The site is located at the 316 North Juanita Avenue, City of Los Angeles (Attachment 1, Site Map). Production well 01S13W04K01S is located 18,015 feet from the site (Attachment 2, one-mile radius map). The site consists of two buildings for general office use, equipment storage and vehicle maintenance and parking lot.

On November 10, 2004, a 12,000-gallon gasoline underground storage tank (UST) was removed. Low or non-detectable concentrations of fuel hydrocarbons were detected. However, water accumulating in the excavation pit was sampled and found that the maximum concentrations of petroleum hydrocarbons as gasoline (TPH_G) at 20,900 µg/L, benzene concentration at 524 µg/L, and methyl tertiary butyl ether (MTBE) concentration at 5,400 µg/L were detected.

In November 2007, five boring were drilled and converted to groundwater monitoring wells. Since then, the maximum concentrations of petroleum hydrocarbons as diesel (TPH_D) at 7,900 µg/L(11/07), and MTBE concentration at 13.1 µg/L (2/08) were detected in groundwater samples. Non-detectable concentrations of all other fuel hydrocarbons were detected in the soil and groundwater samples.

Non-detectable concentrations of MTBE were detected in soil samples except at boring MW-1 which detected maximum concentration of MTBE at 0.051 mg/kg at a depth of 10 feet below ground surface (bgs). Groundwater was encountered between 10 feet to 13 feet bgs. The low concentrations of MTBE in soil and groundwater samples in shallow groundwater would not cause impacts on drinking water aquifer.

In October 2008, two hydropunch groundwater samples were collected to further assess the groundwater plume. Non-detectable concentrations of fuel hydrocarbons were detected.

Attachment 3 shows the summary of soil analytical results.

Attachment 4 shows the summary of groundwater analytical results.

Contaminant Exposure Pathways Evaluation

Direct Contact

The residual concentrations of gasoline constituents in the soil beneath the site do not cause any direct contact concerns, because analytical results from the latest soil sampling are all below their respective SLs.

Protection of Drinking Water Aquifer

The groundwater beneath the site did not detect any concentrations of gasoline constituents higher than MCLs. The nearest drinking water well is 18,015 feet from the site.

Plume Migration

Groundwater sampling data showed low or non-detectable concentrations of fuel hydrocarbons. Therefore, there is no plume migration.

Vapor Intrusion

The residual concentrations of gasoline constituents in the soil beneath the site are not to cause any vapor intrusion concerns because low benzene concentrations were detected in all soil samples.

Factors Supporting Low Risk Closure

Based on the above assessment, staff recommends to grant a low-risk closure for the site for the following reasons:

- The source of the petroleum contamination has been abated as the UST at the site has been removed.

Site Name/Address:	Staff Initial:
AT&T G1118 Facility 316 N. Juanita Avenue Los Angeles, CA 90004	

- No free product has ever been observed in any of the monitoring wells.
- The extent of soil and groundwater contamination has been adequately defined.
- The levels of the residual soil contamination are all below the respective SLs.
- The groundwater samples did not detected any fuel hydrocarbons higher than MCLs.

X. MTBE FATE & TRANSPORT PLUME LENGTH ANALYSIS

The MTBE fate and transport analysis can not be assessed since the highest MTBE concentration was only 8.65 µg/L (below the MCL).

XI. ELECTRONIC DELIVERABLE FORMAT (EDF) SUBMISSION: Yes

Has electronic data reporting requirement been met? **Yes**

XII. AB 681 REQUIREMENT (Land Owner Notification)

Verify property ownership http://assessor.lacounty.gov/extranet/DataMaps/Pais.aspx (date) : 3/16/09

Have landowner or impacted site notification requirements been met? Yes

- TPH = Total petroleum hydrocarbons.
- BTEX = benzene, toluene, ethylbenzene, and xylenes, respectively. MTBE = methyl tertiary butyl ether.
- Respective MCLs (ppm): B=0.001, T=0.15, E=0.7, X=1.75, MTBE=0.013.
- BTEX screening concentrations determined per the attenuation factor method as described in RWQCB Guidance for VOC Impacted Sites (March 1996), with a natural degradation factor of 11 for BTEX and of 3 for MTBE. Table values can be linearly interpolated between distance above groundwater and are proportional to fraction of each lithological thickness.
- Values in Table 4-1 are for soils above drinking water aquifers. All groundwaters are considered as drinking water resources unless exempted by one of the criteria as defined under SWRCB Resolution 88-63 (TDS>3000 mg/L, or deliverability <200 gal/day, or existing contamination that cannot be reasonably treated). Regional Board staff will make a determination of potential water use at a particular site considering water quality objectives and beneficial uses. For non-drinking water aquifers, regardless of depth, TPH for ">150 feet" category in the table should be used; BTEX screening levels are set at 100 times respective MCLs and MTBE 30 times MCL as preliminary levels determined to be protective of human health and the environment.
- Distance above groundwater must be measured from the highest anticipated water level. Lithology is based on the USCS scale.
- In areas of naturally-occurring hydrocarbons, Regional Board staff will make determinations on TPH levels.

3.0 ANALYTICAL TESTING

Soil samples were submitted to Associated Laboratories (AL) for analysis, which is State certified for hazardous waste testing (Certification No. 1338) using a 24-hour turn-around-time. Analytical laboratory results are provided on Figure 4 and laboratory reports are provided in Appendix A.

Samples were submitted for the following analysis:

- Total petroleum hydrocarbons as gasoline (TPH-g) using EPA Method 8015(m).
- Benzene (B), Toluene (T), Ethylbenzene (E), and Total Xylenes (X) using EPA Method 8260B (collectively BTEX).
- 5 Oxygenates: Methyl-t-butyl ether (MtBE), Di-isopropyl ether (DIPE), Ethyl-t-butyl ether (EtBE), Tert-amyl methyl ether (TAME), and Tert-butanol (TBA) using EPA Method 8260B.
- 1,2-Dibromoethane (EDB), and 1,2-Dichloroethane (EDC) using EPA Method 8260B.
- Methanol using EPA Method 8015M.
- Ethanol using EPA Method 8260B.
- The samples were collected and preserved using EPA Method SW5035.
- The analytical testing COELT/EDF data has been uploaded to the Geotracker website in compliance with AB2886 requirements.

UNDERGROUND STORAGE TANKS PROGRAM – CASE CLOSURE
PACIFIC BELL TELEPHONE COMPANY, AT&T
316 NORTH JUANITA AVENUE, LOS ANGELES, CA
(CASE NO. 900040225A)

Dear Mr. Weller:

This letter confirms the completion of the site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the underground storage tank(s) is greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground tank(s) site is in compliance with the requirements of subdivision (a) and (b) of section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of section 25296.10 of the Health and Safety Code.

If you have groundwater monitoring wells or vapor extraction wells at the subject property, you must comply with the following:

1. All wells must be located and properly abandoned.

2. Well abandonment permits must be obtained from the Los Angeles County Department of Public Health, Environmental Health Division, and all other necessary permits must be obtained from the appropriate agencies prior to the start of work.

3. You must submit a report on the abandonment of the wells to this office by **June 15, 2009**. This report must include, at a minimum, a site map, a description of the well abandonment process, and copies of all signed permits.

If you have any questions regarding this matter, please contact Mrs. Mercedes Hsu at (213) 576-6712 or e-mail her at mhsu@waterboards.ca.gov, or contact Dr. Weixing Tong at (213) 576-6715 or wtong@waterboards.ca.gov.

Sincerely,

Tracy J. Egoscue
Executive Officer

** Approved Seismic Gas Shut-Off Valve may be required. **

In the event that any box (i.e. 1-16) is filled to capacity, it is possible that additional information has been captured electronically and could not be printed due to space restrictions. Nevertheless, the information printed exceeds that required by Section 19825 of the Health and Safety Code of the State of California.

15. Building Relocated From:

16. CONTRACTOR, ARCHITECT, & ENGINEER NAME	ADDRESS		CLASS	LICENSE#	PHONE #
(C) Mjk Construction Inc	2766 Pomona Blvd,	Pomona, CA 91768	B	586870	(909) 594-9830

PERMIT EXPIRATION/REFUNDS: This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by LADBS (Sec. 22.12 & 22.13 LAMC). The permittee may be entitled to reimbursement of permit fees if the Department fails to conduct an inspection within 60 days of receiving a request for final inspection (HS 17951).

17. LICENSED CONTRACTOR'S DECLARATION

I hereby affirm under penalty of perjury that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect. The following applies to B contractors only: I understand the limitations of Section 7057 of the Business and Professional Code related to my ability to take prime contracts or subcontracts involving specialty trades.

License Class: B Lic. No.: 586870 Contractor: MJK CONSTRUCTION INC

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

( ) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(✓) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier: Granite State Ins. Co. Policy Number: 5708056

( ) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov. Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is avaiable at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead.

20. CONSTRUCTION LENDING AGENCY DECLARATION

I hereby affirm under penalty of perjury that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civil Code).
Lender's name (if any): Lender's address:

21. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Licensed Contractor's Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration / Lead Hazard Warning, Construction Lending Agency Declaration and Final Declaration; and
(2) This permit is being obtained with the consent of the legal owner of the property.

1. NEW 2"ø VENT WITH DOUBLE SWING JOINTS FASTEN WITH U-BOLTS AND BRACKETS ATTACHED TO BLDG. WITH EXPANDION ANCHOR OR TOGGLE BOLTS. TERMINATE AT 18" ABOVE ROOF LINE WITH CODE APPROVED VENT CAP. EXACT LOCATION SHALL BE COORDINATED IN THE FIELD BY THE CONTRACTOR.
2. DOUBLE CONTAINED SUPPLY AND RETURN LINE. (1 1/4"ø PRIMARY AND 2"ø SECONDARY). AS SHOWN + TOMS CONT.
3. CONTRACTOR SHALL COORDINATE EXACT LOCATION OF ALL UNDERGROUND PIPES AND CONDUIT IN THE FIELD.
4. EXISTING TLS-250 SHALL BE RE-USED. EXISTING SENSOR SHALL BE RE-USED. CONTRACTOR SHALL PROVIDE NECESSARY CABLES AND CONDUITS. VERIFY EXACT LOCATION.
5. EXISTING LEAKS ALERT SHALL BE RE-USED. RE-USE EXISTING SENSORS. CONTRACTOR SHALL PROVIDE NECESSARY CABLES AND CONDUITS. VERIFY EXACT LOCATION.
6. EXISTING TANK AND CONNECTED PIPING SHALL BE REMOVED ONLY WHEN THE NEW TANK IS COMPLETELY INSTALLED AND READY TO RECEIVE FUEL FOR STORAGE. FUEL INSIDE EXISTING TANK SHALL BE REMOVED AND TRANSFERED TO THE NEW COMPLETELY INSTALLED TANK. FUEL FROM OLD TANK SHALL BE FILTERED BEFORE TRANSFERING TO NEW TANK. (BY CONTRACTOR).
7. NEW UNDERGROUND TANK SHALL BE PURCHASED AND PAID FOR BY PACIFIC BELL. THE CONTRACTOR SHALL COORDINATE WITH SUPPLIER FOR DELIVERY OF TANK TO THE JOB SITE. CONTRACTOR SHALL BE RESPONSIBLE FOR COMPLETE INSTALLATION AND ALL WORK INDICATED IN THIS DRAWINGS AND SPECIFICATIONS.
8. EXISITNG ISLAND AND FUEL DISPENSER TO REMAIN (TO BE REUSED) CONTRACTOR SHALL CONNECT NEW SUPPLY AND VAPOR LINES FROM NEW TANK TO EXIST DISPENSER. CONTRACTOR TO INSTALL EMERGENCY SHUT-OFF VALVE, OPW 10-B.

GENERAL NOTES:

1. ALL FUEL SUPPLY, VAPOR, AND VENT LINES SHALL BE SLOPED TOWARDS TANK. (1/4" PER FOOT.)
2. SUPPLY AND VAPOR LINES SHALL BE PROVIDED WITH A SECONDARY CONTAINMENT SYSTEM. FOR SECONDARY CONTAINMENT METHOD OF INSTALLATION, CONTRACTOR SHALL SUBMIT EQUIPMENT SUBMITTAL (METHOD OF INSTALLATION) TO STORMS AND LOWE BEFORE START OF WORK. PRESSURE AND VACUUM TESTING FOR PIPES SHALL BE PER PIPE MANUFACTURER'S RECOMMENDATIONS.
3. TOPPING THE TANK WITH GASOLINE FUEL FOR TESTING SHALL BE COORDINATED WITH PACIFIC BELL ENGINEER. FUEL WILL BE PROVIDED BY PACIFIC BELL.
4. M.O.P. FOR VARIOUS INSTALLATIONS SHALL BE APPROVED BY PACIFIC BELL ENGINEER BEFORE DOING ANY WORK.
5. PROVIDE OSHA APPROVED SHORING FOR ALL TANK EXCAVATIONS.

SPECIAL NOTES:

1. PROVIDE SHORING (PER OSHA STD SECTION 15.40 & 15.41) FOR ALL TANK REMOVAL AND INSTALLATIONS. CONTRACTOR SHALL OBTAIN PERMIT FROM CAL OSHA.
2. CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING ALL NECESSARY PLAN CHECKS AND BUILDING PERMIT, I.E. FIRE DEPARTMENT, BUILDING AND SAFETY, AQMD, CTC.
3. CONTRACTOR SHALL BE RESPONSIBLE FOR REGISTERING TANK TO THE CITY AND OBTAINING AN OPERATION PERMIT. (CONTRACTOR SHALL PAY FOR PERMIT).
4. ANY WORK ASSOCIATED WITH SOIL CONTAMINATIONS UNCOVERED DURING CONSTRUCTION WILL NOT BE A PART OF THE SCOPE OF WORK.
5. REMOVE EXISTING CONCRETE UNDER EXISTING REPORT. (90% COMPACTION). LAB TEST RESULT SHALL BE INCLUDED.
6. PACIFIC BELL WILL BE RESPONSIBLE FOR THE FOLLOWING ITEMS:
   A. SOIL SAMPLE REPORT.
   B. MARINE CHEMIST REPORT.
   C. TRIPLE RINSE REPORT.
   D. CLOSURE REPORT.

GENERAL NOTES: (ELECTRICAL)

1. INTERCEPT EXISTING WIRES AND CONDUITS FOR EXISTING TLS-250 AND LEAK ALERT. EXACT LOCATION SHALL BE VERIFIED IN THE FIELD BY THE CONTRACTOR.

Jodi Vanneman
Environmental Consultant

SUMMARY OF EXPERIENCE

Ms. Vanneman's expertise is knowledge and application of environmental regulations pertaining to both the environment and occupational health and safety.

Facilities audited for environmental and health and safety compliance by Ms. Vanneman include foundries, cabling operations, extrusion/molding operations, aerospace, commercial printing, food preparation/packaging, metal plating/etching, automotive, painting, woodworking, biomedical, concrete mixing/molding, and other various commercial and industrial facilities. Ms. Vanneman has also conducted numerous facility dismantling/decontamination projects.

To assist the financial community, Ms. Vanneman has performed and/or managed over 1,000 Phase I, II and III Environmental Site Assessments/Remediation including several types of properties not limited to industrial, commercial residential, and agricultural. These projects range from single-property transactions to multi-site portfolios. Environmental issues addressed include radon, EMR, asbestos, lead, wetlands, third-party hydrocarbon contamination, and previous on-site contaminants.

Michael S. Ryniak
Program Manager
465 Shadow Mountain Dr.
Prescott, AZ 86301
Office: 928.227.4669 Mobile: 928.925.4173

SUMMARY OF EXPERIENCE

Michael S. Ryniak is an environmental scientist with more than 25 years of environmental industry experience specializing in environmental investigations and site assessments. Mr. Ryniak also has experience conducting NEPA assessments, subsurface investigations, as well as performing indoor air quality, asbestos, radon, lead paint, and lead water surveys. He has also prepared asbestos and lead paint operations and maintenance plans and moisture management plans.

Mr. Ryniak has conducted over 1,000 environmental site-acquisition assessments/due diligence assignments for a wide range of properties throughout the United States. These assessments have been performed to evaluate site conditions, potential off-site liabilities, environmental control systems, and site remediation costs in order to advise prospective buyers, current operators, and owners of potential and existing environmental concerns. Furthermore, as a supervisor, Mr. Ryniak has been responsible for the review and client technical relations for over 4,000 additional Phase I Environmental Site Assessments. Mr. Ryniak has worked with corporate environmental officers, numerous Wall Street lending institutions, legal counsel, governmental agencies, rating agencies, investment companies and real estate brokers to develop strategies for managing properties with environmental concerns.

At EBI Consulting, Mr. Ryniak provides Senior Level review and quality control of Phase I Site Assessments and Environmental Screening reports, as well as client support, managing selected client accounts. Mr. Ryniak has over five years experience concentrating on providing these services to HUD Lender clients. Additionally, Mr. Ryniak is involved in marketing outreach activities with local Arizona banks.

RELEVANT PROJECT EXPERIENCE

ENVIRONMENTAL SITE ASSESSMENTS: Mr. Ryniak has conducted ASTM Phase I Environmental Site Assessments, Environmental Site Screenings, and soil and groundwater sampling for various clients and has prepared Phase I and Phase II reports for a variety of properties located in the United States. These properties have included industrial, commercial, retail, and multi-family residential properties, as well as telecommunications sites. Mr. Ryniak has conducted assessments at numerous senior living facilities, including all levels of senior care. Mr. Ryniak has also conducted indoor air quality, radon, asbestos-containing materials, lead-based paint and lead water surveys. Mr. Ryniak participated in remedial investigation and feasibility studies for four Arizona "Superfund" sites in Phoenix and Tucson.

OPERATIONS & MAINTENANCE PLANS: Mr. Ryniak has prepared asbestos and lead paint operations and maintenance plans, and moisture management plans for a variety of commercial and multi-family residential facilities throughout the United States.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 05/18/2018 has revealed that there are 2 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 3

RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 11 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/30/2018 has revealed that there are 22 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 3 CPS-SLIC sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 11 UST sites within

approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 36 EDR Hist Auto sites within approximately 0.25 miles of the target property.

FINDS:

Registry ID: 110002683392

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:
Date form received by agency: 05/31/2006
Site name: J.P. CARROL COMPANY
Classification: Large Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D018
. Waste name: BENZENE

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL

J.P. CARROL COMPANY (Continued) **1010313354**

ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: * Discovery
Completed Date: 06/20/1991
Comments: From EPA CERCLA PA fit report. Site is located in three lots. 1) 218 N. Juanita Avenue: the site currently leased by Lynde-Ordnay Co., Inc. Carroll Trust has owned since 1940s and LOC leased it since then. 1990 geophysical surveys located three underground tanks on the property. 2) 220 N. Juanita Avenue: it is currently a vacant lot. The Parker Judge owned in 1938. Paint Engineers owned and operated in 1946. Carroll Trust since 1953. 3) 222 N. Juanita Avenue: Hansen's Juices leased it since 1989. The Los Angeles unified school district conducted Phase I & II investigations to purchase the property. Revealed petroleum contamination in the soil. Stoddard solvent was detected in the soil. The highest level was 4500 mg/kg volatile organics and chlorinated hydrocarbons were also detected in the soil. Contamina- tion has also been detected in the groundwater. FIT recommended NFA for EPA. Medium priority PEA required.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

SHELL SERVICE (Continued) **1006804895**

. Waste code: D018
. Waste name: BENZENE

Violation Status: No violations found

FINDS:

Registry ID: 110013311665

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002677504

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

FINDS:

Registry ID: 110002871054

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002890710

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Case Type:	Cleanup Program Site
Case Worker:	TA
Local Agency:	Not reported
RB Case Number:	0803
File Location:	Regional Board
Potential Media Affected:	Indoor Air, Other Groundwater (uses other than drinking water), Soil, Soil Vapor
Potential Contaminants of Concern:	Other Solvent or Non-Petroleum Hydrocarbon, Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History:	This Site is a 2.4-acre parcel of land occupied by the SMH Site that consists of several buildings hosting administrative offices, warehouses for the storage of streetlight parts, and vehicle maintenance garages. Historical records show that the SMH Site was built upon residential property in 1926. Gasoline and a waste oil underground storage tanks (USTs) were removed from the SMH Site in 1990. The Regional Boards Underground Storage Tank (UST) Section issued a closure for the USTs and the case was transferred to the Site Cleanup Program because of the detection of VOCs and SVOCs in the Sites groundwater monitoring wells. Thereafter, various investigations were conducted that include a soil vapor survey, installation of 32 soil borings and 14 groundwater monitoring wells at the SMH Site. The analytical results confirmed that both soil and groundwater beneath the SMH Site are impacted with tetrachloroethylene (PCE), trichloroethylene (TCE) and benzene. The data show PCE concentrations as high as 1,670 micrograms per kilogram (a%g/Kg) in soil, 13,500 micrograms per liter (a%g/L) in the soil vapor collected from 5 feet below ground surface (bgs) and 23,300 a%g/L in groundwater. In addition, benzene was detected up to 602 a%g/Kg and 392 a%g/L in soil and groundwater, respectively. The site assessment identifies two separate potential source areas of PCE impacted soil at the SMH Site. PCE concentrations of 2,634 and 1,670 micrograms per kilogram (a%g/Kg) in the northern and southern portion, respectively, were reported. The most recent groundwater monitoring results show PCE concentration as high as 75,000 micrograms per liter (a%g/L) and TCE as high as 123 a%g/L. Soil vapor survey conducted at the site also confirm the presence of VOCs. The highest PCE concentration detected in soil vapor at the Site is 1,100 a%g/L. In addition, benzene was detected up to 602 a%g/Kg and 392 a%g/L in soil and groundwater, respectively The results of soil and groundwater samples collected along sewer and storm drain pipelines servicing the dry cleaning facility located north east of the SMH Site. PCE concentration as high as 1,100 a%g/Kg in soil and greater than 1,000 a%g/L in groundwater was detected in samples obtained approximately 50 feet southwest of the dry cleaning facility. Based on the data, LADWP claims that the dry cleaning facility is a potential source of PCE contamination at the SMH Site. The Regional Board is following up on the potential contribution of PCE contamination from the dry cleaners. According to the Department of Water Resources Bulletin No. 104, the Site is located in the Hollywood Basin of the Coastal Plain of Los Angeles. The SMH Site lies on the western flank of the Elysian Hills that is underlain by recent alluvium, which includes the Gaspur aquifer overlying the Puente Formation. Based on the soil boring log, the soil beneath the SMH Site consists of primarily clay, sandy clay and silt to a depth of 20 feet, the maximum depth of investigation. Depth to the shallow

LA DWP STREETLIGHT MAINTENANCE HQTS (Continued) **S103437995**

groundwater beneath the SMH Site ranged from approximately 15 to 21 feet below ground surface (bgs). The direction of groundwater flow is to the southwest.

Region:	STATE
Facility Status:	**Open - Inactive**
Status Date:	01/28/2016
Global Id:	SL0603711101
Lead Agency:	LOS ANGELES RWQCB (REGION 4)
Lead Agency Case Number:	Not reported
Latitude:	34.08291
Longitude:	-118.284318
Case Type:	Cleanup Program Site
Case Worker:	RV
Local Agency:	Not reported
RB Case Number:	1232
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply, Soil, Soil Vapor
Potential Contaminants of Concern:	* Chlorinated Hydrocarbons
Site History:	The Site is located in an area that is characterized by a mixed commercial residential use. Jesse Cleaners was in operation from 1995 through 2008 and the building is currently vacant. However, a dry cleaning establishment has been present on the site in the same tenant space since 1981. In 2006, two separate subsurface investigations were conducted at the Site. These are: 1) Western Environmental Engineers Company (WEECO) installed four soil borings

JESSE CLEANERS (Continued) **S109117980**

to 10 feet below ground surface (bgs); and 2) JMK installed five additional soil borings to 25 feet bgs. The limited soil sampling and analysis, confirmed that soil beneath the Site are impacted with PCE and trichloroethylene (TCE). Based on the analytical results, up to 1,350,085 micrograms per kilogram (a%g/kg) of PCE and 1,834 a%g/kg of TCE were detected in soil samples collected from beneath the former dry cleaning machine. Groundwater samples obtained from locations immediately down gradient from the Jesse Cleaners and approximately 50 feet from the Streetlight Maintenance Headquarters (SMH) site have PCE concentrations greater than 1,000 micrograms per liter (a%g/L).

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Completed Document Type: Public Participation Plan / Community Relations Plan
Completed Date: 05/01/2002
Comments: DTSC approved the Public Participation Plan, dated May 2002.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 06/15/2010
Comments: DTSC concurred with the recommendations of the Operation and Maintenance Report and noted discrepancies between the paper and electronic copies of the Report. DTSC pointed out that the paper copy and the electronic copy of all submittals provided to DTSC be accurate and consistent with each other.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 11/17/2010
Comments: DTSC concurred with the recommendations of the Operation and Maintenance Report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 5 Year Review Reports
Completed Date: 06/15/2011
Comments: DTSC provided two comments on the Report that should be addressed in future reports. DTSC also concurred with the recommendations to reduce O&M activities to an annual basis and to remove soil vapor probe MW-1-28 from routine monitoring activities; however, monitoring should continue at soil vapor probe MW-4-15.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 05/13/2018

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 05/13/2018

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 05/18/2018

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/01/2018

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Last EDR Contact: 05/29/2018
Next Scheduled EDR Contact: 09/10/2018
Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 02/13/2018

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

SCRD DRYCLEANERS: State Coalition for Remediation of Drycleaners Listing

The State Coalition for Remediation of Drycleaners was established in 1998, with support from the U.S. EPA Office of Superfund Remediation and Technology Innovation. It is comprised of representatives of states with established drycleaner remediation programs. Currently the member states are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines
An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 01/03/2018

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

316 N. JUANITA AVE.
316 N. JUANITA AVE.
LOS ANGELES, CA 90004

TARGET PROPERTY COORDINATES

Latitude (North):	34.077111 - 34° 4’ 37.60’’
Longitude (West):	118.289771 - 118° 17’ 23.18’’
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	380993.7
UTM Y (Meters):	3771261.8
Elevation:	271 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5630741 HOLLYWOOD, CA
Version Date:	2012

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

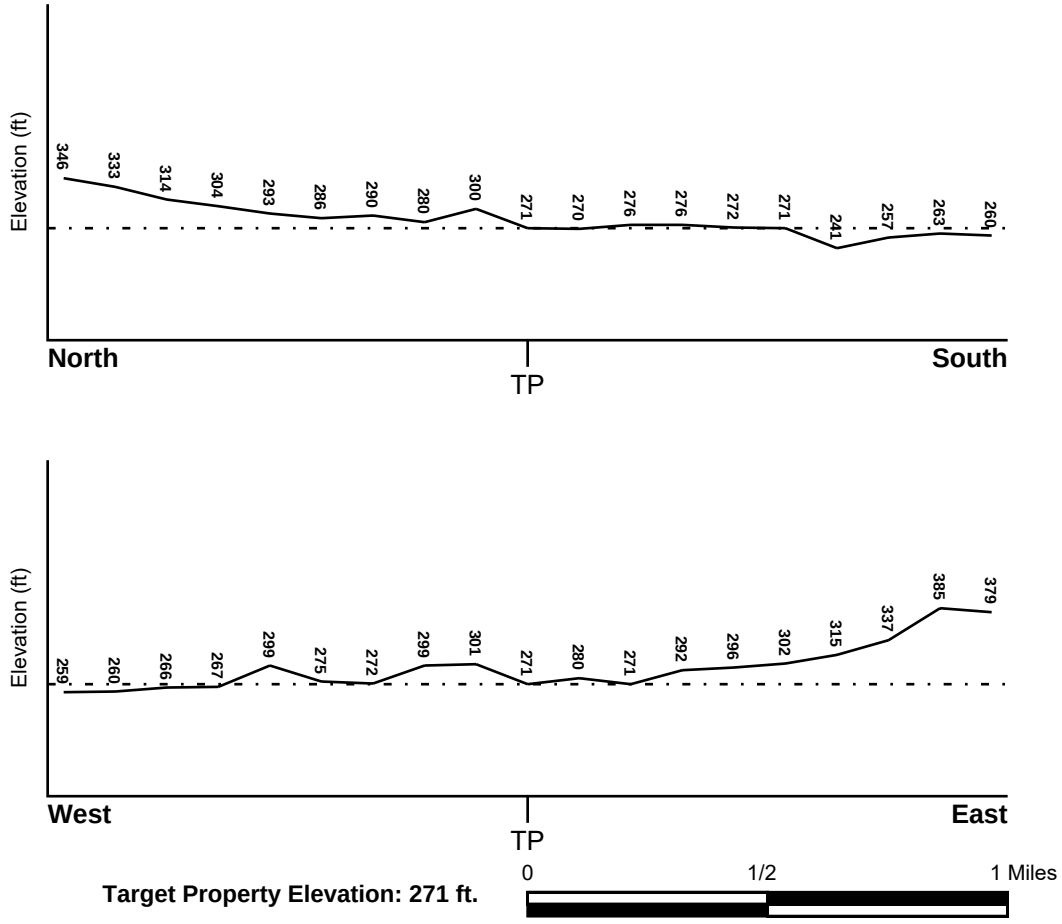
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ESE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1610F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
Not Reported	

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
HOLLYWOOD	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
1	0 - 1/8 Mile West	Not Reported
2	1/2 - 1 Mile SSW	SW
A3	1/2 - 1 Mile SSW	Varies
A4	1/2 - 1 Mile SSW	Not Reported
1G	0 - 1/8 Mile West	Not Reported
2G	1/2 - 1 Mile SSW	SW
3G	1/2 - 1 Mile SSW	Varies
4G	1/2 - 1 Mile SSW	Not Reported

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Tertiary
Series:	Miocene
Code:	Tm *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
sandy loam
gravelly - sandy loam
silt loam
clay
fine sand
gravelly - sand
sand
fine sandy loam

Surficial Soil Types:
sandy loam
gravelly - sandy loam
silt loam
clay
fine sand
gravelly - sand
sand
fine sandy loam

Shallow Soil Types:
fine sandy loam
gravelly - loam
sandy clay
sandy clay loam
clay
silty clay
sand

Deeper Soil Types:
gravelly - sandy loam
sandy loam
very gravelly - sandy loam
stratified
very fine sandy loam
weathered bedrock
sand
gravelly - fine sandy loam
silty clay loam
clay loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

WELL SEARCH DISTANCE INFORMATION

DATABASE	SEARCH DISTANCE (miles)
Federal USGS	1.000
Federal FRDS PWS	Nearest PWS within 1 mile
State Database	1.000

FEDERAL USGS WELL INFORMATION

MAP ID	WELL ID	LOCATION FROM TP
No Wells Found		

FEDERAL FRDS PUBLIC WATER SUPPLY SYSTEM INFORMATION

MAP ID	WELL ID	LOCATION FROM TP

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

The use of this material is subject to the terms of a license agreement. You will be held liable for any unauthorized copying or disclosure of this material.

This Report contains certain products owned by or licensed by Tele Atlas North America, Inc. ("TANA") and licensed to EDR pursuant to an agreement between EDR and TANA (the "TANA Agreement"). Such products include the Dynamap® /2000 (commencing with the most current version, nationwide coverage, ArcInfo™ format, tiled by county, with semi−annual Updates) and are referred to in this Report as the "Licensed Products".

The use of the Licensed Products with a non−TANA map may result in increased variance between the location displayed on the map and ground truth location.

The recipient of the Report (hereinafter referred to as an "End User") shall use such Report solely for its internal purposes and not for resale.

U.S. GOVERNMENT RIGHTS. If End User is an agency, department, or other entity of the United States Government, or funded in whole or in part by the United States Government, then use, duplication, reproduction, release, modification, disclosure or transfer of this commercial product and accompanying documentation, is restricted in accordance with the LIMITED or RESTRICTED rights as described in DFARS 252.227−7014(a)(1) (JUN 1995) (DOD commercial computer software definition), DFARS 227.7202−1 (DOD policy on commercial computer software), FAR 52.227−19 (JUN 1987) (commercial computer software clause for civilian agencies), DFARS 252.227−7015 (NOV 1995) (DOD technical data − commercial items clause); FAR 52.227−14 Alternates I, II, and III (JUN 1987) (civilian agency technical data and noncommercial computer software clause); and/or FAR 12.211 and FAR 12.212 (commercial item acquisitions), as applicable. In case of conflict between any of the FAR and DFARS provisions listed herein, the construction that provides greater limitations on the Government's rights shall control. Contractor/manufacturer is Tele Atlas North America, Inc., 11 Lafayette Street, Lebanon, NH 03766−1445. Phone: 603.643. 0330. The Licensed Products are © 1984−2008 by Tele Atlas North America, Inc. ALL RIGHTS RESERVED. For purpose of any public disclosure provision under any federal, state or local law, it is agreed that the Licensed Products are a trade secret and a proprietary commercial product and not subject to disclosure.

If End User is an agency, department, or other entity of any State government, the United States Government or any other public entity or funded in whole or in part by the United States Government, such End User agrees to protect the Licensed Products from public disclosure and to consider the Licensed Products exempt from any statute, law, regulation, or code, including any Sunshine Act, Public Records Act, Freedom of Information Act, or equivalent, which permits public access and/or reproduction or use of the Licensed Products. In the event that such exemption is challenged under any such laws, any and all right to retain any copies or to use of the Licensed Products shall be terminated and considered immediately null and void. Any copies of the Licensed Products held by End User shall immediately be destroyed. If any court of competent jurisdiction considers this clause void and unenforceable, in whole or in part, for any reason, then all Licensed Products previously delivered to End User will be destroyed.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 332 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

1.0 INTRODUCTION

Hydrologue Inc. (HI) has been retained by AT&T Services Inc. (formerly SBC) to prepare a workplan for a limited Focused Site Assessment at the Pacific Bell LSANCA86 (G1118) Facility located at 316 N Juanita Ave Los Angeles CA 90004-3502 (hereinafter referred to as Site). This workplan is prepared based on Los Angeles Fire Department (LAFD) Local Oversight Program (LOP) requirement to conduct a preliminary site assessment in the proximity of the former 12,000-gallon gasoline double-wall steel underground storage tank (UST).

1.1 Site Description

The SBC property is located in a predominantly commercial area of Los Angeles, California. The Site consists of several buildings utilized for equipment storage and vehicle maintenance. The remainder of the Site is used for parking of SBC fleet and personal vehicles. The Site is located at an elevation of approximately 280 feet mean sea level (MSL). Local topography slopes to the southeast.

1.2 Property Owner

The Site is identified as Pacific Bell Telephone Co. LSANCA86 Facility (Building and GEO Location Code: G1118) and is owned by Pacific Bell Telephone Company d/b/a AT&T.

2.0 BACKGROUND

2.1 Previous Work

On November 10, 2004, SBC removed one 12000-gallon gallon gasoline underground storage tank (UST) from the Site and HI prepared the UST removal report (*UST REMOVAL REPORT / SOILS REPORT FOR PERMIT #12134 dated November 17, 2004*). HI reported that there was no evidence of leaks or holes in the UST that was removed. Soil samples were collected from the sidewalls of the UST excavation and a sample collected from the accumulated water within the excavation. The results of the analytical testing show that NO petroleum constituents were detected above the method detection limits in the soil samples collected beneath the UST and the former fuel dispenser, except for minor Methyl-t-butyl ether (MTBE) concentrations at 2.7 micrograms per kilogram (µg/Kg), 4.7 µg/Kg, and 6 µg/Kg, slightly above the detection limit, detected in samples 1A, 1B and D1, respectively. Total Petroleum Hydrocarbons as gasoline (TPH-g) and Volatile Organic Compounds (VOCs) concentrations at 20,900 micrograms per liter (µg/L), Benzene at 524 µg/L, Toluene at 2,030 µg/L, Ethylbenzene at 282 µg/L, Total Xylenes at 1,770 µg/L, Ethanol at 2,050 µg/L, MTBE at 5,400 µg/L, Tert-amyl methyl ether (TAME) at 18 µg/L, and Tert-butanol (TBA) at 812 µg/L were detected in the accumulated water within the excavation.

HI concluded the following: Preliminary research indicates that there was a previous onsite leak reported in or around 1989. Closure for the Site was granted by the RWQCB or the LAFD in 1996. The current data is insufficient at this time to conclude if the detected compound concentrations in the accumulated water sample collected from the base of the excavation are related to the current UST, the UST removed in 1989, or another source. Therefore, additional assessment is required to assess quality and any potential impact of groundwater underlying the Site.

2.2 Scope of Work

The scope of work as discussed between the LOP, SBC and HI is as follows**:**

- Preparation of a workplan and a Site-specific Health and Safety Plan;
- Mark the location of the proposed soil borings and inform US Alert 48 hours prior to initiating field activity;
- Drill five soil borings to a depth of 30 feet bgs using a hollow stem auger (HSA) drilling rig;
- Collect soil samples from each boring at 5 feet intervals to the termination depth of each soil boring;
- Conversion of the soil borings into 2-inch groundwater monitoring wells;
- Subsequent well development, survey, purging, and sampling; and,
- Preparation of the site assessment report.

2.3 Geology and Hydrogeology

The site is located in the northern portion of the Los Angeles Coastal Plain approximately three miles south of the Santa Monica Mountains and five miles northeast of the Baldwin Hills. The Silver Lake Reservoir, located approximately three miles northeast of the site and the Hollywood Reservoir, located approximately four miles northwest of the site, are the closest perennial surface water bodies. The site is located in the La Brea Plain of the Los Angeles Central Basin, and is underlain primarily by recent alluvial sediments consisting of clay, sand and gravel. According to the California Department of Water Resources, the Exposition Aquifer extends from approximately 40 feet below ground surface (bgs) to ground surface in the region of the site.

The La Brea Plain is located east of the Newport-Inglewood belt of hills and west of the Elysian Hills. A surface was originally cut by the sea during Pleistocene time on lower Pleistocene and older formations. On this eroded surface 90 to 200 feet of alluvial sediments have been deposited, the top of which now forms the La Brea Plain. The La Brea Plain has apparently been warped into an east-west anticlinal structure extending westerly from the Elysian Hills. Because of this warping and partial uplifting, the plain is being dissected and removed by erosion. A younger series of alluvial fans forming the Hollywood piedmont slope have buried the La Brea Plain from the north. Poland, et al., (*Poland, J. F., Piper, A. M., and others. "Ground Water Geology of the Coastal Zone Long Beach - Santa Ana Area, California". USGS Water Supply Paper 1109. 1956*) described the La Brea Plain and the Santa Monica Plain as being of similar origin, and additional exposures and close study of the land forms indicate that both of these forms are related in age to the Ocean Park Plain and the Torrance Plain.

The oldest geologic unit mapped in the Hollywood Quadrangle is the Cretaceous granodiorite and quartz diorite (Kgr), which is exposed in the northern part of the map area in the Santa Monica Mountains. Locally, at the surface, the granitic rocks are soft and crumbly due to weathering.

The Tertiary bedrock formations exposed on hills at the vicinity of the Site (Tush and Tmms) are assigned to deep-marine biogenic and clastic rocks of the upper Miocene Modelo Formation and upper Miocene Puente Formation. The Modelo Formation is composed of interbedded shale, siltstone, and sandstone (Tush). Tush consists of gray to light brown, thin bedded, silty clay shale, locally contains scattered large calcareous nodules; in places contains thin interbeds of fine-grained sandstone; lower part locally contains thin lenses of light tan, platy, semi-siliceous or diatomaceous shale. These formations are prone to slope failure where bedding planes are inclined in the same direction as the slope.

The Elysian Park Hills are primarily composed of deep-marine clastic and biogenic rocks of the upper Miocene Puente/Monterey Formation. These rocks consist of interbedded and interfingering siltstone and fine sandstone (Tpnl), siliceous shale and siltstone (Tpn2), diatomaceous shale and siltstone (Tpn3), and fine- to coarse-grained, thinly laminated to thick-bedded sandstone (Tpn4). The southern end of the Elysian Park Hills is composed of massive, soft, micaceous marine siltstone of the Pliocene Fernando Formation (TO). Tmss consists of tan

to light gray semi-friable arkosic sandstone that includes some interbeded silty shale.

The Quaternary unit mapped beneath the Site is Pleistocene alluvial deposits (Qoa). These old Quaternary sedimentary deposits are exposed over much of the center of the Hollywood Quadrangle and within, and adjacent to, the Baldwin Hills in southeast corner. In general, older alluvium in the Hollywood Quadrangle consists of layers of fine to coarse clayey sandand sandy clay with lesser amount of silt.

2.4 Depth To Groundwater

Publicly available information indicates that the depth to groundwater in the vicinity of the Site is 19.1 feet bgs. This is based on information from Well #2671A (ground surface elevation of 283.6.1 feet above MSL) located on Melrose and El Centro (just to the north-west of the Site) last measured on May 20, 2004. The depth to groundwater in the vicinity of the Site in another well is 6.5 feet bgs. This is based on information from Well #2692C (ground surface elevation of 242 feet above MSL) located on Kingsley and 1st (just to the west of the Site) last measured on April 5, 1978 (personal communication with Brian Hill, County of Los Angeles Department of Public Works, Hydrology Division, November 17, 2004).

3.0 FIELD INVESTIGATION

3.1 Pre Drilling

Prior to drilling activities, a Site visit will be conducted by a Hydrologue Senior Geologist. The locations of proposed borings/groundwater monitoring wells will be marked on the ground. Underground Service Alert (USA) will be notified. A Site-Specific Health and Safety Plan will be prepared and followed during field activities. HI will contact the LAFD and Client a minimum of 5 working days prior to any drilling and sampling work in order to allow a LAFD representative to be on-site during the drilling and sampling operations. Prior to drilling, a Health and Safety meeting will be held, and health and safety issues related to the Site conditions and drilling activities will be discussed with the drilling crew.

3.2 Well Construction Permits

Well construction permits will be obtained from Los Angeles County Department of Health Services.

3.3 Drilling

Five soil borings associated with the proposed groundwater monitoring wells will be drilled to a proposed termination depth of 30 feet bgs using a drilling rig equipped with 8-inch or 10-inch diameter continuous flight HSA under the direct supervision of a Hydrologue California Registered Geologist. The proposed soil borings will be converted into permanent 2-inch diameter groundwater monitoring wells.

Soil samples will be collected from each boring beginning at approximately 5 feet bgs and at approximately 5-foot intervals thereafter until the termination depth of each boring or groundwater is reached, whichever comes first. One soil sample will also be collected at or immediately above the soil/groundwater interface. Currently it is estimated that only the 5, 10 and 15-foot samples will be collected.

Soil samples will be obtained using a split-spoon modified California sampler lined with brass rings. The ends of the brass ring will be covered with Teflon sheet tape and plastic caps and taped with silicon tape over the ends. All samples will be labeled with sample identification, date and time of sampling and the HI project number, and sealed in Ziploc™ plastic bags. The samples then will be immediately placed into an ice chest chilled using frozen blue and/or crushed ice. Prior to use, all the tubes will be washed in a non-phosphate cleanser solution, rinsed with tap water and then distilled water.

The sampler will be attached to a down-hole hammer, lowered to the specific sampling depth, and then be driven 18-inches into the formation. All borings will be logged in the field in accordance with the Unified Soil Classification System according to ASTM Standards.

The presence of any volatile hydrocarbons emanating from the soil will be determined using a handheld Photovac Microtip Photoionizer Detector (PID) Model MP-1000. The soil contained

in the second tube from the bottom of the cutting shoe of the split-spoon sampler at each sampling interval will be placed in a sealed Ziploc™ plastic bag and allowed to sit in the sun for approximately 5 minutes. The headspace in the bags will then be analyzed using the PID. The PID measurements will be recorded on the boring logs.

3.4 Well Construction

The soil borings will be converted into groundwater monitoring wells which will be constructed of a 20-foot long section of flush threaded 2-inch diameter Schedule 40 PVC screen with 0.01-inch slots connected to 10-foot flush threaded 2-inch diameter Schedule 40 PVC casing extending to the surface. The annular space between the borehole and the well screen will be backfilled with # 2/12 Monterey Sand to approximately 1 feet above the well screen using a tremie pipe followed by 1.5-2 feet of ¼-inch hydrated bentonite pellets. The remaining annular space will be sealed using a 1:10 ratio of Portland cement to water with 5% bentonite via a tremie pipe. The groundwater monitoring wells will be completed at the surface by installation of an 8-inch diameter well box with a traffic rated well cover. The well casing will be equipped with a water tight lockable cap. All well string materials will be steam-cleaned prior to installation.

3.5 Well Head Elevation Survey

A California Board for Professional Engineers and Land Surveyors licensed surveyor will survey the TOC elevations for the groundwater monitoring well(s). The TOC elevations of the Site's groundwater monitoring well will be surveyed to an accurate datum or established benchmark.

3.6 Groundwater Monitoring Well Development

Immediately after installation of the screen and sand-pack but before installation of the well seal, each groundwater monitoring well will be developed by the drilling rig under the supervision of a HI geologist. A surge block will be used to force water through the well screen and a bailer will be used to remove large volumes of water from the well and to move water through the well screen.

Surging and bailing will continue until the produced water is free of visible sediment and the pH, temperature, and specific conductance of the produced water have stabilized. Stabilization of the physical parameters indicates that water in the groundwater monitoring well is representative of the water in the formation. Development will continue until sediment is reasonably cleared from the well, and the turbidity of the development water is low. HI will handle and dispose of produced water.

The groundwater monitoring wells will be then once again be developed not less than 72 hours hence by pumping a minimum of 5 well volumes of groundwater using a Whale Supersub 921 submersible pumping system. After installation and development, the groundwater monitoring wells will be allowed to stabilize 72 hours prior to sampling.

3.7 Groundwater Elevation Measurements

Depth to groundwater will be obtained in each groundwater monitoring well prior to groundwater sampling of the proposed groundwater monitoring wells. After noting the time and date, the static water level in the groundwater monitoring wells will be measured with respect to the TOC using an interface probe marked with divisions allowing measurements to the nearest 0.01 feet. The interface probe and associated measuring tape will be washed in a solution of warm tap water and a non-phosphate detergent and rinsed with de-ionized water prior to use in order to reduce the possibility of cross-contamination. Results are reported in feet below TOC (depth to water) which will be used to calculate the groundwater surface elevation in feet. All the aforementioned data will be used to prepare a groundwater elevation map for the Site.

3.8 Groundwater Sampling

Prior to groundwater sampling, approximately three well borehole volumes of groundwater will be purged from the proposed groundwater monitoring wells using a Whale Supersub 921 submersible pump (Pumping System). During purging, temperature, conductivity, and pH of the purged groundwater will be monitored over time and noted on groundwater purging and sampling logs. A groundwater sample will be collected after the water column in the wells is recovered to more than 80 % of its static condition/initial height.

Groundwater sampling will be accomplished by lowering a pre-cleaned disposable polyethylene bailer approximately 2 feet into the water column of the well. Groundwater samples will be collected in five 40 milliliter Volatile Organic Analysis (VOA) vials via a flow control device inserted into the bottom of the bailer for VOC analysis. All sample containers will be examined to ensure that no head space remained after sampling. The pre-cleaned sample containers containing appropriate preservatives for analytical testing will be supplied by the laboratory, a Department of Health Services certified laboratory for hazardous waste testing. The samples will be sealed, labeled with the sample identification, date, time of sampling and the HI project number. They will be then placed in bubble wrap and immediately placed into a chilled ice chest containing frozen blue and crushed ice. The pumping system and its associated water hose will be decontaminated prior to purging of the groundwater monitoring wells by placing the pump in a 5-gallon bucket containing tap water and a non-phosphate cleanser, followed by a 5-gallon bucket containing distilled water. Once the submersible pump has displaced the water from the bucket, the exterior of the tubing and the reel will be also rinsed with distilled water. The pump, its associated water hose, and electrical cables will be also rinsed with deionized water. This procedure will be performed to ensure that the interior and exterior of the tubing attached to the pump are properly decontaminated.

3.9 Equipment Decontamination

All HSAs and drilling rods will be steamed cleaned prior to drilling at each boring location. Following sample collection, all sampling equipment, including the brass rings, will be brushed clean in a solution of non-phosphate cleanser and rinsed with tap and distilled water and then will be shaken to remove excess moisture.

3.10 QA/QC

Chain-of-custody (COC) records will be used to document sample collection and shipment to laboratory for analysis. All sample shipments for analyses will be sent to or picked up by the analytical laboratory at the end of each sampling day and will be accompanied by a COC record. COC forms will be completed and sent with the samples for each laboratory and each shipment. The COC records identify the contents of each shipment and maintain the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in their view, locked up, or kept in a secured area that is restricted to authorized personnel.

For field quality assurance/quality control (QA/QC) purposes, a field/equipment blank will be prepared, along with the collected groundwater samples. The field/equipment blank will be used to demonstrate whether the sampling procedures have any positive interference on the analytical results. The field/equipment blank will be collected, employing the equipment used to purge the groundwater monitoring well and obtain the groundwater sample. The trip blank will be supplied by the laboratory and will be used to provide a measure of the potential positive interference introduced by sample preservation, transportation, storage, and analysis. The aforementioned QA/QC blanks will be handled and processed in exactly the same manner as other samples, as described above. Additionally, the laboratory will perform matrix spikes, matrix spike duplicates, method blanks, check samples and standards in accordance with the Regional Water Quality Control Board (RWQCB) guidelines to provide a measure of the potential positive interference introduced by the laboratory procedure and analytical testing methods.

The containers will be handled in the same fashion as other samples (i.e. placed in a cooler with ice and identified on the COC) and delivered to the Laboratory for analysis with other samples collected the same day.

3.11 Waste Handling

All waste and effluent generated during this investigation (soil cuttings, development, purge, and decontamination fluids) will be sealed in 55-gallon steel drums that meet Department of Transportation standards for hazardous material transport. Each drum will be labeled with the boring/well number, date of waste generation, type of waste, Site and project name, and the name and phone number of the Site owner.

Based on the analytical results of the soil and groundwater samples, the client will arrange for appropriate disposal of the soil cuttings and decontamination fluid.

4.0 LABORATORY ANALYSIS

All soil and groundwater samples will be logged on requisite Chain-of-Custody record forms and delivered to American Scientific Laboratories (Certification No. 2200), Los Angeles California, a State certified laboratory for hazardous waste testing.

The soil samples and groundwater samples will be analytically tested as follows:

- Total petroleum hydrocarbons as gasoline (TPH-g) using EPA Method 8260.
- Benzene (B), Toluene (T), Ethylbenzene (E), and Total Xylenes (X) using EPA Method 8260B (collectively BTEX).
- 5 Oxygenates: Methyl-t-butyl ether (MtBE), Di-isopropyl ether (DIPE), Ethyl-t-butyl ether (EtBE), Tert-amyl methyl ether (TAME), and Tert-butanol (TBA) using EPA Method 8260B.
- Ethanol using EPA Method 8260B.
- 1, 2-Dibromoethane (EDB), and 1,2-Dichloroethane (EDC) using EPA Method 8260B (Lead Scavengers).
- Only one soil sample from one soil boring MW-1 at the 5, 10 feet and 15 feet bgs level feet bgs level will be tested for total lead using EPA Method 6010C and organic lead using CA T22.
- The soil samples will be collected and preserved using EPA Method SW5035.

The field/equipment (QA/QC) samples will be only be analyzed for BTEX/MTBE/Fuel Oxygenates using EPA Method 8260B.

5.0 PROPOSED WORK SCHEDULE

The field investigation is on a priority schedule per SBC's priority matrix and field work should begin within 2-3 weeks of receiving written authorization for the workplan from the LAFD, and receipt of well permits.

6.0 REPORTING

All work will be completed under the supervision of a Hydrologue California Registered Civil Engineer or Registered Geologist experienced in completing subsurface soil and groundwater contaminant investigations. A written report of the data collected during the field investigations will be prepared and incorporated into a final report. It is anticipated that the report will be completed within 10 working days after receipt of the final laboratory reports.

7.0 REPORTING REQUIREMENTS

This report entitled *WORKPLAN FOR SITE ASSESSMENT* dated January 18, 2006 should be submitted by SBC to the following agencies.

Inspector Neil Reitzell
Captain Frank K. Comfort
Los Angeles Fire Department/Environmental
200 North Main St., City Hall
Room 1700 CHE 17th Floor Annex
Los Angeles, CA 90012

8.0 LIMITATION

Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities. The findings and conclusions presented herein are based primarily upon the analyses of test results from the soil and/or water and/or air samples during this study. This report has been prepared exclusively for SBC (CLIENT) and other authorized parties for the subject site at a specific point in time, and hence it DOES NOT contain sufficient information for other parties or other uses (with the exception of parties named in the "Reporting Requirements" Section *supra*). CLIENT shall be the sole beneficiary of this agreement, and no third party shall be an intended beneficiary unless so stated in writing. No other third party shall have the right to rely on HI's opinions rendered in connection with this report without HI's written consent. This report is also for the use and review of the jurisdictional regulatory agency(s) as named in the "Reporting Requirements" Section *supra.* This report shall not create any rights or benefits to parties other than CLIENT, HI and other expressly named parties. The conclusions and recommendations included in this report are based on information contained or referenced herein, and our best judgment. No other warranty, expressed or implied, is made as to the professional advice contained in this report. No right or interest in the contract associated with this report may be assigned by either HI or CLIENT without the written permission of the other party, and any attempted assignment shall be wholly void and totally ineffective for all purposes. No delegation of any duty owed by either HI or CLIENT may be made without the written permission of the other party. This report is prepared subject to the terms and conditions in the contract related to this report and which was expressly negotiated, agreed to and acknowledged by CLIENT.

All work has been conducted in accordance with generally accepted practices in the fields of environmental engineering, geology, and hydrogeology that exist in this or similar localities at this time. No other warranty, either expressed or implied, is made. The fact that HI finds no recognized environmental conditions after performing the work described herein does not constitute a warranty by HI that this property is free of contamination. HI's opinion about the condition of this Site does not constitute a warranty of any kind. It is impossible to guarantee that any property is free from contamination without testing every square inch of the property for every conceivable hazardous substance, which would obviously be prohibitively expensive. Due to the inherent limits of time and cost, some uncertainty about Site conditions will always remain.

LEGEND

af / Qg / Qc / Qa — Qls

SURFICIAL SEDIMENTS

unconsolidated detrital sediments; generally undissected

af *artificial cut and fill* — **Qls** *landslide debris*

Qg *gravel and sand of major stream channels*

Qc *clay and sand of pre-development marshlands*

Qa *alluvium: clay, sand and gravel; includes gravel and sand of minor stream channels*

Qae / Qop / Qoa

OLDER SURFICIAL SEDIMENTS

unconsolidated to weakly consolidated; dissected and eroded where elevated; late Pleistocene age

Qae *similar to* **Qa**, *but slightly elevated and dissected; includes alluvial fan sediments*

Qop *paleosoil in Baldwin Hills (Fox Hills residual paleosoil of Weber et al. 1982); moderately indurated, erosion-resistant, gray to rusty brown pebbly and sandy paleosoil or "hardpan" on* **Qoa**

Qoa *older alluvium, gray to light brown pebble-gravel, sand, silt, and clay of detritus derived from Santa Monica Mountains; similar to* **Qae**, *but slightly consolidated; in Baldwin Hills designated as Baldwin Hills sandy gravel (Weber et al. 1982), where it is much dissected and eroded*

—UNCONFORMITY—
In mountain areas

Tush

UNNAMED SHALE

(included in Puente Formation by Lamar 1970, and Weber 1980; equivalent to upper Modelo Formation of Hoots 1931; upper Modelo Formation of Durrell 1954, in Santa Monica Mountains; and to Sisquoc Shale of Dibblee 1989, in Ventura Basin)
marine clastic; late Miocene age("Delmontian" and upper Mohnian Stages)

Tush *gray to light brown, thin-bedded silty clay shale, soft and crumbly; locally contains scattered hard calcareous nodules; in places contains laminae of fine grained soft sandstone*

Tm / Tmss

MONTEREY FORMATION

(included in Puente Formation by Lamar 1970, and Weber 1980; lower member of Modelo Formation of Hoots 1931, and lower Modelo Formation of Durrell 1954, in Santa Monica Mountains; equivalent to Monterey Formation of Dibblee 1989, in Ventura Basin)
marine biogenic and clastic; mostly late Miocene age (Mohnian Stage)

Tm *white-weathering, thin bedded, platy siliceous shale, hard to semi-chalky; at Griffith Park directly overlies granodiorite basement rocks if not in fault(?) contact*

Tmss *tan to light gray semi-friable sandstone; includes thin interbeds of micaceous silty clay shale; forms Elysian deep sea fan of Dibblee 1989*

Section 1
Introduction

1.1 Introduction

RMT, Inc. (RMT) has been retained by AT&T Services, Inc. (AT&T), the current property owner and occupant to implement the Work Plan which was approved on August 9, 2007 by the Los Angeles Regional Water Quality Control Board (RWQCB). The Site is a current Pacific Bell Telephone Co. d/b/a AT&T G1118 (LSANCA86) Fleet Yard located at 316 N. Juanita Avenue, Los Angeles, California 90004 (Site) (See Figure 1).

1.2 Objective

The results of the previous underground storage tank (UST) removal at the Site have indicated that groundwater beneath the Site may have been impacted with hydrocarbons. The RWQCB has determined that further action is warranted and has directed AT&T to conduct a soil and groundwater investigation beneath the Site.

1.3 Scope of Work

In accordance with the RWQCB approved and amended work plan, and the Site-Specific Risk Analysis and Health and Safety Plan, RMT performed a vadose zone soil-matrix and groundwater investigation described in more detail in Sections 3 through 5.

All work was completed under the responsible charge of Mr. Alan Lui, a California Professional Civil Engineer (PE) experienced in environmental investigations. Mr. Lui supervised all work associated with the project within the purview of the professional, as defined in the Professional Engineers Act of the California Code of Regulations.

Section 2
Summary of Site Conditions

2.1 Site Location

The "Site" is defined as the real property located at 316 N. Juanita Avenue, Los Angeles, Los Angeles County, California, 90004. The property is bordered by private property to the south, private property and Oakwood Avenue on the north, Madison Avenue to the east and Juanita Avenue to the west.

The Site consists of two buildings utilized for general office use, equipment storage and vehicle maintenance. The remainder of the Site is used for parking of AT&T fleet and personal vehicles.

The vicinity around the Site has been developed for mixed industrial, commercial, and residential use. The Site is generally surrounded by other commercial and industrial sites. Figures 1 & 3 show the location of the Site.

2.2 Site History

On November 10, 2004, a 12,000-gallon gasoline UST was removed from the Site. Following removal of the 12,000-gallon UST, two soil samples were collected from the base of the tank excavation and one soil sample was collected from beneath the location of the former fuel dispenser. The only constituent detected in the three soil samples was methyl tert butyl ether (MTBE) at concentrations of 2.7 micrograms per kilogram (ug/kg), 4.7 ug/kg, and 6.0 ug/kg. However, water accumulating in the excavation was sampled and analyzed with the following concentrations of chemicals detected: 20,900 ug/L Total Petroleum Hydrocarbons (TPH) – Gasoline (TPH-GRO); 524 ug/L benzene; 2,030 ug/L toluene; 282 ug/L ethylbenzene; 1,770 ug/L total xylenes; 5,400 ug/L MTBE; 2,050 ug/L ethanol; 18 ug/L tert-amyl methyl ether (TAME); and 812 ug/L tert-butanol (TBA). The UST Removal Report, dated November 17, 2004, was submitted by Hydrologue Inc. (HI, 2004) to the Los Angeles Fire Department (LAFD).

On January 12, 2006, the LAFD requested an investigation work plan, which was prepared and submitted to the LAFD on January 18, 2006. Upon the request of the LAFD, an Unauthorized Release form was submitted on April 18, 2007, and on April 19, 2007, the LAFD referred the case to the RWQCB. The RWQCB requested additional background information for their review of the investigation work plan on May 22, 2007, which was submitted on July 12, 2007. The January 18, 2006 Work Plan was approved with comments by the RWQCB on August 9, 2007,

and a deadline of October 15, 2007 was set for completion of the investigation and submittal of a report. This deadline was extended to December 15, 2007 by Ms. Mercedes Hsu on September 10, 2007.

2.3 Topography

The site and surrounding properties gently slope to the east. According to the United States Geologic Survey (USGS) Hollywood, CA. 7.5 Minute Series topographic map, the Site elevation is 297 feet above mean sea level (msl).

2.4 Geology & Hydrogeology

The following section is extracted from the previously submitted work plan. The Site is located in the northern portion of the Los Angeles Coastal Plain approximately three miles south of the Santa Monica Mountains and five miles northeast of the Baldwin Hills. The Silver Lake Reservoir, located approximately three miles northeast of the site and the Hollywood Reservoir, located approximately four miles northwest of the site, are the closest perennial surface water bodies. The Site is located in the La Brea Plain of the Los Angeles Central Basin, and is underlain primarily by recent alluvial sediments consisting of clay, sand and gravel. According to the California Department of Water Resources, the Exposition Aquifer extends from approximately 40 feet below ground surface (bgs) to ground surface in the region of the Site (HI, 2006).

The La Brea Plain is located east of the Newport-Inglewood belt of hills and west of the Elysian Hills. A surface was originally cut by the sea during Pleistocene time on lower Pleistocene and older formations. On this eroded surface, 90 to 200 feet of alluvial sediments have been deposited, the top of which now forms the La Brea Plain. The La Brea Plain has apparently been warped into an east-west anticlinal structure extending westerly from the Elysian Hills. Because of this warping and partial uplifting, the plain is being dissected and removed by erosion. A younger series of alluvial fans forming the Hollywood piedmont slope have buried the La Brea Plain from the north. Poland, et al., (Poland, 1956) described the La Brea Plain and the Santa Monica Plain as being of similar origin, and additional exposures and close study of the land forms indicate that both of these forms are related in age to the Ocean Park Plain and the Torrance Plain (HI, 2006).

The oldest geologic unit mapped in the Hollywood Quadrangle is the Cretaceous granodiorite and quartz diorite (Kgr), which is exposed in the northern part of the map area in the Santa Monica Mountains. Locally, at the surface, the granitic rocks are soft and crumbly due to weathering. The Tertiary bedrock formations exposed on hills at the vicinity of the Site (Tush

and Tmms) are assigned to deep-marine biogenic and clastic rocks of the upper Miocene Modelo Formation and upper Miocene Puente Formation. The Modelo Formation is composed of interbedded shale, siltstone, and sandstone (Tush). Tush consists of gray to light brown, thin bedded, silty clay shale, and locally contains scattered large calcareous nodules; in places, it also contains thin interbeds of fine-grained sandstone; the lower part locally contains thin lenses of light tan, platy, semi-siliceous or diatomaceous shale. These formations are prone to slope failure where bedding planes are inclined in the same direction as the slope (HI, 2006).

The Elysian Park Hills are primarily composed of deep-marine clastic and biogenic rocks of the upper Miocene Puente/Monterey Formation. These rocks consist of interbedded and interfingering siltstone and fine sandstone (Tpnl), siliceous shale and siltstone (Tpn2), diatomaceous shale and siltstone (Tpn3), and fine- to coarse-grained, thinly laminated to thick-bedded sandstone (Tpn4). The southern end of the Elysian Park Hills is composed of massive, soft, micaceous marine siltstone of the Pliocene Fernando Formation (TO). Tmss consists of tan to light gray semi-friable arkosic sandstone that includes some inter-bedded silty shale. The Quaternary unit mapped beneath the Site is Pleistocene alluvial deposits (Qoa). These old Quaternary sedimentary deposits are exposed over much of the center of the Hollywood Quadrangle and within, and adjacent to, the Baldwin Hills in the southeast corner. In general, older alluvium in the Hollywood Quadrangle consists of layers of fine to coarse clayey sand and sandy clay with a lesser amount of silt (HI, 2006).

A map of regional geology is presented in Figure 2.

2.5 Regional Groundwater Quality

The site is located in an area which has been in commercial use for at least 75 years, primarily associated with industrial uses. RMT conducted a review of certain RWQCB files, particularly for the former ARCO facility, which is located to the south of the subject site. RMT also reviewed records available through Geotracker, a database maintained by the RWQCB.

This review identified the former ARCO site, which has been impacted by hydrocarbons, and is located to the south and cross-gradient of the subject site:

- **Former ARCO (LUFT # T0603700432; ID 900040098)** – The Former Arco site located at 3737 Beverly Blvd. W, Los Angeles, CA 90004 is located immediately adjacent to the south of the AT&T Site. This site has had a fueling service station since at least 1950. Several gasoline and diesel USTs have been determined to be leaking from the late 1980's and 1990's and have been removed. A review of the quarterly monitoring data show that elevated levels of TPH-GRO, BTEX and

MTBE have been encountered below the former Arco Site. Remediation has been ongoing. The historical site assessment reports for this site have also reported "*near saturated gasoline contaminated soil*" just south of the AT&T site. However, the current groundwater monitoring results show that the groundwater monitoring wells close to the AT&T property line show low levels of hydrocarbon contamination.

The subject site is located cross-gradient of the significant impacts to regional groundwater from the former ARCO site.

2.6 Chemicals of Potential Concern

Based on information regarding the history of the Site and discussions with the RWQCB, the following contaminants of concern have been identified and addressed as part of this Investigation. The primary contaminants of concern are hydrocarbons (TPH, MTBE, BTEX, TAME and TBA) and ethanol, which were detected in the UST removal.

Section 3
Field Work

3.1 Sampling Strategy & Approach

The field sampling investigation consisted of two components: a vadose zone soil and a groundwater sampling investigation.

The following sections describe the sampling rationale, investigative methods and procedures, sample analysis program, sample handling, decontamination procedures, and management of investigation derived wastes (IDW).

3.2 Sampling Strategy

3.2.1 Vadose Zone Soil Sampling

The soil sampling locations and existing on-Site features are presented on Figure 4. Vadose zone soil sampling was conducted at five (5) locations to characterize the on-Site soil.

3.2.2 Groundwater Sampling

After the soil borings were converted to groundwater monitoring wells, the wells were developed, purged and sampled. The groundwater samples from the five onsite monitoring wells were analytically tested. The methods, procedures and results are presented in the concurrently submitted, *Fourth Quarter 2007 Groundwater Monitoring Report* for the Site.

3.3 Health and Safety

All activities were conducted in accordance with the Site Specific Health and Safety Plan (HSP), a copy of which was submitted to the RWQCB. The HSP identifies Site hazards and mitigations measures to reduce exposure of Site workers to those hazards.

Field activities were performed in accordance with the safety requirements outlined in the Site-specific HSP. RMT field personnel reviewed the HSP before performing any field work and conducted daily health and safety tailgate meetings with subcontractors working at the Site.

3.4 Utility Clearance

Prior to commencement of field activities, Underground Services Alert (USA) was notified of RMT's intent to conduct subsurface investigations at least 48 hours prior to initiation of intrusive field sampling. All proposed boring locations were clearly marked with white paint as required by USA. USA contacted all utility owners of record within the site vicinity and notified them of RMT's intention to conduct subsurface investigations in proximity to buried utilities. All utility owners of record, or their designated agents, marked the position of their utilities on the ground surface throughout the area designated for investigation.

3.5 Vadose Zone Soil Sampling

Vadose zone soil sampling was conducted at five (5) locations to characterize the on-Site soil. At each onsite location, soil samples were collected from depths of 5, 10 and 15 feet below ground surface (bgs) as shown in Table 1. The boring locations are shown on Figure 4. Vadose zone soil sampling was conducted on November 1 and 2, 2007, by JDK Drilling Inc (JDK), a California Water Well Drilling Contractor C-57 # 887038, of Covina, California, using a CME -75 hollow-stem auger drilling rig to assess soil and groundwater conditions beneath the site.

The soil boring locations are shown on Figure 4. The soil borings were advanced to approximately 30 feet bgs. RMT observed the soil during drilling and collected soil samples at 5-foot depth intervals, approximately, from the boring using a California Modified split-spoon soil sampler.

During drilling operation, an organic vapor monitor (OVM) was used to monitor the soil for the presence and level of organic vapors in the borings and to screen soil samples. These organic vapor readings were recorded on boring logs, prepared by the field geologist during drilling activities. The presence of any volatile hydrocarbons emanating from the soil was determined using a properly calibrated handheld OVM. The soil was collected from each sampling interval and was placed in a sealed Ziploc™ plastic bag and allowed to equilibrate for approximately 15 minutes prior to placing the probe tip into the container.

The boring logs recorded the following sampling information:

- boring number and location;
- sample identification numbers;
- date and time;
- sample depth;

- lithologic description in accordance with the Unified Soils Classification System (USCS);
- description of any visible evidence of soil contamination (i.e., odor, staining); and
- organic vapor monitor readings.

The following section describes type of vadose zone soil sampling methodology that was used at the site.

Soil Sample Collection: A hollow-stem auger rig was used for drilling and sample collection. The soil borings were sampled at discrete depths. Discrete soil samples were collected using an 18-inch long modified California sampler lined with 2-inch new stainless steel liners. Samples were collected in 6-inch long, 2-inch diameter stainless steel sleeves. The sampler was driven 18 inches with a standard 30-inch drop of a 140-pound hammer. The hammer blow counts were recorded on the boring logs. Selected sleeves were then sealed for chemical analysis. The remaining soil was then used for lithologic description. After decontamination and adding new sleeves, the sample barrel was lowered back into the augers, additional 5-foot sections of auger were added, and the process was repeated until the desired depth was reached.

Sample Preparation & Preservation: After sample recovery, the ends of that portion of the sleeve selected for analytical testing were covered with Teflon and plastic caps taped over the ends. The samples were properly labeled with the sample identification, date and time of sampling and project number. The samples were immediately placed into an ice chest chilled using frozen blue and/or crushed ice.

Soil samples requiring VOC analysis were manually cored using an EPA SW5035 Method. The sampling and preservation protocols used the ESS Lock N' Load 5035 Soil Syringe Sampler. The Soil Syringe Sampler is a one-time use tool, which collects approximately 5 grams of soil. The soil collected from the Soil Syringe Sampler was then transferred into pre-weighed 40-mL vials with appropriate preservatives. Two ESS LowBleed Septa 40-mL vials were prepared using Sodium Bisulfate solution preservative for low concentration testing and one ESS LowBleed Septa 40-mL vial was prepared using methanol preservative for high concentration testing.

Equipment Decontamination: All drilling rods were steam-cleaned prior to drilling at each boring location. Following sample collection, all sampling equipment were brushed clean in a solution of non-phosphate cleanser and rinsed with tap water and distilled water, and then shaken to remove excess moisture.

QA/QC Samples: A field/equipment blank was prepared, along with the collected soil samples for field quality assurance/quality control (QA/QC) purposes to demonstrate whether the field

sampling procedures have any interference on the analytical results. One field equipment blank water sample was collected after completion of drilling activities by pouring laboratory provided Ultra Pure Blank Water over decontaminated drilling equipment, such as a sampling barrel. The water was collected in laboratory provided 40-ml vials. The aforementioned QA/QC blanks were handled and processed in exactly the same manner as other samples, as described above. Additionally, the laboratory performed matrix spikes, matrix spike duplicates, method blanks, check samples and standards in accordance with the RWQCB guidelines to provide a measure of the potential positive interference introduced by laboratory procedures and analytical testing methods. The containers were handled in the same fashion as other samples (i.e. placed in a chilled cooler and identified on the COC) and delivered to the laboratory for analysis with other samples collected the same day.

3.6 Field Instrument Calibration

An OVM was used for health and safety monitoring and field screening during soil sampling. The data was used as an immediate indicator of volatile organic vapors in subsurface materials. A handheld Thermo OVM 580B Portable VOC Photo Ionization Detector (PID) calibrated against an Isobutylene gas standard was employed at the Site.

The handheld (PID) calibrated against an Isobutylene gas standard displayed VOCs concentration in units equivalent to parts per million (ppm). Isobutylene gas standard, containing a known concentration of isobutylene, was used to set the sensitivity. Isobutylene at 100 ppm in air was used for calibration purposes. The instrument was calibrated as follows:

1. Connect the calibration adapter to the gas inlet tube of the PID, and connect the calibration adapter to the isobutylene Gas cylinder. Hand tighten the fittings.

2. Turn the flow controller knob counter-clockwise about half a turn to start the flow of gas. The pump noise should change indicating that the gas has started to flow.

3. Wait for the instrument reading to stabilize within ±0.1 ppm. This usually takes about 30 to 40 seconds. When the last digit of the reading stops changing for a few seconds, press the [enter] key to complete the procedure.

4. Turn the flow controller knob fully clockwise to turn off the flow of gas. Disconnect the calibration adapter from the PID.

One may press the [menu] key at any time before pressing the [enter] key in Step 3 to abort the calibration. In this case, the previously stored calibration data is not changed.

The instruments were calibrated at a minimum of once per day. The OVM which was used at the Site was equipped with a lamp energy of 10.6 eV.

3.7 Boring Logs

A lithologic description of the materials encountered and collected was maintained on boring logs compiled by the field geologist. Soils were classified in accordance with the Unified Soils Classification System (USCS), and descriptions included soil type, particle size and distribution, color, moisture content, and evidence of contamination (discoloration, unusual odors, etc.). The soil samples were screened for the presence of elevated organic vapor concentrations using an OVM and the measurements were recorded on the boring log.

3.8 Decontamination Procedures

All equipment that came into contact with potentially contaminated soil or water was decontaminated consistently to assure the quality of samples collected. Disposable equipment intended for one time use was not decontaminated, but packaged for appropriate disposal. Decontamination occurred prior to and after each use of a piece of equipment. All drilling and sampling devices used were decontaminated using the following procedures:

- Non-phosphate detergent and tap water wash, using a brush if necessary;
- Tap-water rinse;
- Initial deionized/distilled water rinse; and
- Final deionized/distilled water rinse.

Equipment was decontaminated in a designated area on pallets or plastic sheeting, and clean bulky equipment stored on plastic sheeting in uncontaminated areas. Cleaned small equipment was stored in plastic bags. Materials to be stored more than a few hours was also covered.

3.9 Investigation Derived Waste

All equipment that came into contact with potentially contaminated soil or water was decontaminated consistently to assure the quality of samples collected. Disposable equipment (if any) intended for one time use was not decontaminated, but packaged for appropriate disposal. Decontamination occurred prior to and after each use of a piece of equipment. All drilling and sampling devices used were decontaminated in a pre-designated area using the following procedures:

- Non-phosphate detergent and tap water wash and brush;

- Tap water rinse;
- Initial deionized/distilled water rinse; and
- Final deionized/distilled water rinse.

Soils generated during drilling and decontamination fluids were placed and sealed in U.S. Department of Transportation (DOT) approved 55 gallon drums for temporary storage pending disposal. The drums were labeled with the boring number, date of waste generation, type of waste, Site and project name, and the name and phone number of the Site owner. The IDW (decontamination water and soil cuttings) were disposed at appropriate disposal/ treatment/ recycling facilities by Belshire Environmental. All shipping documents (hazardous waste manifests and bills of lading) are attached in Appendix I.

Section 4
Installation of Monitoring Wells

4.1 Well Permits

Prior to installation of the new wells, monitoring well permits were obtained from the Los Angeles Department of Health Services (LADHS). Copies of these permits are included in Appendix G.

4.2 Drilling of Groundwater Monitoring Wells

On the same day of drilling, the soil borings MW1, MW2, MW3, MW4 and MW5 were converted into groundwater monitoring wells under the direction of a RMT geologist. Each borehole was drilled to a depth of approximately 30 feet bgs. Upon completion of soil borings, wells were constructed in the boreholes through the hollow stem auger. JDK Drilling Inc a California Water Well Drilling Contractor C-57 # 887038, of Covina completed the groundwater monitoring well installation using a hollow stem drilling rig (Figure 4 and Appendix B).

4.3 Well Construction

Provided below is a description of well construction activities with specific well construction details included in Appendix B.

Groundwater monitoring wells were constructed by using 2 inch diameter flush-threaded Schedule (Sch) 40 polyvinyl chloride (PVC) well screen casing and material. The well screen section was constructed using 20 ft lengths of 0.010 slotted Sch 40 PVC and sand filter pack. Each well head was constructed with flush-mounted traffic-rated well boxes designed to reduce the infiltration of surface water. The monitoring well casings were secured with a locking slip cap fitted with a water resistant lock.

The casing and screen assembly was suspended by wire-line during the installation of the filter pack, bentonite seal, and grout to keep the casing straight in the borehole. Annular materials were placed in the borehole from the top of the open HSA. Sand pack (Monterey #2/12) was installed from the bottom of the borehole to 2-feet above the top of screen.

The wells were surged and bailed after sand placement, and the depth to the filter pack was checked for settlement. A bentonite seal (Enviroplug medium chips) with a thickness of

approximately 3 feet was installed above the sand filter pack and hydrated. The remaining annular space was backfilled with bentonite/cement grout to approximately 2 ft bgs. The remaining annular space was sealed using concrete. Well construction details are included in Appendix B. The locations of these new wells are shown on Figure 4. The well string materials were steam-cleaned prior to installation.

4.4 Well Survey

A California-licensed land surveyor, William L. Meagher of WM Surveys Inc. (PLS # 5948) of Ventura, California, surveyed the elevation of the ground surface and the measuring point (top of casing) at each well location relative to mean sea level for all groundwater monitoring wells on November 6, 2007. The survey was completed using a state benchmark as the control. Well survey coordinates and the well survey data are provided in Appendix F. The GEO_XY and GEO_Z survey data have been uploaded into Geotracker.

4.5 Well Development

The monitoring wells were developed under observation by the RMT geologist on the day of the drilling after installing the filter pack, but before placing the seal by the drilling rig crew. This procedure allows fluids to flow more freely into the well. Prior to well development, the wells were surged approximately 10 minutes. This method involved surging the groundwater in the well with a surge block to induce the entry of sediments from the sand pack into the well casing. A stainless steel bailer was then used to remove water and sediments from the well and to move water through the well screen. Surging and bailing continued until the produced water was free of visible sediment and the pH, temperature, and specific conductance of the produced water had stabilized. Stabilization of the physical parameters indicated that water in the groundwater monitoring well was representative of the water in the formation. Development continued until at least five casing volumes were removed, sediment was reasonably cleared from the well, and the turbidity of the development water was low.

Well development logs are included in Appendix E.

On November 8, 2007, all groundwater monitoring wells were again developed by pumping a minimum of 5 to 10 well volumes of groundwater using a Grundfos RediFlo 2 submersible pump. Development continued until sediment was reasonably cleared from the well, and the turbidity of the development water was low.

4.6 Groundwater Monitoring Summary

Groundwater monitoring field activities were conducted on November 15, 2007. See Appendix E for the groundwater Sampling Procedures and Field Sheets

4.6.1 Current Field Activities

Groundwater monitoring frequency	Quarterly
Activity date	November 15, 2007
Field subcontractor	RMT Inc.
Purging method	Submersible pump
Purging subcontractor	RMT Inc
Disposal method/facility	Hauled offsite by Belshire Environmental
Gallons of groundwater purged:	Approximately 40 gallons
Number of groundwater wells total	5
Number of groundwater wells offsite	0
Number of wells sampled this period	5
Number of wells with Product	None.

4.6.2 Site Hydrology

Average groundwater elevation (of wells gauged):	259.29 feet above MSL
Average groundwater elevation change from previous quarter:	n/a
Approximate groundwater flow direction:	east-southeast
Approximate hydraulic gradient:	0.05 foot/foot

4.6.3 Groundwater Conditions

Maximum TPH-DRO concentration:	7.9 mg/L – MW3
Minimum TPH- DRO concentration:	ND
Historical maximum TPH- DRO concentration:	7.9 mg/L – MW3 (11/15/2007)
Maximum MTBE concentration:	6.8 ug/L – MW2
Minimum MTBE concentration:	5.1 – MW1
Historical maximum MTBE concentration:	6.8 ug/L – MW2 (11/15/2007)

Section 5
Laboratory Analysis & Sample Preservation

5.1 Analysis Methods

All soil samples were logged on requisite Chain-of-Custody record and delivered to American Scientific Laboratories (Certification No. 2200), Los Angeles California, a State certified laboratory for hazardous waste testing.

A total of 15 soil samples were collected from MW1, MW2, MW3, MW4 and MW5 soil borings along with a field equipment blank, and were analytically tested for:

- TPH-DRO (Extractable Diesel Range Organics C28 to C40) using EPA Method 8015B;
- TPH-ORO (Heavy Extractable Range Organics C28 +) using EPA Method 8015B;
- TPH-GRO (Gasoline Range Organics C6 to C10) using EPA Method 8260B;
- BTEX using EPA Method 8260B;
- Ethanol using EPA Method 8260B; and
- 5 Fuel Oxygenates: methyl-t-butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), tert-amyl methyl ether (TAME), tert-butanol (TBA) using EPA Method 8260B.

The soil samples were collected and preserved using EPA Method SW5035.

5.2 Sample Containers and Preservation

Sample containers for trip and equipment blanks for the specified analyses were provided by the laboratory immediately prior to the sampling event. The pre-cleaned containers were not rinsed prior to sample collection. Any requisite preservatives were added to the containers by the laboratory prior to shipment of the sample containers to the sample collector.

The labeled and sealed soil sample sleeves were placed into clear plastic Ziploc bags, and then placed into an ice chest filled with ice for transport to a California certified analytical laboratory. Soil samples were logged on a Chain-of-Custody form. The Chain-of-Custody forms were also placed into a clear plastic Ziploc bag, and then placed inside the ice chest. One ice chest per day was used to hold all of the soil samples.

5.3 Sample Labels and Identification System

A sample label was placed on each sample container and had the following information:

- Project number
- Site name and location
- Boring number
- Sample identification number
- Sampler's initials
- Date and time of collection
- Preservative, if any.

Soil samples were given an identification starting with MW, followed by the location number, followed by "d" and the depth (feet bgs) at which they are taken, for example MW1d05 or MW1d10. Field Blanks were labeled QCEB.

5.4 Sample Packaging and Shipment

Following collection and labeling, the following protocol was followed for soil sample packaging:

1. A self-adhesive custody seal was placed across the lid of each sample container.

2. Sample containers were placed in clear, plastic, leak-resistant bags prior to placement in the ice chest. Caps were checked for tightness, prior to placing the sample in the bag.

3. Samples to be shipped were placed in the cooler and packed with packaging materials to minimize the potential for disturbance and/or breakage of the sample containers.

4. Ice and "Blue Ice" packs were placed in leak-resistant plastic bags and included in the coolers to keep samples at a chilled temperature during transport to the analytical laboratory. When ice is used, the drain plug of the cooler was secured with fiberglass tape to prevent melting ice from leaking out of the cooler.

5. The chain-of-custody form was placed in a water-resistant plastic bag and taped on the inside of the lid of the cooler.

6. Strapping tape was placed around all coolers prior to transport to the laboratory.

A temperature blank consisting of a 40-milliliter glass vial of distilled water was included in each cooler sent to the analytical laboratory. The purpose of the temperature blank was to allow the analytical laboratory to obtain a representative measurement of the temperature of samples enclosed in a cooler without disturbing the actual samples. The field team packaged and labeled

the temperature blank like a regular water sample; however, the analytical laboratory only measured the temperature of the blank.

Every effort was made to transport the samples to the analytical laboratory at the end of each sampling day. However, if the sampling runs late and the laboratory closes, the samples were stored overnight in a secured location (e.g., at the office) under appropriate chain-of-custody procedures, and the samples were delivered to the laboratory the next day. Prior to overnight storage, the cooler(s) were restocked with new ice or blue ice to maintain the samples in a chilled state. The temperature blank inside each cooler was checked by the sample collector at the beginning of the evening and in the morning and the temperature readings were recorded in the field logbook.

5.5 Chain-of-Custody Records

Chain-of-custody (COC) records were used to document sample collection and shipment to laboratory for analysis. All sample shipments for analyses were be accompanied by a COC record. Form(s) were completed and sent with the samples for each laboratory and each shipment. If multiple coolers are sent to a single laboratory on a single day, COC form(s) were completed and sent with the samples for each cooler. The COC record identified the contents of each shipment and maintained the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in someone's view, locked up, or kept in a secured area that is restricted to authorized personnel. Until receipt by the laboratory, the custody of the samples were the responsibility of the sample collector. A self-adhesive custody seal was placed across the lid of each sample, except for VOC samples (which need to avoid adhesives). The shipping containers in which samples are stored (usually a sturdy picnic cooler or ice chest) was also sealed with self-adhesive custody seals any time they are not in someone's possession or view before shipping. All custody seals were signed and dated.

Section 6
Results of Investigation

6.1 Site Geology

Soil encountered in borings MW1 through MW5 consists of heterogeneous, interbedded clay, silty clay and/or clayey sand to a depth of approximately 30 feet bgs (the maximum depth explored). Descriptions of the conditions encountered in the soil borings are presented on the soil boring logs in Appendix B.

6.2 Soil Characterization Results

6.2.1 TPH

- TPH-DRO was not detected in the soil samples.
- TPH-ORO was only detected in the sample from MW2 at 10 feet bgs at 140 mg/Kg.
- TPH-GRO was not detected in the soil samples.

6.2.2 BTEX & Fuel Oxygenates

- MTBE was only detected in soil boring MW1 at 5 feet (16 ug/kg), 10 feet (51 ug/kg) and 15 feet (7.4 ug/kg) bgs.
- Benzene was not detected in the soil samples.
- Ethylbenzene was not detected in the soil samples.
- Toluene was not detected in the soil samples.
- Total xylenes were not detected in the soil samples.
- DIPE was not detected in the soil samples.
- ETBE was not detected in the soil samples.
- TAME was not detected in the soil samples.

- TBA was not detected in the soil samples.

6.2.3 Ethanol

- Ethanol was not detected in the soil samples.

The analytical testing results of laboratory QA/QC samples, which include matrix spike/matrix spike duplicates, check blank, method blanks, continuing calibration verification, laboratory control sample/laboratory control sample duplicate, calibration standards, and reference standards, are also found in the laboratory reports and generally fell within acceptable ranges (see Appendix C).

6.3 Groundwater Characterization Results

6.3.1 TPH

- TPH-DRO was only detected in monitoring well MW3 at 7.9 mg/L.
- TPH-ORO was not detected in the groundwater samples
- TPH-GRO was not detected in the groundwater samples.

6.3.2 BTEX & Fuel Oxygenates

- MTBE was only detected in two monitoring wells, MW1 (5.1 ug/L) and MW2 (6.8 ug/ L).
- Benzene was not detected in the groundwater samples.
- Ethylbenzene was not detected in the groundwater samples.
- Toluene was not detected in the groundwater samples.
- Total xylenes were not detected in the groundwater samples.
- DIPE was not detected in the groundwater samples.
- ETBE was not detected in the groundwater samples.
- TAME was not detected in the groundwater samples.
- TBA was not detected in the groundwater samples.

6.3.3 Ethanol

- Ethanol was not detected in the groundwater samples.

The analytical testing results of laboratory QA/QC samples, which include matrix spike/matrix spike duplicates, check blank, method blanks, continuing calibration verification, laboratory control sample/laboratory control sample duplicate, calibration standards, and reference standards, are also found in the laboratory reports and generally fell within acceptable ranges (see Appendix D).

Section 7
Summary

Based on the results of this investigation, RMT is providing the following summary and conclusions:

- Five soil borings (MW1, MW2, MW3, MW4 and MW5) were drilled to a termination depth of 30 feet bgs, using hollow stem auger drilling techniques. Soil samples were collected at five foot intervals in from each boring until 15 feet bgs.
- No visual, olfactory, or PID indications of contamination were encountered in the soil borings.
- The soil samples were collected and preserved using EPA Method SW5035.
- The soil borings were converted into groundwater monitoring wells (MW1, MW2, MW3, MW4 and MW5). The installed groundwater monitoring wells were then surveyed by a licensed surveyor, developed, and sampled.
- Soil encountered in borings MW1 through MW5 consists of heterogeneous, inter-bedded clay, silty clay and/or clayey sand to a depth of approximately 30 feet bgs (the maximum depth explored). Based on the low permeability of the saturated zone, the groundwater wells can be classified as low recovery wells.
- The laboratory analytical results of soil samples collected from the soil borings show that TPH-DRO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the soil samples collected. TPH-ORO was only detected in one sample from MW2 at 10 feet bgs at 140 mg/Kg. MTBE was only detected in one soil boring MW1 at 5 feet (16 ug/kg), 10 feet (51 ug/kg) and 15 feet (7.4 ug/kg) bgs.
- The laboratory analytical results of groundwater samples collected from the five monitoring wells show that TPH-ORO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the groundwater samples collected. TPH-DRO was only detected in one monitoring well, MW3 at 7.9 mg/L. MTBE was only detected in two monitoring wells, MW1 (5.1 ug/L) and MW2 (6.8 ug/ L).
- The former Arco site located at 3737 Beverly Blvd W, Los Angeles, CA 90004 is located immediately adjacent to the south of the AT&T Site. The former ARCO site has had a fueling service station since at least 1950. Several gasoline and diesel USTs have been

determined to be leaking from the late 1980's and 1990's and have been removed. A review of the quarterly monitoring data show that the elevated levels of TPH-GRO, BTEX and MTBE have been encountered below the former Arco Site. Remediation has been ongoing. The historical site assessment reports for this site have also reported "*near saturated gasoline contaminated soil*" just south of the AT&T site. Other sites in the vicinity cannot be ruled out as a source for hydrocarbon concentrations detected in the groundwater in the area.

- The California Primary Maximum Contaminant Level (MCL) for MTBE is 13 ug/L. The highest MTBE detected in the groundwater is 6.8 ug/L in MW2. The highest TPH-DRO detected in groundwater is 7.9 mg/L in MW3. The minor residual contamination could be potentially unrelated to the former gasoline UST which is the subject of this investigation. The current concentrations in both soil and groundwater do not warrant further investigations and/or corrective action.

- The analytical testing COELT/ EDF data have been uploaded to the State of California Geotracker database website in compliance with California's electronic reporting requirements.

Based on the current and previous investigations, RMT recommends that this Site be granted No Further Action status by the Los Angeles Regional Water Quality Control Board if groundwater monitoring for three more quarters confirm that the concentrations of contaminants of concern decrease or remain stable at the Site.

Section 8
Document Distribution

RMT recommends that copies of this document be submitted to the following agency:

2004 UST Removal Report

3.0 ANALYTICAL TESTING

Soil samples were submitted to Associated Laboratories (AL) for analysis, which is State certified for hazardous waste testing (Certification No. 1338) using a 24-hour turn-around-time. Analytical laboratory results are provided on Figure 4 and laboratory reports are provided in Appendix A.

Samples were submitted for the following analysis:

- Total petroleum hydrocarbons as gasoline (TPH-g) using EPA Method 8015(m).
- Benzene (B), Toluene (T), Ethylbenzene (E), and Total Xylenes (X) using EPA Method 8260B (collectively BTEX).
- 5 Oxygenates: Methyl-t-butyl ether (MtBE), Di-isopropyl ether (DIPE), Ethyl-t-butyl ether (EtBE), Tert-amyl methyl ether (TAME), and Tert-butanol (TBA) using EPA Method 8260B.
- 1,2-Dibromoethane (EDB), and 1,2-Dichloroethane (EDC) using EPA Method 8260B.
- Methanol using EPA Method 8015M.
- Ethanol using EPA Method 8260B.
- The samples were collected and preserved using EPA Method SW5035.
- The analytical testing COELT/EDF data has been uploaded to the Geotracker website in compliance with AB2886 requirements.

4.0 DEPTH TO GROUNDWATER

Publicly available information indicates that the depth to usable groundwater in the vicinity of the Site is 19.1 feet bgs. This is based on information from Well #2671A (ground surface elevation of 283.6.1 feet above MSL) located on Melrose and El Centro (just to the north-west of the Site) last measured on May 20, 2004. The depth to usable groundwater in the vicinity of the Site in another well is 6.5 feet bgs. This is based on information from Well #2692C (ground surface elevation of 242 feet above MSL) located on Kingsley and 1st (just to the west of the Site) last measured on April 5, 1978 (personal communication with Brian Hill, County of Los Angeles Department of Public Works, Hydrology Division, November 17, 2004).

5.0 CONCLUSIONS

Based on the data contained in this report, the following are concluded:

- ☐ One 12,000-gallon gasoline double-walled Modern Welding Glassteel UST was properly removed from the Site and disposed under state and local regulations.
- ☐ The results of the analytical testing show that **NO** TPH-g, BTEX, DIPE, TAME, ETBE, TBA, EDB, EDC, Ethanol were detected above the method detection limits in the soil samples collected beneath the UST and the former fuel dispenser. Minor MTBE at 2.7 J µg/Kg, 4.7 J µg/Kg, 6 µg/Kg, slightly above the detection limit was detected in samples 1A, 1B and D1 only.
- ☐ Elevated concentrations of TPH-g (20,900 µg/L), BTEX, Ethanol (2,050 µg/L), MTBE (5,400 µg/L), TAME (18 µg/L), TBA (812 µg/L) were detected in the accumulated water within the excavation.
- ☐ All soil samples were collected and preserved using EPA Method SW5035.

Preliminary research indicates that there was a previous onsite leak reported in or around 1989. Closure for the Site was granted by the RWQCB or the LAFD in 1996. The current data is insufficient at this time to conclude if the current levels of elevated concentrations detected in the accumulated water sample collected from the base of the excavation are related to the current UST; the 1989 UST, or another source. Therefore, additional assessment is required to assess quality and any potential impact of groundwater underlying the Site.

WORK / SAMPLING PERFORMED
Install five soil borings to depth of 30 ft. in the location of the former UST pit.
A hollow stem auger drill rig was used.
Soil samples were collected at 5 ft. intervals to groundwater. Samples were analyzed for TPH diesel,
TPH gasoline, BTEX, MTBE, DIPE, ETBE, TAME, TBA and ethanol.
Borings were converted into 2" diameter pvc monitoring wells.
Soil cuttings and purge water are stored onsite temporarily until shipped out for offsite disposal.

Enclosed are the results of analyses on 6 samples analyzed as specified on attached chain of custody.

Wendy Lu
Organics Supervisor

Rojert G. Araghi
Laboratory Director

American Scientific Laboratories, LLC (ASL) accepts sample materials from clients for analysis with the assumption that all of the information provided to ASL verbally or in writing by our clients (and/or their agents), regarding samples being submitted to ASL, is complete and accurate. ASL accepts all samples subject to the following conditions:

1) ASL is not responsible for verifying any client-provided information regarding any samples submitted to the laboratory.
2) ASL is not responsible for any consequences resulting from any inaccuracies, omissions, or misrepresentations contained in client-provided information regarding samples submitted to the laboratory.

Appendix E
Groundwater Sampling Procedures & Field Sheets

INSPECTION AND GAUGING

Wells are inspected prior to evacuation and sampling. The condition of the wellhead is checked and noted according to a wellhead inspection checklist. Standard measurements include the depth to water (DTW) and the total well depth (TD) obtained with industry standard electronic water level indicators that are graduated in increments of hundredths of a foot. The water in each well is inspected for the presence of immiscibles. When free product is suspected, its presence is confirmed using an electronic interface probe (e.g. MMC). No samples are collected from a well containing over two-hundredths of a foot (0.02') of product.

EVACUATION

Depth to water measurements are collected by RMT personnel prior to purging and minimum purge volumes are calculated anew for each well based on the height of the water column and the diameter of the well. Expected purge volumes are never less than three case volumes. Well purging devices are selected on the basis of the well diameter and the total volume to be evacuated. In most cases, the well will be purged using an electric submersible pump (i.e. Grundfos) suspended near (but not touching) the bottom of the well.

STABILIZATION of PARAMETERS

Well purging completion standards include minimum purge volumes, but additionally require stabilization of specific groundwater parameters prior to sample collection. Typical groundwater parameters used to measure stability are electrical conductivity, pH, and temperature. Instrument readings are obtained at regular intervals during the evacuation process (no less than once per case volume). Stabilization standards for routine quarterly monitoring of fuel sites include the following: Temperature is considered to have stabilized when successive readings do not fluctuate more than +/- 1 degree Celsius. Electrical conductivity is considered stable when successive readings are within 10%. pH is considered to be stable when successive readings remain constant or vary no more than 0.2 of a pH unit.

DEWATERED WELLS

Normal evacuation removes no less than three case volumes of water from the well. However, less water may be removed in cases where the well dewaters and does not immediately recharge.

MEASURING RECHARGE

Upon completion of well purging, a depth to water measurement is collected and notated to ensure that the well has recharged to within 80% of its static, pre-purge level prior to sampling. Wells that do not immediately show 80% recharge or dewatered wells will be allowed a

minimum of 2 hours to recharge prior to sampling. The water level at time of sampling will be noted.

PURGEWATER CONTAINMENT

Non-hazardous purgewater evacuated from each groundwater monitoring well is captured and contained in 55-gallon drums, on-board storage tanks on the Sampling Vehicle and/or special water hauling trailers. Effluent from the decontamination of reusable apparatus (sounders, electric pumps and hoses etc.) consisting of groundwater combined with deionized water and non-phosphate soap, is similarly captured. Non-hazardous purge and rinsate water is off loaded into 55-gallon drums on site.

SAMPLE COLLECTION DEVICES

All samples are collected using disposable bailers.

SAMPLE CONTAINERS

Sample material is decanted directly from the sampling bailer into sample containers provided by the laboratory that will analyze the samples. The transfer of sample material from the bailer to the sample container conforms to USEPA specifications. The type of sample container, material of construction, method of closure and filling requirements are specific to the intended analysis. Chemicals needed to preserve the sample material are commonly placed inside the sample containers by the laboratory or glassware vendor prior to delivery of the bottle to our personnel. The laboratory sets the number of replicate containers.

QA/QC SAMPLES

For field Quality Assurance/Quality Control (QA/QC) purposes, either an equipment blank (QCEB) sample or a trip blank (QCTB) sample may be prepared along with the collected groundwater samples. If trip blanks are collected during this event, they are taken to the site and kept inside the sample cooler for the duration of the event. They are turned over to the laboratory for analysis with the other collected samples. The QCEB sample is generally obtained after decontamination activities by pouring ultra-pure de-ionized water over the pump. A sample is then collected using, to the extent feasible, the same sampling protocol and equipment used to obtain the other samples. Any collected QA/QC blank samples are handled and processed in exactly the same manner as regular samples, as described herein. Additionally, the laboratory performed matrix spikes, matrix spike duplicates, method blanks, check samples and standards in accordance with the RWQCB guidelines to provide a measure of the positive interference introduced by the laboratory procedure and analytical testing methods.

DUPLICATES

Duplicates, if requested, may be collected at a site. The Duplicate sample is labeled "DUP" and the time of collection is omitted from the COC, thus rendering the sample blind.

SAMPLE STORAGE

All sample containers are promptly placed in food grade ice chests for storage in the field and transport (direct or via our facility) to the designated analytical laboratory. These ice chests contain quantities of restaurant grade ice as a refrigerant material. The samples are maintained in either an ice chest or a refrigerator until relinquished into the custody of the laboratory or laboratory courier.

DOCUMENTATION CONVENTIONS

A label must be affixed to all sample containers. In most cases these labels are generated by our office personnel and are partially preprinted. Labels can also be hand written by our field personnel. The site is identified with the store number and site address, as is the particular groundwater well from which the sample is drawn (e.g. MW-1, MW-2, S-1 etc.) The time and date of sample collection along with the initials of the person who collects the sample are handwritten onto the label. Chain of Custody records are created using client specific preprinted forms following USEPA specifications.

DECONTAMINATION

All equipment is brought to the site in clean and serviceable condition and is cleaned after use in each well and before subsequent use in any other well. Equipment (i.e. reels, pumps and bailers) are decontaminated before leaving the site. Any sensitive equipment or parts (i.e. Dissolved Oxygen sensor membrane, water level indicator, etc.) that cannot be washed using the high pressure water, will be sprayed with a nonphosphate soap and deionized water solution and rinsed with deionized water.

RMT

IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED IN THE FIELD ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THIS OFFICE, WORK PLAN MODIFICATIONS MAY BE REQUIRED

WELL DECOMMISSIONING

Well Depth Log / Records	n/a
Method of Well Assessment	
Depth and Number of Perforations	
Type of Perforator Size of Perforations	
Type and Amount of Sealant	
Method of Upper Seal Pressure Application	

DISPOSITION OF PERMIT (Department Use Only)
THIS PERMIT IS CONSIDERED COMPLETE WHEN THE WORK PLAN IS APPROVED AND WHEN THE WELL COMPLETION LOG IS RECEIVED. NO WELL CONSTRUCTION OR DECOMMISSIONING CAN BE INITIATED WITHOUT THE WORK PLAN APPROVAL FROM THIS DEPARTMENT

WORK PLAN APPROVAL
This Approval is Valid for 180 Days

Date 10/17/07 R.E.H.S. Michael Lui

Conditions ON 10/16/07 #1005 WAS PAID FOR PERMIT # 756595 TO CONSTRUCT MW-1, 2, 3, 4 & 5 PLEASE, CALL ME FOR SOIL INSPECTION AT LEAST 48 HOURS PRIOR TO START DRILLING

COMPLETED 11/2/07

For Final Inspection
Call Michael Lui
(626) 430-5398
8 a.m. to 10 a.m.

I hereby agree to comply in every respect with all the regulations of the County Environmental Health Division and with all ordinances and laws of the County of Los Angeles and the State of California pertaining to well construction, reconstruction and decommissioning. Upon completion of the well and with in thirty days thereafter, I will furnish the Environmental Health office with a completion log of the well giving date drilled, depth of the well, perforations in the casing, and any other data deemed necessary by County Environmental Health Division.

Applicant's Signature

Applicant Name: (Print) Chris D'Sa

Fax Number: 213-947-4183 10/17/07

NOTICE

This well permit approval is limited to compliance with the California well standards and the Los Angeles County Health and Safety Code and does not grant any rights to construct, reconstruct, or decommission any well. Applicant is responsible for securing all other permits necessary to perform the work.

IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED IN THE FIELD ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THIS OFFICE, WORK PLAN MODIFICATIONS MAY BE REQUIRED

Well Depth Log / Records	n/a
Method of Well Assessment	
Depth and Number of Perforations	
Type of Perforator Size of Perforations	
Type and Amount of Sealant	
Method of Upper Seal Pressure Application	

DISPOSITION OF PERMIT (Department Use Only)
THIS PERMIT IS CONSIDERED COMPLETE WHEN THE WORK PLAN IS APPROVED AND WHEN THE WELL COMPLETION LOG IS RECEIVED. NO WELL CONSTRUCTION OR DECOMMISSIONING CAN BE INITIATED WITHOUT THE WORK PLAN APPROVAL FROM THIS DEPARTMENT

ENVIRONMENTAL APPROVAL

Date 10/17/07 R.E.H.S. Michael Lui

Conditions ON 10/16/07 #1005 WAS PAID FOR PERMIT #756595 TO CONSTRUCT MW-1, 2, 3, 4 & 5
PLEASE CALL ME FOR SOIL INSPECTION AT LEAST 48 HOURS PRIOR TO START DRILLING.

For Final Inspection
Call Michael Lui
(626) 430-5398
8 a.m. to 10 p.m.

I hereby agree to comply in every respect with all the regulations of the County Environmental Health Division and with all ordinances and laws of the County of Los Angeles and the State of California pertaining to well construction, reconstruction and decommissioning. Upon completion of the well and with in thirty days thereafter, I will furnish the Environmental Health office with a completion log of the well giving date drilled, depth of the well, perforations in the casing, and any other data deemed necessary by County Environmental Health Division.

Applicant's Signature

Applicant Name: (Print) Chris D'Sa

Fax Number: 213-947-4183 10/17/07

NOTICE

This well permit approval is limited to compliance with the California well standards and the Los Angeles County Health and Safety Code and does not grant any rights to construct, reconstruct, or decommission any well. Applicant is responsible for securing all other permits necessary to perform the work.

UNDERGROUND STORAGE TANKS PROGRAM
PACIFIC BELL TELEPHONE COMPANY, AT&T
316 NORTH JUANITA AVENUE, LOS ANGELES, CA
(CASE NO. 900040225A)

Dear Mr. Smith:

Thank you for submitting the general information package dated July 12, 2007. We have reviewed the "UST Removal Report/Soils Report (Report)," dated November 17, 2004, and the "Workplan for Site Assessment (Workplan)," dated January 18, 2006, prepared by Hydrologue, Inc. (HI), for the subject site. The Report indicated that the total petroleum hydrocarbons as gasoline (TPH_G) concentration at 20,900 µg/L, benzene concentration at 524 µg/L and methyl tertiary butyl ether (MTBE) concentration at 5,400 µg/L were detected in a water sample collected from the excavation. In the Workplan, HI proposes to drill five soil borings and convert the borings to groundwater monitoring wells to assess soil and groundwater contamination beneath the site

We concur with the Workplan as proposed, provided the following conditions are met:

1. The construction, development, and abandonment of groundwater monitoring wells must comply with requirements prescribed in the California Well Standards (Bulletin 74-90), published by the California Department of Water Resources (can be seen at www.dpla2.water.ca.gov and go to "groundwater").

2. All necessary permits must be obtained from the appropriate agencies prior to the start of work.

3. Pursuant to State Water Resources Control Board Resolution No. 92-49, under Water Code section 13304, all fieldwork related to subsurface investigation must be conducted by, or under the direct responsible supervision of, a licensed California Professional Geologist (PG) or Civil Engineer (PE). All technical documents submitted to this Regional Board must be reviewed and signed and/or stamped by a licensed California PG or PE with at least five years subsurface hydrogeologic experience.

4. Soil must be logged at five-foot intervals, at changes in the soil lithology, and at areas of obvious contamination. The registered professional in responsible charge shall review the boring logs and assume the responsibility for the accuracy and completeness of the logs.

Soil samples collected from on-site wells must be prepared per EPA Method 5035 for analyses.

5. Soil and Groundwater samples must be analyzed by Cal-LUFT GC/FID or Cal-LUFT GC/MS Method for TPH_G, total petroleum hydrocarbons as diesel (TPH_D), and by EPA Method 8260B for benzene, toluene, ethlybenzene, and xylenes (BTEX), and fuel oxygenate compounds including MTBE, di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), and TBA. Ethanol is also required and shall be analyzed by either method above. The analytical detection limits must conform to the Regional Board General Laboratory Testing Requirements (9/06) (http://www.waterboards.ca.gov/losangeles/html/lab_report.html). All respective analytical methods must be certified by the California Environmental Laboratory Accreditation Program (ELAP). All analytical data must be reported by a California-certified laboratory.

   Prior to consideration of case closure, you must analyze at least one round of groundwater samples including all common aromatic and chlorinated volatile organic compounds per EPA Method 8260B. If the site has a waste oil tank, the full suite of aromatic and chlorinated analyses must also be tested and reported per EPA Method 8260B.

6. All proposed groundwater monitoring wells must be developed and surveyed to a benchmark of known elevation above mean sea level by a licensed land surveyor or registered civil engineer. Prior to collecting samples, free product thickness (if present) must be determined and the depth to water must measured in all wells to be sampled, then the wells are to be properly purged until the temperature, conductivity, and pH stabilize, and the water is free of suspended and settleable matter, before samples are collected for analysis. Any wells containing free product must be purged to remove any standing product, allowed to equilibrate to prepurged levels and free product thickness measured and reported.

7. You are required to submit a technical report summarizing this phase of investigation by **October 15, 2007.** The report must also include the soil boring logs, analytical results, well permits, geologic cross-section, isoconcentration map of contaminants, and as-built construction details of the new groundwater monitoring wells installed.

8. You are required to implement a quarterly groundwater monitoring program. The groundwater monitoring reports are to be submitted by the fifteenth day following the end of the month as shown in the following schedule:

Reporting Period	Report Due Date
January-March	April 15th
April-June	July 15th
July-September	October 15th
October-December	January 15th

The first groundwater monitoring report under this schedule is due by **October 15, 2007.**

9. The quarterly groundwater monitoring report must include the following:

   - A separate summary table containing current concentrations.
   - A summary table containing all historical data per each well with groundwater depth (or elevation) and well screen intervals.
   - A regional map depicting site vicinity business and street, etc.
   - A site plot plan depicting site location, tank and associated system locations.
   - A site map depicting all well locations and groundwater elevations (contour) with flow gradient and direction.
   - An isoconcentration map for TPH(g), benzene, MTBE, and TBA, respectively.
   - A hydrograph superimposing on concentration over time at the most impacted well for TPH(g), benzene, MTBE, and TBA (or at any other wells as warranted).
   - Conclusions and recommendations.

10. Two weeks prior to commencing field work, a Health and Safety plan pertinent to the subject project must be submitted to this office. The field crew must follow the Health and Safety Plan.

11. Please notify us at least seven working days prior to the start of work so that we may schedule a member of our staff to be present.

If you have any questions concerning this matter, please call me at (213) 576-6712 or e-mail me at mhsu@waterboards.ca.gov.

Sincerely,

Mercedes S. Hsu

Please check appropate box below and attach all required analytical reports. Unless otherwise noted, composite samples should be collected with the following frequency: 1sample for 100 cubic yards or less ; 3 samples for 500 cu yds or less ; 5 samples for 1000 cu yds .1 additional sample for each additional 500cu yds greater than 1000 cu yds

[X]

I/we certify that the soil referenced herein is contaminated soley by Virgin petroleum products from leaking underground storage tank(s).

Attached is analytical data from state certified lab for the following

1) Total Petroleum Hydrocarbons (TPH, EPA 8015 Modified)

2) Benzene/Toluene/Ethylbenzene/xylene (BTEX, EPA 8020)

[ ]

I/We certified that some or all of the contaminants in the soil referenced herein is waste oil, or some other non-virgin petroleum product, or virgin petroleum product from something other tham a leaking underground storage tank.
Attached is analytical data from a state certified lab for the following:

1) Total metals concentration for a thru q below (TTLC test)

a) Antimony	g)Cobalt	m) Selenium
b) Arsenic	h)Copper	n) Silver
c) Barium	I) Lead	o) Thalium
d) Berylium	j) Mercury	p) Vanadium
e) Cadmium	k) Molybdenum	q) Zinc
f) Chromium	l) Nickel	

Note: If any item a thru q is greater than 10 times its Soluble Threshold Limit concentration (STLC) the soluble metal concentration must be determined by the Waste Extraction Test procedure.

2) THP by:
EPA 418.1 or
EPA 8015 modified

3) BTEX/VOC by:
EPA 8020 EPA 8010
or EPA 8260(combines above)

4) PCB'S(waste oil only)
5) Additional analytical data as required.

No soils referenced herein may be delivered until the forgoing certificate is received and approved by TPST, and TPST issues manifests and assigns a delivery date. If any soils delivered to TPST are found to be "Hazardous Waste" pursuant to federal or state regulations, the client shall be solely responsible for their removal. If the client fails to remove such soils, TPST, acting as client's agent, may arrange for such removal at client's expense.

This is a complete and accurate description of the soil referenced herein; no deliberate or willful omissions have been made and all known or suspected hazards have been disclosed herein. I/We certify that the soil is not "hazardous" as defined by U.S. Department of Transportation (DOT), U.S. Environmental Protection Agency (EPA), State of local regulations. I/We further certify that the soils referenced herein contain no free liquids. All analysis reports attached.

Section 1
Introduction

1.1 Introduction

RMT, Inc. (RMT) has been retained by AT&T Services, Inc. (AT&T), the current property owner and occupant for environmental services as required by the Los Angeles Regional Water Quality Control Board (RWQCB). The Site is a Pacific Bell Telephone Co. d/b/a AT&T G1118 (LSANCA86) Fleet Yard located at 316 N. Juanita Avenue, Los Angeles, California 90004 (Site) (See Figure 1).

Based on the current and previous investigations, RMT previously recommended that this Site be granted No Further Action status by the RWQCB if groundwater monitoring for three more quarters confirm that the concentrations of contaminants of concern decrease or remain stable at the Site. In a letter dated January 7, 2008, the RWQCB concurred with RMT's conclusions and recommendations and directed AT&T to conduct two more rounds of groundwater monitoring, at which time the site will be re-evaluated for low risk closure. Therefore, in accordance with the RWQCB's guidance, the Second Quarter 2008 Groundwater Monitoring Report was submitted to the RWQCB as the final monitoring event and the RWQCB was respectfully requested to grant closure for this Site. However, in a letter dated July 28, 2008, the RWQCB requested the collection of two "hydropunch" groundwater samples down-gradient of well MW-5. The proposed grab groundwater sampling locations were presented and approved by Ms. Mercedes Hsu of the RWQCB on September 17, 2008.

1.2 Objectives & Scope of Work

RMT's scope of work listed below was developed in coordination with AT&T and the RWQCB to accomplish the following objectives:

- To evaluate whether there is any hydrocarbon contamination in the down-gradient shallow groundwater below the Site; and

The following scope of work was approved by the AT&T and the RWQCB prior to this investigation:

- Collect a total of two groundwater samples in two down -gradient locations (see Figure 4) using a hollow stem auger drilling rig. Groundwater was anticipated to be between 10-15 feet below ground surface (bgs). These borings were logged and groundwater samples collected.

- Analytically test the collected groundwater samples in accordance with the previously submitted work plan.

The work was completed under the responsible charge of Galen Kenoyer, Ph.D.,a California Professional Geologist (PG) with more than 25 years of experience in environmental investigations.

Section 2
Summary of Site Conditions

2.1 Site Location

The "Site" is defined as the real property located at 316 N. Juanita Avenue, Los Angeles, Los Angeles County, California, 90004. The property is bordered by private property to the south, private property and Oakwood Avenue on the north, Madison Avenue to the east and Juanita Avenue to the west.

The Site consists of two buildings utilized for general office use, equipment storage and vehicle maintenance. The remainder of the Site is used for parking of AT&T fleet and personal vehicles.

The vicinity around the Site has been developed for mixed industrial, commercial, and residential use. The Site is generally surrounded by other commercial and industrial sites. Figures 1 & 3 show the location of the Site.

2.2 Site History

On November 10, 2004, a 12,000-gallon gasoline UST was removed from the Site. Following removal of the 12,000-gallon UST, two soil samples were collected from the base of the tank excavation and one soil sample was collected from beneath the location of the former fuel dispenser. The only constituent detected in the three soil samples was methyl tert butyl ether (MTBE) at concentrations of 2.7 micrograms per kilogram (ug/kg), 4.7 ug/kg, and 6.0 ug/kg. However, water accumulating in the excavation was sampled and analyzed with the following concentrations of chemicals detected: 20,900 ug/L Total Petroleum Hydrocarbons – Gasoline (TPH-GRO); 524 ug/L benzene; 2,030 ug/L toluene; 282 ug/L ethylbenzene; 1,770 ug/L total xylenes; 5,400 ug/L MTBE; 2,050 ug/L ethanol; 18 ug/L tert-amyl methyl ether (TAME); and 812 ug/L tert-butanol (TBA). The UST Removal Report, dated November 17, 2004, was submitted by Hydrologue Inc. (HI, 2004) to the Los Angeles Fire Department (LAFD).

On January 12, 2006, the LAFD requested an investigation work plan, which was prepared and submitted to the LAFD on January 18, 2006. Upon the request of the LAFD, an Unauthorized Release form was submitted on April 18, 2007, and on April 19, 2007, the LAFD referred the case to the RWQCB. The RWQCB requested additional background information for their review of the investigation work plan on May 22, 2007, which was submitted on July 12, 2007. The January 18, 2006 Work Plan was approved with comments by the RWQCB on August 9, 2007,

and a deadline of October 15, 2007 was set for completion of the investigation and submittal of a report. This deadline was extended to December 15, 2007 by Ms. Mercedes Hsu on September 10, 2007.

In November 2007, RMT completed a Phase II Site Assessment investigation. The following is summarized from the report dated November 29, 2007 which was submitted to the RWQCB:

- Five soil borings (MW1, MW2, MW3, MW4 and MW5) were drilled to a termination depth of 30 feet bgs, using hollow stem auger drilling techniques. Soil samples were collected at five foot intervals in from each boring until 15 feet bgs. No visual, olfactory, or PID indications of contamination were encountered in the soil borings. Soil encountered in borings MW1 through MW5 consists of heterogeneous, inter-bedded clay, silty clay and/or clayey sand to a depth of approximately 30 feet bgs (the maximum depth explored). Based on the low permeability of the saturated zone, the groundwater wells can be classified as low recovery wells.

- The soil borings were converted into groundwater monitoring wells (MW1, MW2, MW3, MW4, and MW5). The installed groundwater monitoring wells were then surveyed by a licensed surveyor, developed, and sampled.

- The laboratory analytical results of soil samples collected from the soil borings show that TPH-DRO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the soil samples collected. TPH-ORO was only detected in one sample from MW2 at 10 feet bgs at 140 mg/kg. MTBE was only detected in one soil boring MW1 at 5 feet (16 ug/kg), 10 feet (51 ug/kg) and 15 feet (7.4 ug/kg) bgs. The soil samples were collected and preserved using EPA Method SW5035.

- The laboratory analytical results of groundwater samples collected from the five monitoring wells show that TPH-ORO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the groundwater samples collected. TPH-DRO was only detected in one monitoring well, MW3 at 7.9 mg/L. MTBE was only detected in two monitoring wells, MW1 (5.1 ug/L) and MW2 (6.8 ug/L).

- The former ARCO site located at 3737 Beverly Blvd W, Los Angeles, CA 90004 is located immediately adjacent to the south of the AT&T Site. The former ARCO site has had a fueling service station since at least 1950. Several gasoline and diesel USTs have been determined to be leaking from the late 1980's and 1990's and have been removed. A review of the quarterly monitoring data show that the elevated levels of TPH-GRO,

BTEX and MTBE have been encountered below the former ARCO Site. Remediation has been ongoing. The historical site assessment reports for this site have also reported "near saturated gasoline contaminated soil" just south of the AT&T site. Other sites in the vicinity cannot be ruled out as a source for hydrocarbon concentrations detected in the groundwater in the area.

- The California Primary Maximum Contaminant Level (MCL) for MTBE is 13 ug/L. The highest MTBE detected in the groundwater in November 2007 was 6.8 ug/L in MW2. The highest TPH-DRO detected in groundwater was 7.9 mg/L in MW3. The residual contamination could be unrelated to the former gasoline UST which is the subject of this investigation. The current concentrations in both soil and groundwater do not warrant further investigations and/or corrective action.

Based on the current and previous investigations, RMT previously recommended that this Site be granted No Further Action status by the RWQCB if groundwater monitoring for three more quarters confirm that the concentrations of contaminants of concern decrease or remain stable at the Site. In a letter dated January 7, 2008, the RWQCB concurred with RMT's conclusions and recommendations and directed AT&T to conduct two more rounds of groundwater monitoring, at which time the site will be re-evaluated for low risk closure. Therefore, in accordance with the RWQCB's guidance, the Second Quarter 2008 Groundwater Monitoring Report was submitted to the RWQCB as the final monitoring event. During this final groundwater monitoring event, the laboratory analytical results of groundwater samples collected from the five monitoring wells show that TPH-ORO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the groundwater samples collected. TPH-DRO was only detected in two monitoring wells, MW5 (at 10.5 mg/L) and MW3 (at 0.82 mg/L). MTBE was only detected in one monitoring well, MW2 (8.65 ug/L).

RMT concluded the following in the Second Quarter 2008 Groundwater Monitoring Report:

- The TPH-DRO results in the groundwater were anomalous and appear inconsistent with historical data related to the 12,000-gallon **gasoline** UST that was removed from the Site on November 10, 2004 and which is the subject of this site investigation. The ARCO site located at 3737 Beverly Blvd W, Los Angeles, CA 90004 (*Case #: 900040098*) is located immediately adjacent to the south of the AT&T Site. The former ARCO site has had a fueling service station since at least 1950. Several gasoline and diesel USTs have been determined to be leaking between the late 1980's and 1990's and have been removed. Remediation has been ongoing. The historical site assessment reports for this site have also reported "near saturated gasoline contaminated soil" just south of the

AT&T site. Other sites in the vicinity cannot be ruled out as a source for hydrocarbon concentrations detected in the groundwater in the area

- The foregoing conclusions were also further evidenced by the lack of contaminants in soil samples which were collected during the installation of the groundwater monitoring wells in November 2007. No visual, olfactory, or PID indications of contamination were encountered in the soil borings. No TPH-DRO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were detected above laboratory reporting limits in any of the soil samples collected. TPH-ORO was only detected in one sample from MW2 at 10 feet bgs at 140 mg/Kg. MTBE was only detected in one soil boring MW1 at 5 feet (16 ug/kg), 10 feet (51 ug/kg) and 15 feet (7.4 ug/kg) bgs.

Due to the foregoing, the RWQCB was respectfully requested to grant closure for this Site. However, in a letter dated July 28, 2008, the RWQCB requested the collection of two "Hydropunch®" type groundwater samples downgradient of well MW-5. The proposed grab groundwater sampling locations were presented to Ms. Mercedes Hsu of the RWQCB and approved by the RWQCB on September 17, 2008.

2.3 Topography

The site and surrounding properties gently slope to the east. According to the United States Geologic Survey (USGS) Hollywood, CA. 7.5 Minute Series topographic map, the Site elevation is 297 feet above mean sea level (msl).

2.4 Geology & Hydrogeology

The following section is extracted from the previously submitted work plan. The Site is located in the northern portion of the Los Angeles Coastal Plain approximately three miles south of the Santa Monica Mountains and five miles northeast of the Baldwin Hills. The Silver Lake Reservoir, located approximately three miles northeast of the site and the Hollywood Reservoir, located approximately four miles northwest of the site, are the closest perennial surface water bodies. The Site is located in the La Brea Plain of the Los Angeles Central Basin, and is underlain primarily by recent alluvial sediments consisting of clay, sand, and gravel. According to the California Department of Water Resources, the Exposition Aquifer extends from approximately 40 feet below ground surface (bgs) to ground surface in the region of the Site (HI, 2006).

The La Brea Plain is located east of the Newport-Inglewood belt of hills and west of the Elysian Hills. A surface was originally cut by the sea during Pleistocene time on lower Pleistocene and older formations. On this eroded surface, 90 to 200 feet of alluvial sediments have been deposited, the top of which now forms the La Brea Plain. The La Brea Plain has apparently been warped into an east-west anticlinal structure extending westerly from the Elysian Hills. Because of this warping and partial uplifting, the plain is being dissected and removed by erosion. A younger series of alluvial fans forming the Hollywood piedmont slope have buried the La Brea Plain from the north. Poland, et al., (1956) described the La Brea Plain and the Santa Monica Plain as being of similar origin, and additional exposures and close study of the land forms indicate that both of these forms are related in age to the Ocean Park Plain and the Torrance Plain (HI, 2006).

A map of regional geology is presented in Figure 2. The oldest geologic unit mapped in the Hollywood Quadrangle is the Cretaceous granodiorite and quartz diorite, which is exposed in the northern part of the map area in the Santa Monica Mountains. Locally, at the surface, the granitic rocks are soft and crumbly due to weathering. The Tertiary bedrock formations exposed on hills at the vicinity of the Site are assigned to deep-marine biogenic and clastic rocks of the upper Miocene Modelo Formation and upper Miocene Puente Formation. The Modelo Formation is composed of interbedded shale, siltstone, and sandstone (Tush). Tush consists of gray to light brown, thin bedded, silty clay shale, and locally contains scattered large calcareous nodules; in places, it also contains thin interbeds of fine-grained sandstone; the lower part locally contains thin lenses of light tan, platy, semi-siliceous or diatomaceous shale (HI, 2006).

The Elysian Park Hills are primarily composed of deep-marine clastic and biogenic rocks of the upper Miocene Puente/Monterey Formation. These rocks consist of interbedded and interfingering siltstone and fine sandstone (Tpnl), siliceous shale and siltstone (Tpn2), diatomaceous shale and siltstone (Tpn3), and fine- to coarse-grained, thinly laminated to thick-bedded sandstone (Tpn4). The southern end of the Elysian Park Hills is composed of massive, soft, micaceous marine siltstone of the Pliocene Fernando Formation (TO). Tmss consists of tan to light gray semi-friable arkosic sandstone that includes some inter-bedded silty shale. The Quaternary unit mapped beneath the Site is Pleistocene alluvial deposits (Qoa). These old Quaternary sedimentary deposits are exposed over much of the center of the Hollywood Quadrangle and within, and adjacent to, the Baldwin Hills in the southeast corner. In general, older alluvium in the Hollywood Quadrangle consists of layers of fine to coarse clayey sand and sandy clay with a lesser amount of silt (HI, 2006).

2.5 Regional Groundwater Quality

The site is located in an area which has been in commercial use for at least 75 years, primarily associated with industrial uses. RMT conducted a review of certain RWQCB files, particularly for the former ARCO facility, which is located to the south of the subject site. RMT also reviewed records available through Geotracker, a database maintained by the RWQCB.

This review identified the former ARCO site, which has been impacted by hydrocarbons, and is located to the south and cross-gradient of the subject site:

- **Former ARCO (LUFT # T0603700432; ID 900040098)** – The Former Arco Site located at 3737 Beverly Blvd. W, Los Angeles, CA 90004 is located immediately adjacent to the south of the AT&T Site. This site has had a fueling service station since at least 1950. It is unknown when this site stopped being an active service station. Several gasoline and diesel USTs have been determined to be leaking from the late 1980's and 1990's and have been removed. A review of the quarterly monitoring data show that elevated levels of TPH-GRO, BTEX and MTBE have been encountered below the former Arco Site. Remediation has been ongoing. The historical site assessment reports for this site have also reported "*near saturated gasoline contaminated soil*" just south of the AT&T site.

The subject site is located cross-gradient of the significant impacts to regional groundwater from the former ARCO site.

2.6 Chemicals of Potential Concern

Based on information regarding the history of the Site and discussions with the RWQCB, the following contaminants of concern have been identified and addressed as part of this Investigation. The primary contaminants of concern are hydrocarbons (TPH, MTBE, BTEX, TAME and TBA) and ethanol, which were detected in the UST removal.

Section 3
Field Investigation

3.1 Health and Safety

A site-specific health and safety plan (HSP) was generated in accordance with the proposed scope of work. The HSP was designed primarily to minimize exposure of RMT personnel to potentially hazardous materials. The HSP was prepared under the direction of RMT 's health and safety officer and was implemented in the field by the site safety officer.

Prior to field work, a Health and Safety meeting was held, and health and safety issues related to the Site conditions and drilling activities was discussed with the drilling crew.

3.2 Utility Clearance

Prior to commencement of field activities, Underground Services Alert (USA) was notified of RMT's intent to conduct subsurface investigations at least 48 hours prior to initiation of intrusive field sampling. Proposed boring and soil gas locations were clearly marked with white paint as required by USA. USA contacted all utility owners of record within the site vicinity and notified them of RMT's intention to conduct subsurface investigations in proximity to buried utilities. All utility owners of record, or their designated agents, marked the position of their utilities on the ground surface throughout the area designated for investigation.

Prior to drilling, all the boring locations were hand augered to about 5 feet below ground surface (bgs) to reduce the risk of encountering underground utilities or subsurface structures during drilling activities.

3.3 Well Permits

Prior to drilling, permits were obtained from the Los Angeles County Department of Health. Copies of these permits are attached as Appendix C.

3.4 Drilling of Soil Borings

Two soil borings (B5 and B6) were drilled to depths of 20 feet bgs for this phase of the investigation. The boring locations are shown on Figure 4. Drilling and groundwater sampling was conducted on October 20, 2008, by JDK Drilling Inc (JDK), a California Water Well Drilling

Contractor C-57 # 887038, of Anaheim, California, using a CME -75 hollow-stem auger drilling rig to assess subsurface conditions beneath the site. RMT observed the soil during drilling and collected soil samples at 5-foot depth intervals, approximately, from the boring using a California Modified split-spoon soil sampler.

The following section describes type of vadose zone soil sampling methodology that was used at the site.

Hollow-Stem Auger Soil Sample Collection: : A hollow-stem auger rig was used for drilling and sample collection. The soil borings were sampled at discrete depths. Discrete soil samples were collected using an 18 inch long modified California sampler lined with 2-inch new stainless steel liners. Samples were collected in 6-inch long, 2-inch diameter stainless steel sleeves. The sampler was driven 18 inches with a standard 30-inch drop of a 140-pound hammer. The hammer blow counts were recorded on the boring logs. The remaining soil was then used for lithologic description. After decontamination and adding new sleeves, the sample barrel was lowered back into the augers, additional 5-foot sections of auger were added, and the process was repeated until the desired depth was reached.

Field Instrument Monitoring: During drilling operation, an organic vapor monitor (OVM) was used to monitor the presence and level of organic vapors in the borings and to screen soil samples. The soil was collected from each sampling interval and was placed in a sealed Ziploc™ plastic bag and allowed to equilibrate for approximately 15 minutes prior to placing the probe tip into the container. The organic vapor readings were recorded on boring logs prepared by the field geologist during drilling activities.

Field Instrument Calibration: An OVM was used for health and safety monitoring of air in the breathing zone, and for field screening during soil sampling. The data were used as an immediate indicator of volatile organic vapors in subsurface materials. A handheld Thermo OVM 580B Portable VOC Photo Ionization Detector (PID) calibrated against an Isobutylene gas standard was employed at the Site.

The calibrated OVM displayed VOCs concentration in units equivalent to parts per million (ppm). Isobutylene gas standard, containing a known concentration of isobutylene, was used to set the sensitivity of the instrument. Isobutylene at 100 ppm in air was used for calibration purposes. The instrument was calibrated as follows:

1. Connect the calibration adapter to the gas inlet tube of the PID, and connect the calibration adapter to the isobutylene gas cylinder. Hand tighten the fittings.

2. Turn the flow controller knob counterclockwise about half a turn to start the flow

of gas. The pump noise should change indicating that the gas has started to flow.

3. Wait for the instrument reading to stabilize within ±0.1 ppm. This usually takes about 30 to 40 seconds. When the last digit of the reading stops changing for a few seconds, press the [enter] key to complete the procedure.

4. Turn the flow controller knob fully clockwise to turn off the flow of gas. Disconnect the calibration adapter from the PID.

The instruments was calibrated at a minimum of once per day. The OVM which was at the Site is equipped with lamp energy of 10.6 eV.

3.5 Boring Logs

A lithologic description of the materials encountered and collected was maintained on boring logs compiled by the field geologist. Soils were classified in accordance with the Unified Soils Classification System (USCS), and descriptions included soil type, particle size and distribution, color, moisture content, and evidence of contamination (discoloration, unusual odors, etc.). The soil samples were screened for the presence of elevated organic vapor concentrations using an OVM and the measurements recorded on the boring log.

3.6 Backfilling of All Borings

After groundwater sampling the borings were properly sealed the same day, by the C-57 licensed Water Well Driller under the direct supervision of RMT.

Upon reaching the termination depth, each boring was backfilled with Portland cement grout. Five gallons of water were mixed with each 94 pound cement bag. The surface was leveled to match existing grade.

3.7 Decontamination Procedures

All equipment that comes into contact with potentially contaminated soil or water was decontaminated to assure the quality of samples collected. Disposable equipment intended for one time use was not decontaminated, but packaged for appropriate disposal. Decontamination occurred prior to and after each use of a piece of equipment. All drilling and sampling devices used were decontaminated using the following procedures:

- Non-phosphate detergent and tap water wash, using a brush if necessary

- Tap-water rinse
- Initial deionized/distilled water rinse
- Final deionized/distilled water rinse.

3.8 Investigation Derived Waste (IDW)

Soil generated during drilling and decontamination fluids were placed and sealed in U.S. Department of Transportation (DOT) approved 55 gallon drums for temporary storage pending disposal. The drums were labeled with the boring number, date of waste generation, type of waste, Site and project name, and the name and phone number of the Site owner. The IDW (decontamination water and soil cuttings) were disposed at appropriate disposal/ treatment/ recycling facilities by Belshire Environmental. All shipping documents (hazardous waste manifests and bills of lading) are attached in Appendix E.

Section 4
Sample Collection Activities

4.1 Drilling of Temporary Groundwater Monitoring Wells

On the same day of drilling, soil borings B6 and B7 were converted into temporary groundwater monitoring wells under the direction of a RMT geologist. Each borehole was drilled to a depth of approximately 20 feet bgs. Upon completion of soil borings, temporary wells were constructed in the boreholes through the hollow stem auger. JDK Drilling Inc a California Water Well Drilling Contractor C-57 # 887038, of Anaheim completed the groundwater monitoring well installation using a hollow stem drilling rig.

4.2 Temporary Well Construction

Provided below is a description of temporary well construction activities:

- Temporary groundwater monitoring wells were constructed by using 2-inch diameter flush-threaded Schedule 40 polyvinyl chloride (PVC) well screen casing and material. The well screen section was constructed using 10-ft lengths of 0.010 slotted SCH 40 PVC and sand filter pack.

- The casing and screen assembly was suspended during the installation of the filter pack to keep the casing straight in the borehole. Annular materials were placed in the borehole from the top of the open HSA. Sand pack (Monterey #2/12) was installed from the bottom of the borehole to 2-feet above the top of screen. The depth to the filter pack was checked for settlement.

4.3 Groundwater Sampling

Standard measurements include the depth to water (DTW) and the total well depth (TD) obtained with electronic water level indicators that are graduated in increments of hundredths of a foot. The water in each well was visually inspected for the presence of free product. However, none of the wells showed any presence of free product. Depth to water measurements were collected by RMT personnel prior to purging and minimum purge volumes calculated for each well based on the height of the water column and the diameter of the well. Purge volumes are a minimum of three casing volumes. Each of the temporary wells were purged using an electric submersible pump (Grundfos) suspended near (but not touching) the bottom of the well.

Purge water evacuated from each temporary groundwater monitoring well was captured and contained in 55-gallon drums. Decontamination water for reusable apparatus (sounders, electric pumps and hoses etc.) consisting of groundwater combined with de-ionized water and non phosphate soap, was also captured in drums and stored on site.

Upon completion of well purging, a depth to water measurement was collected and notated to ensure that the well had recharged to within 80% of its static, pre-purge level prior to sampling.

Groundwater samples were collected directly from the purge water stream, as described above. The pumping rate was adjusted downward to minimize aeration, bubble formation, or turbulent filling of sample bottles.

Groundwater samples were collected using the following procedures:

- For volatile organic analyses, groundwater samples are collected in 40-milliliter, VOA vials with Teflon-lined caps. A pre-measured quantity of hydrochloric acid preservative was added to all vials by the laboratory prior to receipt by the laboratory. For TPH, analysis, groundwater samples were collected in 500-mlliliter amber glass bottles. Samples are held at 4°C or less while in the field and in transit to the laboratory. Other appropriate containers, preservatives, and holding protocols are used for non-volatile analyses.

- VOA vials are filled completely so that no headspace or air bubbles are present within the vial. Care is taken so that the vials are not overfilled, and the preservative is not lost.

- Sample containers are immediately labeled and sealed after collection.

- Samples are stored in a cooler while on-site and in transport to the laboratory or office. The cooler has sufficient ice to maintain appropriate temperature prior to collecting samples. The VOA vials are kept chilled both prior to and after filling.

All the samples were delivered to an independent California Certified Hazardous Waste Testing Laboratory for analytical testing following EPA chain of custody procedures.

4.4 Sample Analysis

Offsite groundwater analytical services were provided by American Scientific Laboratories, Inc. (ASL) of Los Angeles, California (ELAP Certification No. 2200).

The following samples (including field quality control [QC] samples) was collected and analyzed as part of this investigation effort:

- A total of 2 groundwater samples were collected from the two soil borings.

- One field equipment blank was collected and analytically tested for TPH and VOCs.

A total of 2 groundwater samples were collected from B6 and B7 temporary wells along with a field equipment blank, and were analytically tested for:

- TPH-DRO (Extractable Diesel Range Organics C28 to C40) using EPA Method 8015B;
- TPH-ORO (Heavy Extractable Range Organics C28 +) using EPA Method 8015B;
- TPH-GRO (Gasoline Range Organics C6 to C10) using EPA Method 8260B;
- BTEX using EPA Method 8260B;
- Ethanol using EPA Method 8260B; and
- 5 Fuel Oxygenates: methyl-t-butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), tert-amyl methyl ether (TAME), tert-butanol (TBA) using EPA Method 8260B.

4.5 QA/QC Samples

For QA/QC purposes, one field equipment rinseate blank (QCEB) was prepared, along with the collected samples. The field equipment blanks were used to demonstrate whether the sample containers and or the sampling procedures have any positive interference on the analytical results. The QCEB sample was obtained after decontamination activities by pumping de-ionized water through the pump then collecting a water sample from the pump discharge port itself using, to the extent feasible, the same sampling protocol and equipment used to obtain the other samples.

The aforementioned QA/QC blanks were handled and processed in exactly the same manner as other samples, as described above. Additionally, the laboratory performed matrix spikes, matrix spike duplicates, method blanks, check samples and standards in accordance with the LARWQCB WIP guidelines to provide a measure of the potential positive interferences introduced by the laboratory procedure and analytical testing methods.

4.6 Sample Containers and Preservation

Sample containers for equipment blanks for the specified analyses were provided by the laboratory immediately prior to the sampling event. The pre-cleaned containers were not rinsed prior to sample collection. Any requisite preservatives were pre-added to the containers by the laboratory prior to shipment of the sample containers to the sample collector.

The labeled and sealed samples were placed into clear plastic Ziploc bags, and then placed into an ice chest filled with ice for transport to a California certified analytical laboratory. Samples were logged on a Chain-of-Custody form. The Chain-of-Custody forms were also placed into a

clear plastic Ziploc bag, and then placed inside the ice chest. One ice chest per day was used to hold all of the soil samples.

4.7 Sample Labels and Identification System

A sample label was placed on each sample container with the following information:

- Project number
- Site name and location
- Boring number
- Sample identification number
- Sampler's initials
- Date and time of collection
- Preservative, if any.

Groundwater samples were given an identification starting with B, followed by the location number, for example B6. Field Blanks were labeled QCEB.

4.8 Sample Packaging and Shipment

Following collection and labeling, the following protocol was followed for sample packaging:

1. A self-adhesive custody seal was placed across the lid of each sample container.

2. Sample containers were placed in clear, plastic, leak-resistant bags prior to placement in the ice chest. Caps were checked for tightness, prior to placing the sample in the bag.

3. Samples to be shipped were placed in the cooler and packed with packaging materials to minimize the potential for disturbance and/or breakage of the sample containers.

4. Frozen crushed ice were placed in leak-resistant plastic bags and included in the coolers to keep samples at a chilled temperature during transport to the analytical laboratory. Since ice is used, the drain plug of the cooler was secured with fiberglass tape to prevent melting ice from leaking out of the cooler.

5. The chain-of-custody form was placed in a water-resistant plastic bag and taped on the inside of the lid of the cooler.

6. Strapping tape was placed around all coolers prior to transport to the laboratory.

4.9 Chain-of-Custody Records

Chain-of-custody (COC) records were used to document sample collection and shipment to laboratory for analysis. All sample shipments for analyses were be accompanied by a COC record. Form(s) were completed and sent with the samples for each laboratory and each shipment. If multiple coolers are sent to a single laboratory on a single day, COC form(s) were completed and sent with the samples for each cooler. The COC record identified the contents of each shipment and maintained the custodial integrity of the samples. Until receipt by the laboratory, the custody of the samples were the responsibility of the sample collector. A self-adhesive custody seal was placed across the lid of each sample, except for VOC samples (which need to avoid adhesives). The shipping containers in which samples are stored (usually sturdy picnic cooler or ice chest) were also sealed with self-adhesive custody seals any time they are not in someone's possession or view before shipping. All custody seals were signed and dated.

4.10 Sample Documentation

At a minimum, the following information was recorded during the collection of each sample:

- Sample identification number
- Sample location and description
- Site sketch showing sample location and measured distances
- Sampler's name(s)
- Date and time of sample collection
- Designation of sample as composite or grab
- Type of sample (i.e., matrix)
- Type of preservation
- Type of sampling equipment used
- Field observations and details important to analysis or integrity of samples (e.g., heavy rains, odors, colors, etc.)
- Instrument readings (e.g., photoionization detector [PID], etc.)
- Chain-of-custody form numbers and chain-of-custody seal numbers
- Transport arrangements (courier delivery, lab pickup, etc.)
- Recipient laboratory or laboratories

Section 5
Results of Investigation

5.1 Site Geology

Soil encountered in borings B6 and B7 consists of heterogeneous, interbedded clay, silty clay and/or clayey sand to a depth of approximately 20 feet bgs (the maximum depth explored). Descriptions of the conditions encountered in the soil borings are presented on the soil boring logs in Appendix A.

5.2 Site Groundwater Conditions

Groundwater was encountered at 15.01 feet bgs in boring B6 and approximately at 19 feet bgs in boring B7.

5.3 Groundwater Characterization Results

5.3.1 TPH

- TPH-DRO was not detected in the groundwater samples.
- TPH-ORO was not detected in the groundwater samples.
- TPH-GRO was not detected in the groundwater samples.

5.3.2 BTEX & Fuel Oxygenates

- MTBE was not detected in the groundwater samples.
- Benzene was not detected in the groundwater samples.
- Ethylbenzene was not detected in the groundwater samples.
- Toluene was not detected in the groundwater samples.
- Total xylenes were not detected in the groundwater samples.
- DIPE was not detected in the groundwater samples.
- ETBE was not detected in the groundwater samples.
- TAME was not detected in the groundwater samples.

- TBA was not detected in the groundwater samples.

5.3.3 Ethanol

- Ethanol was not detected in the groundwater samples.

The analytical testing results of laboratory QA/QC samples, which include matrix spike/matrix spike duplicates, check blank, method blanks, continuing calibration verification, laboratory control sample/laboratory control sample duplicate, calibration standards, and reference standards, are also found in the laboratory reports and generally fell within acceptable ranges (see Appendix B).

.

Section 6
Summary and Conclusions

Based on the results of this investigation, RMT is providing the following summary and conclusions:

- Two soil borings (B6 and B7) were drilled to a termination depth of 20 feet bgs, using hollow stem auger drilling techniques.
- No visual, olfactory, or PID indications of contamination were encountered in the soil borings.
- The soil borings were converted into temporary groundwater monitoring wells (B6 and B7). The installed groundwater monitoring wells were then purged and sampled.
- Soil encountered in borings B6 and B7 consists of heterogeneous, interbedded clay, silty clay and/or clayey sand to a depth of approximately 20 feet bgs (the maximum depth explored).
- The laboratory analytical results of groundwater samples collected from the temporary monitoring wells show that TPH-DRO, TPH-ORO, TPH-GRO, MTBE, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in either of the groundwater samples collected from the two down-gradient temporary wells.
- The temporary groundwater monitoring wells were removed and the boreholes were sealed the same day in accordance with the Los Angeles County Department of Health permit regulations.
- The analytical testing COELT/ EDF data have been uploaded to the State of California Geotracker database website in compliance with California's electronic reporting requirements.

During the three previous groundwater monitoring events, the laboratory analytical results of groundwater samples collected from the five monitoring wells show that TPH-ORO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the groundwater samples collected. In the final Second Quarter 2008 event, TPH-DRO was only detected in two monitoring wells, MW5 (at 10.5 mg/L) and MW3 (at 0.82 mg/L). MTBE was only detected in one monitoring well, MW2 (8.65 ug/L). RMT had previously concluded (RMT Inc, 2008b) that the previous TPH-DRO results in the groundwater were anomalous and appear inconsistent with historical data related

to the 12,000-gallon **gasoline** UST that was removed from the Site on November 10, 2004 and which is the subject of this site investigation. This conclusion is also supported by the following:

- The current investigation confirms that no TPH-DRO, TPH-ORO, TPH-GRO, MTBE, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were detected in the two down-gradient temporary wells.

- TPH-GRO has always been below laboratory reporting limits during the groundwater monitoring activities for the onsite wells.

- The ARCO site located at 3737 Beverly Blvd W, Los Angeles, CA 90004 (*Case #: 900040098*) is located immediately adjacent to the south of the AT&T Site. The former ARCO site has had a fueling service station since at least 1950. Several gasoline and diesel USTs have been determined to be leaking between the late 1980's and 1990's and have been removed. Remediation also has been ongoing at the ARCO site. The historical site assessment reports for this ARCO site have also reported "near saturated gasoline contaminated soil" just south of the AT&T site.

- Other sites in the vicinity cannot be ruled out as a source for hydrocarbon concentrations detected in the groundwater in the area.

- The soil samples results which were collected during the installation of the groundwater monitoring wells in November 2007 showed no visual, olfactory, or PID indications of contamination during the drilling of the soil borings. No **TPH-DRO**, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were detected above laboratory reporting limits in any of the soil samples collected. TPH-ORO was only detected in one sample from MW2 at 10 feet bgs at 140 mg/Kg. MTBE was only detected in one soil boring MW1 at 5 feet (16 ug/kg), 10 feet (51 ug/kg) and 15 feet (7.4 ug/kg) bgs.

Based on the results of current and previous investigations, RMT recommends that this Site be granted No Further Action status by the Los Angeles Regional Water Quality Control Board.

WORK / SAMPLING PERFORMED
Install two soil borings to depth of 20 ft. on the eastern portion of the Site
A hollow stem auger drill rig was used.
Soil samples were collected at 5 ft. intervals to groundwater. Groudnwater samples colelcted and analyzed fo
TPH gasoline, BTEX, MTBE, DIPE, ETBE, TAME, TBA and ethanol.
Borings were converted into temp 2" diameter pvc monitoring wells.
Borings destroyed the same day
Soil cuttings and purge water are stored onsite temporarily until shipped out for offsite disposal.

PIPE SCHEDULE: 40

PIPE JOINTS: THREADED O-RINGS

SOLVENT USED? NO

SCREEN TYPE: 2-INCH PVC

SCR. SLOT SIZE: 0.01-INCH INCH

BOREHOLE DIAMETER: 8 IN. FROM 0 TO 20 FT.
____ IN. FROM ____ TO ____ FT.

SURF. CASING DIAMETER: ____ IN. FROM ____ TO ____ FT.
____ IN. FROM ____ TO ____ FT.

WELL DEVELOPMENT

DEVELOPMENT METHOD: PUMP

TIME DEVELOPING: 0.5 HOURS PER WELL

WATER REMOVED: 10 TO 20 GALLONS

WATER ADDED: 0 GALLONS

WATER CLARITY BEFORE / AFTER DEVELOPMENT

CLARITY BEFORE: TURBID

COLOR BEFORE: MED. TURBIDITY

CLARITY AFTER:

COLOR AFTER: LIGHT BROWN

ODOR (IF PRESENT)

PROTECTIVE COVER AND LOCK INSTALLED ☐ YES ☑ NO

PERMANENT, LEGIBLE WELL LABEL ADDED' ☐ YES ☑ NO

Enclosed are the results of analyses on 3 samples analyzed as specified on attached chain of custody.

Wendy Lu
Organics Supervisor

Rojert G. Araghi
Laboratory Director

American Scientific Laboratories, LLC (ASL) accepts sample materials from clients for analysis with the assumption that all of the information provided to ASL verbally or in writing by our clients (and/or their agents), regarding samples being submitted to ASL, is complete and accurate. ASL accepts all samples subject to the following conditions:

1) ASL is not responsible for verifying any client-provided information regarding any samples submitted to the laboratory.
2) ASL is not responsible for any consequences resulting from any inaccuracies, omissions, or misrepresentations contained in client-provided information regarding samples submitted to the laboratory.

UNDERGROUND STORAGE TANK PROGRAM – DIRECTIVE TO TAKE CORRECTIVE ACTION IN RESPONSE TO UNAUTHORIZED UNDERGROUND STORAGE TANK RELEASE PURSUANT TO HEALTH AND SAFETY CODE SECTION 25296.10 AND TITLE 23, CALIFORNIA CODE OF REQULATIONS, SECTIONS 2720-2727
PACIFIC BELL TELEPHONE COMPANY, AT&T
316 NORTH JUANITA AVENUE, LOS ANGELES, CA
(CASE NO. 900040225A)

Dear Mr. Weller:

Pursuant to Health and Safety Code section 25296.10, you are required to take corrective action (i.e. Preliminary Site Assessment, Soil and Water Investigation, Corrective Action Plan Implementation, and Verification Monitoring) to ensure protection of human health, safety and environment. Corrective action requirements are set forth in California Code of Regulations (CCR), title 23, Chapter 16, sections 2720 through 2727.

We have reviewed the "Second Quarter 2008 Groundwater Monitoring Report (Report)," dated July 10, 2008, prepared by RMT, Inc. (RMT), for the subject site. The Report indicated that the current maximum total petroleum hydrocarbon as diesel (TPH_D) at 10,500 µg/L, and methyl tertiary butyl ether (MTBE) concentration at 8.65 µg/L were detected at the site. TPH_D was detected in the most downgradient well MW-5.

Based on our review, we have determined that the groundwater contamination plume has not been adequately assessed at the Site. At least one downgradient groundwater monitoring well must be installed to assess the extent of the groundwater contamination plume. Alternatively, you can use hydro-punch groundwater sampling method. At least two hydro-punch groundwater samples downgradient of MW-5 must be collected.

You can proceed with the field work for the hydro-punch sampling provided that the Board staff concur with the site plan for boring locations.

Pursuant to State Water Resources Control Board Resolution No. 92-49, under Water Code section 13304, all fieldwork related to subsurface investigation must be conducted by, or under the direct responsible supervision of, a licensed California Professional Geologist (PG) or Civil Engineer (PE). All technical documents submitted to this Regional Board must be reviewed and signed and/or stamped by a licensed California PG or PE with preferably five years subsurface hydrogeologic experience.

Groundwater samples must be analyzed by Cal-LUFT GC/FID or Cal-LUFT GC/MS Method for TPH_G, total petroleum hydrocarbons as diesel (TPH_D), and by EPA Method 8260B for benzene, toluene, ethlybenzene, and xylenes (BTEX), and fuel oxygenate compounds including methyl tertiary butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), and tertiary butyl alcohol (TBA). Ethanol is also required and shall be analyzed by either method above. The analytical detection limits must conform to the Regional Board General Laboratory Testing Requirements (9/06) (http://www.waterboards.ca.gov/losangeles/publications_forms/forms/ust/lab_forms/labreq9-06.pdf). All respective analytical methods must be certified by the California Environmental Laboratory Accreditation Program (ELAP). All analytical data must be reported by a California-certified laboratory.

Prior to consideration of case closure, you must analyze at least one round of groundwater samples including all common aromatic and chlorinated volatile organic compounds per EPA Method 8260B. If the site has a waste oil tank, the full suite of aromatic and chlorinated analyses must also be tested and reported per EPA Method 8260B.

If you have any questions concerning this matter, please call me at (213) 576-6712 or e-mail me at mhsu@waterboards.ca.gov.

UNDERGROUND STORAGE TANKS PROGRAM
PACIFIC BELL TELEPHONE COMPANY, AT&T
316 NORTH JUANITA AVENUE, LOS ANGELES, CA
(CASE NO. 900040225A)

Dear Mr. Smith:

We have received the "Phase II Environmental Site Assessment Report (Report)," dated November 29, 2007, prepared by RMT, Inc. (RMT), for the subject site. A total of five borings were drilled. Analytical test results of soil samples indicated all fuel hydrocarbons constituents were not detected. The borings were converted to groundwater monitoring wells. Analytical results of groundwater samples indicated that maximum total petroleum hydrocarbon as gasoline (TPH_G) concentration at 7,900 µg/L and methyl tertiary butyl ether (MTBE) concentration at 6.8 µg/L were detected. RMT recommended no further action for the site.

We have reviewed the information provided including previous site assessments and determined that you are required to conduct at least two more rounds of quarterly groundwater monitoring events. We will review the additional groundwater monitoring data for low risk closure.

If you have any questions concerning this matter, please call me at (213) 576-6712 or e-mail me at mhsu@waterboards.ca.gov.

Sincerely,

Mercedes S. Hsu

UNDERGROUND STORAGE TANKS PROGRAM
PACIFIC BELL TELEPHONE COMPANY, AT&T
316 NORTH JUANITA AVENUE, LOS ANGELES, CA
(CASE NO. 900040225A)

Dear Mr. Smith:

Thank you for submitting the general information package dated July 12, 2007. We have reviewed the "UST Removal Report/Soils Report (Report)," dated November 17, 2004, and the "Workplan for Site Assessment (Workplan)," dated January 18, 2006, prepared by Hydrologue, Inc. (HI), for the subject site. The Report indicated that the total petroleum hydrocarbons as gasoline (TPH_G) concentration at 20,900 µg/L, benzene concentration at 524 µg/L and methyl tertiary butyl ether (MTBE) concentration at 5,400 µg/L were detected in a water sample collected from the excavation. In the Workplan, HI proposes to drill five soil borings and convert the borings to groundwater monitoring wells to assess soil and groundwater contamination beneath the site

We concur with the Workplan as proposed, provided the following conditions are met:

1. The construction, development, and abandonment of groundwater monitoring wells must comply with requirements prescribed in the California Well Standards (Bulletin 74-90), published by the California Department of Water Resources (can be seen at www.dpla2.water.ca.gov and go to "groundwater").

2. All necessary permits must be obtained from the appropriate agencies prior to the start of work.

3. Pursuant to State Water Resources Control Board Resolution No. 92-49, under Water Code section 13304, all fieldwork related to subsurface investigation must be conducted by, or under the direct responsible supervision of, a licensed California Professional Geologist (PG) or Civil Engineer (PE). All technical documents submitted to this Regional Board must be reviewed and signed and/or stamped by a licensed California PG or PE with at least five years subsurface hydrogeologic experience.

4. Soil must be logged at five-foot intervals, at changes in the soil lithology, and at areas of obvious contamination. The registered professional in responsible charge shall review the boring logs and assume the responsibility for the accuracy and completeness of the logs.

Soil samples collected from on-site wells must be prepared per EPA Method 5035 for analyses.

5. Soil and Groundwater samples must be analyzed by Cal-LUFT GC/FID or Cal-LUFT GC/MS Method for TPH_G, total petroleum hydrocarbons as diesel (TPH_D), and by EPA Method 8260B for benzene, toluene, ethlybenzene, and xylenes (BTEX), and fuel oxygenate compounds including MTBE, di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), and TBA. Ethanol is also required and shall be analyzed by either method above. The analytical detection limits must conform to the Regional Board General Laboratory Testing Requirements (9/06) (http://www.waterboards.ca.gov/losangeles/html/lab_report.html). All respective analytical methods must be certified by the California Environmental Laboratory Accreditation Program (ELAP). All analytical data must be reported by a California-certified laboratory.

   Prior to consideration of case closure, you must analyze at least one round of groundwater samples including all common aromatic and chlorinated volatile organic compounds per EPA Method 8260B. If the site has a waste oil tank, the full suite of aromatic and chlorinated analyses must also be tested and reported per EPA Method 8260B.

6. All proposed groundwater monitoring wells must be developed and surveyed to a benchmark of known elevation above mean sea level by a licensed land surveyor or registered civil engineer. Prior to collecting samples, free product thickness (if present) must be determined and the depth to water must measured in all wells to be sampled, then the wells are to be properly purged until the temperature, conductivity, and pH stabilize, and the water is free of suspended and settleable matter, before samples are collected for analysis. Any wells containing free product must be purged to remove any standing product, allowed to equilibrate to prepurged levels and free product thickness measured and reported.

7. You are required to submit a technical report summarizing this phase of investigation by **October 15, 2007.** The report must also include the soil boring logs, analytical results, well permits, geologic cross-section, isoconcentration map of contaminants, and as-built construction details of the new groundwater monitoring wells installed.

8. You are required to implement a quarterly groundwater monitoring program. The groundwater monitoring reports are to be submitted by the fifteenth day following the end of the month as shown in the following schedule:

Reporting Period	Report Due Date
January-March	April 15th
April-June	July 15th
July-September	October 15th
October-December	January 15th

The first groundwater monitoring report under this schedule is due by **October 15, 2007.**

9. The quarterly groundwater monitoring report must include the following:

   - A separate summary table containing current concentrations.
   - A summary table containing all historical data per each well with groundwater depth (or elevation) and well screen intervals.
   - A regional map depicting site vicinity business and street, etc.
   - A site plot plan depicting site location, tank and associated system locations.
   - A site map depicting all well locations and groundwater elevations (contour) with flow gradient and direction.
   - An isoconcentration map for TPH(g), benzene, MTBE, and TBA, respectively.
   - A hydrograph superimposing on concentration over time at the most impacted well for TPH(g), benzene, MTBE, and TBA (or at any other wells as warranted).
   - Conclusions and recommendations.

10. Two weeks prior to commencing field work, a Health and Safety plan pertinent to the subject project must be submitted to this office. The field crew must follow the Health and Safety Plan.

11. Please notify us at least seven working days prior to the start of work so that we may schedule a member of our staff to be present.

If you have any questions concerning this matter, please call me at (213) 576-6712 or e-mail me at mhsu@waterboards.ca.gov.

Sincerely,

Mercedes S. Hsu

UNDERGROUND STORAGE TANKS (UST) PROGRAM – REQUEST FOR ADDITIONAL INFORMATION
PACIFIC BELL TELEPHONE COMPANY, AT&T
316 NORTH JUANITA AVENUE, LOS ANGELES, CA
(CASE NO. 900040225A) (GLOBAL ID# T0603797875)

Dear Mr. Delano:

On April 19, 2007, the City of Los Angeles Fire Department (LADF) transmitted this case to this agency due to concerns of groundwater impact from the subject site. The California Regional Water Quality Control Board, Los Angeles Region, is the public agency with primary responsibility for the protection of ground and surface water quality for all beneficial uses within the Los Angeles and Ventura counties. As such, we are the lead regulatory agency for overseeing corrective action (assessment and/or monitoring activities) and cleanup of releases from leaking underground storage tank (UST) systems at the subject site.

I. Technical Reports Submitted by Referring Agency

The LADF has provided the Regional Board with the following copies of the technical reports:

- "Workplan For Site Assessment" dated January 18, 2006.

II. Additional Information Required

To facilitate our review, we would appreciate that you provide the following information regarding the referenced site that has not already been submitted (see above):

- Facility contact person's name and phone number (email address, if any);
- Facility mailing address;
- Contaminant release information (e.g., copy of Site Assessment Report);
- Tank removal and/or repair information (include tank size and contents, removal and/or repair date);
- Tank disposal documentation;
- Copies of all previous site assessment and/or remediation report(s), if any;
- Reports of all previous soil and groundwater sample analytical results, if any;

- Name, telephone number and email address of your environmental consultant, if any; and
- Copies of all correspondence regarding environmental assessment for the subject site.

III. Landowner or Impacted Site Notification Requirements

Pursuant to the California Health and Safety Code Chapter 6.75 (Section 25299.37.2) and Division 7 of the Porter Cologne Water Quality Control Act under AB 681, the Regional Board is required to notify all current fee title holders for the subject site or sites impacted by releases from underground storage tanks prior to considering corrective action and cleanup or case closure. If corrective action data from the site indicate that release(s) from the underground storage tank systems have impacted offsite property, you are required to provide to this Regional Board the name, mailing address, and phone number for any new record fee title holders for the subject site and any offsite property(ies) impacted by releases from the subject site, together with a copy of county record of current ownership (grant trust deed), available from the County Recorder's Office, for each property affected. Or as an alternative, you can complete this Regional Board's "Certification Declaration for Compliance with Fee Title Holder Notification Requirements," for each site (available at

http://www.waterboards.ca.gov/losangeles/html/programs/ust/AB681_form.pdf).

If this information has been provided in the past, then you need not provide it again. Copies of future technical reports shall also be sent directly to the property owner of the site and to any other property owner(s) impacted by contamination from the site. You are also responsible to provide new contact information if the property owner(s) has been changed. The new owner shall comply with the requirement stated above.

The above requested information is due to this Regional Board, no later than **July 15, 2007**.

IV. Regulatory Requirement for Electronic Submission of Laboratory Data to the State Geotracker Internet Database

On September 30, 2004, the State Water Resources Control Board (SWRCB) adopted the resolution to revise regulations in Chapter 30, Division 3 of Title 23 of California Code of Regulations (CCR), which requires persons to ensure electronic submission of laboratory analytical data (i.e., soil or water chemical analysis) and locational data (i.e., location and elevation of groundwater monitoring wells), via the Internet to the SWRCB's GeoTracker database. The regulations and other background information are available at http://geotracker.waterboards.ca.gov.

In accordance with the above regulations, you are required to submit all future laboratory data over the Internet in the Electronic Deliverable Format to the SWRCB's GeoTracker database for any soil and/or groundwater samples obtained after September 1, 2001. This would include any sampling completed for underground storage tank system removal, site assessment activities, periodic groundwater monitoring, and post cleanup verification sampling. Per the same regulations, you are also required to submit locational data for all groundwater monitoring wells (i.e., latitude, longitude, and elevation survey data) together

with groundwater information (i.e., elevation, depth to free product, monitoring well status, etc.) and a site map commencing January 1, 2002. Hard copy paper reports for the main contents are still required per Regional Board guidelines available at http://www.waterboards.ca.gov/losangeles/html/programs/ust/04_0621_e-QMRGuideline6-04.pdf.

If you have any questions concerning this matter, please call me at (213) 576-6712 or e-mail me at mhsu@waterboards.ca.gov.

Sincerely,

Mercedes S. Hsu

Subject: Second Quarter 2008 Groundwater Monitoring Report
April 1, 2008 through June 30, 2008
AT&T G1118 (LSANCA86) Facility 316 N. Juanita Avenue Los Angeles, CA 90004
RWQCB Case #900040225A RMT, Inc. Project No. 00-06644.02

Dear Ms. Hsu:

On behalf of AT&T Environment, Health and Safety, RMT Inc (RMT) has prepared this Second Quarter 2008 Summary Report for the property located at 316 N. Juanita Avenue, Los Angeles, CA 90004 (the Site; Figure 1). Electronic Deliverable Format (EDF) files have been uploaded to the State Water Resources Control Board Geotracker website.

In accordance with the RWQCB's January 7, 2008 letter, this is the final quarter of monitoring and the RWQCB is respectfully requested to grant closure for this Site.

If you have any questions or need additional information, please contact Mr. Chris D'Sa, the RMT Project Manager at (310) 570-7069 or Mr. Jason Weller, the AT&T Environmental Manager at (214) 464-5226.

Sincerely,

Chris D'Sa
Project Manager

Subject: Second Quarter 2008 Groundwater Monitoring Report
April 1, 2008 through June 30, 2008
AT&T G1118 (LSANCA86) Facility 316 N. Juanita Avenue Los Angeles, CA 90004
RWQCB Case #900040225A RMT, Inc. Project No. 00-06644.02

Dear Ms. Hsu:

On behalf of AT&T Environment, Health and Safety, RMT Inc (RMT) has prepared this Second Quarter 2008 Summary Report for the property located at 316 N. Juanita Avenue, Los Angeles, CA 90004 (the Site; Figure 1). Electronic Deliverable Format (EDF) files have been uploaded to the State Water Resources Control Board Geotracker website.

Based on the current and previous investigations, RMT previously recommended that this Site be granted No Further Action status by the RWQCB if groundwater monitoring for three more quarters confirm that the concentrations of contaminants of concern decrease or remain stable at the Site. In a letter dated January 7, 2008, the RWQCB concurred with RMT's conclusions and recommendations and directed AT&T to conduct two more rounds of groundwater monitoring, at which time the site will be re-evaluated for low risk closure. Therefore, in accordance with the RWQCB's guidance, this is the final quarter of monitoring and the RWQCB is respectfully requested to grant closure for this Site.

If you have any questions or need additional information, please contact Mr. Chris D'Sa, the RMT Project Manager at (310) 570-7069 or Mr. Jason Weller, the AT&T Environmental Manager at (214) 464-5226.
Sincerely,

Chris D'Sa
Project Manager

Attachment 1
2nd Quarter 2008
Groundwater Monitoring Report

1. SITE INFORMATION:

- Site Case No: RWQCB Case #900040225A
LAFD Permit #12134
- Global ID: T0603797875
- Site Name: AT&T G1118 (LSANCA86) Facility
- Address: 316 N. Juanita Avenue, Los Angeles, CA 90004

2. RESPONSIBLE PARTY INFORMATION:

- Contact: Jason Weller
- Company: AT&T Environment, Health & Safety
- Address: 308 South Akard, Room 1700, Dallas, TX 75202
- Phone: 214-464-5226

3. CONSULTANT INFORMATION:

- Contact: Mr. Chris D'Sa
- Company: RMT Inc.
- Address: One Bunker Hill Bldg
601 W 5th St, Ste 760
Los Angeles, CA 90071-2004
- Phone: 213-623-4175 x2503

4. WORK PERFORMED THIS QUARTER:

- Groundwater monitoring

5. WORK PROPOSED FOR NEXT QUARTER:

- none

6. CURRENT PHASE OF PROJECT (Initial Assessment, Additional Assessment, Corrective Action Plan (CAP), Remediation, Post-Remediation Monitoring, etc.):

- Low risk closure

7. DESCRIBE CORRECTIVE AND REMEDIAL TECHNIQUES TO BE IMPLEMENTED IN THE FUTURE AND INCLUDE TIME SCHEDULE FOR THE INITIATION OF THE ASSOCIATED ACTIVITIES (NAPL Removal, Pump and Treat, Vapor Extraction System (VES), Excavation, etc.):

- N/A

8. CURRENTLY MONITORING (Soil, Groundwater, Vapor, None):

- Groundwater

9. MONITORING FREQUENCY (Quarterly, Monthly, etc.):

- Wells MW1, MW2, MW3, MW4 and MW5 are sampled quarterly until 2nd Quarter 2008.

10. CUMULATIVE SOIL REMOVED TO DATE:

- N/A

11. SOIL REMOVED THIS QUARTER:

- None

12. ARE CONTAMINATED SOILS OR LIQUIDS GENERATED FROM INVESTIGATIONS OR CLEANUPS CURRENTLY STORED ONSITE?

- No

13. GROUNDWATER MONITORING SUMMARY

CURRENT FIELD ACTIVITIES

Groundwater monitoring frequency	Quarterly
Activity date	June 24, 2008
Field subcontractor	RMT Inc.
Purging method	Submersible pump
Purging subcontractor	RMT Inc
Disposal method/facility	Hauled offsite by Belshire Environmental
Gallons of groundwater purged:	Approximately 40 gallons
Number of groundwater wells total	5
Number of groundwater wells offsite	0
Number of wells sampled this period	5
Number of wells with Product	None.

SITE HYDROLOGY

Average groundwater elevation (*of wells gauged*):	259.88 feet above MSL
Average elevation change from previous quarter:	-0.84 feet
Approximate groundwater flow direction:	east-southeast
Approximate hydraulic gradient:	0.05 foot/foot

14. GROUNDWATER CONDITIONS

TPH-DRO Range:	10.5 mg/L in MW5 to 0.82 mg/L in MW3 ND (<0.50 mg/L) in MW1, MW2, and MW4
Historical maximum TPH- DRO concentration:	10.5 mg/L - MW5 (06/24/2008)
MTBE Range:	8.65 ug/L in MW2 to ND (<2 ug/L) in MW1, MW3, MW4, and MW5
Historical maximum MTBE concentration:	13.1 ug/L – MW2 (2/11/2008)
TPH-ORO:	ND in all wells (<0.50 mg/L
TPH- GRO:	ND in all wells (<50 ug/L)
Ethanol:	ND in all wells (<500 ug/L)
BTEX, DIPE, ETBE, TAME:	ND in all wells (<2 ug/L
TBA:	ND in all wells (<10 ug/L)

ND	Not Detected
ug/L	Micrograms per liter
ug/Kg	Micrograms per kilogram
mg/L	Milligrams per liter
mg/Kg	Milligrams per kilogram
TPH-DRO	Total Petroleum Hydrocarbons for Extractable Diesel Range Organics (C10 to C28)
TPH-ORO	Total Petroleum Hydrocarbons for Heavy Extractable Oil Range Organics (C28+)
TPH-GRO	Total Petroleum Hydrocarbons Gasoline Range Organics (C6 to C10)
MTBE	methyl-t-butyl ether
DIPE	di-isopropyl ether
ETBE	ethyl-t-butyl ether
TAME	tert-amyl methyl ether
TBA	tert-butanol

15. CONCLUSIONS

- Concentrations of gasoline-related analytes tested are relatively consistent with previous historical results. In accordance with the Los Angeles Regional Water Quality Control Board (RWQCB's) January 7, 2008 letter, this is scheduled to be the final quarter of monitoring and the RWQCB is respectfully requested to grant closure for this Site.

- During this groundwater monitoring event, the laboratory analytical results of groundwater samples collected from the five monitoring wells show that typical gasoline constituents, including TPH-ORO, TPH-GRO, benzene, ethylbenzene, toluene, xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the groundwater samples collected. TPH-DRO was only detected in two monitoring wells, MW5 (at 10.5 mg/L) and MW3 (at 0.82 mg/L). MTBE was only detected in one monitoring well, MW2 (8.65 ug/L).

- The TPH-DRO results in the groundwater are anomalous and are inconsistent with historical data related to the 12,000-gallon **gasoline** UST that was removed from the Site

on November 10, 2004 and which is the subject of this site investigation. The DRO concentrations at MW5 and MW3 appear to be unrelated the AT&T site for the following reasons:

- The former on-site UST contained gasoline, not diesel.
- No gasoline constituents are detected in the groundwater.
- The DRO concentrations are anomalous because they have increased over time at MW5, which is inconsistent with an on-site source because the UST was removed in 2004, and it did not contain diesel.
- The former ARCO site located at 3737 Beverly Blvd W, Los Angeles, CA 90004 (*Case #: 900040098*) is located immediately adjacent to the south side of the AT&T Site. The former ARCO site has had a fueling service station since at least 1950. Several gasoline and diesel USTs at the former ARCO site have been determined to be leaking between the late 1980's and 1990's and have been removed. Remediation has been ongoing. The historical site assessment reports for this site reported "near saturated gasoline contaminated soil" on the ARCO site just south of the AT&T site. Other sites in the vicinity cannot be ruled out as a source for hydrocarbon concentrations detected in the groundwater in the area.

- Soil samples results which were collected during the installation of the groundwater monitoring wells at the AT&T Site in November 2007 also indicate a lack of contamination associated with the former gasoline UST on Site. No visual, olfactory, or PID indications of contamination were encountered in the soil borings. No **TPH-DRO**, TPH-GRO, benzene, ethylbenzene, toluene, xylenes, DIPE, ETBE, TAME, TBA, or ethanol were detected above laboratory reporting limits in any of the soil samples collected. TPH-ORO was only detected in one sample from MW2 at 10 feet bgs at 140 mg/Kg. MTBE was only detected in one soil boring MW1 at 5 feet (16 ug/kg), 10 feet (51 ug/kg) and 15 feet (7.4 ug/kg) bgs.

Based on the current and previous investigations, RMT recommends that this Site be granted No Further Action status and the RWQCB is respectfully requested to grant closure for this Site.

Attachment 4
Groundwater Sampling Procedures & Field Sheets

Inspection & Gauging
Wells are inspected prior to evacuation and sampling. The condition of the wellhead is checked and noted according to a wellhead inspection checklist. Standard measurements include the depth to water (DTW) and the total well depth (TD) obtained with industry standard electronic water level indicators that are graduated in increments of hundredths of a foot. The water in each well is inspected for the presence of free product. When free product is suspected, its presence is confirmed using an electronic interface probe (e.g. MMC). No samples are collected from a well containing free product.

Evacuation
Depth to water measurements are collected by RMT personnel prior to purging and minimum purge volumes are calculated anew for each well based on the height of the water column and the diameter of the well. Purge volumes are a minimum of three case volumes. Well purging devices are selected on the basis of the well diameter and the total volume to be evacuated. In most cases the well will be purged using an electric submersible pump (i.e. Grundfos) suspended near (but not touching) the bottom of the well.

Parameter Stabilization
Purging standards include minimum purge volumes, but additionally require stabilization of specific groundwater parameters prior to sample collection. Typical parameters used to measure stability are electrical conductivity, pH, temperature. Instrument readings are obtained at regular intervals during the evacuation process (no less than once per case volume). Stabilization standards for routine quarterly monitoring include the following: Temperature is considered to have stabilized when successive readings do not fluctuate more than +/- 1 degree Celsius. Electrical conductivity is considered stable when successive readings are within 10%. pH is considered to be stable when successive readings remain constant or vary no more than 0.2 of a pH unit.

Dewatered Wells
Normal evacuation removes no less than three case volumes of water from the well. However, less water may be removed in cases where the well dewaters and does not immediately recharge..

Purge Water Containment
Purge water evacuated from each groundwater monitoring well is captured and contained in 55-gallon drums, on-board storage tanks on the sampling vehicle and/or special water hauling trailers. Effluent from the decontamination of reusable apparatus (sounders, electric pumps and hoses etc.) consisting of groundwater combined with de-ionized water and non-phosphate soap, is also captured in drums. Non-hazardous purge and rinsate water is off loaded into 55-gallon drums on site.

Sample Collection Devices
All groundwater samples are collected using disposable bailers.

Sample Containers
Sample material is decanted directly from the sampling bailer into sample containers provided by

the laboratory that will analyze the samples. The transfer of sample material from the bailer to the sample container conforms to USEPA specifications. The type of sample container, material of construction, method of closure and filling requirements are specific to the intended analysis. Chemicals needed to preserve the sample material are commonly placed inside the sample containers by the laboratory or glassware vendor prior to delivery of the bottle to our personnel. The laboratory sets the number of replicate containers.

QA/QC Samples

For field Quality Assurance/Quality Control (QA/QC) purposes, either an equipment blank (QCEB) sample or a trip blank (QCTB) sample may be prepared along with the collected groundwater samples. If trip blanks are collected during this event, they are taken to the site and kept inside the sample cooler for the duration of the event. They are turned over to the laboratory for analysis with the samples from that site. The equipment blank sample is generally obtained after decontamination activities by pouring ultra-pure, de-ionized water over the pump. A water sample is then collected using, to the extent feasible, the same sampling protocol and equipment used to obtain the other samples. Any collected QA/QC blank samples are handled and processed in exactly the same manner as regular samples, as described herein. Additionally, the laboratory performs matrix spikes, matrix spike duplicates, method blanks, check samples and standards in accordance with the RWQCB guidelines to provide a measure of the positive interference introduced by the laboratory procedure and analytical testing methods.

Duplicates

Duplicates, if requested, may be collected at a site. The Duplicate sample is labeled "DUP" and the time of collection is omitted from the COC, thus rendering the sample blind.

Sample Storage

All sample containers are promptly placed on ice in ice chests for storage in the field and transport (direct or via our facility) to the designated analytical laboratory. The samples are maintained in either an ice chest or a refrigerator until relinquished into the custody of the laboratory or laboratory courier.

Documentation Conventions

Labels are affixed to all sample containers. The sample is identified with the project number and site address, and the groundwater well from which the sample is drawn (e.g. W-01, W-02, etc.). The time and date of sample collection along with the initials of the person who collects the sample are handwritten onto the label. Chain of Custody records are created using client specific preprinted forms following USEPA specifications.

Decontamination

All equipment is brought to the site in clean and serviceable condition and is cleaned between uses in each well. Equipment (reels, pumps and bailers) is decontaminated before leaving the site. Any sensitive equipment or parts (Dissolved Oxygen sensor membrane, water level indicator, etc.) that cannot be washed using the high pressure water, will be sprayed with a non-phosphate soap and de-ionized water solution and rinsed with de-ionized water.

Laboratory Director

American Scientific Laboratories, LLC (ASL) accepts sample materials from clients for analysis with the assumption that all of the information provided to ASL verbally or in writing by our clients (and/or their agents), regarding samples being submitted to ASL, is complete and accurate. ASL accepts all samples subject to the following conditions:

1) ASL is not responsible for verifying any client-provided information regarding any samples submitted to the laboratory.
2) ASL is not responsible for any consequences resulting from any inaccuracies, omissions, or misrepresentations contained in client-provided information regarding samples submitted to the laboratory.

Attachment 6
Background & Site History

The "Site" is located at 316 N. Juanita Avenue, Los Angeles, Los Angeles County, California, 90004. The property is bordered by private property to the south, private property and Oakwood Avenue on the north, Madison Avenue to the east and Juanita Avenue to the west.

On November 10, 2004, a 12,000-gallon gasoline UST was removed from the Site. Following removal of the 12,000-gallon UST, two soil samples were collected from the base of the tank excavation and one soil sample was collected from beneath the location of the former fuel dispenser. The only constituent detected in the three soil samples was methyl tert butyl ether (MTBE) at concentrations of 2.7 micrograms per kilogram (ug/kg), 4.7 ug/kg, and 6.0 ug/kg. However, water accumulating in the excavation was sampled and analyzed with the following concentrations of chemicals detected: 20,900 ug/L Total Petroleum Hydrocarbons (TPH) – Gasoline (TPH-GRO); 524 ug/L benzene; 2,030 ug/L toluene; 282 ug/L ethylbenzene; 1,770 ug/L total xylenes; 5,400 ug/L MTBE; 2,050 ug/L ethanol; 18 ug/L tert-amyl methyl ether (TAME); and 812 ug/L tert-butanol (TBA). The UST Removal Report, dated November 17, 2004, was submitted by Hydrologue Inc. (HI, 2004) to the Los Angeles Fire Department (LAFD).

On January 12, 2006, the LAFD requested an investigation work plan, which was prepared and submitted to the LAFD on January 18, 2006. Upon the request of the LAFD, an Unauthorized Release form was submitted on April 18, 2007, and on April 19, 2007, the LAFD referred the case to the RWQCB. The RWQCB requested additional background information for their review of the investigation work plan on May 22, 2007, which was submitted on July 12, 2007. The January 18, 2006 Work Plan was approved with comments by the RWQCB on August 9, 2007, and a deadline of October 15, 2007 was set for completion of the investigation and submittal of a report. This deadline was extended to December 15, 2007 by Ms. Mercedes Hsu on September 10, 2007.

In November 2007, RMT completed a Phase II Site Assessment investigation. The following is summarized from the report dated November 29, 2007 which was submitted to the RWQCB:

- Five soil borings (MW1, MW2, MW3, MW4 and MW5) were drilled to a termination depth of 30 feet bgs, using hollow stem auger drilling techniques. Soil samples were collected at five foot intervals in from each boring until 15 feet bgs. No visual, olfactory, or PID indications of contamination were encountered in the soil borings. Soil encountered in borings MW1 through MW5 consists of heterogeneous, inter-bedded clay, silty clay and/or clayey sand to a depth of approximately 30 feet bgs (the maximum depth explored). Based on the low permeability of the saturated zone, the groundwater wells can be classified as low recovery wells.
- The soil borings were converted into groundwater monitoring wells (MW1, MW2, MW3, MW4, and MW5). The installed groundwater monitoring wells were then surveyed by a licensed surveyor, developed, and sampled.
- The laboratory analytical results of soil samples collected from the soil borings show that TPH-DRO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the soil samples collected. TPH-ORO was only detected in one sample from MW2 at 10 feet bgs at 140 mg/Kg. MTBE was only detected in one soil boring MW1 at 5 feet (16 ug/kg), 10 feet (51

ug/kg) and 15 feet (7.4 ug/kg) bgs. The soil samples were collected and preserved using EPA Method SW5035.

- The laboratory analytical results of groundwater samples collected from the five monitoring wells show that TPH-ORO, TPH-GRO, Benzene, Ethylbenzene, Toluene, Xylenes, DIPE, ETBE, TAME, TBA, or ethanol were not detected above laboratory reporting limits in any of the groundwater samples collected. TPH-DRO was only detected in one monitoring well, MW3 at 7.9 mg/L. MTBE was only detected in two monitoring wells, MW1 (5.1 ug/L) and MW2 (6.8 ug/L).
- The former ARCO site located at 3737 Beverly Blvd W, Los Angeles, CA 90004 is located immediately adjacent to the south of the AT&T Site. The former ARCO site has had a fueling service station since at least 1950. Several gasoline and diesel USTs have been determined to be leaking from the late 1980's and 1990's and have been removed. A review of the quarterly monitoring data show that the elevated levels of TPH-GRO, BTEX and MTBE have been encountered below the former ARCO Site. Remediation has been ongoing. The historical site assessment reports for this site have also reported "near saturated gasoline contaminated soil" just south of the AT&T site. Other sites in the vicinity cannot be ruled out as a source for hydrocarbon concentrations detected in the groundwater in the area.
- The California Primary Maximum Contaminant Level (MCL) for MTBE is 13 ug/L. The highest MTBE detected in the groundwater in November 2007 was 6.8 ug/L in MW2. The highest TPH-DRO detected in groundwater was 7.9 mg/L in MW3. The residual contamination could be potentially unrelated to the former gasoline UST which is the subject of this investigation. The current concentrations in both soil and groundwater do not warrant further investigations and/or corrective action.

Based on the current and previous investigations, RMT recommended that this Site be granted No Further Action status by the RWQCB if groundwater monitoring for three more quarters confirm that the concentrations of contaminants of concern decrease or remain stable at the Site. In a letter dated January 7, 2008, the RWQCB concurred with RMT's conclusions and recommendations and directed AT&T to conduct two more rounds of groundwater monitoring, at which time the site will be re-evaluated for low risk closure.

APPENDIX H

TERMINOLOGY

TERMINOLOGY

The following provides definitions and descriptions of certain terms that may be used in this report. Italics indicate terms that are defined by ASTM Standard Practice E 1527-13. The Standard Practice should be referenced for further detail related definitions or additional explanation regarding the meaning of terms.

Recognized environmental condition (REC): The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: 1) due to any release to the environment, 2) under conditions indicative of a release to the environment; or 3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

De minimis conditions: Conditions that generally do not present threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions or controlled recognized conditions.

Historical recognized environmental condition(s) (HREC): A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted residential use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a historical recognized environmental condition, the environmental professional must determine whether the past release is a recognized environmental condition at the time of the Phase I Environmental Site Assessment is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past release to be a recognized environmental condition at the time of the Phase I ESA, the condition shall be included in the conclusions section of the report as a recognized environmental condition,

Controlled recognized environmental condition(s) (CREC): A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by the regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). A condition considered by the environmental professional to be a controlled recognized condition shall be listed in the findings section of the Phase I Environmental Site Assessment report, and as a recognized environmental condition in the conclusions section of the Phase I Environmental Site Assessment report. NOTE: A condition identified as a controlled recognized environmental condition does not imply that the environmental professional has evaluated or confirmed the adequacy, implementation, or continued effectiveness of the required control that has been, or is intended to be, implemented.

Material threat: A physically observable or obvious threat which is reasonably likely to lead to a release that, in the opinion of the environmental professional, is threatening and might result in impact to public health or the environment. An example might include an aboveground storage tank that contains a hazardous substance and which shows evidence of damage such that it may cause or contribute to tank integrity failure with a release of contents to the environment.

Material impact to public health or environment: A substantial risk of harm to public health or the environment resulting from the presence or likely presence of an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. An example might include a release of a hazardous substance in concentrations exceeding applicable governmental agency standards under conditions that could reasonably and foreseeably result in substantial exposure to humans or

substantial damage to natural resources. The risk of that exposure or damage would represent a material impact to public health or environment.

General risk of enforcement action: The likelihood that an environmental condition would be subject to enforcement action if brought to the attention of appropriate governmental agencies. If the circumstances suggest an enforcement action would be more likely than not, then the condition is considered a general risk of enforcement action.

Data failure: A failure to achieve the historical research objectives, even after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful. Data failure is one type of data gap.

Data gap: A lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice, including, but not limited to site reconnaissance (for example, an inability to conduct the site visit), and interviews (for example, an inability to interview the key site manager, regulatory officials, etc.).

Subject: **Phase II Environmental Site Assessment**
316 North Juanita Avenue
316 North Juanita Avenue
Los Angeles, California
EBI Project No. 1218000439

Dear Mr. Molloy:

In accordance with the Proposal and Standard Conditions for Engagement approved by yourself on October 30, 2018, EnviroBusiness, Inc. (dba EBI Consulting, hereinafter "EBI") is pleased to submit this Phase II Environmental Site Assessment (ESA) for the above-referenced property (herein referred to as the Subject Property).

This *Report* is addressed to *Flexible PSH, Solutions, Inc.* and such other persons as may be designated by *Flexible PSH, Solutions, Inc.* and respective successors and assigns. This Report is for the use and benefit of, and may be relied upon by, *Flexible PSH, Solutions, Inc.* or any affiliates; initial and subsequent holders from time to time of any debt and/or debt securities secured, directly or indirectly, any participation interest in such debt; any indenture trustee, servicer, or other agent acting on behalf of such holders of such debt and/or debt securities; rating agencies; and the institutional provider(s) from time to time of any liquidity facility or credit support for such financings, and their respective successors and assigns.

The information contained in this report has received appropriate technical review and approval. The conclusions represent professional judgments and are founded upon the findings of the investigations identified in the report and the interpretation of such data based on our experience and expertise according to the existing standard of care. No other warranty or limitation exists, either express or implied.

The conclusions of this Report are based on soil and groundwater analytical data prepared by SGS Laboratories, a California certified laboratory, soil screening results obtained utilizing a field screening instrument, and field observations recorded by EBI personnel.

There are no intended or unintended third party beneficiaries to this Report, except as expressly stated herein.

EBI is an independent contractor, not an employee of either the issuer or the borrower, and its compensation was not based on the findings or recommendations made in the Report or on the closing of any business transaction.

Thank you for the opportunity to prepare this Report, and assist you with this project. Please call us if you have any questions or if we may be of further assistance.

Respectfully submitted,
EBI CONSULTING

The Environmental Professionals listed above performed this Phase II ESA in general conformance with the ASTM E1903-11 Standard Practice for Phase II ESAs. The listed individuals meet the qualifications for individuals completing or overseeing all appropriate inquiries, and possess sufficient specific education, training, and experience necessary to exercise professional judgment to develop opinions and conclusions regarding the existence of environmental conditions on the property. Any work completed on this Phase II ESA by an individual who is not considered an environmental professional was completed under the supervision or responsible charge of the environmental professional.

1.0 INTRODUCTION

In accordance with our Proposal and Standard Conditions for Engagement, EnviroBusiness, Inc. (dba EBI Consulting, hereinafter "EBI") is pleased to submit our *Phase II Environmental Site Assessment (ESA) Report (Report)* on the property located at 316 North Juanita Avenue, Los Angeles, California (the Subject Property). Mr. Chad Bechtel and Ms. Lizette Ruiz of EBI conducted the investigation at the Subject Property on November 30 and December 5, 2018.

1.1 BACKGROUND

EBI was requested to conduct a limited subsurface investigation to evaluate the potential impact to the Subject Property from the following recognized environmental concern(s) identified in EBI's (July 26, 2018) Phase I ESA report:

- AT&T has been engaged in automotive service activities that include petroleum hydrocarbons and generate regulated wastes (used oil and other automotive fluids such as automatic transmission fluid and antifreeze) and has operated automotive lifts since at least 1975. These operations are suspect to have occurred on the Subject Property prior to construction of the vehicle maintenance building that was constructed in 1975. AT&T also operates an in-ground oil/water separator and currently three aboveground hydraulic lifts. These lifts replaced underground hydraulic lifts in 2010 and a portion of the foundation was replaced at that time, per the Building Department record. No data regarding this activity was otherwise identified. The historic use of regulated materials, generation of regulated wastes, and presence of the in-ground automotive lifts and oil/water separator are considered to represent a recognized environmental condition (REC) to the Subject Property.

1.2 STATEMENT OF OBJECTIVES

The primary objective of this Phase II ESA was to evaluate potential impact to the Subject Property from the RECs identified in the Phase I ESA prepared by EBI (July 26, 2018) for the purpose of providing sufficient information regarding the nature and extent of contamination to assist in making informed business decisions about the property; and where applicable, providing the level of knowledge necessary to satisfy the innocent purchaser defense under CERCLA. The investigation focused on: 1) interior locations in the approximate location of the three former underground hydraulic lifts; and 2) exterior locations near the oil/water separator (OWS) and former wash rack.

In order to achieve the objectives of this investigation, EBI performed the following tasks:

- Contacted the local utility locating service Underground Service Alert of Southern California (Ticket #A183110874) prior to undertaking subsurface explorations on-site.

- Retained a private utility locating service (Ground Penetrating Radar Services, Inc. [GPRS]) to further screen for underground utilities in the vicinity of the proposed sampling locations.

- Advanced two exterior soil borings (B-1 and B-2) using direct push drilling methods near the OWS and former wash rack to depths of up to approximately 25 feet bgs.

- Advanced three interior soil borings (B-3 through B-5) using direct push drilling methods adjacent to the former underground hydraulic lifts to depths of up to approximately 28 feet bgs.

- Collected continuous soil samples from the borings, field screened the vapor headspace of the soil samples for total ionizable volatile organic compounds (VOCs) using a photoionization detector (PID), and described the physical characteristics of the soil samples on boring logs.

- Selected one soil sample from each soil boring, prepared, and submitted the samples under chain-of-custody documentation to a California-certified independent laboratory (SGS Laboratories). The samples collected near the OWS and former wash rack (B-1 and B-2) were submitted for analysis of VOCs via United States Environmental Protection Agency (EPA) Method 8260, polycyclic aromatic hydrocarbons (PAHs) via EPA Method 8270, and total petroleum hydrocarbons (TPH) - diesel range organics (DRO) and oil range organics (ORO) via EPA Method 8015. The samples collected near the former underground hydraulic lifts (B-3 through B-5) were submitted for analysis of TPH-DRO and -ORO via EPA Method 8015, PAHs via EPA Method 8270, and polychlorinated biphenyls (PCBs) via EPA Method 8082.

- Collected grab groundwater samples from temporary wells inserted into each boring, prepared, and submitted the samples under chain-of-custody documentation to SGS Laboratories. The samples collected near the OWS and former wash rack (B-1 and B-2) were submitted for analysis of VOCs via EPA Method 8260, PAHs via EPA Method 8270, and TPH-DRO and -ORO via EPA Method 8015. The samples collected near the former underground hydraulic lifts (B-3 through B-5) were submitted for analysis of TPH-DRO and -ORO via EPA Method 8015, PAHs via EPA Method 8270, and PCBs via EPA Method 8082.

- Prepared this summary of pertinent information obtained during this investigation including accompanying illustrations and appendices, along with EBI's findings and preliminary conclusions regarding the presence or absence of contamination in soils beneath the Subject Property in the areas investigated.

A detailed description of investigation methods is provided in Section 3.0 of this report.

1.3 LIMITATIONS AND ASSUMPTIONS

This *Report* was prepared for the use of *Flexible PSH, Solutions, Inc.*. It was performed in accordance with ASTM E1903-11, accepted practices of other consultants undertaking similar studies at the same time and in the same locale under like circumstances. The conclusions provided by EBI are based solely on the information obtained during the subsurface investigation. EBI renders no opinion as to the presence of potential contamination in the areas not investigated. The observations in this *Report* are valid on the date of the investigation. Any additional information that becomes available concerning the Subject Property should be provided to EBI so that our conclusions may be revised and modified, if necessary. This *Report* has been prepared in accordance with the proposal approved by *Flexible PSH, Solutions, Inc.* and with the limitations and assumptions described below, all of which are integral parts of this *Report.* No other warranty, express or implied, is made.

Limitations

1. The observations described in this Report were made under the conditions stated herein. The conclusions presented are based solely upon the services described, and not on scientific tasks or procedures beyond the scope of described services or the time and budgetary constraints imposed by Client. The work described in this Report was carried out in accordance with terms and conditions in our Authorization Letter and Agreement for Environmental Services regarding the Site, which are incorporated herein by references.
2. In preparing this Report, EBI has relied on certain information provided by state and other referenced parties, and on information contained in the files of federal, state and/or local agencies available to EBI at the time of the assessment. Although there may have been some degree of overlap in the information provided by these various sources, EBI did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of these Environmental Services.
3. Observations were made of the Site and of structures on the Site as indicated within the Report. Where access to portions of the Site or to structures on the Site was unavailable or limited, EBI renders no opinion as to the presence of oil or hazardous materials (OHM) in that portion of the Site or structure. In addition, EBI renders no opinion as to the presence of OHM or the presence of indirect evidence relating to OHM where direct observation of the interior walls, floor, or ceiling of a structure on a Site was obstructed by objects or coverings on or over these surfaces. No representations concerning insulating material is express or implied.
4. EBI did not perform testing or analyses to determine the presence or concentration of asbestos, radon, or lead at the Site unless specifically stated otherwise in the Report. Similarly, no investigation of dust or air quality was conducted unless specifically stated otherwise in the Report.
5. The purpose of this Report is to assess the physical characteristics of the Site with respect to the presence of OHM in the environment. No specific attempt was made to determine the compliance of present or past owners or operators of the Site with federal, state, or local laws or regulations (environmental or otherwise).
6. Except as noted in the Report, no quantitative laboratory testing was performed as part of the assessment. Where such analyses have been conducted by an outside laboratory, EBI has relied upon the data provided, and has not conducted an independent evaluation of the reliability of this data.
7. Any qualitative or quantitative information regarding the Site, which was not available to EBI at the time of this assessment may result in a modification of the representations made herein.
8. It is acknowledged that EBI judgments shall not be based on scientific or technical test or procedures beyond the scope of the Services or beyond the time and budgetary constraints imposed by Client. It is acknowledged further that EBI conclusions shall not rest on pure science but on such considerations as economic feasibility and available alternatives. Client also acknowledges that, because geologic and soil formations are inherently random, variable, and indeterminate in nature, the Services and opinions provided under this Agreement with respect to such Services, are not guaranteed to be a representation of actual conditions on the Site, which are also subject to change with time as a result of natural or man-made processes, including water permeation. In performing the Services, EBI shall use that degree of care and skill ordinarily exercised by environmental consultants or engineers performing similar services in the same or similar locality. The standard of care shall be determined solely at the time the Services are rendered and not according to standards utilized at a later date. The Services shall be rendered without any other warranty, express or implied,

including, without limitation, the warranty of merchant ability and the warranty of fitness for a particular purpose.

9. Client and EBI agree that to the fullest extent permitted by law, EBI shall not be liable to Client for any special, indirect or consequential damages whatsoever, whether caused by EBI's negligence, errors, omissions, strict liability, breach of contract, breach of warranty or other cause of causes whatsoever.

Assumptions

1. This Phase II ESA does not address the evaluation of business environmental risks in light of data collected through the Phase II ESA process. Such evaluation is a function of site and transaction-specific variables, and of the user's objectives and risk tolerance. This practice contemplates that the Phase II ESA process was planned and conducted with such variables in mind, and that the user will evaluate legal, business and environmental risks in light of known data relating to the particular site and transaction, and in consultation with legal and business advisors as well as the Phase II Assessor.

2. The ASTM E1903-11 does not define the threshold levels at which target analytes pose a concern of significance to the user. Users may apply this practice not only in light of applicable regulatory criteria and relevant liability principles, but also to meet self-defined objectives.

3. The scope of work for this Phase II ESA is site-specific and context-specific. The assessment process defined by ASTM E1903-11 is intended to generate sound, objective, and defensible information sufficient to satisfy diverse user objectives.

4. No Phase II ESA can eliminate all uncertainty. Furthermore, any sample, either surface or subsurface, taken for chemical testing may or may not be representative of a larger population. Professional judgment and interpretation are inherent in the process, and even when exercised in accordance with objective scientific principles, uncertainty is inevitable. Additional assessment beyond that which was reasonably undertaken may reduce the uncertainty.

5. Even when Phase II ESA work is executed competently and in accordance with ASTM E1903-11, it must be recognized that certain conditions present especially difficult target analyte detection problems. Such conditions may include, but are not limited to, complex geological settings, unusual or generally poorly understood behavior and fate characteristics of certain substances, complex, discontinuous, random, or spotty distributions of existing target analytes, physical impediments to investigation imposed by the location of utilities and other man-made objects, and the inherent limitations of assessment technologies.

6. The Phase II ESA is intended to develop and present sound, scientifically valid data concerning actual site conditions. It shall not be the role of the Phase II Assessor to provide legal or business advice.

1.4 SPECIAL TERMS AND CONDITIONS

This Phase II ESA (the report) has been prepared to assist *Flexible PSH, Solutions, Inc.* in its underwriting of a proposed mortgage loan on the Subject Property. This report can be relied upon by only the parties stated in the transmittal letter at the front of this report. EBI's liability to a purchaser wishing to use this report is limited to the cost of the report. Amendments to EBI's limitations as stated herein that may occur after issuance of the report are considered to be included in this report. Payment for the report is made by, and EBI's contract and report extends to *Flexible PSH, Solutions, Inc.* only, in accordance with our Standard Conditions for Engagement and, Authorization Letter and Agreement for Environmental Services.

2.0 SUBJECT PROPERTY BACKGROUND

2.1 SUBJECT PROPERTY DESCRIPTION AND FEATURES

Information regarding the Subject Property description, improvements, and operations is summarized below:

PROPERTY DESCRIPTION, IMPROVEMENTS, AND OPERATIONS	
Address	316 North Juanita Avenue, Los Angeles, California
Location	Southwest corner of the intersection of North Madison Avenue and Oakwood Avenue and is enclosed by North Juanita Avenue on the west side
Property Owner	According to the Los Angeles County Assessor's Office, the Subject Property is owned by Pacific Bell / S B of E Par 2 Map 303-19-47
Number of Parcels	One – 5501-001-800
Total Land Area	1.93 acre
Number/Type of Buildings	Three/commercial office, vehicle maintenance building, storage building
Number of Stories	One
Date of Construction	1960 – 1981
Area (SF)	5,402± square foot administration building, a 2,160± square foot vehicle maintenance building and a 300± square foot storage building
Basement	None
Operations	Commercial office and vehicle maintenance building
Site Characteristics	At the time of assessment, the Subject Property was solely occupied by AT&T and used for administration, vehicle maintenance and storage. There are currently no manufacturing or fueling operations conducted at the Subject Property.

2.2 PHYSICAL SETTING

Information regarding the physical settings at the Subject Property and immediate vicinity are summarized below:

PHYSICAL SETTING DESCRIPTIONS	
Regional Geology	Information concerning the geology of the Subject Property was obtained from the United States Geological Survey (USGS) Ground Water Atlas of the United States, California Region (1995). The Subject Property is located within the Pacific Border physiographic province, which is characterized by steep rolling hills and mountains and consists of severely folded, faulted, commonly metamorphosed marine and continental sediments.
Depth to Bedrock	No bedrock outcroppings were noted at the Subject Property. Depth to bedrock is expected to be greater than or equal to 28 feet.
Surficial Features	Surface drainage on the Subject Property occurs over land to the surrounding streets primarily to the south and east. No indication of cross-lot runoff, swales, drainage flows, or active rills or gullies were observed on the Subject Property.
Surficial Soils	According to the Natural Resources Conservation Service (NRCS) Web Soil Survey (WSS) website (http://websoilsurvey.nrcs.usda.gov/app/), the dominant soil composition in the vicinity of the Subject Property is classified as Urban Land.
Soil Stratigraphy Encountered during the Investigation	Soil stratigraphy encountered during the completion of soil borings consisted of dark brown to gray/brown clays with varying amounts of fine sand to 28 feet bgs, the total depth explored.

PHYSICAL SETTING DESCRIPTIONS	
Estimated Direction of Groundwater Flow	Local groundwater gradient is expected to follow surface topography; therefore, groundwater flow near the Subject Property is expected to flow to the east-southeast. Groundwater depths and flow gradients are best evaluated by a subsurface investigation involving the installation of at least three groundwater-monitoring wells, survey of well elevations, and precise measurements of hydraulic head. Calculation of groundwater flow directions based on relative differences of hydraulic head on the Subject Property was not included in this scope of work.
Depth to Groundwater (encountered during the investigation)	Depth to groundwater was observed during the investigation at depths of around 11 feet bgs.

2.3 SITE HISTORY AND LAND USE

According to the Phase I ESA prepared by EBI (July 26, 2018), the site history and land use is summarized in the following table:

Period	Site History And Land Use
At least 1894 - 1919	Undeveloped land
1919 – 1957	Residential with limited commercial (venetian blind manufacturing, pottery molding and store 1950 – 1956)
1957 – 1960	Undeveloped
1960 to Present	Existing communications company yard

2.4 ADJACENT PROPERTY LAND USE

Property use in the vicinity of the Subject Property is primarily characterized by multifamily residential and commercial development.

ADJOINING PROPERTIES	
North	The northeast side of the Subject Property is enclosed by Oakwood Avenue followed mostly by undeveloped land and the ramp to the Hollywood 101 Freeway. Remnants of a concrete structure were also located to the north with an unknown former use. MZ Collision at 340 North Juanita Avenue and a triplex at 3812 Oakwood Avenue enclose the northwest side of the Subject Property. EBI noted a few food trucks and an inground oil/water separator at the triplex indicating the residential use was likely converted to commercial use in support of the food trucks.
South	Midway Auto at 3725 - 3737 Beverly Boulevard and Dewey Pest Control at 3713 Beverly Boulevard and 307 – 311 North Madison Avenue enclose the south side of the Subject Property.
East	North Madison Avenue encloses the majority of the east side of the Subject Property. This street is followed by an office building that appears to provide assistance to homeless individuals at 3766 Oakwood Avenue and 340 North Madison Avenue and by a parcel that appeared to be undergoing construction at 320 North Madison Avenue. To the southeast was another Dewey Pest Control facility at 310 North Madison Avenue. The other Dewey Pest Control facility at 3713 Beverly Boulevard also encloses a portion of the southeast side of the Subject Property.
West	North Juanita Avenue encloses the west side of the Subject property followed by apartments at 335 North Juanita Avenue, a landscaping supply storage yard at 311 – 329 North Juanita Avenue and a parking lot associated with an office building to the southwest at 3755 Beverly Boulevard.

2.5 SUMMARY OF PREVIOUS ENVIRONMENTAL ASSESSMENTS

As noted in Section 1.1, EBI was requested to conduct a Phase II ESA to evaluate potential impact to the Subject Property from the following RECs identified in EBI's (July 26, 2018) Phase I ESA report:

- AT&T has been engaged in automotive service activities that include petroleum hydrocarbons and generate regulated wastes (used oil and other automotive fluids such as automatic transmission fluid and antifreeze) and has operated automotive lifts since at least 1975. These operations are suspect to have occurred on the Subject Property prior to construction of the vehicle maintenance building that was constructed in 1975. AT&T also operates an in-ground oil/water separator and currently three aboveground hydraulic lifts. These lifts replaced underground hydraulic lifts in 2010 and a portion of the foundation was replaced at that time, per the Building Department record. No data regarding this activity was otherwise identified. The historic use of regulated materials, generation of regulated wastes, and presence of the in-ground automotive lifts and oil/water separator are considered to represent a recognized environmental condition (REC) to the Subject Property.

During the Phase I ESA, EBI was not provided with or made aware of previous environmental assessments or other documentation regarding environmental investigations performed for the Subject Property other than those documents found on the Geotracker website that are referenced below.

Workplan for Site Assessment, Pacific Bell Telephone Company dba AT&T, 316 N. Juanita Avenue, Los Angeles, California, Hydrologue Inc., January 18, 2006. Significant findings are summarized as follows:

- In November 2004, a 12,000-gallon gasoline UST was removed from the site with no visual evidence of holes or a release from the tank upon removal. Soil samples only detected methyl tertiary butyl ether (MTBE) at 2.7 – 6 parts per billion (ppb). A sample of the water that accumulated at the base of the excavation was also analyzed and total petroleum hydrocarbons as gasoline (TPHg) and benzene, toluene, ethylbenzene and xylene (BTEX) components were detected up to 20,900 ppb and notably included benzene at 524 ppb along with MTBE at 5,400 ppb along with other fuel contaminants.

- A prior UST had been removed from the Subject Property in 1989. A leak was reported during that tank removal activity, the site was added to the LUST List and case closure was issued in 1996. No data regarding the 1989 tank removal was available. Additional work was proposed to further determine whether the source of the groundwater contamination identified in 2004 and include the installation of five groundwater monitoring wells on the Subject Property.

- A site plan included with the Workplan showed the 12,000-gallon UST was located just west of the vehicle maintenance building. At that time, a 250-gallon fuel oil AST was shown on the northeast corner at the southwest side of the storage building. The location of the former UST removed in 1989 was not shown.

Phase II Environmental Site Assessment Report, Case No. 900040225A, AT&T G118 Facility, 316 N. Juanita Avenue, Los Angeles, California, RMT Inc., November 29, 2007. Significant findings are summarized as follows:

- Five borings were installed to a depth of approximately 30 feet below ground surface (bgs). Soil samples were collected at each approximate 5-foot interval and wells were constructed in each

  boring. Laboratory analysis only detected TPH as heavy extractable range organics (TPH-ORO) in one boring (MW2) at 10 feet bgs at 140 parts per million (ppm) and MTBE in another soil boring (MW1) at depths of 10 – 15 feet bgs up to 51 ppb.

- Groundwater samples were collected from each well and the maximum contaminant levels were identified in three of the five wells: total petroleum hydrocarbon as diesel (TPH-DRO) 7,900 ppb in MW3, and MTBE up to 6.8 ppb in MW1 and MW2.

- The former ARCO site to the south at 3737 Beverly Boulevard had been in operation circa 1950s possibly to the early 1990s, was identified as a LUST site and as a potential source of contamination to the Subject Property.

Second Quarter 2008 Groundwater Monitoring Report, AT&T G1118 Facility, 316 N. Juanita Avenue, Los Angeles, California, RMT Inc., July 10, 2008. Significant findings are summarized as follows:

- Groundwater was encountered at depths of 9.7 to 13.2 bgs and the direction of groundwater flow was determined to be to the east-southeast.

- Groundwater samples were collected from each well and the maximum contaminant levels were identified in three of the five wells: TPH-DRO at 820 ppb in MW3 and 10,500 ppb in MW5; and MTBE at 8.65 ppb in MW2. MW3 was located on the northwest side of the Subject Property and MW5 was located south of the vehicle maintenance building (also south of the oil/water separator).

- The former ARCO site to the south at 3737 Beverly Boulevard had been in operation circa 1950s possibly to the early 1990s, was identified as a LUST site and as a potential source of contamination to the Subject Property.

- The report stated that the release did not occur from the former gasoline UST. EBI notes that there was no discussion of the other UST that was removed in 1989. As the report concluded the source did not appear to be on-site, case closure should be granted.

Addendum to Phase II Environmental Site Assessment Report, Case No. 900040225A, AT&T G118 Facility, 316 N. Juanita Avenue, Los Angeles, California, RMT Inc., November 6, 2008. Significant findings are summarized as follows:

- The RWQCB reportedly concurred with the consultant's request that case closure should be granted; however, the RWQCB also requested two grab groundwater samples be collected downgradient of MW5 prior to issuing case closure.

- In October 2008, two grab groundwater samples were collected from temporary wells placed downgradient of MW5. No TPH, BTEX, ethanol or fuel oxygenates were identified above laboratory detection levels in these two grab groundwater samples.

- The temporary wells were properly abandoned and the report concluded case closure should be granted.

Underground Storage Tanks Program – Case Closure Letter, Pacific Bell Telepho5one Company, AT&T, 316 N. Juanita Avenue, Los Angeles, Case No. 900040225A, RWQCB, April 10, 2009.

This letter granted case closure/no further action for the LUST case associated with the 12,000-gallon UST removed in 2004. The reasons for case closure were that no free product was ever observed; the extent of soil and groundwater contamination had been adequately defined; the levels of residual soil contamination were below the respective Screening Levels (SLs) and the groundwater samples "did not detect any fuel hydrocarbons higher than Maximum Contaminant Levels (MCLs for drinking water)."

3.0 RATIONALE AND WORK PERFORMED

3.1 RATIONALE

3.1.1 Conceptual Model

The Conceptual Model is a representation of hypothesized current site conditions, which describes the physical setting characteristics of a site and the likely distribution of target contaminants (in soil, air, ground water, surface water and/or sediments) that might have resulted from a known or likely release and the risk they pose to human and/or ecological receptors. This Conceptual Model takes into consideration the potential distributions of contaminants with respect to the properties, behaviors and fate and transport characteristics of the contaminant in a setting such as that being assessed. The sampling plan was designed to provide for the collection of potentially contaminated environmental media, if they occur, at locations and depths where the highest concentrations are likely to occur.

Site Environmental Concerns		**Site Physical Characteristics**		**Onsite Environmental Receptors**	
RECs	**COC's**	**Primary Release Media**	**Fate & Transport**	**Potential Exposure Route(s)**	**Potential Human Exposure**
On-site automotive servicing OWS and wash rack	VOCs PAHs TPH PCBs	Soil Groundwater	Soil Groundwater	Ingestion Inhalation Dermal (direct Contact)	Tenants Site workers Construction workers

COC = contaminants of concern

Assumptions:
1. Assumes the Subject Property retains existing use (Commercial)
2. Construction Worker exposure is limited due to short exposure duration

3.1.2 Rationale for Soil Boring Placement

The rationale for the placement of the soil borings was based on the 1) the *Likely Release Area(s)* that target analytes were first introduced into environmental media as a result of a release; and 2) the likely vertical and horizontal migration of the release.

3.1.3 Chemical Testing Plan

The chemical testing plan was designed to detect the target analytes that are present in, or have been released or potentially have been released to, environmental media at the site, and which are of interest in the context of the particular Phase II ESA and its objectives, the presence of which will be sought and concentrations of which will be quantified through chemical testing.

3.1.4 Deviations from the Proposed Scope of Work

There were no significant deviations to the proposed scope of work. EBI notes the soil samples from borings B-1 and B-5 were collected below the groundwater table and/or the "smear zone" which initially appeared to be above the groundwater table. Therefore, these soil samples are not representative of the current vadose zone soil (i.e., unsaturated soil zone above the water table) conditions and were not included in the evaluation[1]. EBI notes that this does not alter our findings and conclusions.

3.2 EXPLORATION, SAMPLING, AND TEST SCREENING METHODS

3.2.1 Pre-Drilling Activities

As required to install the soil borings on the Subject Property, EBI obtained a soil boring permit from the County of Los Angeles Department of Public Health, Environmental Health - Drinking Water Program (Permit #SR0165541) prior to conducting the field work activities. A copy of the permit is included as Attachment E.

EBI's drilling subcontractor submitted dig-safe clearance request to Underground Service Alert of Southern California to mark-out the locations of utilities on the Subject Property on November 7, 2018. Clearance for drilling at the Subject Property was granted for after 7:00 a.m. on November 13, 2018. EBI additionally retained a private utility locating service (Ground Penetrating Radar Services, Inc.) to screen for underground utilities in the area of the soil borings.

Personal health and safety precautions were followed in accordance with applicable federal and state law or local equivalents and any requirements imposed by the owner, occupant, or field personnel. EBI prepared a site-specific health and safety plan (HASP) and conducted a health and safety meeting with the onsite personnel prior to the drilling activities. No additional pre-drilling activities were performed as part of this investigation.

3.2.2 Soil Borings

A total of five borings (B-1 through B-5) were advanced at the Subject Property using a direct push rig operated by J&H Drilling Co., Inc. of Buena Park, California. EBI recorded soil sampling information and the physical characteristics of each soil sample onto boring logs presented in Appendix B.

TABLE 3.2.2
SUMMARY OF SOIL BORING DETAILS

Boring ID#	Location	Termination Depth/Reason (feet bgs)	Approx. Depth to Groundwater (feet)	Sample ID #/ Depths	Target Analytes/ EPA Method
B-1	Exterior location adjacent to the OWS	25 (termination per SOW)	11	B-1 (22.5-25) B-1 GW (20)	VOCs / 8260 PAHs / 8270 TPH / 8015

[1] The smear zone is generally defined as soil or rock in the vicinity of the capillary fringe, and below the water table, which contains contaminants in a sorbed or free product phase. The smear zone developed when the water table fluctuates or is depressed by non-aqueous phase liquids (NAPL).

Boring ID#	Location	Termination Depth/Reason (feet bgs)	Approx. Depth to Groundwater (feet)	Sample ID #/ Depths	Target Analytes/ EPA Method
B-2	Exterior location adjacent to the former wash rack	25 (termination per SOW)	11	B-2 (12.5-15) B-2 GW (17)	VOCs / 8260 PAHs / 8270 TPH / 8015
B-3	Interior location, approximate former location of west hydraulic lift	15 (Equipment refusal)	11	B-3 (7.5-10) B-3 GW (11)	TPH / 8015 PAHs / 8270 PCBs / 8082
B-4	Interior location, approximate former location of center hydraulic lift	20 (termination per SOW)	11	B-4 (7.5-10) B-4 GW (11)	TPH / 8015 PAHs / 8270 PCBs / 8082
B-5	Interior location, approximate former location of east hydraulic lift	28 (termination per SOW)	11	B-5 (28) B-5 GW (28)	TPH / 8015 PAHs / 8270 PCBs / 8082
Notes: VOCs – Volatile organic compounds (VOCs) via EPA Method 8260 PAHs – Polynuclear aromatic hydrocarbons (PAHs) via EPA Method 8270 TPH – Total petroleum hydrocarbons (TPH) via EPA Method 8015 PCBs - Polychlorinated biphenyls (PCBs) via EPA Method 8082 (#) – Depth below grade sample collected					

Boring locations are illustrated on Figure 3, Boring Location Map.

3.2.3 Field Screening

The vapor headspace of each soil sample was field-screened using a photoionization detector (PID). The PID provides a reading of total ionizable VOCs. The PID was calibrated with an isobutylene standard, to measure total VOCs as isobutylene equivalents. The PID has a practical sensitivity of approximately one part per million by volume (ppmV). PID readings should not be considered as exact measurements, but as relative readings of VOCs between locations. The soil samples were placed in a zip-lock bag approximately three-quarters full with the soil to be analyzed, which was sealed for approximately 10 minutes in a warm (>60˚ F) location for equilibration. The headspace analysis was conducted by inserting the probe of the PID through an opening in the zip-lock bag and into the space above the soil sample.

A strong petroleum odor and possible staining was observed in the soil sample collected from a depth of 20-25 feet bgs in boring B-1 with a PID reading of 15.0 ppmV. A strong petroleum odor was observed in the soil sample collected from a depth of 25-28 feet bgs in boring B-5 with a PID reading of 35.1 ppmV. No other visual or olfactory evidence of contamination or elevated PID readings above background was observed in the other soil samples collected. The PID results are noted in the Boring Logs provided in Appendix B.

3.2.4 Soil Sampling and Analysis

Selected "grab" soil samples (of approximate 6" intervals) from the borings were collected in laboratory-provided sample containers. Each sample was labeled/logged onto a chain-of-custody form, and placed in a cooler with ice for preservation in accordance with current Federal EPA SW-846 (3rd ed.). The samples were submitted to an independent qualified laboratory (SGS Laboratories) for analyses. The samples were analyzed for the target analytes noted in Table 3.2.2.

Samples submitted for VOC analyses were collected into 40-ml vials containing methanol using Terracore samplers in accordance with EPA Method 5035.

In order to ensure that no cross-contamination between samples occurred, all non-dedicated sampling equipment was decontaminated after the collection of each sample. Sampling equipment was scrubbed with a brush to remove loose material and then washed thoroughly with a laboratory grade detergent and water to remove all particulate matter and surface film. After washing, each piece and brush was rinsed with clean distilled water. Dedicated sampling equipment such as sampling liners and latex gloves were properly disposed of after the handling of each sample was complete. Samples were then collected using clean disposable gloves and laboratory-provided glassware appropriate for the specified analysis.

3.2.5 Groundwater Sampling and Analysis

Grab groundwater samples were collected from temporary small-diameter PVC well screens installed within the soil borings using new bailers or new tubing and a peristaltic pump. The groundwater samples were collected in clean laboratory-provided containers. Samples collected for VOC analysis were preserved with hydrochloric acid to a pH less than 2. Each sample was labeled/logged onto a chain-of-custody form, and placed in a cooler with ice for preservation in accordance with current Federal EPA SW-846 (3rd ed.). After collection, the samples were submitted to an independent qualified laboratory (SGS Laboratories) for analyses. The samples were analyzed for the target analytes noted in Table 3.2.2.

3.2.6 Abandonment of Borings

Upon completion of the soil sampling activities, each soil boring was tremie filled with neat cement in accordance with the County of Los Angeles permit requirements. The top two to four inches were patched with concrete or asphalt to match existing conditions.

4.0 PRESENTATION OF EVALUATION AND RESULTS

The analytical results of the soil and groundwater samples were compared to the following regulatory screening values:

1) California Department of Toxic Substances Control (DTSC, June 2018) Modified Screening Levels (DTSC-SLs);

2) EPA (November 2018) Regional Screening Levels (RSLs); and

3) California San Francisco Bay Regional Water Quality Control Board (RWQCB; February 2016) Tier 1 Environmental Screening Levels (ESLs, i.e., unrestricted land uses) for TPH because DTSC-SLs and EPA RSLs have not been developed for TPH.

4.1 SOIL ANALYSIS RESULTS

The soil samples were analyzed for the target analytes noted in Table 3.2.2. The following table presents only the contaminants identified above the laboratory method detection limits.

Table 4.1 – Soil Analytical Results

Table 4.1	**Soil Results**					
Project:	**316 North Juanita Avenue**					
Project Number:	**1218000461**					
Results flagged as "Exceed" if any of the selected criteria exceeded (most stringent).				**Legend:**	Hit	Exceed
Client Sample ID:		**B-2 (12.5-15)**	**B-3 (7.5-10)**	**B-4 (7.5-10)**	**DTSC Modified RSLs Res/Com/Ind**	**Tier 1 ESLs**
Lab Sample ID:		**FA59800-2**	**FA59800-3**	**FA59800-4**		
Date Sampled:		**11/30/18**	**11/30/18**	**11/30/18**		
Matrix:		**Soil**	**Soil**	**Soil**		
Total Petroleum Hydrocarbons (TPH)						
TPH-DRO (C10-C28)	mg/kg	31.6	249	42.0	NS	230
TPH-ORO (>C28-C40)	mg/kg	75.0	994	90.9	NS	5,100
Polycyclic Aromatic Hydrocarbons						
Benzo(g,h,i)perylene	mg/kg	0.0386 I	ND (0.017)	ND (0.017)	NS	NS
Indeno(1,2,3-cd)pyrene	mg/kg	0.0225 I	ND (0.020)	ND (0.020)	1.1 / 21	NS
Volatile Organic Compounds (VOCs)						
Acetone	mg/kg	0.0610 B	NA	NA	61,000 / 670,000	NS
2-Butanone (MEK)	mg/kg	0.0087 I	NA	NA	27,000 / 190,000	NS
Methylene Chloride	mg/kg	ND (0.0031)	NA	NA	1.9 / 24	NS
Toluene	mg/kg	ND (0.00079)	NA	NA	1,100 / 5,400	NS

Notes: All results are shown in milligrams per kilogram (mg/kg)
NA = Not analyzed
ND = Non-detect
NS = No Standard listed or Not Applicable
a = Suspected laboratory contaminant
B = Indicates analyte found in associated method blank
J = Indicates a laboratory estimated value
DTSC Modified RSLs = California Department of Toxic Substances Control (DTSC) Modified EPA Region IX Regional Screening Levels (RSLs) HERO HHRA Note Number 3, issued June 2018, Table 1 DTSC-SLs Residential and Commercial/Industrial Soil Screening Levels (SLs)
Shading = Contaminant not listed on HERO Note 3; therefore, DTSC recommends usage of May 2018 EPA RSLs
Tier 1 ESLs = California Regional Water Quality Control Board (RWQCB), San Francisco Bay Area Region, Tier 1 Environmental Screening Levels (ESLs) for Soil, February 2016 (Rev 3).

The soil sample results of analysis revealed the following:

1) No PCBs were detected[1] at concentrations greater than the laboratory method detection limits in the samples submitted for those analyses.

2) No VOCs were detected in the soil samples collected from borings B-1 and B-2 except acetone, 2-butanone (MEK), methylene chloride, and toluene. None of the detected concentrations exceeded the corresponding DTSC-SLs for residential and commercial/industrial soil. It is noted that concentrations of acetone and toluene were detected in the associated laboratory method blank sample.

3) TPH-DRO and TPH-ORO were detected at concentrations greater than the laboratory method detection limits in each of the soil samples submitted for analysis. None of the detected concentrations exceeded the corresponding Tier 1 ESLs except those detected in the 7.5 to 10 foot sample collected from boring B-3.

4) The PAHs benzo(g,h,i)perylene and indeno(1,2,3-cd)pyrene were detected in the soil sample collected from boring B-2. None of the detected concentrations exceeded the corresponding DTSC-SLs for residential and commercial/industrial soil.

Laboratory soil analytical results and complete laboratory data sheets and chain-of-custody documentation are presented in Appendix C.

4.2 GROUNDWATER ANALYSIS RESULTS

The groundwater samples were analyzed for the target analytes noted in Table 3.2.2. The following table presents only the contaminants identified above the laboratory method detection limits.

Table 4.2 – Groundwater Analytical Results

Table 4.2	**Groundwater Results**								
Project:	**316 North Juanita Avenue**								
Project Number:	**1218000461**								
Results flagged as "Exceed" if any of the selected criteria exceeded (most stringent).							**Legend:**	Hit	Exceed

Date Sampled:		**11/30/18**	**11/30/18**	**11/30/18**	**11/30/18**	**12/5/18**			
Matrix:		**Groundwater**	**Groundwater**	**Groundwater**	**Groundwater**	**Groundwater**			
Total Petroleum Hydrocarbons (TPH)									
TPH-DRO (C10-C28)	µg/L	707	550	1,360	1,300	7,640	NS	100	
TPH-ORO (>C28-C40)	µg/L	545	737	489	443	7,400	NS	100***	
Volatile Organic Compounds (VOCs)									
MTBE	µg/L	10.3	20.9	NA	NA	NA	13.0	NS	
m,p-Xylene	µg/L	0.75 J	ND (0.47)	NA	NA	NA	10,000	NS	

Notes: All results are shown in micrograms per liter (µg/L)
ND = Non-detect
J = Indicates a laboratory estimated value
Tier 1 ESLs = California Regional Water Quality Control Board (RWQCB), San Francisco Bay Area Region, Tier 1 Environmental Screening Levels (ESLs) for Groundwater, February 2016 (Rev 3)

[1] Detected means that the analyte concentration exceeded the laboratory reporting limit.

***TPH-ORO is not soluble – if detected, add to TPH-DRO and compare to TPH-DRO standard
DTSC Modified MCLs = California Department of Toxic Substances Control (DTSC) HERO HHRA Note Number 3, issued June 2018, Table 4 DTSC-Modified Groundwater Maximum Contaminant Levels (MCLs)
Shading = Contaminant not listed on HERO Note 3; therefore, DTSC recommends usage of May 2018 EPA MCLs

The groundwater sample results of analysis revealed the following:

1) No PAHs or PCBs were detected at concentrations greater than the laboratory method detection limits in the samples submitted for those analyses.

2) No VOCs were detected except m,p-xylenes and MTBE. None of the detected concentrations exceeded the corresponding regulatory screening values except MTBE in the sample collected from boring B-2.

3) TPH-DRO and TPH-ORO were detected in each of the samples at concentrations that exceeded the corresponding Tier 1 ESLs for groundwater.

Laboratory groundwater analytical results and complete laboratory data sheets and chain-of-custody documentation are presented in Appendix C.

5.0 FINDINGS & CONCLUSIONS

We have performed a Phase II ESA at the property at (address) in general conformance with the scope and limitations of ASTM E1903-11 and for the following objectives:

- The primary objective of this Phase II ESA was to evaluate potential impact to the Subject Property from the RECs identified in the Phase I ESA prepared by EBI (July 26, 2018) for the purpose of providing sufficient information regarding the nature and extent of contamination to assist in making informed business decisions about the property; and where applicable, providing the level of knowledge necessary to satisfy the innocent purchaser defense under CERCLA. The investigation focused on: 1) interior locations in the approximate locations of the three former underground hydraulic lifts; and 2) exterior locations near the oil/water separator (OWS) and former wash rack.

The scope of work conducted by EBI on November 30 and December 5, 2018 included the following:

1) Advanced two exterior soil borings (B-1 and B-2) using direct push drilling methods near the OWS and former wash rack to depths of up to approximately 25 feet bgs.

2) Advanced three interior soil borings (B-3 through B-5) using direct push drilling methods adjacent to the former underground hydraulic lifts to depths of up to approximately 28 feet bgs.

3) Collected continuous soil samples from the borings, field screened the vapor headspace of the soil samples for total ionizable VOCs using a PID, and described the physical characteristics of the soil samples on boring logs.

4) Selected one soil sample from each soil boring, prepared, and submitted the samples under chain-of-custody documentation to a California-certified independent laboratory (SGS Laboratories). The samples collected near the OWS and former wash rack (B-1 and B-2) were submitted for analysis of VOCs via EPA Method 8260, PAHs via EPA Method 8270, and TPH-DRO and - ORO via EPA Method 8015. The samples collected near the former underground hydraulic lifts (B-3 through B-5) were submitted for analysis of TPH-DRO and -ORO via EPA Method 8015, PAHs via EPA Method 8270, and PCBs via EPA Method 8082.

5) Collected grab groundwater samples from temporary wells inserted into each boring, prepared, and submitted the samples under chain-of-custody documentation to SGS Laboratories. The samples collected near the OWS and former wash rack (B-1 and B-2) were submitted for analysis of VOCs via EPA Method 8260, PAHs via EPA Method 8270, and TPH-DRO and -ORO via EPA Method 8015. The samples collected near the former underground hydraulic lifts (B-3 through B-5) were submitted for analysis of TPH-DRO and -ORO via EPA Method 8015, PAHs via EPA Method 8270, and PCBs via EPA Method 8082.

Validation of the Conceptual Model

It is EBI's opinion that the findings and results of this Phase II ESA investigation are consistent with and support the assumptions of the Conceptual Model presented in Section 3.1.1. Sufficient investigation has been demonstrated to support sound conclusions regarding the presence of the target analytes.

Findings

The findings of the Phase II ESA indicated the following:

1) Soil stratigraphy observed during advancement of the soil borings consisted of dark brown to gray/brown clays with varying amounts of fine sand to 28 feet bgs, the total depth explored. Groundwater stabilized at depths of approximately 11 feet bgs in each of the temporary groundwater monitoring wells.

2) The soil sample results of analysis revealed the following:

   a) No PCBs were detected at concentrations greater than the laboratory method detection limits in the samples submitted for those analyses.

   b) No VOCs were detected in the soil samples collected from borings B-1 and B-2 except acetone, 2-butanone (MEK), methylene chloride, and toluene. None of the detected concentrations exceeded the corresponding DTSC-SLs for residential and commercial/industrial soil. It is noted that concentrations of acetone and toluene were detected in the associated laboratory method blank sample.

   c) TPH-DRO and TPH-ORO were detected at concentrations greater than the laboratory method detection limits in each of the soil samples submitted for analysis. None of the detected concentrations exceeded the corresponding Tier 1 ESLs except those detected in the 7.5 to 10 foot sample collected from boring B-3.

   d) The PAHs benzo(g,h,i)perylene and indeno(1,2,3-cd)pyrene were detected in the soil sample collected from boring B-2. None of the detected concentrations exceeded the corresponding DTSC-SLs for residential and commercial/industrial soil.

3) The groundwater sample results of analysis revealed the following:

   a) No PAHs or PCBs were detected at concentrations greater than the laboratory method detection limits in the samples submitted for those analyses.

   b) No VOCs were detected except m,p-xylenes and MTBE. None of the detected concentrations exceeded the corresponding regulatory screening values except MTBE in the sample collected from boring B-2.

   c) TPH-DRO and TPH-ORO were detected in each of the samples at concentrations that exceeded the corresponding Tier 1 ESLs for groundwater.

Conclusions

Based on the findings of this Phase II ESA, EBI concludes the following:

1) Significant subsurface impacts related to the historical uses of the OWS, former wash rack, and hydraulic lifts were not identified. The soil and groundwater results show that the contaminant concentrations (e.g., TPH-DRO, TPH-ORO, and MTBE) detected in the samples collected during EBI's 2018 Phase II ESA investigation are comparable to those collected by others during previous sampling events, which was issued a no further action (NFA) determination by the RWQCB in 2009.

6.0 RECOMMENDATIONS

Based on the findings and conclusions of this Phase II ESA, additional subsurface investigation does not appear to be warranted at this time. However, In the event any future redevelopment or excavation/construction activities are conducted at the Subject Property, further assessment of the soil should be conducted. In the event that impacted soil and/or groundwater is identified, the oversight of the subsurface activities should be conducted by an environmental professional and any impacted soil and/or groundwater should be handled/disposed in accordance with the applicable regulatory regulations.

RE: SGS North America Inc. - Orlando job FA59800 Reissue

Dear Mr. Deutsch,

The final report for job number FA59800 has been revised to exclude sample FA59800-1 from the final report.

SGS North America Inc. - Orlando apologies for any inconvenience this may have caused. Please feel free to contact us if we can be of further assistance.

Sincerely,

SGS North America, Inc. - Orlando

Run #2		

TPH Extractable

CAS No.	Compound	Result	RL	MDL	Units	Q
	TPH (C10-C28)	7.64	0.77	0.31	mg/l	
	TPH (> C28-C40)	7.40	0.77	0.31	mg/l	

CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits
84-15-1	o-Terphenyl	87%		50-131%

ND = Not detected MDL = Method Detection Limit
RL = Reporting Limit
E = Indicates value exceeds calibration range

J = Indicates an estimated value
B = Indicates analyte found in associated method blank
N = Indicates presumptive evidence of a compound

APPENDIX D
PROFESSIONAL QUALIFICATIONS

EBI Consulting
environmental | engineering | due diligence

Chad Bechtel, R.G.
Project Scientist
5316 West Brown Street
Glendale, AZ 85302
Mobile: 623.512.7138

SUMMARY OF EXPERIENCE

Chad Bechtel is an EBI Project Scientist. He has worked in the environmental field since 2005. His experience includes conducting environmental site assessments, asbestos surveys, lead-based paint surveys, limited indoor air quality evaluations, visual mold inspections, hazardous materials inspections, abatement/remediation project oversight and monitoring, and clearance inspections and sampling, as well as preparing reports and project documents and submitting documents for regulatory compliance. He has been assigned to projects involving remedial investigations with tasks including groundwater, soil and soil vapor sampling, monitoring well installations and development of wells and regulatory oversight of underground storage tank removals.

RELEVANT PROJECT EXPERIENCE

ASTM PHASE I ENVIRONMENTAL SITE ASSESSMENTS (ESAS): Conducted various Phase I Environmental Assessments for both private sector and municipal clients on properties throughout the western United States. Included visual inspections of properties, comprehensive photographic logs, interviews, review of historical records, and comprehensive written reports. The ESAS were performed in accordance with the American Society of Testing and Materials (ASTM) Standard Practices for Environmental Site Assessment requirements, and Mr. Bechtel meets the ASTM requirements of an Environmental Professional (EP).

PHASE II ENVIRONMENTAL SITE ASSESSMENTS: Conducted various Phase II Site Assessment projects to evaluate potential soil and/or groundwater contamination. Performed numerous field activities which included collection of soil, soil vapor, and groundwater samples, measurement of water levels, submittal of samples for laboratory analysis submittal under proper chain of custody, and prepared reports of the findings.

PHASE III ENVIRONMENTAL REMEDIATION OVERSIGHT: Provided regulatory oversight for the removal of contaminated groundwater and soil at various facilities including gasoline stations, shooting ranges and industrial facilities. Collected soil and groundwater samples for remediation progress reports and completion confirmation and prepared reports of the findings.

RADON SAMPLING: Followed strict guidelines for the placement and collection of radon samples in order to test for the presence of radon gas in indoor air at various apartment complexes and prepared reports of the findings.

LIMITED/COMPREHENSIVE ASBESTOS SURVEYS: Performed both Limited and Comprehensive inspections on buildings for asbestos containing materials (ACM) for planned renovations and/or demolitions. Assessed the condition of suspect ACM, either friable or non-friable, on interior and exterior portions of a facility and prepared reports of the findings.

ASBESTOS ABATEMENT OVERSIGHT: Performed regulatory oversight of asbestos abatement activities. Inspected worker training and fit test documents, containment construction and performed final visual clearance after abatement was completed. In addition, collected ambient air samples during abatement activities and clearance air samples following abatement activities and prepared reports of the findings.

NEPA ASSESSMENTS: Prepared numerous NEPA consultation reports, compliance audits, biological assessments and other various environmental assessments for telecommunications sites. Has helped various clients facilitate the Section 106 / environmental review process to ensure compliance with Federal Communications Commission (FCC) requirements under the National Environmental Policy Act (NEPA).

Ryan Deutsch, P.G.
SIR Program Manager
21 B Street
Burlington, MA 01803
Office: 303.641.9820 Mobile: 303.641.9820

SUMMARY OF EXPERIENCE

Mr. Ryan Deutsch is a licensed Professional Geologist and has over 11 years of professional consulting experience in finance and development due diligence for environmental site assessments, subsurface contamination investigation and remediation, and indoor air and vapor intrusion assessments on various types of commercial and residential properties for a diverse group of clients including lending institutions, investment and legal firms, special servicers, receiverships, property owners, government agencies, telecommunication companies, and corporations. Mr. Deutsch has successfully performed and managed over 1,200 technical environmental site assessments, contamination and remediation projects in several states.

At EBI Consulting, Mr. Deutsch has worked as a Program Manager since 2010 in the Site Investigation and Remediation (SIR) Group from his office in Denver, Colorado, and specializes in business development and project management including client proposals and cost estimates, contractor and field staff coordination and scheduling, and management of contamination investigation and remediation projects for real estate and telecommunication clients.

RELEVANT PROJECT EXPERIENCE

- Review site documentation and reports to develop project scope of work, budget, and client proposal, obtain cost estimates from specialized subcontractors, coordinate staffing and scheduling, and facilitate contamination investigation projects to determine presence and extent of contamination in soil, soil vapor, groundwater, and/or indoor air.
- Manage field staff and subcontractors, conduct and supervise soil, soil vapor, groundwater and indoor air sampling activities, determine appropriate laboratory analysis requirements, write and review subsurface investigation reports, and make recommendations to clients based on analytical results and state/federal reporting requirements.
- Organize personnel to conduct subsurface investigations involving the location of public and private utilities, obtaining required municipal and/or government agency permits, location of underground tanks, product lines, and utilities using geophysical methods, advancement and logging of soil borings, collection of soil, soil vapor and groundwater samples, installation and surveying of monitoring wells to calculate hydrogeologic gradients, removal and/or remediation of contaminated soil, groundwater, hydraulic equipment, and/or Underground Storage Tanks (usts).
- Analyze and interpret laboratory analytical data and state standard and guidance documents and communicate with state regulatory agencies and clients regarding identified contamination and requirements for reporting, additional investigation, and additional investigation, corrective action and remediation measures.
- Sample for suspect Asbestos Containing Materials (acms), Lead-Based Paint, Lead in Drinking Water, Radon, and Mold in commercial and residential structures.

- Perform all aspects of due diligence associated with environmental assessments and property condition assessments including research of historical property uses, field inspections, personnel interviews, material sampling and testing, database analysis, review of building plans and drawings, property and building component reserve and replacement cost estimates, and report writing.
- Managed and conducted environmental studies for roadway, corridor expansion, and bridge replacement projects for city, county, and state government agencies as well as private properties that were acquired by government and/or private land conservation groups for public parks and nature preserves.

EDUCATION

Bachelor of Science, Hydrogeology/Environmental Geology, University of Texas at Austin

PROFESSIONAL AFFILIATIONS

- OSHA 40-hour Hazardous Materials Safety Training
- U.S. EPA / Colorado A.H.E.R.A. / A.S.H.A.R.A. Asbestos Inspector Certification
- U.S. Department of Housing and Urban Development Visual Assessment Course for Lead-based Paint Inspection
- Scientist Member of the National Ground Water Association (NGWA)

Brett A. Bardsley, P.G.
Senior Project Manager
21 B Street
Burlington, MA 01803
Mobile: 425.985.7302

SUMMARY OF EXPERIENCE

Mr. Bardsley has over 18 years of experience in soil, soil gas, surface water, stormwater, and groundwater investigations and remediation; and hazardous and solid waste management. He has experience as a project manager and/or project geologist on numerous environmental site assessments including real estate transfer, refinancing, and re-use and re-purposing assessments.

Activities have included all aspects of preliminary site assessments and subsequent site investigations on properties with environmental contamination, hazardous waste investigations, industrial facility closures, and underground storage tanks (USTs) / aboveground storage tanks (ASTs), and remediation projects. Mr. Bardsley has also negotiated with and obtained closure from various regulatory agencies.

Mr. Bardsley has worked with corporate environmental officers, Wall Street lending institutions, legal counsels, investment companies, petroleum related clients and real estate brokers to develop strategies for managing environmental due diligence investigation for property acquisition and financing. Mr. Bardsley has also provided litigation support for different environmental projects; and on-call environmental compliance inspections on several Washington State Department of Transportation (WSDOT) roadway construction projects. He has participated in a variety of projects throughout the United States, but more specically in the western United States including Alaska, Arizona, California, Colorado, Idaho, Montana, New Mexico, Nevada, Oregon, Texas, Utah, and Washingon.

RELEVANT PROJECT EXPERIENCE

- Managed, conducted, and provided technical oversight for numerous phase I Environmental Site Assessments (ESAs) for sites throughout the western United States, as well as initial site assessments (ISAs) and hazardous substance liablity assessments (HSLAs) for sites in California, in accordance with ASTM E 1527.
- Designed and conducted/managed numerous subsequent Phase II assessments. Examples include former and existing dry cleaning facilities, aerospace engineering facilities, electrical manufacturing facilities, former and current automobile dealerships and/or repair shops, former and current aggregate mining sites, former shooting ranges, former and current hot mix plants (asphalt concrete), former burn dumps, and former hospitals (including the former Sutter Memorial Hospital in Sacramento, Califorina, which was repurposed for residential land uses).
- Managed, conducted, and provided technical oversight for the following:
  - Numerous petroleum-related facilities including retail gasoline service stations, bulk fuel facilities, pipeline projects, and automotive dealerships throughout the western United States.
  - A former coal mine that was backfilled with cement kiln dust (CKD) near Ravensdale, Washington.
  - Several "Rails to Trails" projects in California.
  - Various remediation and compliance projects including the following California sites: Port of Richmond, Marina Bay, North Hollywood Operable Unit (NHOU) Superfund Site, and the Pacific Gas and Electric's (PG&E's) Topock and Hinkley Compressor Station sites. Some of the remediation technologies have included large scale soil remediation projects, dual phase extraction systems, air sparge (AS)/soil vapor extraction (SVE) systems, and sub-slab depressurization (SSD) systems.

environmental | engineering | due diligence

Brett A. Bardsley, P.G.
Senior Project Manager
21 B Street
Burlington, MA 01803
Mobile: 425.985.7302

- Several Brownfields projects.
- Various solid waste facilities including active and former landfills including former burn dumps.

- Operated and maintained soil, soil gas, and groundwater remediation systems.
- Designed and conducted groundwater monitoring programs.
- Provided geologist services for both environmental and geotechnical subsurface investigations.

EDUCATION

- Bachelor of Arts in Geography (1995), University of Utah, Salt Lake City, Utah
- Bachelor of Arts in Geology (2000), University of Colorado, Boulder, Colorado

PROFESSIONAL REGISTRATIONS

- Professional Geologist, California #9170
- Professional Geologist, Oregon #G2167
- Professional Geologist, Washington #2623
- OSHA 29 CFR 1910.120 40 Hour HAZWOPER

PROFESSIONAL DEVELOPMENT COURSES

- *The Vapor Intrusion Risk Pathway: A Practical Guide* presented on May 8 and 9, 2018, in Santa Fe, New Mexico, by Hartman Environmental Geoscience Training. Instructor was Dr. Blayne Hartman with Hartman Environmental Geoscience. Equivalent to 13.0 professional development hours.
- *Advances in Assessment the Vapor Intrusion Pathway* presented on December 4, 2018, by Air & Waste Management Association in Phoenix, Arizona. Instructors were Robert Ettinger, Senior Principal Environmental Scientist, Geosyntec; and Dr. Loren Lund, Vapor Intrusion/Risk Assessment Leader, Jacobs. Equivalent to 3.5 professional development hours.
- *Vapor Intrusion, Remediation, and Site Closure* presented on December 5 and 6, 2018, by Air & Waste Management Association in Phoenix, Arizona. Equivalent to 10.0 professional development hours.

Work Plan Approval

WORK SITE ADDRESS	CITY	ZIP	EMAIL ADDRESS
316 N Juanita Avenue	Los Angeles	90004	cbechtel@ebiconsulting.com

NOTICE:

- WORK PLAN APPROVALS ARE VALID FOR 180 DAYS. 30 DAY EXTENSIONS OF WORK PLAN APPROVALS ARE CONSIDERED ON AN INDIVIDUAL (CASE-BY-CASE) BASIS AND MAY BE SUBJECT TO ADDITIONAL PLAN REVIEW FEES (HOURLY RATE AS APPLICABLE).
- WORK PLAN MODIFICATIONS MAY BE REQUIRED IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED AT THE SITE INSPECTION ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.
- WORK PLAN APPROVALS ARE LIMITED TO COMPLIANCE WITH THE CALIFORNIA WELL STANDARDS AND THE LOS ANGELES COUNTY CODE AND DOES NOT GRANT ANY RIGHTS TO CONSTRUCT, RENOVATE, OR DECOMMISSION ANY WELL. THE APPLICANT IS RESPONSIBLE FOR SECURING ALL OTHER NECESSARY PERMITS SUCH AS WATER RIGHTS, PROPERTY RIGHTS, COASTAL COMMISSION APPROVALS, USE COVENANTS, ENCROACHMENT PERMISSIONS, UTILITY LINE SETBACKS, CITY/COUNTY PUBLIC WORKS RIGHTS OF WAY, ETC.
- THIS PERMIT IS NOT COMPLETE UNTIL ALL OF THE FOLLOWING REQUIREMENTS ARE SIGNED BY THE DEPUTY HEALTH OFFICER. WORK SHALL NOT BE INITIATED WITHOUT A WORK PLAN APPROVAL STAMPED BY THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.

TO BE COMPLETED BY DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM:

X	WORK PLAN APPROVED FOR: 5 Soil Boring/Exp. Hole	**PERMIT NUMBER:**	SR0165541	**DATE:**	November 13, 2018

ADDITIONAL APPROVAL CONDITIONS:

- Work plan approval is issued for scope of work submitted to the Drinking Water Program. Any modifications to the scope of work will require additional work plan review.
- As discussed, please ensure the boring/exploration hole is backfilled within 24 hours of boring construction.
- Ensure to backfill using a tremie pipe under pressure or equivalent equipment with approved cement grout, proceeding upward from the bottom of the boring/exploration hole.
- Ensure soil borings are sealed per California Well Standards 74-90
  - Cement grout mix ratio of 5-6 gallons of water per 94-pound bag of Portland cement.
  - Up to 6% of Bentonite may be added to the cement-based mix.
  - No hydrated Bentonite chips
- Borings/Exploration holes must comply with all applicable requirements published in the California Well Standards (Bulletins 74-81 and 74-90) and the Los Angeles County Code, Title 11.

EXECUTIVE SUMMARY

AEI Consultants (AEI) was retained by Flexible PSH Solutions, Inc to conduct a Phase I ESA in conformance with AEI's contract and the scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) for the property located at 3812-3838 Oakwood Avenue, Los Angeles, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Sections 1.4, 1.5, and 1.6 of this report.

Pertinent subject property information is noted below:

PROPERTY INFORMATION	
Site Address(es)	3812-3838 Oakwood Avenue, Los Angeles, Los Angeles County, California 90004
Property ID (APN or Block/Lot)	5501-001-023, 5501-001-025
Location	South side of Oakwood Avenue and east side of North Juanita Avenue
Property Type	Mixed-Use (Office, Retail, and/or Multifamily)
SITE AND BUILDING INFORMATION	
Approximate Site Acreage/Source	0.28/Los Angeles County Assessor's Office (LACAO)
Number of Buildings	Four
Building Construction Date(s)	1924, 1939, 1963
Building Square Footage (SF)/Source	7,151/LACAO
Number of Floors/Stories	One (3812 1/2 and 3814 1/2 Oakwood Avenue) Two (3812 and 3820-3838 Oakwood Avenue)
Basement or Subgrade Area(s)	None identified
Number of Units	Five (Galindo Commissary office; apartment; two residential cottages, and Mackintosh & Mackintosh office)
Additional Improvements	Ashphalt- and concrete-paved parking areas
On-site Occupant(s)	Galindo Commissary (3812 Oakwood Avenue) with apartment above Residential cottages (3812 1/2 and 3814 1/2 Oakwood Avenue) Mackintosh & Mackintosh construction engineers (office) (3820-3838 Oakwood Avenue)
Current On-site Operations/Use	Overnight storage and occasional washing of food trucks (Galindo Commissary) Typical office/administrative operations (Mackintosh & Mackintosh) Residential (cottages)
Current Use of Hazardous Substances	None identified
REGULATORY INFORMATION	
Regulatory Database Listing(s)	None identified

A chronological summary of historical subject property information is as follows:

Date Range	Subject Property Description and Use (Historical Addresses)	Source(s)
1912-1919	Residential	Building Records, Sanborn Map
1924-1939	Current residences constructed (3812-3814 1/2 Oakwood Avenue)	Building Records, Assessor's Records, City Directories
1939-1963	Residential (3812-3818 Oakwood Avenue; 342-344 North Juanita Avenue)	Aerial Photographs, Building Records, City Directories, Sanborn Maps
1963-1969	Four residences (3812, 3812 1/2, 3814, 3814 1/2 Oakwood Avenue), and engineering office (3820-3838 Oakwood Avenue)	Aerial Photographs, Building Records, Sanborn Maps
1970-1995	Three residences (3812, 3812 1/2, 3814 1/2 Oakwood Avenue) and engineering office (3820-3838 Oakwood Avenue)	Aerial Photographs, Building Records, City Directories, Sanborn Map
1995-Present	Three residences (3812, 3812 1/2, 3814 1/2 Oakwood Avenue), office and food truck commissary (3812 Oakwood Avenue), and engineering office (3820-3838 Oakwood Avenue)	Aerial Photographs, Building Records, City Directories, Interviews, Onsite Observations

The immediately surrounding properties consist of the following:

Direction	Tenant/Use (Address)	Regulatory Database Listing(s)
North	Oakwood Avenue followed by 101 Freeway entrance, beyond which is the Delancey Street Foundation, a rehabilitation center (400 North Vermont Avenue)	None identified
East	Parking lot (316 North Juanita Avenue)	LUST, UST, SWEEPS UST, CA FID UST, HIST UST, HIST CORTESE, RCRA-LQG
South	MZ Collision Center (340 North Juanita Avenue)	None identified
West	North Juanita Avenue followed by multi-family residential (335 North Juanita Avenue)	None identified

If the surrounding properties are listed in the regulatory database, please refer to Section 5.1 for discussion.

FINDINGS

Recognized Environmental Condition (REC) is defined by the ASTM Standard Practice E1527-13 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

- AEI did not identify evidence of RECs during the course of this assessment.

Controlled Recognized Environmental Condition (CREC) is defined by the ASTM Standard Practice E1527-13 as a past release of hazardous substances or petroleum products that has been

addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- AEI did not identify evidence of CRECs during the course of this assessment.

Historical Recognized Environmental Condition (HREC) is defined by the ASTM Standard Practice E1527-13 as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls.

- AEI did not identify evidence of HRECs during the course of this assessment.

Other Environmental Considerations (OEC) warrant discussion, but do not qualify as RECs as defined by the ASTM Standard Practice E1527-13. These include, but are not limited to, de minimis conditions and/or environmental considerations such as the presence of ACMs, LBP, radon, mold, and lead in drinking water, which can affect the liabilities and financial obligations of the client, the health and safety of site occupants, and the value and marketability of the subject property.

- A storm drain and three-chambered clarifier system are present on the central portion of 3812-3814 1/2 Oakwood Avenue, adjacent to the Galindo Commissary food truck parking area. According to Mr. Galindo, the clarifier was installed in 1995, and is used for occasional food truck rinsing. No evidence of wash detergents or chemicals was observed onsite. Reportedly, engine and undercarriage washing are not performed onsite. While some diluted concentrations of the petroleum products and hazardous materials used on site may be present in the waste streams discharged to the drain, they drain system is not expected to represent a significant environmental concern at this time.
- Due to the age of the subject property buildings, there is a potential that ACMs are present. The observed suspect ACMs at the subject property were in good condition at the time of the site reconnaissance and are not expected to pose a health and safety concern to the occupants of the subject property at this time. Based on the potential presence of ACMs, AEI recommends the implementation of an O&M Plan which stipulates that the repair and maintenance of damaged materials should be performed to protect the health and safety of the building occupants. In the event that building renovation or demolition activities are planned, a thorough asbestos survey to identify asbestos-containing building materials is required in accordance with the EPA NESHAP 40 CFR Part 61 prior to demolition or renovation activities that may disturb suspect ACMs.
- Due to the age of the subject property buildings, there is a potential that LBP is present. All painted surfaces were observed in good condition and are not expected to pose a health and safety concern to the occupants of the subject property at this time. However, based on the potential presence of LBP and residential nature of occupancy, AEI recommends the property owner implement an LBP O&M Plan to protect the health and safety of the building occupants. Local regulations may apply to LBP in association with building demolition/renovations and worker/occupant protection. Actual material samples would need to be collected or an x-ray fluorescence (XRF) survey performed in order to determine if LBP is present. It should be noted that construction activities

that disturb materials or paints containing any amount of lead may be subject to certain requirements of the OSHA lead standard contained in 29 CFR 1910.1025 and 1926.62.

Conclusions, Opinions, and Recommendations

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) of 3812-3838 Oakwood Avenue, Los Angeles, Los Angeles County, California, the *subject property*. Any exceptions to, or deletions from, this practice are described in Sections 1.4, 1.5, and 1.6 of this report.

AEI did not identify evidence of RECs or CRECs in connection with the subject property during the course of this assessment. AEI recommends no further investigation for the subject property at this time.

1.0 INTRODUCTION

This report documents the methods and findings of the Phase I Environmental Site Assessment performed in conformance with AEI's contract and scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) for the property located at 3812-3838 Oakwood Avenue, Los Angeles, Los Angeles County, California (Appendix A: Figures and Appendix B: Property Photographs).

1.1 Scope of Work

The purpose of the Phase I ESA is to assist the client in identifying potential RECs, in accordance with ASTM E1527-13, associated with the presence of any hazardous substances or petroleum products, their use, storage, and disposal at and in the vicinity of the subject property. Property assessment activities focused on: 1) a review of federal, state, tribal, and local databases that identify and describe underground fuel tank sites, leaking underground fuel tank sites, hazardous waste generation sites, and hazardous waste storage and disposal facility sites within the ASTM approximate minimum search distance; 2) a property and surrounding site reconnaissance, and interviews with the past and present owners and current occupants and operators to identify potential environmental contamination; and 3) a review of historical sources to help ascertain previous land use at the site and in the surrounding area.

1.2 Additional Services

Other Environmental Considerations such as ACMs, LBP, lead in drinking water, radon, mold, and wetlands can result in business environmental risks for property owners which may disrupt current or planned operations or cash flow and are generally beyond the scope of a Phase I assessment as defined by ASTM E1527-13. Based upon the agreed-on scope of services this ESA did not include subsurface or other invasive assessments, business environmental risks, or other services not specifically identified and discussed herein.

1.3 Significant Assumptions

The following assumptions are made by AEI in this report. AEI relied on information derived from secondary sources including governmental agencies, the client, designated representatives of the client, property contact, property owner, property owner representatives, computer databases, and personal interviews. AEI has reviewed and evaluated the thoroughness and reliability of the information derived from secondary sources including government agencies, the client, designated representatives of the client, property contact, property owner, property owner representatives, computer databases, or personal interviews. It appears that all information obtained from outside sources and reviewed for this assessment is thorough and reliable. However, AEI cannot guarantee the thoroughness or reliability of this information.

Groundwater flow, unless otherwise specified by on-site well data or well data from the subject property or nearby sites, is inferred from contour information depicted on the USGS topographic maps. AEI assumes the property has been correctly and accurately identified by the client, designated representative of the client, property contact, property owner, and property owner's representatives.

1.4 LIMITATIONS

Property conditions, as well as local, state, tribal, and federal regulations can change significantly over time. Therefore, the recommendations and conclusions presented as a result of this assessment apply strictly to the environmental regulations and property conditions existing at the time the assessment was performed. Available information has been analyzed using currently accepted assessment techniques and it is believed that the inferences made are reasonably representative of the property. AEI makes no warranty, expressed or implied, except that the services have been performed in accordance with generally accepted environmental property assessment practices applicable at the time and location of the assessment.

Considerations identified by ASTM as beyond the scope of a Phase I ESA that may affect business environmental risk at a given property include the following: ACMs, radon, LBP, lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, mold, and high voltage lines. These environmental issues or conditions may warrant assessment based on the type of the property transaction; however, they are considered non-scope issues under ASTM Standard Practice E1527-13.

If requested by the client, these non-scope issues are discussed herein. Otherwise, the purpose of this assessment is solely to satisfy one of the requirements for qualification of the innocent landowner defense, contiguous property owner or bona fide prospective purchaser under CERCLA. ASTM Standard Practice E1527-13 and the United States EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) constitute the "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in:

1. 42 U.S.C. § 9601(35)(B), referenced in the ASTM Standard Practice E1527-13.
2. Sections 101(35)(B) (ii) and (iii) of CERCLA and referenced in the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312).
3. 42 U.S.C. § 9601(40) and 42 U.S.C. § 9607(q).

The Phase I Environmental Site Assessment is not, and should not be construed as, a warranty or guarantee about the presence or absence of environmental contaminants that may affect the property. Neither is the assessment intended to assure clear title to the property in question. The sole purpose of assessment into property title records is to ascertain a historical basis of prior land use. All findings, conclusions, and recommendations stated in this report are based upon facts, circumstances, and industry-accepted procedures for such services as they existed at the time this report was prepared (i.e., federal, state, and local laws, rules, regulations, market conditions, economic conditions, political climate, and other applicable matters). All findings, conclusions, and recommendations stated in this report are based on the data and information provided, current subject property use, and observations and conditions that existed on the date and time of the property reconnaissance.

Responses received from local, state, or federal agencies or other secondary sources of information after the issuance of this report may change certain facts, findings, conclusions, or circumstances to the report. A change in any fact, circumstance, or industry-accepted procedure upon which this report was based may adversely affect the findings, conclusions, and recommendations expressed in this report.

AEI's limited radon screening, if included, is intended to provide a preliminary screening to evaluate the potential presence of elevated radon concentrations at the site. The proposed scope is not intended to define the full extent of the presence of radon at the subject property. As such, the results should be used for lending purposes only. The recommendations and conclusions presented as a result of the limited preliminary radon screening apply strictly to the property conditions existing at the time the sampling was performed. The sample analytical results are only valid for the time, place, and condition of the site at the time of collection and AEI does not warrant that the results will be repeatable or are representative of past or future conditions.

1.5 Limiting Conditions/Deviations

The performance of this assessment was limited by the following:

- While additional assessments may have been conducted on the subject property, these documents must be provided for AEI's review in order for the information to be summarized/included in this report. Please refer to Section 6.3 for a summary of previous reports and other documentation provided to AEI during this assessment.
- The User did not complete the ASTM User Questionnaire or provide the User information to AEI. AEI assumes that qualification for the LLPs is being established by the User in documentation outside of this assessment.

1.6 Data Failure and Data Gaps

According to ASTM E1527-13, data gaps occur when the Environmental Professional is unable to obtain information required by the Standard, despite good faith efforts to gather such information. Pursuant to ASTM E1527-13, only significant data gaps, defined as those that affect the ability of the Environmental Professional to identify RECs, need to be documented.

Data failure is one type of data gap. According to ASTM E1527-13, data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met. Pursuant to ASTM E1527-13, historical sources are required to document property use back to the property's first developed use or back to 1940, whichever is earlier, or periods of five years or greater.

1.6.1 Data Failure

The following data failure was identified during the course of this assessment:

Data Failure	The earliest historical resource obtained during this assessment was a building record from 1912 indicating that the subject property was developed with a residence. The lack of historical sources for the subject property dating back to first developed use represents historical data source failure. However, as it is assumed that the subject property would have been previously used for residential purposes, if not undeveloped, this data failure is not expected to significantly alter the findings of this assessment.
Information/Sources Consulted	City directories, Sanborn fire insurance maps, aerial photographs, agency records, interviews

1.6.2 Significant Data Gaps

AEI did not identify significant data gaps which affected our ability to identify RECs.

1.7 Reliance

All reports, both verbal and written, are for the benefit of Flexible PSH Solutions, Inc. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of AEI. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with AEI granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against AEI, its officers, employees, vendors, successors or assigns. Reliance is provided in accordance with AEI's contract and Terms and Conditions executed by Flexible PSH Solutions, Inc on February 21, 2019. The limitation of liability defined in the Terms and Conditions is the aggregate limit of AEI's liability to the client and all relying parties.

2.0 SITE AND VICINITY DESCRIPTION

2.1 SITE LOCATION AND DESCRIPTION

PROPERTY INFORMATION	
Site Address(es)	3812-3838 Oakwood Avenue, Los Angeles, Los Angeles County, California 90004
Property ID (APN or Block/Lot)	5501-001-023, 5501-001-025
Location	South side of Oakwood Avenue and east side of North Juanita Avenue
Property Type	Mixed-Use (Office, Retail, and/or Multifamily)
SITE AND BUILDING INFORMATION	
Approximate Site Acreage/Source	0.28/Los Angeles County Assessor's Office (LACAO)
Number of Buildings	Four
Building Construction Date(s)	1924, 1939, 1963
Building Square Footage (SF)/Source	7,151/LACAO
Number of Floors/Stories	One (3812 1/2 and 3814 1/2 Oakwood Avenue) Two (3812 and 3820-3838 Oakwood Avenue)
Basement or Subgrade Area(s)	None identified
Number of Units	Five (Galindo Commissary office; apartment; two residential cottages, and Mackintosh & Mackintosh office)
Additional Improvements	Ashphalt- and concrete-paved parking areas
On-site Occupant(s)	Galindo Commissary (3812 Oakwood Avenue) with apartment above Residential cottages (3812 1/2 and 3814 1/2 Oakwood Avenue) Mackintosh & Mackintosh construction engineers (office) (3820-3838 Oakwood Avenue)
Current On-site Operations/Use	Overnight storage and occasional washing of food trucks (Galindo Commissary) Typical office/administrative operations (Mackintosh & Mackintosh) Residential (cottages)
Current Use of Hazardous Substances	None identified
REGULATORY INFORMATION	
Regulatory Database Listing(s)	None identified

2.2 ON-SITE UTILITIES

Utility	Source/System Information
Heating System	Natural gas
Cooling System	Electricity
Potable Water	LACDPW
Sewage Disposal/Treatment	City of Los Angeles

2.3 Site and Vicinity Characteristics

The subject property is located in a residential, commercial, and light industrial area of Hollywood, a neighborhood within the City of Los Angeles, California. The immediately surrounding properties consist of the following:

Direction	Tenant/Use (Address)	Regulatory Database Listing(s)
North	Oakwood Avenue followed by 101 Freeway entrance, beyond which is the Delancey Street Foundation, a rehabilitation center (400 North Vermont Avenue)	None identified
East	Parking lot (316 North Juanita Avenue)	LUST, UST, SWEEPS UST, CA FID UST, HIST UST, HIST CORTESE, RCRA-LQG
South	MZ Collision Center (340 North Juanita Avenue)	None identified
West	North Juanita Avenue followed by multi-family residential (335 North Juanita Avenue)	None identified

If the surrounding properties are listed in the regulatory database, please refer to Section 5.1 for discussion.

2.4 Physical Setting

Geologic Unit: Description/Source	Qoa: Dissected older alluvial gravel and sand, undeformed, age late Pleistocene/USGS and United States Department of the Interior
Soil Series: Description/Source	According to the United States Department of Agriculture's Report and General Soil Map for Los Angeles County, the area surrounding the subject property is underlain by soils of the Ramona-Placentia association. The soils of this association occur only in the Los Angeles basin. They are on gently sloping terraces between elevations from near sea level and 1,300 feet. Ramona soils in the Los Angeles basin are over 60 inches deep, are well drained and have slow subsoil permeability. They are characterized by brown to reddish-brown, heavy loam, loam, or sandy loam surface layers about 18 inches thick. Subsoils are brown to reddish-brown, dense clay loam or clay about 30 inches thick. The substratum is brown to reddish-brown loam or light clay loam. Some subsoils may be stratified beds of silt to sand. Areas with up to 60 percent by volume stones and cobbles also occur. Available water holding capacity is 8.0 to 10.0 inches for 60 inches of soil depth. Water holding capacity is reduced by the percentage of coarse fragments in those areas containing stones and cobbles. Placentia soils are over 18 inches deep, are moderately well drained and have very slow subsoil permeability. They are characterized by brown to reddish-brown loam or sandy loam surface layers abruptly underlain by a dense, dark reddish-brown, clay loam subsoil at about 18 inches. The substratum occurs at about 48 inches and is brown loam. The dense subsoil restricts the movement of air and water and the development of roots and is therefore considered limiting for effective soil depth. Occasional areas have subsoils composed mainly of gravelly deposits and some have an iron-cemented hardpan. Available water-holding capacity is about 2.0 to 2.5 inches for 18 inches of effective soil depth.

Groundwater Flow Direction/Source	Southeast/Topographic map interpretation
Estimated Depth to Groundwater/ Source	10-13 feet bgs/Groundwater monitoring data for east-adjacent site at 316 North Juanita Avenue, obtained from the RWQCB
Surface waters on the subject property or adjacent sites	None
Additional notes	None

Note: Groundwater flow direction can be influenced locally and regionally by the presence of local wetland features, surface topography, recharge and discharge areas, horizontal and vertical inconsistencies in the types and location of subsurface soils, and proximity to water pumping wells. Depth and gradient of the water table can change seasonally in response to variation in precipitation and recharge, and over time, in response to urban development such as storm water controls, impervious surfaces, pumping wells, cleanup activities, dewatering, seawater intrusion barrier projects near the coast, and other factors.

3.0 HISTORICAL REVIEW OF SITE AND VICINITY

Reasonably ascertainable standard historical sources as outlined in ASTM Standard E1527-13 were used to determine previous uses and occupancies of the subject property that are likely to have led to RECs in connection with the subject property. A chronological summary of historical data found, including but not limited to aerial photographs, historical city directories, Sanborn fire insurance maps, and agency records, is as follows:

Date Range	Subject Property Description and Use (Historical Addresses)	Source(s)
1912-1919	Residential	Building Records, Sanborn Map
1924-1939	Current residences constructed (3812-3814 1/2 Oakwood Avenue)	Building Records, Assessor's Records, City Directories
1939-1963	Residential (3812-3818 Oakwood Avenue; 342-344 North Juanita Avenue)	Aerial Photographs, Building Records, City Directories, Sanborn Maps
1963-1969	Four residences (3812, 3812 1/2, 3814, 3814 1/2 Oakwood Avenue), and engineering office (3820-3838 Oakwood Avenue)	Aerial Photographs, Building Records, Sanborn Maps
1970-1995	Three residences (3812, 3812 1/2, 3814 1/2 Oakwood Avenue) and engineering office (3820-3838 Oakwood Avenue)	Aerial Photographs, Building Records, City Directories, Sanborn Map
1995-Present	Three residences (3812, 3812 1/2, 3814 1/2 Oakwood Avenue), office and food truck commissary (3812 Oakwood Avenue), and engineering office (3820-3838 Oakwood Avenue)	Aerial Photographs, Building Records, City Directories, Interviews, Onsite Observations

AEI did not identify potential environmental concerns in association with the current or historical use of the subject property.

If available, copies of historical sources are provided in the report appendices.

3.1 AERIAL PHOTOGRAPHS

AEI reviewed aerial photographs of the subject property and surrounding area. A search was made of the EDR collection of aerial photographs. Aerial photographs were reviewed for the following years:

Year(s)	Subject Property Description	Adjacent Site Descriptions
1928, 1938	The two current cottage residences (3812 and 3814 Oakwood Avenue) are visible on the eastern portion of the site. The northwestern portion also appears developed with single-family residences.	NORTH: A road is visible in the approximately location of Oakwood Avenue, followed by what appear to be residences and/or commercial buildings EAST: Appears developed with residences SOUTH: Appears developed with residences WEST: A road is visible in the approximately location of North Juanita Avenue, followed by what appear to be residences
1948	The current residence and garage/office structure is visible at 3814 1/2 Oakwood Avenue)	No significant changes visible
1952	No significant changes visible	NORTH: Oakwood Avenue is visible in its present location, followed by the current freeway entrance ramp and vacant land EAST: No significant changes visible SOUTH: No significant changes visible WEST: No significant changes visible
1964, 1972, 1980	The current commercial structure and residences/office area visible	NORTH: No significant changes visible EAST: Appears in its current configuration as an asphalt-paved parking lot SOUTH: The current commercial/light industrial structures are visible WEST: Appears developed with a multi-family residence and a parking lot
1985	No significant changes visible	NORTH: The current multi-family/ rehabilitation facility appears under construction EAST: No significant changes visible SOUTH: No significant changes visible WEST: No significant changes visible
1989	No significant changes visible	NORTH: The current multi-family/ rehabilitation facility is visible EAST: No significant changes visible SOUTH: No significant changes visible WEST: Appears vacant and graded
1994, 2005, 2010	No significant changes visible	NORTH: No significant changes visible EAST: No significant changes visible SOUTH: No significant changes visible WEST: Appears paved and utilized as a parking lot
2012, 2014, 2016	No significant changes visible	NORTH: No significant changes visible EAST: No significant changes visible SOUTH: No significant changes visible WEST: The current multi-family structure is visible

AEI did not identify potential environmental concerns in association with the historical use of the subject property during the aerial photograph review.

3.2 Sanborn Fire Insurance Maps

Sanborn Fire Insurance maps were developed in the late 1800s and early 1900s for use as an assessment tool for fire insurance rates in urbanized areas. A search was made of the EDR collection of Sanborn Fire Insurance maps.

The following maps were reviewed:

Year(s)	Subject Property Description (Listed Address)	Adjacent Site Descriptions
1919	The eastern portion is shown with a small dwelling at 3812 Oakwood Avenue. The northwestern portion is shown with portions of small residences at 3816 and 3818 Oakwood Avenue, and 342 and 344 North Juanita Avenue	NORTH: Oakwood Avenue is shown in its approximate current location, followed by vacant lots and greenhouse structures EAST: Depicted with dwellings and a shop SOUTH: Depicted with dwellings WEST: Depicted with North Juanita Avenue followed by dwellings
1950, 1955	The eastern portion is depicted with the current dwellings at 3812, 3812 1/2, and 3814 1/2 Oakwood Avenue, and an additional dwelling at 3814 Oakwood Avenue. The northwest portion is depicted with portions of dwellings at 3816, 3816 1/2, and 3818 Oakwood Avenue, and 342 North Juanita Avenue	NORTH: Depicted with Oakwood Avenue followed by an entrance ramp for the Hollywood Freeway EAST: Depicted with dwellings and a small Venetian blinds manufacturing shop SOUTH: Depicted with dwellings WEST: Depicted with dwellings and a vacant lot
1956	No significant changes depicted	NORTH: Oakwood Avenue appears in its current configuration EAST: The former Venetian blinds manufacturing shop is now labeled "pottery molding" SOUTH: No significant changes depicted WEST: No significant changes depicted
1957, 1959	No significant changes depicted	NORTH: No significant changes depicted EAST: Shown as vacant lots SOUTH: Depicted with dwellings and vacant lots WEST: No significant changes depicted
1960, 1961	No significant changes depicted	NORTH: No significant changes depicted EAST: No significant changes depicted SOUTH: Depicted with dwellings and the Pacific Telephone & Telephone Company's service yard WEST: No significant changes depicted
1966, 1968, 1969	The northwest portion is depicted with the current office building (3820 Oakwood Avenue/344 North Juanita Avenue), with auto garages on the basement level	NORTH: No significant changes depicted EAST: No significant changes depicted SOUTH: Depicted with a glass warehouse and the Pacific Telephone & Telephone Company's service yard WEST: No significant changes depicted

Year(s)	Subject Property Description (Listed Address)	Adjacent Site Descriptions
1970	The former dwelling at 3814 Oakwood Avenue is no longer visible	No significant changes depicted

AEI did not identify potential environmental concerns in association with the historical use of the subject property during the Sanborn map review.

3.3 City Directories

A search of historical city directories was conducted for the subject property utilizing EDR. No potential tenants of concern were identified based on AEI's review of the historical city directories. Directories were reviewed in approximate five-year increments from 1920 to 2014. The first listing for the subject property appeared in 1924. Please refer to the appendices for a complete list of historical subject property tenants identified by EDR.

Year(s)	Address - Occupant Listed
1924	3816, 3818 Oakwood; 342, 344 N Juanita: residential
1929	3816 Oakwood; 342, 344 N Juanita: residential
1933	3812, 3814, 3816, 3818 Oakwood; 344 N Juanita: residential
1937	3812, 3814, 3816, 3818 Oakwood; 342, 344 N Juanita: residential
1942	3812, 3814, 3818 Oakwood; 342, 344 N Juanita: residential
1951	3812, 3814 Oakwood: residential
1976	3812 Oakwood: residential 3820 Oakwood: Sterges Alfred Associates industrial designers 3838 Oakwood: Mackintosh & Mackintosh engineers; Nestaway Products; Rollway Grandstand Corp.; Stanley Construction Corp.; Urban Architects & Planners Inc.
1981	3812, 3814 1/2 Oakwood: residential 3820 Oakwood: Sterges Alfred Associates industrial designers 3838 Oakwood: Mackintosh & Mackintosh engineers; Rollway Grandstand Corp.; Stanley Construction Corp.
1986	3812, 3820 Oakwood: Sterges Alfred Associates industrial designers 3838 Oakwood: Mackintosh & Mackintosh engineers; Rollway Grandstand Corp.
1990	3838 Oakwood: Mackintosh & Mackintosh engineers; Rollway Grandstand Corp.
2000	3812 Oakwood: Galindo, Juan; Galindo Andrea 3838 Oakwood: Mackintosh & Mackintosh engineers; Rollway Grandstand Corp.
2006	3812 Oakwood: Galindo's Commissary 3814 Oakwood: residential 3838 Oakwood: Mackintosh & Mackintosh engineers
2010, 2014	3812 Oakwood: Galindo's Commissary

AEI did not identify potential environmental concerns in association with the historical use of the subject property during the city directory review.

3.4 Historical Topographic Maps

In an attempt to close any data failure, AEI reviewed historical topographic maps at NETR's www.historicaerials.com. No additional historical information was obtained from available topographic maps.

3.5 CHAIN OF TITLE

Based on the quality of information obtained from other sources, a chain of title search was not performed as part of this assessment.

4.0 REGULATORY AGENCY RECORDS REVIEW

Local and state agencies, such as environmental health departments, fire prevention bureaus, and building and planning departments are contacted to identify any current or previous reports of hazardous substance use, storage, and/or unauthorized releases that may have impacted the subject property. In addition, information pertaining to AULs, defined as legal or physical restrictions, or limitations on the use of, or access to, a site or facility, is requested.

4.1 LOCAL ENVIRONMENTAL HEALTH DEPARTMENT AND/OR STATE ENVIRONMENTAL AGENCY

Agency	Date Contacted	Method of Contact	Name & Title of Contact	Agency Response
Los Angeles County Fire Department (LACFD)	March 1, 2019	Website	N/A	No records on file

4.2 FIRE DEPARTMENT

Agency	Date Contacted	Method of Contact	Name & Title of Contact	Agency Response
Los Angeles City Fire Department (LAFD)	March 1, 2019	Website	N/A	No records on file

4.3 BUILDING DEPARTMENT

Agency	Date Contacted	Method of Contact	Name & Title of Contact	Agency Response
Los Angeles Department of Building and Safety (LADBS)	March 1, 2019	Website	N/A	Records discussed below

Records Summary

Year(s)	Owner/Applicant	Description of Permit and Building Use
1912	Barry F Holtman	Erect Class "D" five-room residence (344 N Juanita)
1914	Mrs. Carrie Carr Holtian	Addition to dwelling (342-344 N Juanita) Plumbing permit / residence (3816 Oakwood)
1924	Mrs. HL Olincy	Construct Class "D" residences (3812 1/2, 3814, and 3814 1/2 Oakwood)
1934	H Olincy	Add porch to home (3812 Oakwood)
1939	Olincy	Construct Class "D" building - four garages with residence above; add tile bath and kitchen / residence (3814 1/2 Oakwood)
1961	Maurice G Gekler	Add wine cellar in garage; addition to wine cellar / residence (3812 Oakwood)
1963	Stanley Construction	Demolish residence (3816 Oakwood) Construct new brick and concrete office building (344 N Juanita)
1964	Stanley Construction	Interior partitions / office (344 N Juanita)
1969	Mr. Gekler	Demolish dwelling (3814 Oakwood)
1974	Albyn & Charles Mackintosh	Interior alterations / office (3820 Oakwood)

Year(s)	Owner/Applicant	Description of Permit and Building Use
1984	Charles Mackintosh	Add second floor and stairway / office (3838 Oakwood)
1995	Juan Galindo	Convert single-family dwelling to storage; convert garages to office (3812 Oakwood)
2006	Galindo, Juan and Dora A	Convert single-family dwelling to office (3812 Oakwood)
2018	Mackintosh & Mackintosh Inc.	Reroof office (3838 Oakwood)

Evidence indicating current or prior use or storage of hazardous substances was not on file for the subject property with the LADBS.

4.4 Planning Department

Agency	Date Contacted	Method of Contact	Name & Title of Contact	Agency Response
Los Angeles Planning Division (LAPD)	March 1, 2019	Website	N/A	No evidence indicating the existence of AULs on file for the subject property

4.5 Assessor's Office

Agency	Date Contacted	Method of Contact	Name & Title of Contact	Agency Response
Los Angeles County Assessor's Office	March 1, 2019	Website	N/A	Information obtained is discussed below

Records Summary

APN	5501-001-023, 5501-001-025
Acreage	0.28 acres
Construction Date	1924 (3812 1/2 and 3814 1/2 Oakwood) 1939 (3812 Oakwood) 1963 (3838 Oakwood)
Building Square Footage	7,151 square feet total
Current Owner	Mr. Juan Galindo (3812-3814 1/2 Oakwood) Mr. Steven Povenghi (3838 Oakwood)

4.7 Oil and Gas Wells

Agency	Date Referenced	Resource	Oil or gas wells located within 500 feet of the subject property
California Department of Oil, Gas and Geothermal Resources (CA DOGGR)	March 8, 2019	CA DOGGR Map	No

4.8 Oil and Gas Pipelines

Agency	Date Referenced	Resource	Pipelines located within 500 feet of the subject property
National Pipeline Mapping System (NPMS)	March 8, 2019	NPMS Public Map Viewer	No

4.9 State Environmental Superliens

The NETR Online Environmental Lien and AUL State Statutes website was visited to determine if the State of California has an environmental superlien which would allow environmental authorities the right to place a first priority lien on the subject property.

According to the NETR Online Environmental Lien and AUL State Statutes website, the State of California does not appear to allow environmental superliens.

4.10 State Property Transfer Laws

In accordance with our approved scope of services, AEI did not assess whether the subject property is subject to any state property transfer laws.

5.0 REGULATORY DATABASE RECORDS REVIEW

AEI contracted EDR to conduct a search of publicly available information from federal, state, tribal, and local databases containing known and suspected sites of environmental contamination and sites of potential environmental significance. Data gathered during the current regulatory database search is compiled by EDR into one regulatory database report. Location information for listed sites is designated using geocoded information provided by federal, state, or local agencies and commonly used mapping databases with the exception of "Orphan" sites. Due to poor or inadequate address information, Orphan sites are identified but not geocoded/mapped by EDR, rather, information is provided based upon vicinity zip codes, city name, and state. The number of listed sites identified within the approximate minimum search distance from the federal and state environmental records database listings specified in ASTM Standard E1527-13 is summarized in Section 5.1, along with the total number of Orphan sites. A copy of the regulatory database report, which includes detailed descriptions of the databases noted below, is included in Appendix C of this report.

In determining if a listed site is a potential environmental concern to the subject property, AEI generally applies the following criteria to classify the site as lower potential environmental concern: 1) the site only holds an operating permit (which does not imply a release), 2) the site's distance from, and/or topographic position relative to, the subject property, and/or 3) the site has recently been granted "No Further Action" by the appropriate regulatory agency.

Regulatory database listings associated with the subject property, adjacent site(s) and/or nearby sites of concern that were determined to warrant additional discussion are identified and further discussed in Section 5.1.

5.1 RECORDS SUMMARY

ORPHAN	N/A	2			
ADDITIONAL ENVIRONMENTAL RECORD SOURCES	SP/ADJ	7		✔	

Facility Name	Pacific Bell
Address	3804 Oakwood Avenue
Distance & Direction	Adjacent to the east
Hydrologic Position	Cross- to downgradient
Databases Listed	LUST, UST, CA FID UST, HIST CORTESE, SWEEPS UST
Comments	According to listing details and records with the RWQCB, this site was historically equipped with two 300-gallon diesel USTs. In 1988, a release of diesel was found to have impacted an aquifer used for drinking water supply, and an unauthorized release case was opened (RWQCB Case 900040307). Case closure was granted on October 17, 1996. No further case details or records were available with the RWQCB GeoTracker resource. Based on the regulatory status and the inferred direction of groundwater flow, the former diesel release at this location is not expected to constitute a significant environmental concern.

Facility Name	Belmont/Hollywood No. 1
Address	Oakwood Avenue/Juanita Avenue
Distance & Direction	Unknown
Hydrologic Position	Unknown
Databases Listed	ENVIROSTOR, SCH
Comments	The property at this location, which refers to the intersection to the northwest of the subject property, was identified as an EnviroStor/School Investigation Site. In Los Angeles County, existing and potential school sites are investigated for potential soil contamination, such as lead and other contaminants. Although these sites are frequently listed on the EnviroStor database, the listings do not necessarily correspond to a subsurface release. According to EnviroStor details, this 1.2-acre site was investigated for potential Endrin lead in soils. In 2000, a Phase I was completed, and an Environmental Oversight Agreement was accepted. The current status as of 2002 was "inactive - action required". Due to the soil-based nature of the investigation, any potential lead or other heavy metals found at this location would not be expected to constitute a significant environmental concern to the subject property. The listings for this site are therefore not expected to constitute a significant enivronmental concern.

Facility Name	Pacific Bell

Address	316 North Juanita Avenue
Distance & Direction	Adjacent to the east
Hydrologic Position	Cross- to downgradient
Databases Listed	RCRA-LQG, UST, SWEEPS UST, HIST UST, CA FID UST, LUST, HIST CORTESE
Comments	Listing details indicate that this property was historically equipped with two 12,000-gallon gasoline USTs that were installed in 1979, and one 550-gallon waste oil UST that was installed in 1966. In 1989, a release of gasoline was found to have impacted an aquifer used for drinking water supply, and an unauthorized release case was opened (RWQCB Case 900040225). Case closure was granted on May 23, 1996. No further case details or records were available with the RWQCB GeoTracker resource. A second release was reported at this location in 2004, and a new LUST case was opened for the site (900040225A). According to case details, a 12,000-gallon gasoline UST was removed on November 10, 2004. Groundwater was found between 10 and 13 feet bgs, and was found to be contaminated with significant levels of total petroleum hydrocarbons as gasoline (TPHg) and methyl tert-butyl ether (MTBE). A total of five groundwater monitoring wells were installed. By 2008, levels of TPHg and TPH as diesel (TPHd) had fallen to non-detect levels, and MTBE was detected at levels below the Maximum Contaminant Limit (MCL). Case closure was granted by the RWQCB on April 6, 2009. Based on the regulatory status, the former releases at this site are not expected to constitute a significant environmental concern.

Facility Name	Applied Graphics Tech, Gore Gr
Address	340 North Madison Avenue
Distance & Direction	0.065 miles east
Hydrologic Position	Cross- to downgradient
Databases Listed	EnviroStor, HAZNET, EMI, RCRA-LQG
Comments	According to regulatory details, this site was identified as an EnviroStor "tiered permit". Tiered permit sites are documented handlers of hazardous materials/ wastes, and do not necessarily refer to a subsurface release. No evidence of a documented release was encountered for this site. Based on this information and the inferred direction of groundwater flow, the listings for this site are not expected to constitute a significant environmental concern.

5.2 Vapor Migration

AEI reviewed reasonably ascertainable information for the subject and nearby properties, including a regulatory database, files for nearby release sites, and/or historical documentation, to determine if potential vapor-phase migration concerns may be present which could impact the subject property.

Based on a review of available resources as documented in this report, AEI did not identify significant on-site concerns and/or regulated listings from nearby sites which suggest that a vapor-phase migration concern currently exists at the subject property.

6.0 INTERVIEWS AND USER PROVIDED INFORMATION

6.1 INTERVIEWS

Pursuant to ASTM E1527-13, the following interviews were performed during this assessment in order to obtain information indicating RECs in connection with the subject property.

6.1.1 OWNER AND KEY SITE MANAGER

Relation to Property	Name	Date Interviewed	Method of Contact	Year First Associated w/ Property	Notes
Owner, 3812-3814 1/2 Oakwood	Mr. Juan Galindo	March 7, 2019	In Person	1995	Interviewed; see Interview Summary table below
Owner, 3820-3838 Oakwood	Mr. Steven Povenghi	N/A	N/A	Unknown	Not interviewed; refer to key site manager interview below
Key Site Manager, 3820-3838 Oakwood	Mr. Francisco Ortiz	March 7, 2019	In Person	1993	Interviewed; see Interview Summary table below

Interview Summary

Question	Owner (Representative) Response/Comment	Key Site Manager Response/ Comment
Do you have any knowledge of USTs, clarifiers or oil/water separators, sumps, or other subsurface features?	Yes; refer to Section 7.1 for discussion of clarifier at 3812-3814 1/2 Oakwood Avenue	No
Do you have any knowledge of previous environmental investigations conducted on site?	No	No
Do you have any knowledge of current or past industrial operations and/or other operations which would involve the use of hazardous substances and/or petroleum products?	No	No
Are you aware of any known plans for site redevelopment or change in site use?	No	No
Are you aware of any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property?	No	No
Are you aware of any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the property?	No	No
Are you aware of any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products?	No	No
Are you aware of any incidents of flooding, leaks, or other water intrusion, and/or complaints related to indoor air quality?	No	No

6.1.2 Past Owners, Operators, and Occupants

AEI attempted to obtain contact information for past owners, operators and occupants of the subject property in order to interview them regarding the potential for contamination at the property. AEI requested this contact information of Mr. Juan Galindo, Mr. Steven Povenghi, reviewed agency records, and performed online research to obtain this information. Contact information was not found. As such, interviews with past owners, operators and occupants were not reasonably ascertainable.

6.1.3 Interview with Others

Information obtained during interviews with local government officials is incorporated into the appropriate segments of this report.

6.2 User Provided Information

User provided information is intended to help identify the possibility of RECs in connection with the subject property. According to ASTM E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), certain items should be researched by the prospective landowner or grantee, and the results of such inquiries may be provided to the Environmental Professional. The responsibility for qualifying for LLPs by conducting the inquiries ultimately rests with the User, and providing the information to the Environmental Professional would be prudent if such information is available.

The User did not complete the ASTM User Questionnaire or provide the User information to AEI. AEI assumes that qualification for the LLPs is being established by the User in documentation outside of this assessment.

Question	Response / Comment
1. Environmental liens that are filed or recorded against the property (40 CFR 312.25) Did a search of recorded land title records (or judicial records where appropriate) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?	Information not provided
2. Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)). Did a search of recorded land title records (or judicial records where appropriate) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?	Information not provided
3. Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28). Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?	Information not provided

Question	Response / Comment
4. Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29). Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?	Information not provided
5. Commonly known or reasonably ascertainable information about the property (40 CFR 312.30). Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example: (a) Do you know the past uses of the property? (b) Do you know of specific chemicals that are present or once were present at the property? (c) Do you know of spills or other chemical releases that have taken place at the property? (d) Do you know of any environmental cleanups that have taken place at the property?	Information not provided
6. The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31). Based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of contamination at the property?	Information not provided

6.3 Previous Reports and Other Provided Documentation

No prior reports or other relevant documentation in association with the subject property was made available to AEI during the course of this assessment.

6.4 Environmental Lien Search

In accordance with our approved scope of services, an environmental lien search was not performed as part of this assessment.

7.0 SITE RECONNAISSANCE

Site Reconnaissance Date	March 7, 2019
AEI Site Assessor(s)	Brant Rotnem
Property Escort(s)/ Relationship(s) to Property	Mr. Juan Galindo, Owner, 3812-3814 1/2 Oakwood Avenue; Mr. Francisco Ortiz, Key Site Manager, 3820-3838 Oakwood Avenue
Units/Areas Observed	All accessible interior and exterior areas
Area(s) not accessed and reason(s)	N/A
Other Physical Constraints	None

Reconnaissance Findings Summary

Feature	Observed on Subject Property (see Section 7.1)	Observed on Adjacent Property (see Section 7.2)
Regulated Hazardous Substances/Wastes and/or Petroleum Products in Connection with Property Use		
Aboveground/Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)		
Hazardous Substance and Petroleum Product Containers Not in Connection with Property Use		
Unidentified Substance Containers		
Electrical or Mechanical Equipment Likely to Contain Fluids		
Interior Stains or Corrosion		
Strong, Pungent, or Noxious Odors		
Pools of Liquid		
Drains, Sumps, and Clarifiers	✔	
Pits, Ponds, and Lagoons		
Stained Soil or Pavement		
Stressed Vegetation		
Solid Waste Disposal or Evidence of Fill Materials		
Waste Water Discharges		
Wells		
Septic Systems		
Biomedical Wastes		
Other	✔	

7.1 SUBJECT PROPERTY RECONNAISSANCE FINDINGS

During the site reconnaissance, AEI observed the items listed in the above Reconnaissance Findings Summary table, which are further discussed below.

DRAINS, SUMPS, AND CLARIFIERS

A storm drain and three-chambered clarifier system are present on the central portion of 3812-3814 1/2 Oakwood Avenue, adjacent to the Galindo Commissary food truck parking area. According to Mr. Galindo, the clarifier was installed in 1995, and is used for occasional food

truck rinsing. No evidence of wash detergents or chemicals was observed onsite. Reportedly, engine and undercarriage washing are not performed onsite. While some diluted concentrations of the petroleum products and hazardous materials used on site may be present in the waste streams discharged to the drain, they drain system is not expected to represent a significant environmental concern at this time.

OTHER

Cleaning supplies and detergents are stored on the ground floor of 3820-3838 Oakwood Avenue. All chemicals were packaged in consumer quantities. Based on the nature of these materials, the presence of cleaning supplies at the subject property is not expected to represent a significant environmental concern.

7.2 ADJACENT PROPERTY RECONNAISSANCE FINDINGS

During the site reconnaissance, AEI did not observe any of the items listed in the above Reconnaissance Findings Summary table.

8.0 NON-ASTM SERVICES

8.1 ASBESTOS-CONTAINING BUILDING MATERIALS

Asbestos is the name for a group of naturally occurring silicate minerals that can be separated into fibers. The fibers are strong, durable, and resistant to heat and fire. They are also long, thin and flexible, so they can even be woven into cloth. Because of these qualities, asbestos has been used in thousands of consumer, industrial, maritime, automotive, scientific and building products. During the 20th century, some 30 million tons of asbestos have been used in industrial sites, homes, schools, shipyards and commercial buildings in the United States. Commercial use of ACM began in the early 1900's and peaked in the period between 1940 and into the 1970's. Common ACMs include pipe-covering, insulating cement, insulating block, refactory and boiler insulation materials, transite board, fireproofing spray, joint compound, vinyl floor tile, ceiling tile, mastics, roofing products, and duct insulation for HVAC applications. Inhalation of asbestos fibers can result in deleterious health effects.

The potential for ACM was evaluated based the USEPA Guidance Document: Managing Asbestos in Place - A Building Owner's Guide to Operations and Maintenance Programs for Asbestos-Containing Materials (the Green Book). In 1973 the NESHAPS banned the use of most spray-applied surfacing ACM, specifically asbestos containing spray-on fireproofing and insulation. Subsequent revisions to this regulation in 1975 and 1978 effectively eliminated the use of friable pre-molded pipe, boiler, turbine, and duct insulation; and the spray application of friable asbestos-containing materials for all uses in buildings. In 1989 the EPA issued regulations to ban some asbestos-containing products and phase out most others over a multi-year period. The "Ban and Phase-Down" rule was challenged in court and the regulation remanded to the agency. As a result, any asbestos-containing products then "in commerce" would not be banned. Those not in commerce would be banned. Those materials "banned" could not be sold. It did not affect such materials already installed, or in use. Most US firms voluntarily ceased production of asbestos containing building materials not covered by the aforementioned Federal bans by the mid-1980's. In 1994, the OSHA determined that employers and building owners are required to treat installed thermal system installation and sprayed on and troweled-on surfacing materials, as well as vinyl or asphalt flooring material, as ACM in buildings constructed no later than 1980 until tested by laboratory analysis to prove otherwise.

The information below is for general informational purposes only and does not constitute an asbestos survey. In addition, the information is not intended to comply with federal, state or local regulations in regards to ACM.

Due to the age of the subject property buildings, there is a potential that ACMs are present. A limited list of typical suspect ACMs is included in the following table:

Material Type	Location
Plaster (acoustical and smooth)	Walls and ceilings
Ceiling tile	Ceiling systems
Thermal systems insulations, packings, and gaskets	Heating systems, cooling systems, domestic and heating and cooling piping, ductwork, and other equipment
Floor tile and associate mastics, flooring felts, and papers (under hardwood/other)	Floors
Vinyl sheet flooring and adhesives	Floors
Cove base and associated mastics	Walls
Ceramic tile adhesives and grouts	Walls, floors, and ceilings
All adhesives	Mirrors, wall coverings, construction, etc.
Grout and caulking	Windows and doors
Gypsum board, tape, and joint compound	Wall and ceiling systems
Insulation materials	Walls, ceilings, and attic spaces
Roofing materials (felts, rolled, shingle, flashings, adhesives, tar, and insulations)	Roof and parapet wall systems
Brick and block, mortars	Walls

The observed suspect ACMs at the subject property were in good condition at the time of the site reconnaissance and are not expected to pose a health and safety concern to the occupants of the subject property at this time. Based on the potential presence of ACMs, AEI recommends the implementation of an O&M Plan which stipulates that the repair and maintenance of damaged materials should be performed to protect the health and safety of the building occupants. In the event that building renovation or demolition activities are planned, a thorough asbestos survey to identify asbestos-containing building materials is required in accordance with the EPA NESHAP 40 CFR Part 61 prior to demolition or renovation activities that may disturb suspect ACMs.

8.2 Lead-Based Paint

LBP is defined as any paint, varnish, stain, or other applied coating that has ≥1 mg/cm² (5,000 µg/g or 5,000 ppm) or more of lead by federal guidelines; state and local definitions may differ from the federal definitions in amounts ranging from 0.5 mg/cm² to 2.0 mg/cm². Section 1017 of the Housing and Urban Development (HUD) Guidelines, Residential Lead-Based Paint Hazard Reduction Act of 1992, otherwise known as "Title X", defines a LBP hazard as "any condition that causes exposure to lead that would result in adverse human health effects" resulting from lead-contaminated dust, bare, lead-contaminated soil, and/or lead-contaminated paint that is deteriorated or present on accessible, friction, or impact surfaces. Therefore, under Title X, intact LBP on most walls and ceilings would not be considered a "hazard", although the paint should be maintained and its condition monitored to ensure that it does not deteriorate and become a hazard. Additionally, Section 1018 of this law directed HUD and EPA to require the disclosure of known information on LBP and LBP hazards before the sale or lease of most housing built before 1978. Most private housing, public housing, or federally owned or subsidized housing is affected by this rule.

Under OSHA, LCP is defined as any paint with any detectable amount of lead present in it. Therefore, all LBP is considered LCP. Conversely, LCP may not meet the criteria to be considered LBP in accordance with HUD guidelines or some states' definition of LBP.

It is important to note that LCP may create a lead hazard when being removed. The condition of

these materials must be monitored when they are being disturbed. In the event LCP is subject to abrading, sanding, torching, and/or cutting during demolition or renovation activities, there may be regulatory issues that must be addressed.

The information below is for general informational purposes only and does not constitute a lead hazard evaluation. In addition, the information is not intended to comply with federal, state, or local regulations in regards to LBP.

In buildings constructed after 1978, it is unlikely that LBP is present; however, some paints utilized after 1978 will be LCP under OSHA. Structures built prior to 1978 and especially prior to the 1960s should be expected to contain LBP.

Due to the age of the subject property buildings, there is a potential that LBP is present. All painted surfaces were observed in good condition and are not expected to pose a health and safety concern to the occupants of the subject property at this time. However, based on the potential presence of LBP and residential nature of occupancy, AEI recommends the owner implement a LBP O&M Plan which stipulates that the assessment, repair and maintenance of damaged painted surfaces be performed to protect the health and safety of the building occupants. Local regulations may apply to LBP in association with building demolition/renovations and worker/occupant protection. Actual material samples would need to be collected or an XRF survey performed in order to determine if LBP is present. It should be noted that construction activities that disturb materials or paints containing any amount of lead may be subject to certain requirements of the OSHA lead standard contained in 29 CFR 1910.1025 and 1926.62.

8.3 Radon

Radon is a naturally-occurring, odorless, and invisible gas. Natural radon levels vary and are closely related to geologic formations. Radon may enter buildings through basement sumps or other openings.

The United States EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three radon zones, with Zone 1 being those areas with the average predicted indoor radon concentration in residential dwellings exceeding the EPA Action Limit of 4.0 pCi/L. It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the EPA recommends site specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Radon sampling was not requested as part of this assessment. According to the US EPA, the radon zone level for the area is Zone 2, which has a predicted average indoor screening level between 2 pCi/L and 4 pCi/L, equal to or below the action level of 4 pCi/L set forth by the US EPA.

8.4 Mold

Molds are simple microscopic organisms which can often be seen in the form of discoloration, frequently green, gray, white, brown, or black. When excessive moisture or water accumulates indoors, mold growth may occur, particularly if the moisture problem remains undiscovered or

unaddressed. As such, interior areas of buildings characterized by poor ventilation and high humidity are the most common locations of mold growth. Building materials, including drywall, wallpaper, baseboards, wood framing, insulation, and carpeting, often play host to such growth. Mold spores primarily cause health problems through the inhalation of spores or the toxins they emit when they are present in large numbers. This can occur when there is active mold growth within places where people live or work.

Mold, if present, may or may not visually manifest itself. Neither the individual completing this inspection, nor AEI has any liability for the identification of mold-related concerns except as defined in applicable industry standards. In short, this Phase I ESA should not be construed as a mold survey or inspection.

This activity was not designed to discover all areas which may be affected by mold growth on the subject property. Rather, it is intended to give the client an indication if significant (based on observed areas) mold growth is present at the subject property. Potential areas of mold growth, such as in pipe chases, HVAC systems, and behind enclosed walls and ceilings, were not observed as part of this limited assessment.

AEI observed interior areas of the subject property buildings to identify the potential presence of mold. AEI did not note obvious visual or olfactory indications of the presence of mold, nor did AEI observe obvious indications of significant water damage. As such, no bulk sampling of suspect surfaces was conducted as part of this assessment and no additional action with respect to suspect mold appears to be warranted at this time.

9.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONALS

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR Part 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

3814-3838 OAKWOOD AVENUE
LOS ANGELES, CA 90004

COORDINATES

Latitude (North):	34.0774450 - 34° 4' 38.80''
Longitude (West):	118.2898300 - 118° 17' 23.38''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	380988.8
UTM Y (Meters):	3771299.0
Elevation:	271 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no

further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 12/13/2018 has revealed that there are 2 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 4 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 11 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/29/2018 has revealed that there are

EXECUTIVE SUMMARY

23 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 30 LUST sites within

approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 3 CPS-SLIC sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 12 UST sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 12 EDR Hist Auto

sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

FINDS:

Registry ID: 110002683392

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Historical Generators:
Date form received by agency: 05/31/2006
Site name: J.P. CARROL COMPANY
Classification: Large Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D018
. Waste name: BENZENE

J.P. CARROL COMPANY (Continued) **1010313354**

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
