots room to expand into loose soil to hasten establishment.

2. Identify the trunk flare. The trunk flare is where the roots spread at the base of the tree. This point should be partially visible after the tree has been planted (see diagram). If the trunk flare is not partially visible, you may have to remove some soil from the top of the root ball. Find it so you can determine how deep the hole needs for proper planting.

3. Remove tree container for containerized trees. Carefully cutting down the sides of the container may make this easier. Inspect the root ball for circling roots and cut or remove them. Expose the trunk flare, if necessary.

4. Place the tree at the proper height. Before placing the tree in the hole, check to see that the hole has been dug to the proper depth and no more. The majority of the roots on the newly planted tree will develop in the top 12 inches of soil. If the tree is planted too deeply, new roots will have difficulty developing because of a lack of oxygen. It is better to plant the tree a little high, 1-2 inches above the base of the trunk flare, than to plant it at or below the original growing level. This planting level will allow for some settling.

5. Straighten the tree in the hole. Before you begin backfilling, have someone view the tree from several directions to confirm that the tree is straight. Once you begin backfilling, it is difficult to reposition the tree.

6. Fill the hole gently but firmly. Fill the hole about one-third full and gently but firmly pack the soil around the base of the root ball. Be careful not to damage the trunk or roots in the process. Fill the remainder of the hole, taking care to firmly pack soil to eliminate air pockets that may cause roots to dry out. To avoid this problem, add the soil a few inches at a time and settle with water. Continue this process until the hole is filled and the tree is firmly planted. It is not recommended to apply fertilizer at time of planting.

7. Stake the tree, if necessary. If the tree is grown properly at the nursery, staking for support will not be necessary in most home landscape situations. Studies have shown that trees establish more quickly and develop stronger trunk and root systems if they are not staked at the time of planting. However, protective staking may be required on sites where lawn mower damage, vandalism, or windy conditions are concerns. If staking is necessary for support, there are three methods to choose among: staking, guying, and ball stabilizing. One of the most common methods is staking. With this method, two stakes used in conjunction with a wide, flexible tie material on the lower half of the tree will hold the tree upright, provide flexibility, and minimize injury to the trunk (see diagram). Remove support staking and ties after the first year of growth.

8. Mulch the base of the tree. Mulch is simply organic matter applied to the area at the base of the tree. It acts as a blanket to hold moisture, it moderates soil temperature extremes, and it reduces competition from grass and weeds. A 2- to 3-inch layer is ideal. More than 3 inches may cause a problem with oxygen and moisture levels. When placing mulch, be sure that the actual trunk of the tree is not covered. Doing so may cause decay of the living bark at the base of the tree. A mulch-free area, 1 to 2 inches wide at the base of the tree, is sufficient to avoid moist bark conditions and prevent decay.

DRAFT

TREE MAINTENANCE AND PRUNING

Some trees do not generally require pruning. The occasional removal of dead twigs or wood is typical. Occasionally a tree has a defect or structural condition that would benefit from pruning. Any pruning activity should be performed under the guidance of a certified arborist or tree expert.

Because each cut has the potential to change the growth of the tree, no branch should be removed without a reason. Common reasons for pruning are to remove dead branches, to remove crowded or rubbing limbs, and to eliminate hazards. Trees may also be pruned to increase light and air penetration to the inside of the tree's crown or to the landscape below. In most cases, mature trees are pruned as a corrective or preventive measure.

Routine thinning does not necessarily improve the health of a tree. Trees produce a dense crown of leaves to manufacture the sugar used as energy for growth and development. Removal of foliage through pruning can reduce growth and stored energy reserves. Heavy pruning can be a significant health stress for the tree.

Yet if people and trees are to coexist in an urban or suburban environment, then we sometimes have to modify the trees. City environments do not mimic natural forest conditions. Safety is a major concern. Also, we want trees to complement other landscape plantings and lawns. Proper pruning, with an understanding of tree biology, can maintain good tree health and structure while enhancing the aesthetic and economic values of our landscapes.

DRAFT

Pruning Techniques – From the I.S.A. Guidelines

Specific types of pruning may be necessary to maintain a mature tree in a healthy, safe, and attractive condition.

Cleaning is the removal of dead, dying, diseased, crowded, weakly attached, and low- vigor branches from the crown of a tree.

Thinning is the selective removal of branches to increase light penetration and air movement through the crown. Thinning opens the foliage of a tree, reduces weight on heavy limbs, and helps retain the tree's natural shape.

Raising removes the lower branches from a tree to provide clearance for buildings, vehicles, pedestrians, and vistas.

Reduction reduces the size of a tree, often for clearance for utility lines. Reducing the height or spread of a tree is best accomplished by pruning back the leaders and branch terminals to lateral branches that are large enough to assume the terminal roles (at least one-third the diameter of the cut stem). Compared to topping, reduction helps maintain the form and structural integrity of the tree.

TREE MAINTENANCE AND PRUNING, continued

How Much Should Be Pruned?

Mature trees should require little routine pruning. A widely accepted rule of thumb is never to remove more than one-quarter of a tree's leaf-bearing crown. In a mature tree, pruning even that much could have negative effects. Removing even a single, large- diameter limb can create a wound that the tree may not be able to close. The older and larger a tree becomes, the less energy it has in reserve to close wounds and defend against decay or insect attack. Pruning of mature trees is usually limited to removal of dead or potentially hazardous limbs.

Wound Dressings

Wound dressings were once thought to accelerate wound closure, protect against insects and diseases, and reduce decay. However, research has shown that dressings do not reduce decay or speed closure and rarely prevent insect or disease infestations. Most experts recommend that wound dressings not be used.

DRAFT

DISEASES AND INSECTS

Continual observation and monitoring of your tree can alert you to any abnormal changes. Some indicators are: excessive leaf drop, leaf discoloration, sap oozing from the trunk and bark with unusual cracks. Should you observe any changes, you should contact a Tree specialist or Certified Arborist to review the tree and provide specific recommendations. Trees are susceptible to hundreds of pests, many of which are typical and may not cause enough harm to warrant the use of chemicals. However, diseases and insects may be indication of further stress that should be identified by a professional.

GRADE CHANGES

The growing conditions and soil level of trees are subject to detrimental stress should they be changed during the course of construction. Raising the grade at the base of a tree trunk can have long-term negative consequences. This grade level should be maintained throughout the protected zone. This will also help in maintaining the drainage in which the tree has become accustomed.

INSPECTION

The property owner should establish an inspection calendar based on the recommendation provided by the tree specialist. This calendar of inspections can be determined based on several factors: the maturity of the tree, location of tree in proximity to high-use areas vs. low-use area, history of the tree, prior failures, external factors (such as construction activity) and the perceived value of the tree to the homeowner.

DRAFT

Assumptions and Limiting Conditions

No warranty is made, expressed or implied, that problems or deficiencies of the trees or the property will not occur in the future, from any cause. The Consultant shall not be responsible for damages or injuries caused by any tree defects, and assumes no responsibility for the correction of defects or tree related problems.

The owner of the trees may choose to accept or disregard the recommendations of the Consultant, or seek additional advice to determine if a tree meets the owner's risk abatement standards.

The Consulting Arborist has no past, present or future interest in the removal or retaining of any tree. Opinions contained herein are the independent and objective judgments of the consultant relating to circumstances and observations made on the subject site.

The recommendations contained in this report are the opinions of the Consulting Arborist at the time of inspection. These opinions are based on the knowledge, experience, and education of the Consultant. The field inspection was a visual, grade level tree assessment.

The Consulting Arborist shall not be required to give testimony, perform site monitoring, provide further documentation, be deposed, or to attend any meeting without subsequent contractual arrangements for this additional employment, including payment of additional fees for such services as described by the Consultant.

The Consultant assumes no responsibility for verification of ownership or locations of property lines, or for results of any actions or recommendations based on inaccurate information.

This Arborist report may not be reproduced without the express permission of the Consulting Arborist and the client to whom the report was issued. Any change or alteration to this report invalidates the entire report.

Subject: Preliminary Geotechnical Engineering Investigation
Proposed Mixed-Use Development
945 West 8th Street, Los Angeles, California

Ladies and Gentlemen:

This letter transmits the Preliminary Geotechnical Engineering Investigation for the subject property prepared by Geotechnologies, Inc. This report provides preliminary geotechnical recommendations for the development of the site, including earthwork, seismic design, retaining walls, excavations, shoring and foundation design.

Due to the preliminary nature of the project, the structural loads are currently not available. Detailed structural loads shall be provided to this firm for analyses when the project achieves more definition. Foundation recommendations presented herein shall be considered preliminary and are subject to be confirmed or modified subsequent to review of foundation loads.

The validity of the recommendations presented herein is dependent upon review of the geotechnical aspects of the project during construction by this firm. The subsurface conditions described herein have been projected from limited subsurface exploration and laboratory testing. The exploration and testing presented in this report should in no way be construed to reflect any variations which may occur between the exploration locations or which may result from changes in subsurface conditions.

Should you have any questions please contact this office.

Respectfully submitted,
GEOTECHNOLOGIES, INC.

PRELIMINARY GEOTECHNICAL ENGINEERING INVESTIGATION
PROPOSED MIXED-USE DEVELOPMENT
945 WEST 8TH STREET
LOS ANGELES, CALIFORNIA

INTRODUCTION

This report presents the results of the preliminary geotechnical engineering investigation performed on the subject property. The purpose of this investigation was to evaluate the nature of the soils underlying the site, to ascertain their engineering properties, and to provide recommendations for site preparation, grading, foundation design, retaining wall design, expansive soils, resistance to lateral loading, floor slabs, temporary excavations, and asphaltic paving.

This investigation included excavation of seven exploratory borings, collection of representative samples, laboratory testing, engineering analysis, review of published geologic data and available geotechnical engineering information, and the preparation of this report. The boring locations are shown on the enclosed Plot Plan. The results of the exploration and the laboratory testing are presented in the Appendix of this report.

SITE CONDITIONS

The property is located at 945 W. 8th Street, in the City of Los Angeles, California. The subject site is bounded by the "FIGat7th" retail shopping center and the 777 Figueroa Office Tower to the east, by a 13-story parking structure ("FIGat7th" parking structure) to the west, by the entry way to the parking structure and W. 7th Street to the north, and by W. 8th Street to the south. The street elevation of W. 7th Street to the north of the site is approximately 36 to 37½ feet higher than the street elevation of W. 8th Street to the south of the site.

The area of the proposed development is currently vacant. It appears that the subject site was excavated previously during the development of the "FIGat7th" retail shopping center and the 777 Figueroa Office Tower to the east and the existing parking structure to the west, and has remained relatively unchanged since that time. An existing 1½:1 (h:v) fill slope and retaining walls exist along the northern portion of the site. The existing slope descends approximately 60 feet from the parking garage entry way at 7th Street, to a relatively level pad area at the toe of slope.

A pedestrian walkway exists at the toe of slope, which connects between the lowest subterranean levels of the 777 Figueroa Office Tower and the existing parking garage to the west. The area south of the pedestrian walkway slopes gradually upward to the public right of way along 8th Street.

The neighboring development consists of commercial and residential structures, and parking lots. Drainage is by sheetflow along the existing contours to the city streets.

PROPOSED DEVELOPMENT

Information concerning the proposed development was furnished by the client and the project architect, Marmol Radziner. The proposed development will consist of a residential tower that includes an 11-level podium structure, with two completely subterranean levels, three partially subterranean levels (above grade as viewed from W. 8th Street and below grade relative to W. 7th Street), and six above grade levels.

The residential tower would be located atop the podium structure within the northern portion of the development parcel fronting on W. 7th Street. Due to the elevation difference between the north side of the site (at W. 7th Street) and the south side of the site (at W. 8th Street), the proposed residential tower would be 61 stories (approximately 633 feet) above grade as viewed from W. 7th

Street including the podium height, and 64 stories (approximately 673 feet) above grade as viewed from W. 8th Street.

The footprint of the subterranean parking structure will occupy the entire project site. Based on the schematic drawings by the project architect, the lowest level of the parking garage (B5 Level) will have an approximate finished floor elevation of 239.0 feet above Mean Sea Level (MSL), which is approximately 18 to 19 feet below the elevation of W. 8th Street, and approximately 55 to 56½ feet below the elevation of W. 7th Street. In addition, a pedestrian tunnel will be located along the north side of the project site and will extend to a depth of 70 feet below the elevation of W. 7th Street.

Due to the preliminary nature of the project, the structural loads are currently not available. Estimated column loads for the tower are on the order of 6,000 to 8,000 kips. It is anticipated that the average bearing pressure below the tower will be approximately 12,000 pounds per square foot under dead and live loads. The column loads for the remainder of the podium structure and parking garage are anticipated to vary between 1,000 and 2,000 kips. Detailed structural loads shall be provided to this firm for analyses when the project achieves more definition. Foundation recommendations presented herein shall be considered preliminary and are subject to be confirmed or modified subsequent to review of foundation loads.

Grading will consist of excavations for the proposed subterranean levels, removal and recompaction of any unsuitable soils, and minor wall backfill. Preliminarily, retaining walls on the order of 70 feet are anticipated for the proposed project.

Any changes in the design of the project or location of any structure, as outlined in this report, should be reviewed by this office. The recommendations contained in this report should not be considered valid until reviewed and modified or reaffirmed, in writing, subsequent to such review.

GEOTECHNICAL EXPLORATION

FIELD EXPLORATION

The site was explored between April 3, 2008 and April 10, 2008, by drilling seven exploratory borings. The borings were excavated to depths between 70 and 150 feet. Boring Number 1 through Boring Number 3 were excavated with the aid of a bucket-auger rotary drilling machine and were approximately 24 inches in diameter. Boring Number 4 through Boring Number 7 were excavated with the aid of a hollow-stem rotary drilling machine and were approximately 8 inches in diameter. The boring locations are shown on the Plot Plan and the geologic materials encountered are logged on Plates A-1 through A-7.

Samples of the soils encountered in the explorations were collected and transported to the laboratory. The results of the laboratory tests, along with a description of the exploration and laboratory test procedures used are described below.

Geologic Materials

Fill materials underlying the subject site consist of sandy silts, sandy clays, silty sands and clayey sands, which are brown to dark brown in color, slightly moist to moist, medium dense, and firm to stiff, fine to coarse grained, with occasional gravel and asphalt fragments. Fill thickness ranged from 4 to 15 feet was encountered in the exploratory borings.

Younger alluvial soils were encountered in Boring Number 4, which is located near the southern boundary of the site. Younger alluvial soils consist of silty clays, clayey sands, sands, and gravelly sands, which are medium brown to brown in color, slightly moist to moist, dense to very dense, fine to coarse grained, with gravel and cobbles. It is anticipated that the excavation of the proposed subterranean levels will remove all of the younger alluvial soils from the site.

The existing fill materials and younger alluvium are underlain by older alluvium. The older alluvial soils consist of silty clays, clayey silts, silty sands and clayey sands. The older alluvium are reddish brown to grayish brown in color, moist, dense to very dense, and stiff to very stiff, fine grained.

Bedrock materials were encountered in all of the explorations. Bedrock consists of sandstone and siltstone of the Fernando Formation. Bedrock varies between yellowish and grayish brown to gray in color, slightly moist to moist, hard to very hard. More detailed soil profiles may be obtained from individual boring logs.

Groundwater

Very minor seepage of water was encountered at a depth of 26 feet in Boring Number 6, and at 68 feet in Boring Number 2. Both seepage zones are located below the lowest subterranean level of the proposed structure. Groundwater was not encountered in any of the other exploratory borings, which was excavated to a maximum depth of 165 feet in Boring Number 4.

Based on groundwater data supplied by the Seismic Hazard Zone Report of the Hollywood Quadrangle, by the California Geological Survey (SHZR 026), the historic-high groundwater level for the site is on the order of 65 feet below the existing site grade.

Based on the result of the explorations, it is not anticipated that any water will be encountered during excavation of the proposed subterranean levels. Should any seepage encountered during excavation, water seepage could be handled on as-encountered basis, utilizing a series of french drains around the perimeter of the excavation. Dewatering well will not be effective in collecting these localized seepage layers. In addition, it is anticipated that any minor seepage, if encountered locally during excavation, will be able to be handled through the recommended retaining wall subdrainage system.

Fluctuations in the level of groundwater may occur due to variations in rainfall, temperature, and other factors not evident at the time of the measurements reported herein. Fluctuations also may occur across the site. High groundwater levels can result in changed conditions.

SEISMIC EVALUATION

REGIONAL GEOLOGIC SETTING

The subject site is in the northern portion of the Peninsular Ranges Geomorphic Province and south of the Transverse Ranges Geomorphic Province. The Peninsular Ranges are characterized by northwest-trending blocks of mountain ridges and sediment-floored valleys. The dominant geologic structural features are northwest trending fault zones that either die out to the northwest or terminate at east-trending reverse faults that form the southern margin of the Transverse Ranges.

The Transverse Ranges are characterized by roughly east-west trending mountains and the northern and southern boundaries are formed by reverse fault scarps. The convergent deformational features of the Transverse Ranges are a result of north-south shortening due to plate tectonics. This has resulted in local folding and uplift of the mountains along with the propagation of thrust faults. The intervening valleys have been filled with sediments derived from bordering mountains.

REGIONAL FAULTING

Based on criteria established by the California Division of Mines and Geology (CDMG), which is currently known as California Geologic Survey (CGS), faults may be categorized as active, potentially active, or inactive. Active faults are those which show evidence of surface displacement within the last 11,000 years (Holocene-age). Potentially-active faults are those that show evidence of most recent surface displacement within the last 1.6 million years (Quaternary-

age). Faults showing no evidence of surface displacement within the last 1.6 million years are considered inactive for most purposes, with the exception of design of some critical structures. Buried thrust faults are faults without a surface expression but are a significant source of seismic activity. They are typically broadly defined based on the analysis of seismic wave recordings of hundreds of small and large earthquakes in the Southern California area.

Two major buried thrust faults in the Los Angeles area are the Elysian Park fold and thrust belt and the Torrance-Wilmington fold and thrust belt. It is postulated that the Elysian Park structure was responsible for the magnitude 5.9, October 1, 1987 Whittier Narrows earthquake, and that the Torrance-Wilmington structure was responsible for the magnitude 5.0, January 19, 1989 Malibu earthquake. It is believed that the magnitude 6.7, January 17, 1994 Northridge earthquake was caused by a still un-named buried thrust fault located beneath the San Fernando Valley.

Due to the buried nature of these thrust faults, their existence is usually not known until they produce an earthquake. The risk for surface rupture potential of these buried thrust faults is inferred to be low (Leighton, 1990). However, the seismic risk of these buried structures in terms of recurrence and maximum potential magnitude, is not well established. Therefore, the potential for surface rupture on these surface-verging splays at magnitudes higher than 6.0 cannot be precluded.

SEISMIC HAZARDS AND DESIGN CONSIDERATIONS

The primary geologic hazard at the site is moderate to strong ground motion (acceleration) caused by an earthquake on any of the local or regional faults. The potential for other earthquake-induced hazards was also evaluated including surface rupture, liquefaction, dynamic settlement, inundation and landsliding.

Surface Rupture

In 1972, the Alquist-Priolo Special Studies Zones Act (now known as the Alquist-Priolo Earthquake Fault Zoning Act) was passed into law. The Act defines "active" and "potentially active" faults utilizing the same aging criteria as that used by California Geological Survey (CGS). However, established state policy has been to zone only those faults which have direct evidence of movement within the last 11,000 years. It is this recency of fault movement that the CGS considers as a characteristic for faults that have a relatively high potential for ground rupture in the future.

CGS policy is to delineate a boundary from 200 to 500 feet wide on each side of the known fault trace based on the location precision, the complexity, or the regional significance of the fault. If a site lies within an Earthquake Fault Zone, a geologic fault rupture investigation must be performed that demonstrates that the proposed building site is not threatened by surface displacement from the fault before development permits may be issued.

Ground rupture is defined as surface displacement which occurs along the surface trace of the causative fault during an earthquake. Based on research of available literature and results of site reconnaissance, no known active faults or potentially active faults underlie the subject site. In addition, the subject site is not located within an Alquist-Priolo Earthquake Fault Zone. Based on these considerations, the potential for surface ground rupture at the subject site is considered low.

Liquefaction

Liquefaction is a phenomenon in which saturated silty to cohesionless soils below the groundwater table are subject to a temporary loss of strength due to the buildup of excess pore pressure during cyclic loading conditions such as those induced by an earthquake. Liquefaction-related effects include loss of bearing strength, amplified ground oscillations, lateral spreading, and flow failures.

The Seismic Hazards Zone Maps of the State of California (CDMG, 1999), does not classify the site as part of the "Liquefiable" area. This determination is based on groundwater depth records, soil type and distance to a fault capable of producing a substantial earthquake.

Based on groundwater data supplied by the Seismic Hazard Zone Report of the Hollywood Quadrangle, by the California Geological Survey (SHZR 026), the historic-high groundwater level for the site is on the order of 65 feet below the existing site grade.

Due to the very dense nature of the underlying older alluvial soils and bedrock, and the depth to the historic groundwater level, the "Liquefaction" potential for the subject site is considered to be remote.

Lateral Spreading

Lateral spreading is the most pervasive type of liquefaction-induced ground failure. During lateral spread, blocks of mostly intact, surficial soil displace downslope or towards a free face along a shear zone that has formed within the liquefied sediment. According to the procedure provided by Bartlett, Hansen, and Youd, "Revised Multilinear Regression Equations for Prediction of Lateral Spread Displacement", ASCE, Journal of Geotechnical Engineering, Vol. 128, No. 12, December 2002, when the saturated cohesionless sediments with $(N_1)_{60} > 15$, significant displacement is not likely for $M < 8$ earthquakes.

Due to the very dense nature of the underlying soils and bedrock, and the depth to historic groundwater level, the underlying soils would not be prone to liquefaction. Therefore, lateral spreading is considered to be remote.

Dynamic Dry Settlement

Seismically-induced settlement or compaction of dry or moist, cohesionless soils can be an effect related to earthquake ground motion. Such settlements are typically most damaging when the settlements are differential in nature across the length of structures.

Some seismically-induced settlement of the proposed structures should be expected as a result of strong ground-shaking, however, due to the uniform nature of the underlying geologic materials, excessive differential settlements are not expected to occur.

Tsunamis, Seiches and Flooding

Tsunamis are tidal waves generated by fault displacement or major ground movement below the ocean. The site is high enough and far enough from the ocean to preclude being prone to hazards of a tsunami.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. No major water-retaining structures are located immediately up gradient from the project site. Therefore, the risk of flooding from a seismically-induced seiche is considered to be remote.

In addition, review of the County of Los Angeles Flood and Inundation Hazards Map (Leighton, 1990), indicates the site does not lie within the inundation boundaries of a breached upgradient reservoir.

Landsliding

The proposed development will occupy approximately the entire site with subterranean basement walls extending approximately 60 feet in height, and therefore, removing any existing slopes from

the site. The probability of seismically-induced landslides occurring on the site is considered to be low.

CONCLUSIONS AND RECOMMENDATIONS

Based upon the exploration, laboratory testing, and research, it is the preliminary finding of Geotechnologies, Inc. that construction of the proposed mixed-use development is considered feasible from a geotechnical engineering standpoint provided the advice and recommendations presented herein are followed and implemented during construction.

Due to the preliminary nature of the project, the structural loads are currently not available. Detailed structural loads shall be provided to this firm for analyses when the project achieves more definition. Foundation recommendations presented herein shall be considered preliminary and are subject to be confirmed or modified subsequent to review of foundation loads.

Between 4 and 15 feet of existing fill materials was encountered during exploration at the site. Due to the variable nature and the varying depths of the existing fill materials, the existing fill materials are considered to be unsuitable for support of the proposed foundations, floor slabs, or additional fill.

The proposed development will consist of a 61-story residential tower that includes an 11-level podium structure, with two completely subterranean levels, three partially subterranean levels (above grade as viewed from W. 8th Street and below grade relative to W. 7th Street), and six above grade levels. The footprint of the subterranean parking structure will occupy the entire project site. Based on the schematic drawings by the project architect, the lowest level of the parking garage (B5 Level) will extend approximately 18 to 19 feet below the elevation of W. 8th Street, and approximately 55 to 56½ feet below the elevation of W. 7th Street. In addition, a

pedestrian tunnel will be located along the north side of the project site and will extend to a depth of 70 feet below the elevation of W. 7th Street.

Preliminarily, it is anticipated that majority of the existing fill materials will be removed by the excavation of the proposed subterranean levels. However, it is anticipated some fill materials will remain locally below the planned subterranean levels. All existing fill materials and any fill generated during demolition should be properly removed and recompacted for support of the proposed slab-on-grade.

It is anticipated that the proposed tower will be supported on a mat foundation. Mat foundation shall be deepened to bear into the underlying dense Older Alluvium and/or bedrock. Detailed structural loads, size and dimensions of the mat footing shall be provided to this firm for analyses when the project achieves more definition. The design of the foundation system for support of the tower will be an iterative process between the structural engineer and the geotechnical engineer.

As an alternative, the proposed tower may be supported on a system of Auger Cast Piles (ACP) and grade beams. Piles shall be designed to bear into the underlying Older Alluvium and/or bedrock. Due to noise and vibration concerns affecting the neighboring structures, the use of driven piles is not recommended for the project.

The native soils/bedrock contact deepens gradually to the south of the site. The structural columns for the remainder of the podium structure and parking levels south of the residential tower will not be as highly loaded, and may be supported on conventional spread footings bearing in the underlying Older Alluvium.

Any remaining fill materials, not removed during excavation of the proposed subterranean levels, shall be properly removed and recompacted for support of the proposed slab-on-grade. The

existing fill materials may be utilized for the construction of the proposed fill pad. Any imported fill materials shall be verified and tested by this office prior to usage on site.

Due to the depth of the excavation, and the proximity of adjacent public ways, excavation of the proposed subterranean levels will require shoring measures to provide a stable excavation. Temporary shoring may consist of a system of soldier piles and tiebacks. In addition, some of the new foundations may extend below the existing adjacent footings. Underpinning some of the existing footings may be required to provide a stable excavation.

The validity of the conclusions and design recommendations presented herein is dependent upon review of the geotechnical aspects of the proposed construction by this firm. The subsurface conditions described herein have been projected from borings on the site as indicated and should in no way be construed to reflect any variations which may occur between these borings or which may result from changes in subsurface conditions. Any changes in the design or location of any structure, as outlined in this report, should be reviewed by this office. The recommendations contained herein should not be considered valid until reviewed and modified or reaffirmed subsequent to such review.

SEISMIC DESIGN CONSIDERATIONS

Seismic Shearwave Velocity Measurements

Downhole seismic velocity measurements were performed by GeoPentech within Boring Number 4, which was excavated to a depth of 150 feet below the existing site grade, and Boring Number 5, which was excavated to a depth of 70 feet below the existing site grade.

Results of the seismic velocity measurements are presented in the Downhole Seismic Survey Results report by GeoPentech, dated September 19, 2008. The following table presents the average

shear wave velocities of the underlying earth materials measured within Boring Number 4 and Boring Number 5. A copy of the GeoPentech's report is enclosed at the end of the Appendix.

Boring Number	Depth Range (feet)	Average Shear Wave Velocity (feet/second)
B4	0 to 5	790
	5 to 53	1,210
	53 to 130	1,700

Boring Number	Depth Range (feet)	Average Shear Wave Velocity (feet/second)
B5	0 to 5	590
	5 to 55	1,220

2016 California Building Code Seismic Parameters

Based on information derived from the subsurface investigation, the subject site is classified as Site Class C, which corresponds to a "Very Dense Soil and Soft Rock" Profile, according to Table 20.3-1 of ASCE 7-10. This information and the site coordinates were input into the USGS U.S. Seismic Design Maps tool (Version 3.1.0) to calculate the ground motions for the site.

2016 CALIFORNIA BUILDING CODE SEISMIC PARAMETERS	
Site Class	C
Mapped Spectral Acceleration at Short Periods (S_S)	2.361g
Site Coefficient (F_a)	1.0
Maximum Considered Earthquake Spectral Response for Short Periods (S_{MS})	2.361g
Five-Percent Damped Design Spectral Response Acceleration at Short Periods (S_{DS})	1.574g
Mapped Spectral Acceleration at One-Second Period (S_1)	0.829g
Site Coefficient (F_v)	1.3
Maximum Considered Earthquake Spectral Response for One-Second Period (S_{M1})	1.078g
Five-Percent Damped Design Spectral Response Acceleration for One-Second Period (S_{D1})	0.719g

FILL SOILS

The maximum depth of fill encountered on the site was 15 feet. Excavation of the proposed subterranean levels will remove majority of the existing fill soils. However, it is anticipated some fill materials will remain locally below the planned subterranean levels. All existing fill materials and any fill generated during demolition should be properly removed and recompacted for support of the proposed structures.

EXPANSIVE SOILS

The onsite soils are in the very low to moderate expansion range. The Expansion Index was found to be between 20 and 77 for bulk samples remolded to 90 percent of the laboratory maximum density. Recommended reinforcing is noted in the "Foundation Design" and "Floor Slabs" sections of this report.

WATER-SOLUBLE SULFATES

The Portland cement portion of concrete is subject to attack when exposed to water-soluble sulfates. Usually the two most common sources of exposure are from soil and marine environments. The source of natural sulfate minerals in soils includes the sulfates of calcium, magnesium, sodium, and potassium. When these minerals interact and dissolve in subsurface water, a sulfate concentration is created, which will react with exposed concrete. Over time sulfate attack will destroy improperly proportioned concrete well before the end of its intended service life.

The water-soluble sulfate content of some of the underlying soils was determined to be between 2,000 and 20,000 parts per million. The sulfate exposure is considered to be severe, and Type V cement should be utilized for concrete foundations and retaining walls in contact with the site soils. In addition, the maximum water-cementitious materials ratio should not exceed 0.45, and the minimum concrete strength shall be 4,500 psi.

METHANE ZONES

The subject property is not located within the boundary of a "Methane Zone" or a "Methane Buffer Zone" as delineated by the City of Los Angeles, Department of Public Works, Bureau of Engineering. Geotechnologies, Inc. does not practice in the fields of methane assessment, testing, or consultation. A qualified methane consultant should be retained to consider the requirements and implications of the City's Methane ordinance.

GRADING GUIDELINES

Site Preparation

- A thorough search should be made for possible underground utilities and/or structures. Any existing or abandoned utilities or structures located within the footprint of the proposed grading should be removed or relocated as appropriate.

- All vegetation, existing fill, and soft or disturbed geologic materials should be removed from the areas to receive controlled fill. All existing fill materials and any disturbed geologic materials resulting from grading operations shall be completely removed and properly recompacted prior to foundation excavation.

- Any vegetation or associated root system located within the footprint of the proposed structures should be removed during grading.

- Subsequent to the indicated removals, the exposed grade shall be scarified to a depth of six inches, moistened to optimum moisture content, and recompacted in excess of the minimum required comparative density.

- The excavated areas shall be observed by the geotechnical engineer prior to placing compacted fill.

Compaction

The City of Los Angeles Department of Building and Safety requires a minimum 90 percent of the maximum density, except for cohesionless soils having less than 15 percent finer than 0.005 millimeters, which shall be compacted to a minimum 95 percent of the maximum density in accordance with the most recent revision of the Los Angeles Building Code. Based on the laboratory test results performed by this firm, the granular soils encountered at the site would require the 95 percent compaction requirement.

All fill should be mechanically compacted in layers not more than 8 inches thick. All fill shall be compacted to at least 90 percent (or 95 percent for cohesionless soils having less than 15 percent

finer than 0.005 millimeters) of the maximum laboratory density for the materials used. The maximum density shall be determined by the laboratory operated by Geotechnologies, Inc. using the test method described in the most recent revision of ASTM D 1557.

Field observation and testing shall be performed by a representative of the geotechnical engineer during grading to assist the contractor in obtaining the required degree of compaction and the proper moisture content. Where compaction is less than required, additional compactive effort shall be made with adjustment of the moisture content, as necessary, until a minimum of 90 percent (or 95 percent for cohesionless soils having less than 15 percent finer than 0.005 millimeters) compaction is obtained.

Acceptable Materials

The excavated onsite materials are considered satisfactory for reuse in the controlled fills as long as any debris and/or organic matter is removed. Any imported materials shall be observed and tested by the representative of the geotechnical engineer prior to use in fill areas. Imported materials should contain sufficient fines so as to be relatively impermeable and result in a stable subgrade when compacted. Any required import materials should consist of geologic materials with an expansion index of less than 50. The water-soluble sulfate content of the import materials should be less than 0.1% percentage by weight.

Imported materials should be free from chemical or organic substances which could effect the proposed development. A competent professional should be retained in order to test imported materials and address environmental issues and organic substances which might effect the proposed development.

Utility Trench Backfill

Utility trenches should be backfilled with controlled fill. The utility should be bedded with clean sands at least one foot over the crown. The remainder of the backfill may be onsite soil compacted to 90 percent (or 95 percent for cohesionless soils having less than 15 percent finer than 0.005 millimeters) of the laboratory maximum density. Utility trench backfill should be tested by representatives of this firm in accordance with the most recent revision of ASTM D-1557.

Shrinkage

Shrinkage results when a volume of soil removed at one density is compacted to a higher density. A shrinkage factor between 5 and 15 percent should be anticipated when excavating and recompacting the existing fill and underlying native geologic materials on the site to an average comparative compaction of 92 percent.

Weather Related Grading Considerations

When rain is forecast all fill that has been spread and awaits compaction shall be properly compacted prior to stopping work for the day or prior to stopping due to inclement weather. These fills, once compacted, shall have the surface sloped to drain to an area where water can be removed.

Temporary drainage devices should be installed to collect and transfer excess water to the street in non-erosive drainage devices. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. Drainage should not be allowed to flow uncontrolled over any descending slope.

Work may start again, after a period of rainfall, once the site has been reviewed by a representative of this office. Any soils saturated by the rain shall be removed and aerated so that the moisture content will fall within three percent of the optimum moisture content.

Surface materials previously compacted before the rain shall be scarified, brought to the proper moisture content and recompacted prior to placing additional fill, if considered necessary by a representative of this firm.

Geotechnical Observations and Testing During Grading

Geotechnical observations and testing during grading are considered to be a continuation of the geotechnical investigation. It is critical that the geotechnical aspects of the project be reviewed by representatives of Geotechnologies, Inc. during the construction process. Compliance with the design concepts, specifications or recommendations during construction requires review by this firm during the course of construction. Any fill which is placed should be observed, tested, and verified if used for engineered purposes. Please advise this office at least twenty-four hours prior to any required site visit.

FOUNDATION DESIGN - MAT FOUNDATION

Mat Foundation

It is anticipated that the proposed tower will be supported on a mat foundation bearing in the underlying dense Older Alluvium and/or bedrock. Detailed structural loads, size and dimensions of the mat footing shall be provided to this firm for analyses when the project achieves more definition. The design of the foundation system for support of the tower will be an iterative process between the structural engineer and the geotechnical engineer.

Preliminarily, it is anticipated that the proposed tower will have an average bearing pressure of 12,000 pounds per square foot. Foundation bearing pressure will vary across the mat footings, with the highest concentrated loads located at the central cores of the mat foundations.

The proposed tower mat foundation shall be deepened to bear in the underlying bedrock. Given the size of the proposed mat foundation, the average bearing pressure of 12,000 pounds per square foot is well below the allowable bearing pressures, with factor of safety well exceeding 3. For design purposes, an average bearing pressure of 12,000 pounds per square foot, with locally higher pressures up to 15,000 pounds per square foot may be utilized in the mat foundation design. The mat foundation may be designed utilizing a modulus of subgrade reaction of 350 pounds per cubic inch for the portion of mat in contact with bedrock and 250 pounds per cubic inch for the portion of mat in contact with the Older Alluvium. This value is a unit value for use with a one-foot square footing. The modulus should be reduced in accordance with the following equation when used with larger foundations.

$$K = K_1 * [(B + 1) / (2 * B)]^2$$

where K = Reduced Subgrade Modulus
K_1 = Unit Subgrade Modulus
B = Foundation Width (feet)

The bearing values indicated above are for the total of dead and frequently applied live loads, and may be increased by one third for short duration loading, which includes the effects of wind or seismic forces. Since the recommended bearing value is a net value, the weight of concrete in the foundations may be taken as 50 pounds per cubic foot and the weight of the soil backfill may be neglected when determining the downward load on the foundations.

Where foundations will be located immediately adjacent to the neighboring structures, the bottom of the proposed foundations shall be deepened to match the depth of the existing foundations.

Lateral Design for Mat Foundation

Resistance to lateral loading may be provided by friction acting at the base of foundations and by passive earth pressure. An allowable coefficient of friction of 0.35 may be used with the dead load forces.

Passive earth pressure for the sides of foundations poured against undisturbed or recompacted soil may be computed as an equivalent fluid having a density of 300 pounds per cubic foot with a maximum earth pressure of 3,000 pounds per square foot. When combining passive and friction for lateral resistance, the passive component should be reduced by one third. A one-third increase in the passive value may be used for wind or seismic loads.

Foundation Settlement

The majority of the foundation settlement is expected to occur on initial application of loading. It is anticipated that total settlement between 3 to 3½ inches will occur below the more heavily loaded central core portions of the mat foundation beneath the tower. Settlement on the edges of the mat foundation is expected to be between 1½ to 2 inches.

FOUNDATION DESIGN – AUGER CAST PILES

Auger Cast Piles (ACP)

As an alternative, the proposed tower may be supported on a system of Auger Cast Piles (ACP). ACP piles are created by rotating a continuous flight auger into the ground to a specified depth. Subsequently, the augers are slowly withdrawn while cementitious grout is pumped under pressure to create the pile as the auger is being retracted. As the auger is retracted, the spoils on the auger are continuously removed by a small excavator or loader. Once the pile has been grouted and auger

completely removed from the pile, reinforcing cages will then be wet set into the previously placed concrete.

The ACP piles are installed by using a closed tip auger tool. The proposed piles shall be a minimum of 16 inches in diameter, and shall be drilled to derive support from the underlying dense native soils. The following table presents the allowable axial capacity (with a minimum safety factor of 2) for design using the ACP piles with a minimum of 60-foot embedment into the underlying native soils.

Depth of Embedment (feet)	Allowable Axial Capacity (kips)*
60	350

* Uplift capacity may be designed using 50 percent of the downward capacity.

An indicator pile program, including compression and tension load tests, shall be performed at the site to verify the pile design capacities. The allowable pile capacities presented herein are considered to be preliminary, and are subject to be confirmed or modified depending on the results of the indicator pile load test program. In addition to the indicator pile program, Low Strain Pile Integrity Tests (PIT) shall be performed on a minimum of 10 percent of the production piles to verify the structural integrity of the piles. A more detailed specification is presented in the Appendix of this report.

A one-third increase may be used for transient loading such as wind or seismic forces. Allowable uplift capacity may be designed using 50 percent of the allowable downward capacity indicated in the above table. For ultimate compression and tension design, the pile capacities may be doubled.

Where pile groups are required, the piles should be spaced a minimum of 3 diameters on centers. If so spaced, there will be no reduction in the downward or upward capacity of the piles due to group action.

Lateral Design

Lateral loads may be resisted by the piles, and by the passive resistance of the soils against the pile caps. The passive resistance of the soils against pile caps and grade beams may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot. A one-third increase in this value may be used for wind or seismic loads. The resistance of the piles and the passive resistance of the soils against pile caps and grade beams may be combined without reduction in determining the total lateral resistance.

Maximum recommended allowable lateral capacities for 0.5-inch deflection for single, isolated, fixed-head and free-head piles are presented in the Appendix. No factors of safety have been applied to the lateral load values calculated to induce the calculated lateral deflection. Lateral capacities provided are for concrete piles embedded into the underlying native soils encountered during the course of this investigation. Assumed as part of these lateral capacity calculations are a concrete modulus of elasticity of at least 3,000,000 pounds per square inch (psi).

Single isolated piles may be classified as piles spaced at or greater than 8 widths on center. For pile groups where piles will be spaced closer than 8 diameters on center in the direction of loading, the following reduction factor may be utilized to determine the allowable lateral pile capacities for the trailing piles to maintain the 0.5-inch pile deflection. No reduction in lateral capacity will be required for the leading row of piles in the direction of loading.

Pile Spacing	Percentage of Lateral Passive Resistance
7B	85%
6B	70%
5B	55%
4B	40%
3B	25%

Where B is the diameter of the proposed piles

A one-third increase may be used for transient loading such as wind or seismic forces. The capacities presented are based on the strength of the soils. The compressive and tensile strength of the pile sections should be checked to verify the structural capacity of the piles.

Settlement

The maximum settlement of pile-supported foundations is not expected to exceed 1 inch. Differential settlement is not expected to exceed ¼ inch.

Piling Equipment

The piling equipment used for the project shall conform to the specifications below.

- *Piling Rig* – The contractor shall use equipment of adequate torque, crowd force, and power, to achieve the design tip elevation. As a minimum, the piling rig shall be capable of providing a minimum torque of 150,000 ft-lbs, and 25 tons of down crowd thrust.

- *Automated Monitoring Equipment* – The drilling rig shall be equipped with an automated monitoring equipment (AME) designed to monitor the pile installation process. During the drilling process, the AME shall record auger depth, drill torque, and elapsed time. During the grouting process, the AME shall record the auger depth, grout pressure, and elapsed time.

- *Augers* – The augers shall be capable of creating a minimum 18-inch diameter pile.

- *Grouting Equipment* – A grout port shall be located near the tip of the displacement auger. A continuous system of grout mixing, pumping, and agitating equipment shall be utilized. Equipment shall be maintained in good working order to maintain a continuous flow of concrete during auger withdrawal. The grout pump shall be capable of developing displacement pressures of 250-psi.

Pile Installation Procedures

The following installation procedures may be followed to install the ACP piles.

1. Contractor is responsible for using equipment of adequate torque, crowd, and power to achieve the design tip elevation. The piling rig and the flight augers used for the production pile installation shall be of identical design to that used for the indicator pile test program.

2. The flight auger is advanced until it reaches the design tip elevation. The grout port in the auger tool shall be closed with a plug that prevents soil and/or water from entering the hollow shaft while the auger is advanced into the ground.

3. The flight auger shall be capable of creating a smooth walled shaft with a minimum of 16 inches in diameter (both test piles and production piles shall be a minimum of 16 inches in diameter).

4. A minimum delivery pressure of 250 psi plus the hydraulic pressure developed by the grout column in the drill stem shall be applied to create the pile. The operator shall maintain positive rotation of the displacement auger continuously throughout the grouting process until the displacement element is completely retracted from the ground.

5. The piling rig shall be equipped with automated monitoring equipment (AME) to record the auger depth, drill torque, grout pressure, and elapsed time. All recorded data shall be provided for review.

6. Once the grouted pile shaft is filled with concrete, the steel reinforcing cage shall be inserted into the wet concrete pile. All reinforcing elements shall be fitted with centralizers or clip spacers.

Indicator Test Pile Program

An indicator pile test program must be performed and approved by the City of Los Angeles prior to installation of the production piles. The number of indicator test piles shall be a minimum of 2 test piles, or equivalent to 1 percent of the total number of production piles, whichever is greater.

Axial compressive load test shall be performed in accordance with ASTM D1143. Axial tensile load test shall be performed in accordance with ASTM D3689. The test piles and reaction piles shall be considered sacrificial and shall not be utilized for foundation support of the proposed buildings.

The allowable pile capacities and pile lengths presented herein are subject to be confirmed, or altered depending on the results of the indicator pile load test program. Additional foundation piles may be necessary if the actual load tests do not meet the recommended allowable loads presented in this report.

A summary of the indicator pile load test program is provided below.

- The number of indicator test piles shall be a minimum of 2 test piles, or equivalent to 1 percent of the total number of production piles, whichever is greater.
- Load tests shall be performed on sacrificial test piles in accordance with ASTM D1143 (Axial Compressive Load) and D3689 (Axial Tensile Load). The design load shall be held until the measured creep does not exceed 0.005 inch per hour. Piles with a settlement rate exceeding 0.005 inch/hour under the design load during a pile test will be rejected.
- Pile load tests shall be performed to a minimum load equivalent to the ultimate capacity, which is equivalent to two times the allowable capacity.
- Test piles and reaction piles shall be sacrificial and shall not be incorporated as foundation piles. Sacrificial test piles and reaction piles shall be cut off 3 feet below the finished grade and abandoned in place following the completion of the testing program.
- Gamma-Gamma density logging (GDL) and Low Strain Pile Integrity Tests (PIT) shall be performed on all test piles and reaction piles. GDL shall be performed in accordance with Caltrans CT 233. PIT shall be performed in accordance with ASTM D5882.
- One test pile shall be exhumed from the ground to physically examine the pile integrity. Void created as a result of the exhumed pile shall be grouted and abandoned.
- Results of the pile load testing will be submitted as a summary letter to the LADBS Grading Division for review and approval.

Geotechnical Inspections

During pile installation, a City of Los Angeles Deputy Grading Inspector shall record and maintain data for each pile, including the following:

- Pile Number
- Installed pile length
- Auger torque vs. depth
- Head pressure inside the tremie pipe vs. depth
- Drilling rate vs. depth
- Concrete volume vs. depth
- Unanticipated site conditions if any

Non-Destructive Testing

None-destructive testing methods shall be employed to evaluate the integrity of the piles installed to provide quality control and assurance of the pile construction method.

- Gamma-Gamma density logging (GDL) and Low Strain Pile Integrity Tests (PIT) shall be performed on all test piles and reaction piles. GDL shall be performed in accordance with Caltrans CT 233. PIT shall be performed in accordance with ASTM D5882.

- Low Strain Pile Integrity Tests (PIT) shall be performed on 10 percent of the production piles.

- If any PIT test indicates a discontinuity within a tested pile, that pile shall be evaluated by the geotechnical and structural engineers. Unsatisfactory piles may be abandoned in place and shall be replaced with replacement piles.

FOUNDATION DESIGN - CONVENTIONAL FOUNDATION

Conventional

The structural columns for the remainder of the podium structure and parking levels south of the residential tower will not be as highly loaded, and may be supported on conventional spread footings bearing in the underlying Older Alluvium.

Where necessary, in order not to surcharge the subterranean walls and/or foundations of the existing neighboring structures, the proposed foundations shall be deepened to bear below a 1:1 (h:v) surcharge plane extending upward from the bottom of the existing neighboring foundations. Where foundations will be located immediately adjacent to the neighboring structures, the bottom of the proposed foundations shall be deepened to match the depth of the existing foundations.

Wall foundations may be designed utilizing an allowable bearing value of 3,000 pounds per square foot, and should be a minimum of 24 inches in width, 24 inches in depth below the lowest adjacent grade, and 24 inches into the recommended bearing material.

Column foundations may be designed utilizing an allowable bearing value of 4,000 pounds per square foot, and should be a minimum of 24 inches in width, 24 inches in depth below the lowest adjacent grade, and 24 inches into the recommended bearing material.

The bearing value increase for each additional foot of width is 250 pounds per square foot. The bearing value increase for each additional foot of depth is 500 pounds per square foot. The maximum recommended bearing value for footings embedded in the Older Alluvium is 10,000 pounds per square foot.

The bearing values indicated above are for the total of dead and frequently applied live loads, and may be increased by one third for short duration loading, which includes the effects of wind or seismic forces. Since the recommended bearing value is a net value, the weight of concrete in the foundations may be taken as 50 pounds per cubic foot and the weight of the soil backfill may be neglected when determining the downward load on the foundations.

All continuous foundations should be reinforced with a minimum of four #4 steel bars. Two should be placed near the top of the foundation, and two should be placed near the bottom.

Lateral Design

Resistance to lateral loading may be provided by friction acting at the base of foundations and by passive earth pressure. An allowable coefficient of friction of 0.35 may be used with the dead load forces.

Passive earth pressure for the sides of foundations poured against undisturbed or recompacted soil may be computed as an equivalent fluid having a density of 300 pounds per cubic foot with a maximum earth pressure of 3,000 pounds per square foot. When combining passive and friction for lateral resistance, the passive component should be reduced by one third. A one-third increase in the passive value may be used for wind or seismic loads.

Foundation Settlement

Settlement of the foundation system is expected to occur on initial application of loading. The maximum settlement is expected to be 1½ inch and occur below the heaviest loaded columns. Differential settlement is not expected to exceed ½ inch between columns. In addition, differential settlement between the columns supported on conventional foundations and the edges of the mat foundation is anticipated to be ½ inch.

Foundation Observations

It is critical that all foundation excavations are observed by a representative of this firm to verify penetration into the recommended bearing materials. The observation should be performed prior to the placement of reinforcement. Foundations should be deepened to extend into satisfactory geologic materials, if necessary. Foundation excavations should be cleaned of all loose soils prior to placing steel and concrete. Any required foundation backfill should be mechanically compacted, flooding is not permitted.

RETAINING WALL DESIGN

Cantilever retaining walls supporting a level backslope may be designed utilizing a triangular distribution of active earth pressure. Restrained retaining walls may be designed utilizing a triangular distribution of at-rest earth pressure. Retaining walls may be designed utilizing the following table:

Height of Retaining Wall (feet)	Cantilever Retaining Wall Triangular Distribution of Active Earth Pressure (pcf)	Restrained Retaining Wall Triangular Distribution of At-Rest Earth Pressure (pcf)
35 feet	45 pcf	60 pcf
70 feet	48 pcf	60 pcf

The lateral earth pressures recommended above for retaining walls assume that a permanent drainage system will be installed so that external water pressure will not be developed against the walls. Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures.

The upper ten feet of the retaining wall adjacent to streets, driveways or parking areas should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an

assumed 300 pounds per square foot surcharge behind the walls due to normal street traffic. If the traffic is kept back at least ten feet from the retaining walls, the traffic surcharge may be neglected. Foundations may be designed using the allowable bearing capacities, friction, and passive earth pressure found in the "Foundation Design" section above.

Dynamic (Seismic) Earth Pressure

Retaining walls exceeding 6 feet in height shall be designed to resist the additional earth pressure caused by seismic ground shaking. A triangular pressure distribution should be utilized for the additional seismic loads, with an equivalent fluid pressure of 25 pounds per cubic foot. When using the building code loading combination equations, the seismic earth pressure should be combined with the lateral active earth pressure for analyses of restrained basement walls under seismic loading condition.

Surcharge from Adjacent Structures

As indicated herein, additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures for retaining walls and shoring design. The following surcharge equation provided in the LADBS Information Bulletin Document No. P/BC 2008-83, may be utilized to determine the surcharge loads on basement walls and shoring system for existing structures located within the 1:1 (h:v) surcharge influence zone of the excavation and basement.

Resultant lateral force: $R = (0.3*P*h^2)/(x^2+h^2)$

Location of lateral resultant: $d = x*[(x^2/h^2+1)*\tan^{-1}(h/x)-(x/h)]$

where:

R	=	resultant lateral force measured in pounds per foot of wall width.
P	=	resultant surcharge loads of continuous or isolated footings measured in pounds per foot of length parallel to the wall.
x	=	distance of resultant load from back face of wall measured in feet.
h	=	depth below point of application of surcharge loading to top of wall footing measured in feet.
d	=	depth of lateral resultant below point of application of surcharge loading measure in feet.
$\tan^{-1}(h/x)$	=	the angle in radians whose tangent is equal to h/x.

The structural engineer and shoring engineer may use this equation to determine the surcharge loads based on the loading of the adjacent structures located within the surcharge influence zone.

Waterproofing

Moisture effecting retaining walls is one of the most common post construction complaints. Poorly applied or omitted waterproofing can lead to efflorescence or standing water inside the building. Efflorescence is a process in which a powdery substance is produced on the surface of the concrete by the evaporation of water. The white powder usually consists of soluble salts such as gypsum, calcite, or common salt. Efflorescence is common to retaining walls and does not affect their strength or integrity.

It is recommended that retaining walls be waterproofed. Waterproofing design and inspection of its installation is not the responsibility of the geotechnical engineer. A qualified waterproofing consultant should be retained in order to recommend a product or method which would provide protection to below grade walls.

Retaining Wall Drainage

All retaining walls shall be provided with a subdrain in order to minimize the potential for future hydrostatic pressure buildup behind the proposed retaining walls. Subdrains may consist of four-inch diameter perforated pipes, placed with perforations facing down. The pipe shall be encased in at least one-foot of gravel around the pipe. The gravel may consist of three-quarter inch to one inch crushed rocks.

A compacted fill blanket or other seal shall be provided at the surface. Retaining walls may be backfilled with gravel adjacent to the wall to within 2 feet of the ground surface. The onsite earth materials are acceptable for use as retaining wall backfill as long as they are compacted to a minimum of 90 percent (or 95 percent for cohesionless soils having less than 15 percent finer than 0.005 millimeters) of the maximum density as determined by the latest revision of ASTM D 1557.

Certain types of subdrain pipe are not acceptable to the various municipal agencies, it is recommended that prior to purchasing subdrainage pipe, the type and brand is cleared with the proper municipal agencies. Subdrainage pipes should outlet to an acceptable location.

Where retaining walls are to be constructed adjacent to property lines, there is usually not enough space for placement of a standard perforated pipe and gravel drainage system. Under these circumstances, 2-inch diameter weepholes may be placed at the 8 feet on center along the base of the wall. The wall shall be backfilled with a minimum of 1 foot of gravel above the base of the retaining wall. The gravel may consist of three-quarter inch to one inch crushed rocks.

The lateral earth pressures recommended above for retaining walls assume that a permanent drainage system will be installed so that external water pressure will not be developed against the walls. If a drainage system is not provided, the walls should be designed to resist an external

hydrostatic pressure due to water in addition to the lateral earth pressure. In any event, it is recommended that retaining walls be waterproofed.

Retaining Wall Backfill

Any required backfill should be mechanically compacted in layers not more than 8 inches thick, to at least 90 percent (or 95 percent for cohesionless soils having less than 15 percent finer than 0.005 millimeters) of the maximum density obtainable by the latest revision of ASTM D 1557. Flooding should not be permitted. Proper compaction of the backfill will be necessary to reduce settlement of overlying walks and paving. Some settlement of required backfill should be anticipated, and any utilities supported therein should be designed to accept differential settlement, particularly at the points of entry to the structure.

Proper compaction of the backfill will be necessary to reduce settlement of overlying walks and paving. Some settlement of required backfill should be anticipated, and any utilities supported therein should be designed to accept differential settlement, particularly at the points of entry to the structure.

TEMPORARY EXCAVATIONS

It is anticipated that excavations on the order of 45 to 75 feet in vertical height will be required for the subterranean levels. The excavations are expected to expose fill and dense native soils, which are suitable for vertical excavations up to 5 feet where not surcharged by adjacent traffic or structures.

Due to the depth of the excavation, and the proximity of adjacent public ways, it is anticipated that excavation of the proposed subterranean levels and the recommended grading will require shoring measures to provide a stable excavation. Temporary shoring may consist of a system of soldier piles and tiebacks.

However, where sufficient space is available, temporary unsurcharged embankments could be sloped back without shoring. Excavations exceeding 5 feet in height should be excavated at a uniform 1:1 (h:v) slope gradient to a maximum height of 30 feet.

Where sloped embankments are utilized, the tops of the slopes should be barricaded to prevent vehicles and storage loads within five feet of the tops of the slopes. If the temporary construction embankments are to be maintained during the rainy season, berms are suggested along the tops of the slopes where necessary to prevent runoff water from entering the excavation and eroding the slope faces.

It is critical that the soils exposed in the cut slopes are observed by a representative of this office during excavation so that modifications of the slopes can be made if variations in the earth material conditions occur. All excavations should be stabilized within 30 days of initial excavation. Water should not be allowed to pond on top of the excavation nor to flow towards it.

Excavation Observations

It is critical that the soils exposed in the cut slopes are observed by a representative of Geotechnologies, Inc. during excavation so that modifications of the slopes can be made if variations in the geologic material conditions occur. Many building officials require that temporary excavations should be made during the continuous observations of the geotechnical engineer. All excavations should be stabilized within 30 days of initial excavation.

SHORING DESIGN

The following information on the design and installation of the shoring is as complete as possible at this time. It is suggested that a review of the final shoring plans and specifications be made by this office prior to bidding or negotiating with a shoring contractor be made.

One method of shoring would consist of steel soldier piles, placed in drilled holes and backfilled with concrete. The soldier piles may be designed as cantilevers or laterally braced utilizing drilled tie-back anchors or raker braces.

Soldier Piles

Drilled cast-in-place soldier piles should be placed no closer than 2 diameters on center. The minimum diameter of the piles is 18 inches. Structural concrete should be used for the soldier piles below the excavation; lean-mix concrete may be employed above that level. As an alternative, lean-mix concrete may be used throughout the pile where the reinforcing consists of a wideflange section. The slurry must be of sufficient strength to impart the lateral bearing pressure developed by the wideflange section to the earth materials. For design purposes, an allowable passive value for the earth materials below the bottom plane of excavation may be assumed to be 800 pounds per square foot per foot. To develop the full lateral value, provisions should be implemented to assure firm contact between the soldier piles and the undisturbed earth materials.

The frictional resistance between the soldier piles and retained earth material may be used to resist the vertical component of the anchor load. The coefficient of friction may be taken as 0.4 based on uniform contact between the steel beam and lean-mix concrete and retained earth. The portion of soldier piles below the plane of excavation may also be employed to resist the downward loads. The downward capacity may be determined using a frictional resistance of 500 pounds per square foot. The minimum depth of embedment for shoring piles is 5 feet below the bottom of the footing excavation, or 7 feet below the bottom of excavated plane, whichever is deeper.

Casing may be required should caving be experienced in the saturated earth materials. If casing is used, extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than 5 feet.

Piles placed below the water level will require the use of a tremie to place the concrete into the bottom of the hole. A tremie shall consist of a water-tight tube having a diameter of not less than 10 inches with a hopper at the top. The tube shall be equipped with a device that will close the discharge end and prevent water from entering the tube while it is being charged with concrete. The tremie shall be supported so as to permit free movement of the discharge end over the entire top surface of the work and to permit rapid lowering when necessary to retard or stop the flow of concrete. The discharge end shall be closed at the start of the work to prevent water entering the tube and shall be entirely sealed at all times, except when the concrete is being placed. The tremie tube shall be kept full of concrete. The flow shall be continuous until the work is completed and the resulting concrete seal shall be monolithic and homogeneous. The tip of the tremie tube shall always be kept about five feet below the surface of the concrete and definite steps and safeguards should be taken to insure that the tip of the tremie tube is never raised above the surface of the concrete.

A special concrete mix should be used for concrete to be placed below water. The design shall provide for concrete with a strength of 1,000 psi over the initial job specification. An admixture that reduces the problem of segregation of paste/aggregates and dilution of paste shall be included. The slump shall be commensurate to any research report for the admixture, provided that it shall also be the minimum for a reasonable consistency for placing when water is present.

Lagging

Soldier piles and anchors should be designed for the full anticipated pressures. Due to the cohesionless nature of the underlying earth materials, lagging will be required throughout the entire depth of the excavation. Due to arching in the geologic materials, the pressure on the lagging will be less. It is recommended that the lagging should be designed for the full design pressure but be limited to a maximum of 400 pounds per square foot. It is recommended that a

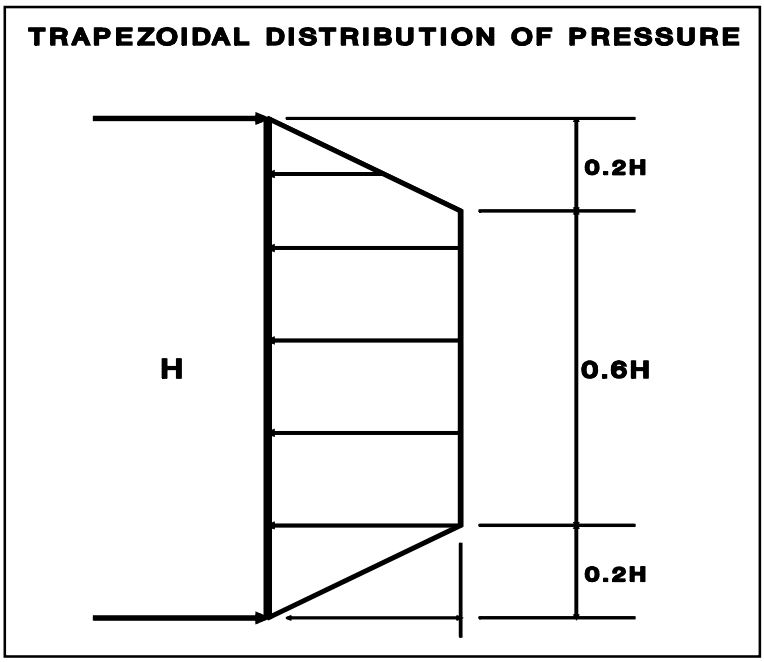
representative of this firm observe the installation of lagging to insure uniform support of the excavated embankment.

Lateral Pressures

A triangular distribution of lateral earth pressure should be utilized for the design of cantilevered shoring system. A trapezoidal distribution of lateral earth pressure would be appropriate where shoring is to be restrained at the top by bracing or tie backs. The design of trapezoidal distribution of pressure is shown in the diagram below. Equivalent fluid pressures for the design of cantilevered and restrained shoring are presented in the following table:

Height of Shoring (feet)	Cantilever Shoring System Equivalent Fluid Pressure (pcf) Triangular Distribution of Pressure	Restrained Shoring System Lateral Earth Pressure (psf)* Trapezoidal Distribution of Pressure
45 feet	38 pcf	25H psf
75 feet	45 pcf	30H psf

*Where H is the height of the shoring in feet.



Where a combination of sloped embankment and shoring is utilized, the pressure will be greater and must be determined for each combination. Additional active pressures should be applied where the shoring will be surcharged by adjacent traffic or structures.

The upper ten feet of the retaining wall adjacent to streets, driveways or parking areas should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pounds per square foot surcharge behind the walls due to normal street traffic. If the traffic is kept back at least ten feet from the retaining walls, the traffic surcharge may be neglected. Foundations may be designed using the allowable bearing capacities, friction, and passive earth pressure found in the "Foundation Design" section above.

Tied-Back Anchors

Tied-back anchors may be used to resist lateral loads. Friction anchors are recommended. For design purposes, it may be assumed that the active wedge adjacent to the shoring is defined by a

plane drawn 35 degrees with the vertical through the bottom plane of the excavation. Friction anchors should extend a minimum of 20 feet beyond the potentially active wedge.

Drilled friction anchors may be designed for a skin friction of 300 pounds per square foot. Pressure grouted anchor may be designed for a skin friction of 2,000 pounds per square foot. Where belled anchors are utilized, the capacity of belled anchors may be designed by assuming the diameter of the bonded zone is equivalent to the diameter of the bell. Only the frictional resistance developed beyond the active wedge would be effective in resisting lateral loads.

It is recommended that at least 3 of the initial anchors have their capacities tested to 200 percent of their design capacities for a 24-hour period to verify their design capacity. The total deflection during this test should not exceed 12 inches. The anchor deflection should not exceed 0.75 inches during the 24 hour period, measured after the 200 percent load has been applied.

All anchors should be tested to at least 150 percent of design load. The total deflection during this test should not exceed 12 inches. The rate of creep under the 150 percent test load should not exceed 0.1 inch over a 15 minute period in order for the anchor to be approved for the design loading.

After a satisfactory test, each anchor should be locked-off at the design load. This should be verified by rechecking the load in the anchor. The load should be within 10 percent of the design load. Where satisfactory tests are not attained, the anchor diameter and/or length should be increased or additional anchors installed until satisfactory test results are obtained. The installation and testing of the anchors should be observed by the geotechnical engineer. Minor caving during drilling of the anchors should be anticipated.

Anchor Installation

Tied-back anchors may be installed between 20 and 40 degrees below the horizontal. Caving of the anchor shafts, particularly within sand deposits, should be anticipated and the following provisions should be implemented in order to minimize such caving. The anchor shafts should be filled with concrete by pumping from the tip out, and the concrete should extend from the tip of the anchor to the active wedge. In order to minimize the chances of caving, it is recommended that the portion of the anchor shaft within the active wedge be backfilled with sand before testing the anchor. This portion of the shaft should be filled tightly and flush with the face of the excavation. The sand backfill should be placed by pumping; the sand may contain a small amount of cement to facilitate pumping.

Deflection

It is difficult to accurately predict the amount of deflection of a shored embankment. It should be realized that some deflection will occur. It is estimated that the deflection could be on the order of one inch at the top of the shored embankment. If greater deflection occurs during construction, additional bracing may be necessary to minimize settlement of adjacent buildings and utilities in adjacent street and alleys. If desired to reduce the deflection, a greater active pressure could be used in the shoring design. Where internal bracing is used, the rakers should be tightly wedged to minimize deflection. The proper installation of the raker braces and the wedging will be critical to the performance of the shoring.

The City of Los Angeles Department of Building and Safety requires limiting shoring deflection to ½ inch at the top of the shored embankment where a structure is within a 1:1 plane projected up from the base of the excavation. A maximum deflection of 1-inch has been allowed provided there are no structures within a 1:1 plane drawn upward from the base of the excavation.

Monitoring

Because of the depth of the excavation, some mean of monitoring the performance of the shoring system is suggested. The monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of all soldier piles and the lateral movement along the entire lengths of selected soldier piles. Also, some means of periodically checking the load on selected anchors will be necessary, where applicable.

Some movement of the shored embankments should be anticipated as a result of the relatively deep excavation. It is recommended that photographs of the existing buildings on the adjacent properties be made during construction to record any movements for use in the event of a dispute.

Shoring Observations

It is critical that the installation of shoring is observed by a representative of Geotechnologies, Inc. Many building officials require that shoring installation should be performed during continuous observation of a representative of the geotechnical engineer. The observations insure that the recommendations of the geotechnical report are implemented and so that modifications of the recommendations can be made if variations in the geologic material or groundwater conditions warrant. The observations will allow for a report to be prepared on the installation of shoring for the use of the local building official, where necessary.

SLABS ON GRADE

Concrete Slabs-on Grade

Concrete floor slabs should be a minimum of 5 inches in thickness, and should be reinforced with a minimum of #4 steel bars on 16-inch centers each way. Slabs-on-grade should be cast over undisturbed natural geologic materials or properly controlled fill materials. Any geologic

materials loosened or over-excavated should be wasted from the site or properly compacted to 90 percent (or 95 percent for cohesionless soils having less than 15 percent finer than 0.005 millimeters) of the maximum dry density.

Outdoor concrete flatwork should be a minimum of 4 inches in thickness, and should be reinforced with a minimum of #3 steel bars on 18 centers each way. Outdoor concrete flatwork should be cast over undisturbed natural geologic materials or properly controlled fill materials. Any geologic materials loosened or over-excavated should be wasted from the site or properly compacted to 90 percent (or 95 percent for cohesionless soils having less than 15 percent finer than 0.005 millimeters) of the maximum dry density.

Design of Slabs That Receive Moisture-Sensitive Floor Coverings

Geotechnologies, Inc. does not practice in the field of moisture vapor transmission evaluation and mitigation. Therefore it is recommended that a qualified consultant be engaged to evaluate the general and specific moisture vapor transmission paths and any impact on the proposed construction. The qualified consultant should provide recommendations for mitigation of potential adverse impacts of moisture vapor transmission on various components of the structure.

Where dampness would be objectionable, it is recommended that the floor slabs should be waterproofed. A qualified waterproofing consultant should be retained in order to recommend a product or method which would provide protection for concrete slabs-on-grade.

All concrete slabs-on-grade should be supported on vapor retarder. The design of the slab and the installation of the vapor retarder should comply with the most recent revisions of ASTM E 1643 and ASTM E 1745. The vapor retarder should comply with ASTM E 1745 Class A requirements.

Where a vapor retarder is used, a low-slump concrete should be used to minimize possible curling of the slabs. The barrier can be covered with a layer of trimmable, compactible, granular fill, where it is thought to be beneficial. See ACI 302.2R-32, Chapter 7 for information on the placement of vapor retarders and the use of a fill layer.

Concrete Crack Control

The recommendations presented in this report are intended to reduce the potential for cracking of concrete slabs-on-grade due to settlement. However even where these recommendations have been implemented, foundations, stucco walls and concrete slabs-on-grade may display some cracking due to minor soil movement and/or concrete shrinkage. The occurrence of concrete cracking may be reduced and/or controlled by limiting the slump of the concrete used, proper concrete placement and curing, and by placement of crack control joints at reasonable intervals, in particular, where re-entrant slab corners occur.

For standard control of concrete cracking, a maximum crack control joint spacing of 12 feet should not be exceeded. Lesser spacings would provide greater crack control. Joints at curves and angle points are recommended. The crack control joints should be installed as soon as practical following concrete placement. Crack control joints should extend a minimum depth of one-fourth the slab thickness. Construction joints should be designed by a structural engineer.

Complete removal of the existing fill soils beneath outdoor flatwork such as walkways or patio areas, is not required, however, due to the rigid nature of concrete, some cracking, a shorter design life and increased maintenance costs should be anticipated. In order to provide uniform support beneath the flatwork it is recommended that a minimum of 12 inches of the exposed subgrade beneath the flatwork be scarified and recompacted to 90 percent (or 95 percent for cohesionless soils having less than 15 percent finer than 0.005 millimeters) relative compaction.

PAVEMENTS

Prior to placing paving, the existing grade should be scarified to a depth of 12 inches, moistened as required to obtain optimum moisture content, and recompacted to 95 percent of the maximum density as determined by the most recent revision of ASTM D 1557. The client should be aware that removal of all existing fill in the area of new paving is not required, however, pavement constructed in this manner will most likely have a shorter design life and increased maintenance costs. The following pavement sections are recommended:

Service	Asphalt Pavement Thickness Inches	Base Course Inches
Passenger Cars	3	4
Moderate Truck	4	6
Heavy Truck	6	9

A subgrade modulus of 100 pounds per cubic inch may be assumed for design of concrete paving. Concrete paving for passenger cars and moderate truck traffic shall be a minimum of 6 inches in thickness, and shall be underlain by 4 inches of aggregate base. Concrete paving for heavy truck traffic shall be a minimum of 7½ inches in thickness, and shall be underlain by 6 inches of aggregate base. For standard crack control maximum expansion joint spacing of 12 feet should not be exceeded. Lesser spacing would provide greater crack control. Joints at curves and angle points are recommended.

Aggregate base should be compacted to a minimum of 95 percent of the most recent revision of ASTM D 1557 laboratory maximum dry density. Base materials should conform to Sections 200-2.2 or 200-2.4 of the "Standard Specifications for Public Works Construction", (Green Book), latest edition.

SITE DRAINAGE

Proper surface drainage is critical to the future performance of the project. Saturation of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the designed engineering properties. Proper site drainage should be maintained at all times.

All site drainage should be collected and transferred to the street in non-erosive drainage devices. The proposed structure should be provided with roof drainage. Discharge from downspouts, roof drains and scuppers should not be permitted on unprotected soils within five feet of the building perimeter. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. Drainage should not be allowed to flow uncontrolled over any descending slope. Planters which are located within a distance equal to the depth of a retaining wall should be sealed to prevent moisture adversely affecting the wall. Planters which are located within five feet of a foundation should be sealed to prevent moisture affecting the earth materials supporting the foundation.

STORMWATER DISPOSAL

Recently regulatory agencies have been requiring the disposal of a certain amount of stormwater generated on a site by infiltration into the site soils. This requirement is not prudent engineering practice. Increasing the moisture content of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the designed engineering properties. This means that any overlying structure, including buildings, pavements and concrete flatwork, could sustain damage due to saturation of the subgrade soils. Structures serviced by subterranean levels could be adversely impacted by stormwater disposal by increasing the design fluid pressures on retaining walls and causing leaks in the walls. Proper site drainage is critical to the performance of any structure in the built environment.

The proposed subterranean levels will extend on the order of 35 to 70 feet below the surrounding street grade. Due to the relatively impermeable nature of the underlying Older Alluvium and bedrock, it is the opinion of this firm that percolation of stormwater into the subgrade soils is not advisable.

DESIGN REVIEW

Engineering of the proposed project should not begin until approval of the geotechnical report by the Building Official is obtained in writing. Significant changes in the geotechnical recommendations may result during the building department review process.

It is recommended that the geotechnical aspects of the project be reviewed by this firm during the design process. This review provides assistance to the design team by providing specific recommendations for particular cases, as well as review of the proposed construction to evaluate whether the intent of the recommendations presented herein are satisfied.

CONSTRUCTION MONITORING

Geotechnical observations and testing during construction are considered to be a continuation of the geotechnical investigation. It is critical that this firm review the geotechnical aspects of the project during the construction process. Compliance with the design concepts, specifications or recommendations during construction requires review by this firm during the course of construction. All foundations should be observed by a representative of this firm prior to placing concrete or steel. Any fill which is placed should be observed, tested, and verified if used for engineered purposes. Please advise Geotechnologies, Inc. at least twenty-four hours prior to any required site visit.

If conditions encountered during construction appear to differ from those disclosed herein, notify Geotechnologies, Inc. immediately so the need for modifications may be considered in a timely manner.

It is the responsibility of the contractor to ensure that all excavations and trenches are properly sloped or shored. All temporary excavations should be cut and maintained in accordance with applicable OSHA rules and regulations.

EXCAVATION CHARACTERISTICS

The exploration performed for this investigation is limited to the geotechnical excavations described. Direct exploration of the entire site would not be economically feasible. The owner, design team and contractor must understand that differing excavation and drilling conditions may be encountered based on boulders, gravel, oversize materials, groundwater and many other conditions. Fill materials, especially when they were placed without benefit of modern grading codes, regularly contain materials which could impede efficient grading and drilling. Southern California sedimentary bedrock is known to contain variable layers which reflect differences in depositional environment. Such layers may include abundant gravel, cobbles and boulders. Similarly bedrock can contain concretions. Concretions are typically lenticular and follow the bedding. They are formed by mineral deposits. Concretions can be very hard. Excavation and drilling in these areas may require full size equipment and coring capability. The contractor should be familiar with the site and the geologic materials in the vicinity.

CLOSURE AND LIMITATIONS

The purpose of this report is to aid in the design and completion of the described project. Implementation of the advice presented in this report is intended to reduce certain risks associated with construction projects. The professional opinions and geotechnical advice contained in this report are sought because of special skill in engineering and geology and were prepared in

accordance with generally accepted geotechnical engineering practice. Geotechnologies, Inc. has a duty to exercise the ordinary skill and competence of members of the engineering profession. Those who hire Geotechnologies, Inc. are not justified in expecting infallibility, but can expect reasonable professional care and competence.

The scope of the geotechnical services provided did not include any environmental site assessment for the presence or absence of organic substances, hazardous/toxic materials in the soil, surface water, groundwater, or atmosphere, or the presence of wetlands.

Proper compaction is necessary to reduce settlement of overlying improvements. Some settlement of compacted fill should be anticipated. Any utilities supported therein should be designed to accept differential settlement. Differential settlement should also be considered at the points of entry to the structure.

GEOTECHNICAL TESTING

Classification and Sampling

The soil is continuously logged by a representative of this firm and classified by visual examination in accordance with the Unified Soil Classification system. The field classification is verified in the laboratory, also in accordance with the Unified Soil Classification System. Laboratory classification may include visual examination, Atterberg Limit Tests and grain size distribution. The final classification is shown on the excavation logs.

Samples of the geologic materials encountered in the exploratory excavations were collected and transported to the laboratory. Undisturbed samples of soil are obtained at frequent intervals. Unless noted on the excavation logs as an SPT sample, samples acquired while utilizing a hollow-stem auger drill rig are obtained by driving a thin-walled, California Modified Sampler with successive 30-inch drops of a 140-pound hammer. The soil is retained in brass rings of 2.50 inches

outside diameter and 1.00 inch in height. The central portion of the samples are stored in close fitting, waterproof containers for transportation to the laboratory. Samples noted on the excavation logs as SPT samples are obtained in accordance with the most recent revision of ASTM D 1586. Samples are retained for 30 days after the date of the geotechnical report.

Moisture and Density Relationships

The field moisture content and dry unit weight are determined for each of the undisturbed soil samples, and the moisture content is determined for SPT samples by the most recent revision of ASTM D 4959 or ASTM D 4643. This information is useful in providing a gross picture of the soil consistency between exploration locations and any local variations. The dry unit weight is determined in pounds per cubic foot and shown on the "Excavation Logs", A-Plates. The field moisture content is determined as a percentage of the dry unit weight.

Direct Shear Testing

Shear tests are performed by the most recent revision of ASTM D 3080 with a strain controlled, direct shear machine manufactured by Soil Test, Inc. or a Direct Shear Apparatus manufactured by GeoMatic, Inc. The rate of deformation is approximately 0.025 inches per minute. Each sample is sheared under varying confining pressures in order to determine the Mohr-Coulomb shear strength parameters of the cohesion intercept and the angle of internal friction. Samples are generally tested in an artificially saturated condition. Depending upon the sample location and future site conditions, samples may be tested at field moisture content. The results are plotted on the "Shear Test Diagram," B-Plates.

The most recent revision of ASTM 3080 limits the particle size to 10 percent of the diameter of the direct shear test specimen. The sheared sample is inspected by the laboratory technician running the test. The inspection is performed by splitting the sample along the sheared plane and

observing the soils exposed on both sides. Where oversize particles are observed in the shear plane, the results are discarded and the test run again with a fresh sample.

Consolidation Testing

Settlement predictions of the soil's behavior under load are made on the basis of the consolidation tests using the most recent revision of ASTM D 2435. The consolidation apparatus is designed to receive a single one-inch high ring. Loads are applied in several increments in a geometric progression, and the resulting deformations are recorded at selected time intervals. Porous stones are placed in contact with the top and bottom of each specimen to permit addition and release of pore fluid. Samples are generally tested at increased moisture content to determine the effects of water on the bearing soil. The normal pressure at which the water is added is noted on the drawing. Results are plotted on the "Consolidation Test," C-Plates.

Expansion Index Testing

The expansion tests performed on the remolded samples are in accordance with the Expansion Index testing procedures, as described in the most recent revision of ASTM D4829. The soil sample is compacted into a metal ring at a saturation degree of 50 percent. The ring sample is then placed in a consolidometer, under a vertical confining pressure of 1 lbf/square inch and inundated with distilled water. The deformation of the specimen is recorded for a period of 24 hour or until the rate of deformation becomes less than 0.0002 inches/hour, whichever occurs first. The expansion index, EI, is determined by dividing the difference between final and initial height of the ring sample by the initial height, and multiplied by 1,000.

Laboratory Compaction Characteristics

The maximum dry unit weight and optimum moisture content of a soil are determined by use of the most recent revision of ASTM D 1557. A soil at a selected moisture content is placed in five layers into a mold of given dimensions, with each layer compacted by 25 blows of a 10 pound hammer dropped from a distance of 18 inches subjecting the soil to a total compactive effort of about 56,000 pounds per cubic foot. The resulting dry unit weight is determined. The procedure is repeated for a sufficient number of moisture contents to establish a relationship between the dry unit weight and the water content of the soil. The data when plotted represent a curvilinear relationship known as the compaction curve. The values of optimum moisture content and modified maximum dry unit weight are determined from the compaction curve.

Grain Size Distribution

These tests cover the quantitative determination of the distribution of particle sizes in soils. Sieve analysis is used to determine the grain size distribution of the soil larger than the Number 200 sieve. The most recent revision of ASTM D 422 is used to determine particle sizes smaller than the Number 200 sieve. A hydrometer is used to determine the distribution of particle sizes by a sedimentation process. The grain size distributions are plotted on the E-Plates presented in the Appendix of this report.

SUBJECT: DOWNHOLE SEISMIC SURVEY RESULTS
BOREHOLES B-4 AND B-5
755 SOUTH FIGUEROA
LOS ANGELES, CALIFORNIA

Dear Mr. Tang,

Per your request and in accordance with the provisions of our proposal, dated August 29, 2008, we have performed downhole seismic surveys within boreholes B-4 and B-5 at the 755 South Figueroa site in Los Angeles, California. Boreholes B-4 and B-5 were drilled and 2-inch PVC casings were installed under the direction of Geotechnologies as part of their geotechnical investigation. The downhole seismic survey was performed within B-4 and B-5 to assist Geotechnologies, Inc. with their evaluation of the site. This letter summarizes the results of the downhole seismic surveys.

Seismic Downhole Methods and Procedures

The seismic downhole method measures both pressure-wave (p-wave) and shear-wave (s-wave) velocities of the geologic-medium adjacent to a borehole by measuring the time required for these waves to travel from a surface source to a sensor fixed at a known depth within a borehole.

Downhole seismic measurements were performed at the subject site on September 4, 2008. The downhole seismic sensor consisted of a triaxial geophone assembly which was pneumatically held against the boring walls. The seismic source consisted of a series of sledgehammer blows to a ground plate and a wood timber, which were offset 5-feet from the borehole. Vertical blows to the ground plate were used to produce p-waves, and horizontal blows to the wood timber were used to produce s-waves. Horizontal blows were made in opposite directions in order to record the characteristic opposite first motions of the s-waves to determine travel-times. The resulting seismic downhole data were recorded with a Geometrics S12 signal enhancing seismograph. Measurements were made at intervals of 5-feet down the borehole. After correcting the travel time for the source offset, seismic-wave travel-times were plotted versus depth. Layer and interval velocities were calculated as the slope of lines drawn through the plotted data.

Seismic Downhole Results

Results of the seismic downhole measurements for boreholes B-4 and B-5 are presented on Figures 1 and 2, respectively. These figures show the measured p-wave and s-wave travel-times and depths; a plot of the p-wave and s-wave travel-times as a function of depth showing the interpreted layer velocities; interpreted p-wave and s-wave layer velocities and depth ranges; and calculated p-wave and s-wave interval velocities.

Table 1 below summarizes the interpreted p-wave and s-wave layer velocities and depths shown on Figures 1 and 2 for the various geologic units within boreholes B-4 and B-5 as logged by Geotechnologies, Inc. As shown on Table 1, the artificial fill within B-4 and B-5 has an s-wave velocity that ranges between approximately 590 to 790 ft/sec. The alluvium/older alluvium unit within B-4 has a measured s-wave velocity of approximately 1,210 ft/sec. Finally, the s-wave velocity of the siltstone/sandstone bedrock measured within B-4 and B-5 ranges between about 1,220 and 1,700 ft/sec.

TABLE 1
SUMMARY OF PRESSURE-WAVE AND SHEAR-WAVE VELOCITY LAYERS

BOREHOLE	PREDOMINANT GEOLOGIC UNIT	PRESSURE-WAVE		SHEAR-WAVE	
		Depth Range (ft)	Velocity (ft/sec)	Depth Range (ft)	Velocity (ft/sec)
B-4	Fill	0 to 5	1,010	0 to 5	790
	Alluvium/ Old Aluvium	5 to 53	3,370	5 to 53	1,210
	Bedrock (Siltstone/Sandstone)	53 to 130	4,000	53 to 150	1,700
B-5	Fill	0 to 5	1,540	0 to 10	590
	Bedrock (Siltstone/Sandstone)	5 to 55	4,570	10 to 60	1,220

Limitations

The above information is based on limited observations and geophysical measurements made as described above. GeoPentech does not guarantee the performance of the project, only that the information provided meets the standard of care of the profession at this time under the same scope limitations imposed by the project. In this regard, our scope of work was limited to making the pressure-wave and shear-wave velocity measurements in two boreholes under the direction of Geotechnologies, Inc. personnel. We relied upon borehole information provided by Geotechnologies, Inc. for the identification of geologic units that we then correlated with the seismic velocity measurements.

We trust the contents of this letter will meet your current needs. If you have questions or require additional information, please call.

Very Truly Yours,

GeoPentech

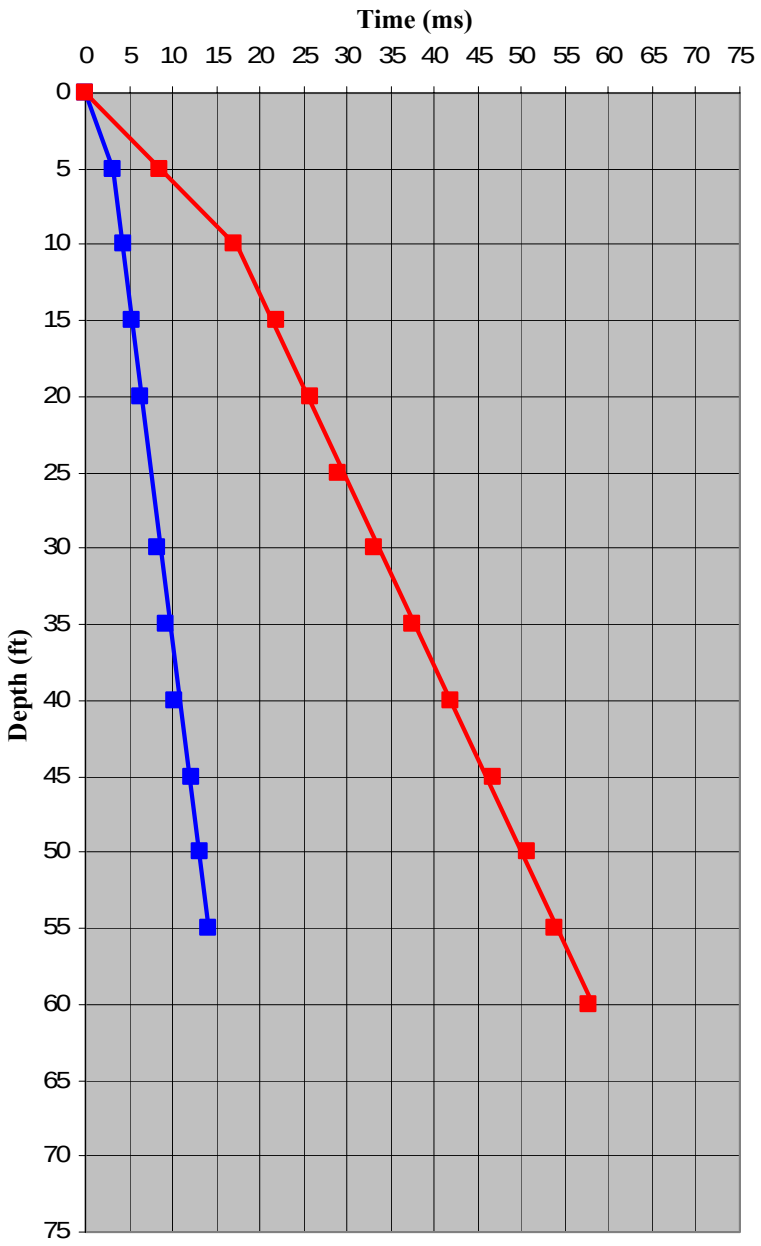
PROJECT: **755 SOUTH FIGUEROA STREET**

PROJECT #: **08014A** | DATE: **SEP 2008** | FIG: **1**

SEISMIC WAVE TRAVEL TIMES

Depth (ft)	P-wave (ms)	S-wave (ms)
0	0	0
5	4.6	12
10	4.9	19
15	5.7	23
20	6.6	26.5
25		29.5
30	8.5	33.5
35	9.3	38
40	10.3	42.2
45	12.3	47
50	13.3	51
55	14.2	54
60		58

TRAVEL TIME PLOT



LAYER VELOCITIES

Layer	P-Velocity (fps)	P-Depth (ft)	S-Velocity (fps)	S-Depth (ft)
1	1,537	0 to 5	588	0 to 10
2	4,567	5 to 55	1,217	10 to 60

INTERVAL VELOCITIES

Depth Range (ft)	P-Velocity (fps)	S-Velocity (fps)
0 to 5	1,537	589
5 to 10	4,425	588
10 to 15	4,879	1,036
15 to 20	5,023	1,286
20 to 25		1,554
25 to 30		1,214
30 to 35	6,081	1,093
35 to 40	4,931	1,175
40 to 45	2,495	1,033
45 to 50	4,954	1,239
50 to 55	5,508	1,649
55 to 60		1,243
