Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D018
. Waste name: BENZENE

Violation Status: No violations found

Registry ID: 110013311665

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	* Discovery
Completed Date:	06/20/1991
Comments:	From EPA CERCLA PA fit report. Site is located in three lots. 1) 218 N. Juanita Avenue: the site currently leased by Lynde-Ordnay Co., Inc. Carroll Trust has owned since 1940s and LOC leased it since then. 1990 geophysical surveys located three underground tanks on the property. 2) 220 N. Juanita Avenue: it is currently a vacant lot. The Parker Judge owned in 1938. Paint Engineers owned and operated in 1946. Carroll Trust since 1953. 3) 222 N. Juanita Avenue: Hansen's

TRUST SERVICES OF AMERICA (Continued) **1000387420**

Juices leased it since 1989. The Los Angeles unified school district conducted Phase I & II investigations to purchase the property. Revealed petroleum contamination in the soil. Stoddard solvent was detected in the soil. The highest level was 4500 mg/kg volatile organics and chlorinated hydrocarbons were also detected in the soil. Contamina- tion has also been detected in the groundwater. FIT recommended NFA for EPA. Medium priority PEA required.

FINDS:

Registry ID: 110002899132

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002890710

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002899123

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Case Type:	Cleanup Program Site
Case Worker:	TA
Local Agency:	Not reported
RB Case Number:	0803
File Location:	Regional Board
Potential Media Affected:	Indoor Air, Other Groundwater (uses other than drinking water), Soil, Soil Vapor
Potential Contaminants of Concern:	Other Solvent or Non-Petroleum Hydrocarbon, Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History:	This Site is a 2.4-acre parcel of land occupied by the SMH Site that consists of several buildings hosting administrative offices, warehouses for the storage of streetlight parts, and vehicle maintenance garages. Historical records show that the SMH Site was built upon residential property in 1926. Gasoline and a waste oil underground storage tanks (USTs) were removed from the SMH Site in 1990. The Regional Boards Underground Storage Tank (UST) Section issued a closure for the USTs and the case was transferred to the Site Cleanup Program because of the detection of VOCs and SVOCs in the Sites groundwater monitoring wells. Thereafter, various

LADWP-STREETLIGHT MAINT.HDQTRS (Continued) **S103437995**

investigations were conducted that include a soil vapor survey, installation of 32 soil borings and 14 groundwater monitoring wells at the SMH Site. The analytical results confirmed that both soil and groundwater beneath the SMH Site are impacted with tetrachloroethylene (PCE), trichloroethylene (TCE) and benzene. The data show PCE concentrations as high as 1,670 micrograms per kilogram (a%g/Kg) in soil, 13,500 micrograms per liter (a%g/L) in the soil vapor collected from 5 feet below ground surface (bgs) and 23,300 a%g/L in groundwater. In addition, benzene was detected up to 602 a%g/Kg and 392 a%g/L in soil and groundwater, respectively. The site assessment identifies two separate potential source areas of PCE impacted soil at the SMH Site. PCE concentrations of 2,634 and 1,670 micrograms per kilogram (a%g/Kg) in the northern and southern portion, respectively, were reported. The most recent groundwater monitoring results show PCE concentration as high as 75,000 micrograms per liter (a%g/L) and TCE as high as 123 a%g/L. Soil vapor survey conducted at the site also confirm the presence of VOCs. The highest PCE concentration detected in soil vapor at the Site is 1,100 a%g/L. In addition, benzene was detected up to 602 a%g/Kg and 392 a%g/L in soil and groundwater, respectively The results of soil and groundwater samples collected along sewer and storm drain pipelines servicing the dry cleaning facility located north east of the SMH Site. PCE concentration as high as 1,100 a%g/Kg in soil and greater than 1,000 a%g/L in groundwater was detected in samples obtained approximately 50 feet southwest of the dry cleaning facility. Based on the data, LADWP claims that the dry cleaning facility is a potential source of PCE contamination at the SMH Site. The Regional Board is following up on the potential contribution of PCE contamination from the dry cleaners. According to the Department of Water Resources Bulletin No. 104, the Site is located in the Hollywood Basin of the Coastal Plain of Los Angeles. The SMH Site lies on the western flank of the Elysian Hills that is underlain by recent alluvium, which includes the Gaspur aquifer overlying the Puente Formation. Based on the soil boring log, the soil beneath the SMH Site consists of primarily clay, sandy clay and silt to a depth of 20 feet, the maximum depth of investigation. Depth to the shallow groundwater beneath the SMH Site ranged from approximately 15 to 21 feet below ground surface (bgs). The direction of groundwater flow is to the southwest.

Latitude:	34.08291
Longitude:	-118.284318
Case Type:	Cleanup Program Site
Case Worker:	RV
Local Agency:	Not reported
RB Case Number:	1232
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply, Soil, Soil Vapor
Potential Contaminants of Concern:	* Chlorinated Hydrocarbons
Site History:	The Site is located in an area that is characterized by a mixed commercial residential use. Jesse Cleaners was in operation from 1995 through 2008 and the building is currently vacant. However, a dry cleaning establishment has been present on the site in the same tenant space since 1981. In 2006, two separate subsurface investigations were conducted at the Site. These are: 1) Western Environmental Engineers Company (WEECO) installed four soil borings to 10 feet below ground surface (bgs); and 2) JMK installed five additional soil borings to 25 feet bgs. The limited soil sampling and analysis, confirmed that soil beneath the Site are impacted with PCE and trichloroethylene (TCE). Based on the analytical results, up to 1,350,085 micrograms per kilogram (a%g/kg) of PCE and 1,834 a%g/kg of TCE were detected in soil samples collected from beneath the former dry cleaning machine. Groundwater samples obtained from locations immediately down gradient from the Jesse Cleaners and approximately 50 feet from the Streetlight Maintenance Headquarters (SMH) site have PCE concentrations greater than 1,000 micrograms per liter (a%g/L).

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

COMMONWEALTH ELEMENTARY SCHOOL ADDITION (Continued) **S113012696**

Completed Date: 09/01/2009
Comments: DTSC reviewed the Operation and Maintenance report and requested that its comments be addressed by 09/15/2009.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 09/21/2009
Comments: DTSC reviewed the Operation and Maintenance Report and noted that an action should be taken prior to the next monitoring event. In addition, DTSC noted it had not received a response to comments on the previous O&M report and requested a response by September 24, 2009.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 12/10/2009
Comments: DTSC concurred with the recommendations of the Operation and Maintenance Report and requested a response to one comment by December 31, 2009.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 03/01/2010
Comments: DTSC concurred with the recommendations of the Operation and Maintenance Report and requested a response to four comments by March 15, 2010.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Public Participation Plan / Community Relations Plan
Completed Date: 05/01/2002
Comments: DTSC approved the Public Participation Plan, dated May 2002.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 06/15/2010
Comments: DTSC concurred with the recommendations of the Operation and Maintenance Report and noted discrepancies between the paper and electronic copies of the Report. DTSC pointed out that the paper copy and the electronic copy of all submittals provided to DTSC be accurate and consistent with each other.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 12/12/2018
Date Data Arrived at EDR: 12/28/2018
Date Made Active in Reports: 01/11/2019
Number of Days to Update: 14

Source: EPA
Telephone: N/A
Last EDR Contact: 02/15/2019
Next Scheduled EDR Contact: 04/15/2019
Data Release Frequency: Quarterly

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/12/2018
Date Data Arrived at EDR: 12/28/2018
Date Made Active in Reports: 01/11/2019
Number of Days to Update: 14

Telephone: N/A
Last EDR Contact: 02/15/2019
Next Scheduled EDR Contact: 04/15/2019
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994
Number of Days to Update: 56

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/12/2018
Date Data Arrived at EDR: 12/28/2018
Date Made Active in Reports: 01/11/2019

Last EDR Contact: 02/15/2019
Next Scheduled EDR Contact: 04/15/2019
Data Release Frequency: Quarterly

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016
Date Data Arrived at EDR: 01/05/2017
Date Made Active in Reports: 04/07/2017

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/12/2018

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Date of Government Version: 12/13/2018

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 03/01/2018

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/01/2018

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by AEI Consultants were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

BOARD OF PUBLIC WORKS

DEPARTMENT OF BUILDINGS

Application for the Erection of Frame Building

CLASS "D"

To the Board of Public Works of the City of Los Angeles:

Application is hereby made to the Board of Public Works of the City of Los Angeles, through the office of the Chief Inspector of Buildings, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be, prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

CITY OF LOS ANGELES
DEPARTMENT OF BUILDING AND SAFETY
BUILDING DIVISION

Application to Alter, Repair, Move or Demolish

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

DECLARATIONS AND CERTIFICATIONS

LICENSED CONTRACTORS DECLARATION

16. I hereby affirm that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

Date _____ Lic. Class _____ Lic. Number _____ Contractor _____ (Signature)

OWNER-BUILDER DECLARATION

17. I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, Business and Professions Code: Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is licensed pursuant to the provisions of the Contractor's License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☒ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business and Professions Code: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____, B. & P. C. for this reason _____

Date _____ Owner's Signature _____

WORKERS' COMPENSATION DECLARATION

18. I hereby affirm that I have a certificate of consent to self-insure, or a certificate of Worker's Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. _____ Insurance Company _____

☐ Certified copy is hereby furnished.

☐ Certified copy is filed with the Los Angeles City Dept. of Bldg. & Safety.

Date _____ Applicant's Signature _____

Applicant's Mailing Address _____

CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

19. I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation Laws of California.

Date _____ Applicant's Signature _____

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

20. I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____ Lender's Address _____

21. I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes.

I realize that this permit is an application for inspection, that it does not approve or authorize the work specified herein, that it does not authorize or permit any violation or failure to comply with any applicable law, that neither the city of Los Angeles nor any board, department, officer or employee thereof make any warranty or shall be responsible for the performance or results of any work described herein or the condition of the property or soil upon which such work is performed. (See Sec. 91.0202 LAMC)

Unless a shorter period of time has been established by an official action, plan check approval expires one and a half years after the fee has been paid. This permit expires two years after the fee has been paid or 180 days after the fee has been paid and construction has not commenced; or if work is suspended, discontinued or abandoned for a continuous period of 180 days (Sec.98.0603 L.A.M.C). Claims for refund of fees paid on permits must be filed within one year from the date of expiration for building permits granted by the Department of Building and Safety (Sec. 22.12 & 22.13 L.A.M.C.).

In the event that any box (i.e. 1-16) is filled to capacity, it is possible that additional information has been captured electronically and could not be printed due to space restrictions. Nevertheless, the information printed exceeds that required by Section 19825 of the Health and Safety Code of the State of California.

15. Building Relocated From:

16. CONTRACTOR, ARCHITECT, & ENGINEER NAME	ADDRESS		CLASS	LICENSE#	PHONE #
(O) , Owner-Builder	3812 Oakwood Ave.,	Los Angeles, CA 90004		0	

PERMIT EXPIRATION/REFUNDS: This permit expires two years after the date of the permit issuance. This permit will also expire if no construction work is performed for a continuous period of 180 days (Sec. 98.0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by LADBS (Sec. 22.12 & 22.13 LAMC). The permittee may be entitled to reimbursement of permit fees if the Department fails to conduct an inspection within 60 days of receiving a request for final inspection (HS 17951).

17. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors' State License Law for the following reason (Section 7031.5, Business and Professions Code:
Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500).):

(X) I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale).

OR

(__) I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations:

(__) I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

(__) I have and will maintain workers' compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued. My workers' compensation insurance carrier and policy number are:

Carrier:_____ Policy Number:_____

(__) I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES.

19. ASBESTOS REMOVAL DECLARATION / LEAD HAZARD WARNING

I certify that notification of asbestos removal is either not applicable or has been submitted to the AQMD or EPA as per section 19827.5 of the Health and Safety Code. Information is available at (909) 396-2336 and the notification form at www.aqmd.gov. Lead safe construction practices are required when doing repairs that disturb paint in pre-1978 buildings due to the presence of lead per section 6716 and 6717 of the Labor Code. Information is avaiable at Health Services for LA County at (800) 524-5323 or the State of California at (800) 597-5323 or www.dhs.ca.gov/childlead.

20. FINAL DECLARATION

I certify that I have read this application **INCLUDING THE ABOVE DECLARATIONS** and state that the above information **INCLUDING THE ABOVE DECLARATIONS** is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein, and it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec. 91.0106.4.3.4 LAMC).

By signing below, I certify that:

(1) I accept all the declarations above namely the Owner-Builder Declaration, Workers' Compensation Declaration, Asbestos Removal Declaration / Lead Hazard Warning and Final Declaration; and
(2) This permit is being obtained with the consent of the legal owner of the property.

SUPPLEMENTAL NOTES:

IMPORTANT NOTICE

* **Prior to the start of any construction work adjacent to any public way, pedestrian protection shall be provided (Sec. 91.3303 L.A.M.C.).**
* Inspection(s) may be requested anytime via the internet or touch tone phone. To request an inspection via the internet, go to www.ladbs.org and click on "Request an Inspection" under Online Services. To request an inspection via touch tone phone, call toll free (888) LA4BUILD (888-524-2845) and select option 1 for Automated Request System. To request an inspection via the Customer Call Center, call 3-1-1 within the City of Los Angeles or (213) 473-3231 outside the City of Los Angeles between 7:00 a.m. and 10:00 p.m. When requesting an inspection, the following are required: (1)The job address, (2)Type of inspection, (3)Use of building, (4)Permit number, (5)Phone number of a contact person should the department need to reach someone.
* Inspection requests received before 4:00 p.m. Monday through Friday (excluding holidays) will normally be made the next business day. Requests received after 4:00 p.m. will be made following the next business day. The Automated Inspection Call Back System (AICBS) will attempt to telephone the contact phone number to confirm the Inspection.
* Permit fees provide for a limited number of inspections. A reinspection fee may be assessed when the work for which an inspection was requested is not complete, when the inspection record or plans are not available, or when there is failure to provide site access to department staff.
* No person shall perform any construction or repair work between the hours of 9:00 p.m.(6:00 p.m. grading) and 7:00 a.m. the following day which results in loud noises to the disturbance of persons occupying sleeping quarters in any dwelling , hotel, motel, apartment, or other place of residence (Sec. 41.40 L.A. M.C.).
* No person, other than an individual homeowner engaged in the repair or construction of his/her single-family dwelling, shall perform any construction or repair work of any kind upon any building or structure located on land developed with residential buildings or perform work within 500 feet of land so occupied, before 8:00 a.m. or after 6:00 p.m. on any Saturday or at any time on Sunday (Sec. 41.40 L.A.M.C.).
* Dust control measures to prevent dust from being blown or deposited over or upon any private property in any residential area must be implemented during any excavation or earth-moving phase of construction, sand blasting , or demolition.
* A separate permit from the State of California Division of Industrial Safety is required prior to starting certain work involving substantial risk to workers such as: construction or demolition exceeding 3 stories or 36 feet in height, or excavations or trenches over 5 feet in depth involving entry by workers.
* Building permits are valid for two years or expire on the 180th day from the date of issuance if the work permitted has not commenced. The department reserves the right to expire any permit where work has been suspended for a period of 180 days or more.
* Inspection services will not be provided when there is an unleashed dog on the premises.

V. FREE PRODUCT

Was free product encountered? **NO**	Has free product been totally recovered? **NA**
When was free product recovery project completed? **NA**	

Site Name/Address:	Staff Initial:
AT&T G1118 Facility 316 N. Juanita Avenue Los Angeles, CA 90004	

VI. SOIL REMEDIATION

Method: **None**	Duration of remediation: **NA**
Waste manifest document: **NA**	Soil disposal volume/ mass removal : **NA**

VII. GROUNDWATER REMEDIATION

Method: **None**	Duration of remediation: **NA**
Waste manifest document: **NA**	Soil disposal volume: **NA**

VIII. RECOMMENDED ACTION

Soil Closure only: **No**	Case Closure: **Yes**	Solvent Case? **No**
Additional action required (i.e.: additional site assessment, remediation, monitoring): **No**		

IX. COMMENTS AND JUSTIFICATION FOR RECOMMENDED ACTION

The site is located at the 316 North Juanita Avenue, City of Los Angeles (Attachment 1, Site Map). Production well 01S13W04K01S is located 18,015 feet from the site (Attachment 2, one-mile radius map). The site consists of two buildings for general office use, equipment storage and vehicle maintenance and parking lot.

On November 10, 2004, a 12,000-gallon gasoline underground storage tank (UST) was removed. Low or non-detectable concentrations of fuel hydrocarbons were detected. However, water accumulating in the excavation pit was sampled and found that the maximum concentrations of petroleum hydrocarbons as gasoline (TPH_G) at 20,900 µg/L, benzene concentration at 524 µg/L, and methyl tertiary butyl ether (MTBE) concentration at 5,400 µg/L were detected.

In November 2007, five boring were drilled and converted to groundwater monitoring wells. Since then, the maximum concentrations of petroleum hydrocarbons as diesel (TPH_D) at 7,900 µg/L(11/07), and MTBE concentration at 13.1 µg/L (2/08) were detected in groundwater samples. Non-detectable concentrations of all other fuel hydrocarbons were detected in the soil and groundwater samples.

Non-detectable concentrations of MTBE were detected in soil samples except at boring MW-1 which detected maximum concentration of MTBE at 0.051 mg/kg at a depth of 10 feet below ground surface (bgs). Groundwater was encountered between 10 feet to 13 feet bgs. The low concentrations of MTBE in soil and groundwater samples in shallow groundwater would not cause impacts on drinking water aquifer.

In October 2008, two hydropunch groundwater samples were collected to further assess the groundwater plume. Non-detectable concentrations of fuel hydrocarbons were detected.

Attachment 3 shows the summary of soil analytical results.

Attachment 4 shows the summary of groundwater analytical results.

Contaminant Exposure Pathways Evaluation

Direct Contact

The residual concentrations of gasoline constituents in the soil beneath the site do not cause any direct contact concerns, because analytical results from the latest soil sampling are all below their respective SLs.

Protection of Drinking Water Aquifer

The groundwater beneath the site did not detect any concentrations of gasoline constituents higher than MCLs. The nearest drinking water well is 18,015 feet from the site.

Plume Migration

Groundwater sampling data showed low or non-detectable concentrations of fuel hydrocarbons. Therefore, there is no plume migration.

Vapor Intrusion

The residual concentrations of gasoline constituents in the soil beneath the site are not to cause any vapor intrusion concerns because low benzene concentrations were detected in all soil samples.

Factors Supporting Low Risk Closure

Based on the above assessment, staff recommends to grant a low-risk closure for the site for the following reasons:

- The source of the petroleum contamination has been abated as the UST at the site has been removed.

Site Name/Address:	Staff Initial:
AT&T G1118 Facility 316 N. Juanita Avenue Los Angeles, CA 90004	

- No free product has ever been observed in any of the monitoring wells.
- The extent of soil and groundwater contamination has been adequately defined.
- The levels of the residual soil contamination are all below the respective SLs.
- The groundwater samples did not detected any fuel hydrocarbons higher than MCLs.

X. MTBE FATE & TRANSPORT PLUME LENGTH ANALYSIS

The MTBE fate and transport analysis can not be assessed since the highest MTBE concentration was only 8.65 µg/L (below the MCL).

XI. ELECTRONIC DELIVERABLE FORMAT (EDF) SUBMISSION: Yes

Has electronic data reporting requirement been met? **Yes**

XII. AB 681 REQUIREMENT (Land Owner Notification)

Verify property ownership http://assessor.lacounty.gov/extranet/DataMaps/Pais.aspx (date) : 3/16/09

Have landowner or impacted site notification requirements been met? Yes

Owner AT&T Services Inc.

Responsible party AT&T Services Inc.

Pre-closure letter sent date NA

	40 feet	B=0.015 T=0.43 E=1.8 X=4.8 MTBE = 0.013	B=0.018 T=0.87 E=2.8 X=7.8 MTBE = 0.022	B=0.029 T=1.6 E=6.3 X=16.9 MTBE = 0.03	B=0.143 T=7.5 E=30 X=83 MTBE = 0.156
	20 feet	B=0.011 T=0.15 E=0.7 X=1.75 MTBE = 0.013	B=0.011 T=0.3 E=0.7 X=1.75 MTBE = 0.013	B=0.011 T=0.45 E=2 X=5.3 MTBE = 0.013	B=0.044 T=2.3 E=9 X=24.5 MTBE = 0.065

- TPH = Total petroleum hydrocarbons.
- BTEX = benzene, toluene, ethylbenzene, and xylenes, respectively. MTBE = methyl tertiary butyl ether.
- Respective MCLs (ppm): B=0.001, T=0.15, E=0.7, X=1.75, MTBE=0.013.
- BTEX screening concentrations determined per the attenuation factor method as described in RWQCB Guidance for VOC Impacted Sites (March 1996), with a natural degradation factor of 11 for BTEX and of 3 for MTBE. Table values can be linearly interpolated between distance above groundwater and are proportional to fraction of each lithological thickness.
- Values in Table 4-1 are for soils above drinking water aquifers. All groundwaters are considered as drinking water resources unless exempted by one of the criteria as defined under SWRCB Resolution 88-63 (TDS>3000 mg/L, or deliverability <200 gal/day, or existing contamination that cannot be reasonably treated). Regional Board staff will make a determination of potential water use at a particular site considering water quality objectives and beneficial uses. For non-drinking water aquifers, regardless of depth, TPH for ">150 feet" category in the table should be used; BTEX screening levels are set at 100 times respective MCLs and MTBE 30 times MCL as preliminary levels determined to be protective of human health and the environment.
- Distance above groundwater must be measured from the highest anticipated water level. Lithology is based on the USCS scale.
- In areas of naturally-occurring hydrocarbons, Regional Board staff will make determinations on TPH levels.

3.0 ANALYTICAL TESTING

Soil samples were submitted to Associated Laboratories (AL) for analysis, which is State certified for hazardous waste testing (Certification No. 1338) using a 24-hour turn-around-time. Analytical laboratory results are provided on Figure 4 and laboratory reports are provided in Appendix A.

Samples were submitted for the following analysis:

- Total petroleum hydrocarbons as gasoline (TPH-g) using EPA Method 8015(m).
- Benzene (B), Toluene (T), Ethylbenzene (E), and Total Xylenes (X) using EPA Method 8260B (collectively BTEX).
- 5 Oxygenates: Methyl-t-butyl ether (MtBE), Di-isopropyl ether (DIPE), Ethyl-t-butyl ether (EtBE), Tert-amyl methyl ether (TAME), and Tert-butanol (TBA) using EPA Method 8260B.
- 1,2-Dibromoethane (EDB), and 1,2-Dichloroethane (EDC) using EPA Method 8260B.
- Methanol using EPA Method 8015M.
- Ethanol using EPA Method 8260B.
- The samples were collected and preserved using EPA Method SW5035.
- The analytical testing COELT/EDF data has been uploaded to the Geotracker website in compliance with AB2886 requirements.

APPENDIX F

QUALIFICATIONS

Brant Rotnem – Associate Consultant

BA Environmental Politics – University of California, Berkeley

Mr. Rotnem has worked in the environmental service industry since 2007, and provides project management to ensure ASTM compliance and satisfaction of client requirements for Phase I Environmental Site Assessments performed throughout North America. He has successfully completed assessments on a variety of residential, commercial, and complex industrial sites. Mr. Rotnem is accustomed to all aspects of Due Diligence Property Assessments and the needs and requirements of a variety of reporting standards, including ASTM, EPA's All Appropriate Inquiry (AAI), Freddie Mac, Fannie Mae, and customized client formats.

Project experience for Mr. Rotnem includes:

- Phase I Environmental Site Assessments - performance and review of hundreds of ASTM E1527-00, E1527-05, and E1527-13 (All Appropriate Inquiry) Phase I investigations for sites ranging from multi-family properties to industrial facilities
- Environmental Transaction Screens
- Limited Environmental Site Assessments
- Regulatory Database Reviews
- Environmental Historical Reviews
- Environmental Transaction Analyses
- Site Surveys
- Historical Records Reviews

In addition, Mr. Rotnem conducts ASHRAE I/II energy audits for small and medium commercial buildings, as well as multi-family residential properties. He has completed various trainings at the Pacific Energy Center and PG&E, and has consulted on implementation of efficiency protocol including heating and cooling systems, lighting, hot water systems and piping, building envelope and insulation, water efficiency, zoning, appliances, and refrigeration.

Mr. Rotnem has been trained in a range of disciplines including environmental science, geography, environmental economics, policy analysis, and energy and resource management. He has performed research in the environmental field in the US, Kenya, France and Cuba.

Taylor Strickland – Client Manager, Senior Project Manager

B.S. – Marine Science/Biology Dual Major, Chemistry Minor
University of Miami

OSHA 40-hour Hazardous Waste Operations and OSHA Supervisor Certified

Mr. Strickland has worked in environmental consulting, due diligence, and remediation services since 2006. Mr. Strickland's current responsibilities include ensuring ASTM compliance and satisfaction of client requirements, project coordination, and oversight due diligence work in the Rocky Mountain Region. Work functions involve project development and planning, assisting clients, project oversight and technical writing. His experience includes due diligence investigations, soil and groundwater investigations, and remediation.

Project experience for Mr. Strickland includes:

- Working with petroleum related investigations including underground storage tank investigations, monitoring and remediation.
- Monitoring and operation of groundwater treatment systems.
- Oversight and installation of remediation systems, monitoring wells, and the associated sampling.
- Operation and Maintenance of multiple types of remediation systems.
- Due diligence work including database reviews, Phase I, and Phase II site investigations.
- Subsurface investigations involving various chemical releases with the soil and groundwater.

Mr. Strickland has been with AEI since 2012 and provides project management to ensure ASTM compliance and satisfaction of client requirements for Phase I Environmental Site Assessments, Environmental Transaction Analyses, Transaction Screens, and Database Reviews. Mr. Strickland's management and technical experience has allowed AEI's projects to be performed in a cost effective and timely manner to the satisfaction of AEI's clients and regulatory agencies.

August 26, 2019

Ms. Adrianna Gjonaj, Environmental Planner
Parker Environmental Consultants
23822 Valencia Boulevard, Suite 301
Valencia, CA 91355

Dear Ms. Gjonaj,

ENLIGHTENMENT PLAZA PROJECT - REQUEST FOR WASTEWATER SERVICE INFORMATION

This is in response to your August 20, 2019 letter requesting a review of your proposed residential project bordered by: west of N Juanita Avenue, north of Oakwood Avenue, east to N Madison Avenue, and south of two commercial buildings with associated parking lots in the city of Los Angeles, CA 90731. The project will consist of 454 residential units. LA Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

LA Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvement projects needed to provide future capacity as the City grows and develops.

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Proposed			
Residential: Studio	75 GPD/ DU	370 DU	27,750
Residential: APT-1 BDRM	110 GPD/ DU	71 DU	7,810
Residential: APT-2 BDRMS	150 GPD/ DU	13 DU	1,950
Supportive Services	50 GPD/1000 SQ.FT	19,641 SQ.FT	982
Common Area	50 GPD/1000 SQ.FT	6,595 SQ.FT	330
Total			**38,822**

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of the proposed project includes an existing 8-inch line on Juanita Ave. The sewage from the existing 8-inch line feeds into a 20-inch line on Berendo St before discharging into a 48-inch sewer line on Normandie Ave. Figure 1 shows the details of the sewer system within the vicinity of the project. The current flow level (d/D) in the 8-inch line cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
8	Juanita Ave.	*	229,323 GPD
18	Madison Ave.	33	2.59 MGD
20	Berendo St.	31	2.05 MGD
48	Normandie Ave.	27	29.86 MGD

* No gauging available

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity, then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. Any sewer ejector shall be reviewed by LASAN staff prior to City of Los Angeles Department of Building and Safety (LADBS) approval. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

If you have any questions, please call Christopher DeMonbrun at (323) 342-1567 or email at chris.demonbrun@lacity.org.

STORMWATER REQUIREMENTS

LA Sanitation, Watershed Protection Program (WPP) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

In accordance with the Municipal Separate Storm Sewer (MS4) National Pollutant Discharge Elimination System (NPDES) Permit (Order No. R4-2012-0175, NPDES No. CAS004001) and the City of Los Angeles Stormwater and Urban Runoff Pollution Control requirements (Chapter VI, Article 4.4, of the Los Angeles Municipal Code), the Project shall comply with all mandatory provisions to the Stormwater Pollution Control Measures for Development Planning (LID Ordinance) and as it may be subsequently amended or modified. Prior to issuance of grading or building permits, the Applicant shall submit a LID Plan to the City of Los Angeles, LA Sanitation, Watershed Protection Division (WPD), for review and approval. The LID Plan shall be prepared consistent with the requirements of the Development Best Management Practices Handbook.

Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lacitysan.org. It is advised that input

regarding LID requirements be received in the early phases of the project from WPD's plan-checking staff.

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the LID requirements. Green Street standard plans can be found at: www.eng2.lacity.org/techdocs/stdplans/

CONSTRUCTION REQUIREMENTS

All construction sites are required to implement a minimum set of BMPs for erosion control, sediment control, non-stormwater management, and waste management. In addition, construction sites with active grading permits are required to prepare and implement a Wet Weather Erosion Control Plan during the rainy season between October 1 and April 15. Additionally, construction sites that disturb more than one-acre of land are subject to the NPDES Construction General Permit issued by the State of California, and are required to prepare, submit, and implement the Storm Water Pollution Prevention Plan (SWPPP).

If there are questions regarding the stormwater requirements, please call WPP's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

GROUNDWATER DEWATERING REUSE OPTIONS

The Los Angeles Department of Water and Power (LADWP) is charged with the task of supplying water and power to the residents and businesses in the City of Los Angeles. One of the sources of water includes groundwater. The majority of groundwater in the City of Los Angeles is adjudicated, and the rights of which are owned and managed by various parties. Extraction of groundwater within the City from any depth by law requires metering and regular reporting to the appropriate Court-appointed Watermaster. LADWP facilitates this reporting process, and may assess and collect associated fees for the usage of the City's water rights. The party performing the dewatering should inform the property owners about the reporting requirement and associated usage fees.

On April 22, 2016 the City of Los Angeles Council passed Ordinance 184248 amending the City of Los Angeles Building Code, requiring developers to consider beneficial reuse of groundwater as a conservation measure and alternative to the common practice of discharging groundwater to the storm drain (SEC. 99.04.305.4). It reads as follows: "Where groundwater is being extracted and discharged, a system for onsite reuse of the groundwater, shall be developed and constructed. Alternatively, the groundwater may be discharged to the sewer."

Groundwater may be beneficially used as landscape irrigation, cooling tower make-up, and construction (dust control, concrete mixing, soil compaction, etc.). Different applications may require various levels of treatment ranging from chemical additives to filtration systems. When onsite reuse is not available the groundwater may be discharged to the sewer system. This allows the water to be potentially reused as

recycled water once it has been treated at a water reclamation plant. If groundwater is discharged into the storm drain it offers no potential for reuse. The onsite beneficial reuse of groundwater can reduce or eliminate costs associated with sewer and storm drain permitting and monitoring. Opting for onsite reuse or discharge to the sewer system are the preferred methods for disposing of groundwater.

To help offset costs of water conservation and reuse systems, LADWP offers Technical Assistance Program (TAP), which provides engineering and technical assistance for qualified projects. Financial incentives are also available. Currently, LADWP provides an incentive of $1.75 for every 1,000 gallons of water saved during the first two years of a five-year conservation project. Conservation projects that last 10 years are eligible to receive the incentive during the first four years. Other water conservation assistance programs may be available from Metropolitan Water District of Southern California. To learn more about available water conservation assistance programs, please contact LADWP Rebate Programs 1-888-376-3314 and LADWP TAP 1-800-544-4498, selection "3".

For more information related to beneficial reuse of groundwater, please contact Greg Reed, Manager of Water Rights and Groundwater Management, at (213)367-2117 or greg.reed@ladwp.com.

SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact LA Sanitation Solid Resources Recycling hotline 213-922-8300.

DATE: September 17, 2019

TO: Adrianna Gjonaj
Parker Environmental Consultants
23822 Valencia Boulevard, Suite 301
Santa Clarita, CA 91355

FROM: Rena Perez, Director
Master Planning & Demographics

SUBJECT: Environmental Impact Report Information Requested for: ***ENLIGHTENMENT PLAZA PROJECT,*** *312, 316, 322, 328 North Juanita Avenue; 317, 321, 327, 333, 339, 345 North Madison Avenue; and 3812, 3812 ½, 3814, 3814 ½, 3818, 3820, 3838 Oakwood Avenue, Los Angeles, CA 90004. The project is planned to construct five 100 percent affordable housing multifamily residential buildings with 454, (71 one-bedroom, 13 two-bedroom and 370 studios), low-income dwelling units.*

Included please find a ***LAUSD Schools Enrollments and Capacities Report*** for the schools and programs serving the project address. This report contains the most recent data available on operating capacities and enrollments, and is designed to address any questions pertaining to overcrowding and factors related to school capacity. All schools operate on single track calendar.

Please note that no new school construction is planned and the data in this report *already take into account*: portable classrooms on site, additions being built onto existing schools, student permits and transfers, programs serving choice areas, and any other operational activities or educational programming affecting the operating capacities and enrollments among LAUSD schools.

Additional information on LAUSD's Capital Improvement programs can be found on the Facilities Services Division main webpage at http://www.laschools.org/new-site/. Listings of residential schools and other programs serving the project can be found using LAUSD's Residential School Finder at http://rsi.lausd.net/ResidentSchoolIdentifier/.

The Developer Fee Justification Study with student generation rates can be found online at https://achieve.lausd.net/domain/921.

MASTER PLANNING AND DEMOGRAPHICS RESPONSE TO SPECIFIC QUESTIONS

NOTES:

[1] School's ID code.

[2] School's name

[3] School's operating capacity. The maximum number of students the school can serve with the school's classroom utilization. Excludes capacity allocated to charter co-locations. Includes capacity for magnet programs.

[4] The total number of students living in the school's attendance area and who are eligible to attend the school at the start of the reported school year, plus students enrolled at any on-site magnet centers.

[5] The number of students actually attending the school at the start of the reported school year, including magnet students.

[6] Reported school year seating overage or (shortage): equal to (capacity) - (resident enrollment).

[7] Reported school year overcrowding status of school. The school is overcrowded if any of these conditions exist:
-There is a seating shortage.
-There is a seating overage of LESS THAN or EQUAL TO a margin of 20 seats.

[8] Projected 5-year total number of students living in the school's attendance area and who are eligible to attend the school as of the start of the school year. Includes magnet students.

[9] Projected seating overage or (shortage): equal to (capacity) - (projected enrollment).

[10] Projected overcrowding status of school. The school will be considered overcrowded in the future if any of these conditions exist:
-There is a seating shortage in the future.
-There is a seating overage of LESS THAN or EQUAL TO a margin of 20 seats in the future.

° Magnet Schools with Resident Kindergarten Enrollment: Resident enrollment is reported for Kindergarten only. Actual enrollment is reported for all grades in school. Projected data not reported.

* Enrollment is by application only.

Resident School Identifier

Instructions:
In the search field below, please enter a street address to identify the designated resident schools associated with the property in question. Please be sure to include the Address Number; Street Direction (i.e. N, S, E, or W); Street Name; Street Suffix/Type, where applicable (i.e. St, Ave, Blvd, etc.); Suffix Direction, where applicable after the Street Suffix/Type (i.e. N, S, E, or W); and Zip Code. An example of this suggested formatting would be 1414 W Vernon Ave, 90062. When searching for an address on a numbered street, please include the appropriate ordinal suffix (i.e. 12th, 41st, 62nd, or 103rd). Please omit any unit designations such as Apt A, Unit 1, or any fractions added to the house number. If you are experiencing difficulties in finding the designated resident schools for your search address, please try this alternative search method.

To identify the LAUSD Board District you reside in, click this link http://rrcc.lacounty.gov/OnlineDistrictmapApp/
For questions regarding Resident School Identifier, click this link mpd@lausd.net

312 N Juanita Ave, Los Angeles, CA, 90004, USA

Results for address: **312 N Juanita Ave, Los Angeles, California, 90004**

If the above search result is not the intended address, please select the 'Show more results' link, if displayed within the map area. Additionally, please verify your search entry following the instructions listed above.

The resident LAUSD School assignments listed below are in effect for this school year and are applicable to students currently eligible to enroll. School attendance boundaries are subject to change as warranted by shifts and growth in student population, by opening of new schools and the reopening of closed schools, and as deemed necessary by LAUSD. Information about schools with boundary changes effective in the upcoming school year and the areas affected by the changes is available on the Boundary Change Information Page.

EARLY CONSULTATION MEETING VERIFICATION (312-328 North Juanita Avenue, 317-345 North Madison Avenue)

Dear Applicant:

Los Angeles Municipal Code Section 12.33 C.1 requires that applicants participate in an early consultation with the Department of Recreation and Parks staff, and Department of City Planning staff, in advance of submitting a tract map application for a project of more than 50 residential dwelling units. The purpose of this early consultation is to discuss whether the City may require a land dedication for the project and/or to discuss credits available to the applicant, if any.

Los Angeles Municipal Code Section 12.33 D.1 requires the Department of Recreation and Parks provide written verification of this early consultation to the project applicant within ten (10) business days of the meeting. Written verification of the early consultation is required before the Department of City Planning may accept an application for a tentative tract map that is subject to the requirements of Los Angeles Municipal Code Section 12.33 D.1.

This letter serves as verification that, on **May 30, 2019**, the applicant/representative of a proposed residential project located at **312-328 North Juanita Avenue, 317-345 North Madison Avenue** participated in an early consultation meeting with the Department of Recreation and Parks.

As currently conceptualized, the project at **312-328 North Juanita Avenue, 317-345 North Madison Avenue** proposes four new buildings containing a total of 431 residential dwelling units (100% affordable except for managers' units). This project will also include supportive social services on-site and common open space areas. This project is located in the Hollywood area of Los Angeles.

Pursuant to Los Angeles Municipal Code Section 12.33 D, residential subdivision projects with more than 50 residential dwelling units may be required by the City to dedicate land, or pay a fee in-lieu, or provide a combination of land dedication and in-lieu fee payment for the purpose of acquiring, expanding and improving park and recreational facilities for new residents.

The amount of land to be dedicated is calculated pursuant to the formula detailed in Los Angeles Municipal Code Section 12.33 D.2. Based on the project description above, and the formula detailed in Los Angeles Municipal Code Section 12.33 D.2, the project at **312-328 North Juanita Avenue, 317-345 North Madison Avenue** may be required by the City to dedicate a maximum of **3.12** acres of land to the City for park and recreational purposes. Per Los Angeles Municipal Code Section 12.33 D.3, a project that is required to make a land dedication to the City may make said land dedication, or any portion thereof, either on-site or off-site of the project location. Any off-site land dedication must be located within a certain radius of the project site.

Following the submission of Tract Map Application for this project to the City, the Advisory Agency will distribute a notification to the Department requesting the Department provide its report and recommendations on the project. Once the Department receives said notification, the Department will prepare a report, with its recommendations for how the project should be required to meet its obligations under Los Angeles Municipal Code Section 12.33 (either though a dedication of park land or the payment of fees in lieu). That report will then be submitted to the Board of Recreation and Park Commissioners for their review and approval. Meetings of the Board of Recreation and Park Commissioners are regularly scheduled and are open to the public (http://www.laparks.org/commission). Once the Board of Recreation and Park Commissioners has approved a recommendation for the project, the Department will prepare and submit its report and recommendations on the project to the Advisory Agency.

If you have any questions or comments regarding this information, please feel free to contact Darryl Ford, of my staff, at (213) 202-2682, at your convenience.

Sincerely,

MICHAEL A. SHULL
General Manager

1. Introduction

This report documents a transportation impact analysis for the proposed Enlightenment Plaza Project located at 321 N Madison Avenue[1] in the Hollywood Area of Los Angeles. The Project Site is part of the block bounded by Beverly Boulevard to the south, Juanita Avenue to the west, Madison Avenue to the east and Oakwood Avenue to the north. The Project location is shown in Figure 1.1.

1.1 Project Description and Location

The Project Site is currently occupied by an AT&T Service Yard, with driveways on Juanita Avenue. The site also includes 3812 Oakwood which has 3 multi-family units. In addition, 3838 Oakwood at the corner of Oakwood / Juanita has an existing office building which will remain.

The Proposed Project, referred to as Enlightenment Plaza will consist of 449 units of housing dedicated to Permanent Supportive Housing (Restricted Affordable) for formerly homeless individuals in 5 buildings, including 5,700 sq.ft. of services (mental and physical health, financial, employment) for on-site residents, and 5 managers units.

The main vehicular access (ingress and egress) is to be provided from Madison Avenue. A centralized drop-off and pickup will also be provided on Madison Avenue. Vehicular access will also be provided from Oakwood Avenue and Juanita Avenue. A Site Plan is shown in Figure 1.2.

The Project Site is located close to many other destination land uses in the Hollywood Area, with excellent access to transit, bike lanes, and a pedestrian network with sidewalks on all streets and pedestrian crosswalks at all intersections. The Vermont /Beverly Red Line rail station and a Rapid Bus stop are approximately 500 feet from the subject site.

1.2 Study Scope

The scope and methodology of this analysis was determined in conjunction with the City of Los Angeles Department of Transportation (LADOT), and was conducted in accordance with the LADOT Traffic Study Guidelines, and defined in a Memorandum of Understanding (see Appendix A).

[1] Including 312-328 N Juanita Ave, 3810-3838 W Oakwood Ave, and 317-345 N Madison Avenue

The analysis addresses the following time periods:

- AM peak hour
- PM peak hour

The analysis also addresses the following scenarios:

- Existing Conditions
- Existing Conditions With Project
- Future Conditions Year Without Project
- Future Conditions Year With Project
- Future Conditions Year With Project With Mitigation

The analysis addresses a future year of 2023, which is the projected year of project completion.

1.3 Overview of Methodology

Intersection Analysis

Intersection analysis was conducted using the "Critical Movement Analysis (Planning Method)" as described in "Transportation Research Circular 212, Transportation Research Board, Washington D.C. 1980", and as required by LADOT's Traffic Study Policy and Procedures, to obtain volume/capacity (V/C) ratios for each intersection.

Congestion Management Program Analysis

A congestion management plan analysis was conducted addressing arterial intersections, freeway segments, and transit, as required by the *2010 Los Angeles County Congestion Management Program (Metro, 2010)* guidelines.

Freeway System

Freeway facilities were evaluated according to the MOU between LADOT and Caltrans (*Agreement Between the City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures (December 2015*)) that sets forth criteria for when a freeway impact analysis should be conducted. This requires an initial evaluation of freeway mainline segments and freeway off-ramps to determine if Project volumes exceed certain thresholds that would require further analysis of the freeway system, The evaluation concluded that the thresholds for analysis were not met (as shown in the MOU in Appendix A), so further freeway analysis was not necessary.

State of California Senate Bill No. 743

State of California Senate Bill 743[1], requires the Governor's Office of Planning and Research to change the California Environmental Quality Act (CEQA) guidelines regarding transportation impact analysis. Under SB 743, the focus of transportation analysis will shift from driver delay – typically measured by traffic level of service (LOS) – to a new measurement that better addresses the state's goals on reduction of greenhouse gas emission (GHG), creation of multimodal transportation and promotion of mixed-use developments. Since 2014, the Governor's Office of Planning and Research has been developing guidelines and has recommended that vehicle-miles traveled (VMT) replace LOS as the primary measure of transportation impacts. Fully implemented guidelines were originally scheduled to be in place by January 1, 2016. However, an extension has allowed cities more time to establish an analysis methodology.

The City of Los Angeles has updated its travel demand model, impact evaluation methodology and transportation impact thresholds based on VMT. The city recently adapted the new CEQA thresholds and methodology for VMT, along with revised Transportation Assessment Guidelines. Because this Project has a signed MOU and submitted its Affordable Housing Referral[2] application to the Department of City Planning (DCP) prior to the City's adoption date, and because this study has already been in substantial progress, this study utilizes the (pervious) guidelines that were in effect when the study commenced. However, a VMT analysis will be prepared as a separate document.

1.4 Organization of this Report

This report is organized as follows. Chapter 2 describes the existing transportation conditions in the area of the Project. Chapter 3 provides a description of the Proposed Project and its transportation characteristics, including trip generation, distribution of project trips, and vehicular access. Chapter 4 analyzes potential transportation impacts for the Existing With Project conditions. Chapter 5 addresses the Future Without Project conditions (year 2023) and sets the future cumulative baseline for analysis of Project impacts at buildout. Chapter 6 addresses the Future With Project Conditions and analyzes the potential transportation impacts of the Project. Chapter 7 identifies proposed transportation measures to mitigate any identified significant impacts caused by the Project. Appendices provide backup technical information, including the LADOT MOU, list of related projects, the Caltrans Freeway Threshold check, traffic counts, and intersection level of service calculations.

2. Existing Conditions

2.1 Roadway System

The proposed project site is located in the Hollywood Area of Los Angeles and bounded by Beverly Boulevard to the south, Juanita Avenue to the west, Madison Avenue to the east and Oakwood Avenue to the north. Regional access to the site is provided primarily by the Hollywood (US-101) Freeway.

A grid system of streets serves the Project area, of which the following are the principal streets, as shown in Figure 2.1. All street classifications are from the City's Mobility Plan 2035.

North-South Streets

Vermont Avenue: Vermont Avenue is a two-way north-south street located to the west of the project site. In the City's Mobility Plan 2035, it is classified as an Avenue I. In the vicinity of the Project Site, Vermont Avenue provides three travel lanes with left-turn lanes at intersections and on-street parking is provided during off-peak hours on the west side of the street with some restrictions.

Virgil Avenue: Virgil Avenue is a two-way north-south street located to the east of the project site. In the City's Mobility Plan 2035, it is classified as an Avenue II. In the vicinity of the Project Site, Virgil Avenue provides two travel lanes with left-turn lanes at intersections and on-street parking is generally allowed with time restriction.

East-West Streets

Rosewood Avenue: Rosewood Avenue is a two-way east-west street located to the west of the Project Site. In the City's Mobility Plan 2035, it is classified as a Collector. In the vicinity of the Project Site, Rosewood Avenue provides one travel lane in each direction and on-street parking is generally provided in off-peak periods with some restrictions.

Beverly Boulevard: Beverly Boulevard is a two-way east-west street located immediately south of the Project Site. In the City's Mobility Plan 2035, it is classified as an Avenue II. In the vicinity of the Project Site, Beverly Boulevard provides three travel lanes in each direction with left turn lanes at major intersections but with no left turn lane at minor streets. On-street parking is provided during off-peak hours on the south side of the street with some restrictions.

1st Street: 1st Street is a two-way street located to the south of the Project Site. In the City's Mobility Plan 2035, it is classified as a Collector. In the vicinity of the Project Site, 1st Street

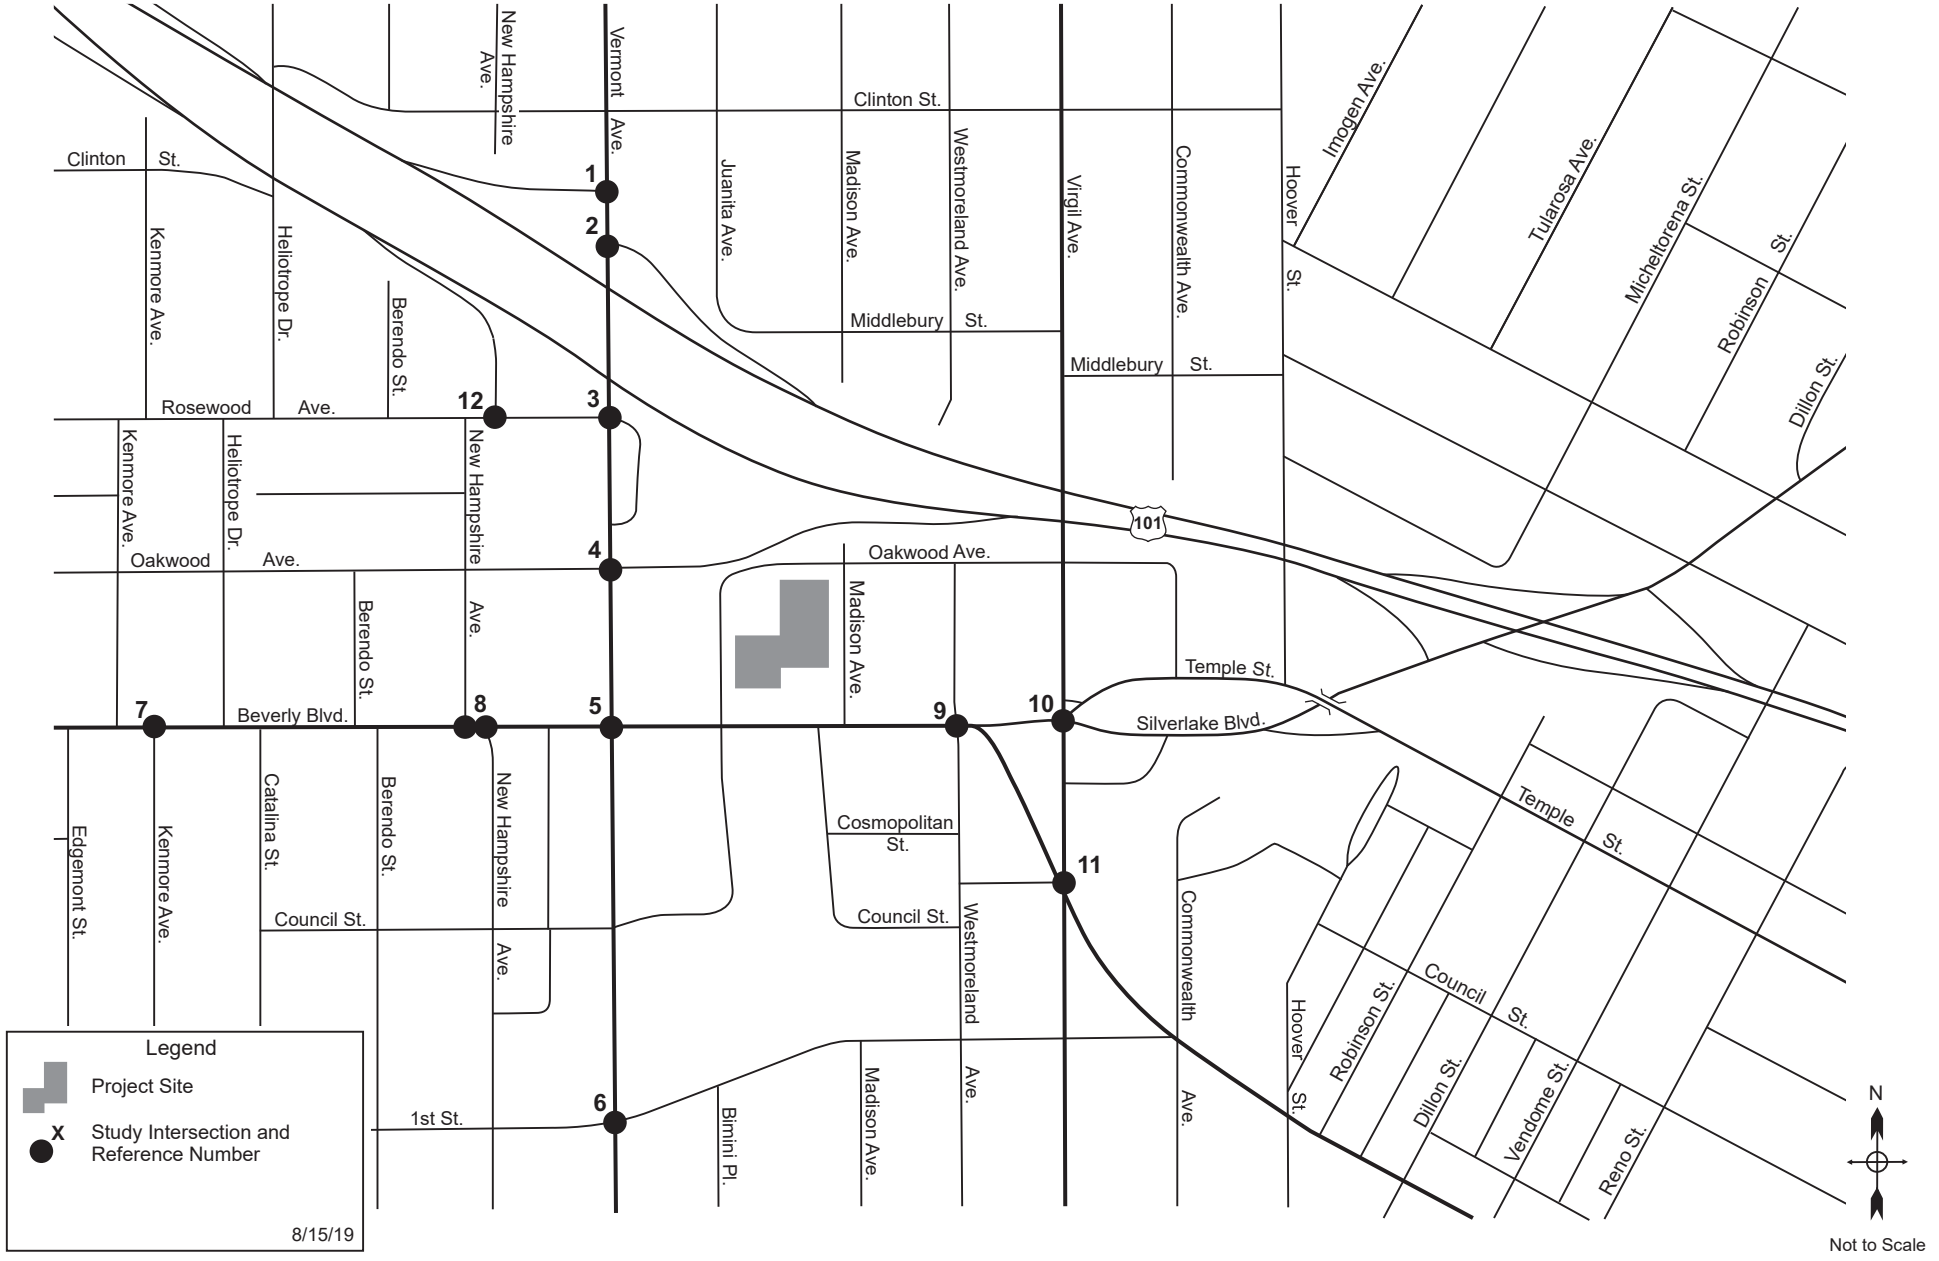

Figure 2.1
Location of Study Intersections

Enlightenment Plaza Project

The **Mobility** Group
Transportation Strategies & Solutions

provides one travel lane with left-turn lanes at intersections and a bike lane in each direction and on-street parking is generally provided on both sides with some restrictions.

Temple Street: Temple Street is a two-way east-west street located to the east of the Project Site. In the City's Mobility Plan 2035, it is classified as an Avenue II. In the vicinity of the Project Site, Temple Street provides two travel lanes in each direction and on-street parking is generally provided in off-peak periods with some restrictions

Silver Lake Boulevard: Silver Lake Boulevard is a two-way east-west street located to the east of the Project Site. In the City's Mobility Plan 2035, it is classified as an Avenue II. In the vicinity of the Project Site, Silver Lake Boulevard provides two travel lanes in each direction and on-street parking is generally provided in off-peak periods on the west side of the street with some restrictions..

Local Streets

Kenmore Avenue: Kenmore Avenue is a two-way north-south street located to the west of the project site. In the City's Mobility Plan 2035, it is classified as a Local Street – Standard. In the vicinity of the Project Site, Kenmore Avenue provides one travel lane in each direction and on-street parking is generally provided in off-peak periods with some restrictions.

New Hampshire Avenue: New Hampshire Avenue is a two-way north-south street located to the west of the project site. In the City's Mobility Plan 2035, it is classified as a Local Street – Standard. In the vicinity of the Project Site, New Hampshire Avenue provides one travel lane in each direction and on-street parking is generally provided in off-peak periods with some restrictions.

Westmoreland Avenue: Westmoreland Avenue is a two-way north-south street located to the east of the project site. In the City's Mobility Plan 2035, it is classified as a Local Street – Standard. In the vicinity of the Project Site, Westmoreland Avenue provides one travel lane in each direction and on-street parking is generally provided in off-peak periods with some restrictions.

The following local streets serves the Project Site:

Madison Avenue: Madison Avenue is a two-way north-south street located immediately east of the Project Site. In the City's Mobility Plan 2035, it is classified as a Local Street – Standard. In the vicinity of the Project Site, Madison Avenue provides one travel lane in each direction. Adjacent to the Project Site on-street parking is generally allowed.

Juanita Avenue: Juanita Avenue is a two-way north-south street located immediately west of the Project Site. In the City's Mobility Plan 2035, it is classified as a Local Street – Standard. In the vicinity of the Project Site, Juanita Avenue provides one travel lane in each direction. Adjacent to the Project Site on-street parking on the west side of the street is generally provided

Oakwood Avenue: Oakwood Avenue is a two-way east-west street located immediately north of the Project Site. In the City's Mobility Plan 2035, it is classified as a Local Street – Standard. In the vicinity of the Project Site, Oakwood Avenue provides one travel lane in each direction. Adjacent to the Project Site on-street parking is generally allowed.

2.2 Study Intersections

A total of twelve study intersections were identified, in conjunction with LADOT staff, for inclusion in the traffic analysis. The analyzed locations are shown in Figure 2.1 and were identified as locations where the majority of trips associated with the Project would be focused based on the estimated trip distribution for the Project. These locations consist of the intersections through which Project trips would travel before dispersing to multiple routes and therefore were the locations where potential traffic impacts were most likely to occur. The intersections identified for analysis are as follows:

1. Vermont Ave &101 NB on-ramp
2. Vermont Ave & 101 NB off-ramp
3. Vermont Ave & Rosewood Ave
4. Vermont Ave & Oakwood Ave
5. Vermont Ave & Beverly Blvd
6. Vermont Ave & W 1st St
7. Beverly Blvd & Kenmore Ave
8. Beverly Blvd & New Hampshire Ave
9. Beverly Blvd & Temple St & Westmoreland Ave
10. Temple St & Virgil Ave & & Silver Lake Blvd
11. Beverly Blvd & Virgil Ave & Council St
12. 101 SB off-ramp & New Hampshire Ave & Rosewood Ave

All of these intersections are signalized. The existing lane configurations for these twelve analyzed intersections are shown in Figure 2.2.

All study intersections are signalized and currently operate under the City's ATSAC system (Automated Traffic Surveillance and Control) which is a centralized control system that provides for the coordination of traffic signal timing to maximize the street capacities and to minimize traffic delays on City streets. All of these signalized intersections also operate under the City's second generation ATCS (Adaptive Traffic Control System) which utilizes enhanced surveillance and control technologies to adapt traffic signal timings to respond to actual traffic conditions on the ground to further improve the effectiveness of the ATSAC system. LADOT estimates that the effect of the ATSAC system is to improve intersection capacity by an average of 7%, and that the effect of the ATCS system is an additional increase in capacity of 3%. As all intersections in the study area operate under both ATSAC and ATCS, in accordance with LADOT procedures a capacity increase of 10% was applied to all intersections in the analysis and is reflected in the level of service calculations.

2.3 Existing Intersection Conditions

Existing Traffic Volumes

Recent traffic counts were used for all of the analyzed intersections. AM and PM peak period traffic counts were conducted in April 2019. As required by LADOT, counts were collected during the hours of 7:00 – 10:00 AM for the morning peak period and 3:00 – 6:00 PM for the PM peak period, and were conducted when schools were in session and outside of holiday periods. The existing peak hour traffic volumes are illustrated in Figures 2.3 and 2.4 for the AM and PM peak hours respectively.

Level of Service Methodology

Level of service (LOS) is a qualitative measure used to describe the condition of traffic flow, ranging from excellent conditions at LOS A to overloaded conditions at LOS F, with each level defined by a range of volume/capacity (V/C) ratios. Table 2.1 defines the ranges of V/C ratios and their corresponding levels of service for signalized intersections. Intersection analysis was conducted using the "Critical Movement Analysis (Planning Method)" as described in "Transportation Research Circular 212, Transportation Research Board, Washington D.C. 1980", and as required by LADOT's Traffic Study Policy and Procedures, to obtain volume/capacity (V/C) ratios for each intersection.

Existing Peak Hour Levels of Service

Table 2.2 summarizes the existing AM and PM peak hour V/C ratios and corresponding levels of service at the analyzed intersections.

AM Peak Hour

All of the studied intersections currently operate at LOS C or better during the AM peak hour with the majority at LOS A or B, except for the following intersection:

10. Temple St & Virgil Ave & Silver Lake Blvd LOS D

PM Peak Hour

All of the studied intersections currently operate at LOS C or better during the PM peak hour with the majority at LOS A or B, except for the following intersection:

10. Temple St & Virgil Ave & Silver Lake Blvd LOS D

Transportation Strategies & Solutions

Table 2.1 Level of Service Definitions for Signalized Intersections

Level of Service	Description	Volume to Capacity Ratio
A	Excellent operation. All approaches to the intersection appear quite open, turning movements are easily made, and nearly all drivers find freedom of operation.	<0.600
B	Very good operation. Many drivers begin to feel somewhat restricted within platoons of vehicles. This represents stable flow. An approach to an intersection may occasionally be fully utilized and traffic queues start to form.	0.601 – 0.700
C	Good operation. Occasionally drivers may have to wait for more than 60 seconds, and backups may develop behind turning vehicles. Most drivers feel somewhat restricted.	0.701 – 0.800
D	Fair operation. Cars are sometimes required to wait for more than 60 seconds during short peaks. There is no long-standing traffic queues. This level is typically associated with design practice for peak periods.	0.801 – 0.900
E	Poor operation. Some long-standing vehicular queues develop on critical approaches to intersections. Delays may be up to several minutes.	0.901 – 1.000
F	Forced flow. Represents jammed conditions. Backups from locations downstream or on the cross street may restrict or prevent movement of vehicles out of the intersections approach lanes; therefore, volumes carried are not predictable. Potential for stop-and-go type traffic flow.	Over 1.001

2.4 Existing Transit Service

The Project Site is well served by transit. The Metro Red Line subway rail station at Vermont Avenue and Beverly Boulevard is located one block from the Project site. It also located within walking distance of six bus routes – Metro 14, Metro 201, Metro 204, one Metro Rapid Route – Metro 754, as well as one LADOT Commuter Express line – CE422, and one LADOT DASH bus line – Wilshire Center/Koreatown. Figure 2.5 shows transit service provided in the Project Area. Table 2.3 lists the individual rail and bus lines serving the Project Area, and indicates the frequency of service (headways) during the AM and PM peak periods.

Summary of Transit Service on Major Streets In the vicinity of the Project Site

Metro Red Line (Metro Rail) runs between Downtown Los Angeles and North Hollywood via Vermont Avenue in the vicinity of the Project. It operates between approximately 4:20am and 1:20pm on weekdays and weekends. It runs at about 10 minute headways during weekday peak periods and around 15-20 minute headways on weekends.

Metro 754 (Metro Bus Rapid Transit) runs between Athens and Hollywood via Vermont Avenue. It operates between approximately 5:10am and 9:25pm on weekdays and between 6:40am and 9pm on weekends. It runs at about 10 minute headways during weekday peak periods and around 15-20 minute headways on weekends.

Metro 14 runs between Beverly Hills and Downtown Los Angeles via Beverly. It operates between approximately 5:10am and 12:50am on weekdays and between 5:30am and 12:50pm on weekends. It runs at about 10 minute headways during weekday peak periods and around 20 minute headways on weekends. It also operates Owl Schedule, between 1:50am and 4:50pm Monday thru Sunday

Metro 201 runs between Glendale and Koreatown Athens and Hollywood via Vermont Avenue in the vicinity of the Project. It operates between approximately 5:45am and 8:40pm on weekdays and between 7am and 9pm on weekends. It runs at about 55 minute headways during weekday peak periods and around 60 minute headways on weekends.

Metro 204 runs between Athens and Hollywood via Vermont Avenue. It operates between approximately 4:50am and 5AM on weekdays and between 5:40am and 5pm on weekends. It runs at about 10 minute headways during weekday peak periods and around 20 minute headways on weekends.

LADOT Commuter Express 422 runs between Hawthorne and Downtown Los Angeles via Highway 101 in the vicinity of the Project. It operates between approximately 5:25am and 8:30am and between 3:35pm and 7:40pm on weekends only. It runs at about 20 minute headways during weekday peak periods

Commuter Express							
CE 422 - Hawthorne - Downtown Los Angeles	Highway 101	Express	5:25 AM - 8:30 AM (WB) 3:35 PM - 7:40 PM (EB)	N/A	20	20	N/A
DASH							
LDWCK - Wilshire Center - Koreatown	Vermont Avenue	DASH	7:30 AM - 7:10 PM (NB) 7:30 AM - 7:10 PM (SB)	20	20	20	20

LADOT DASH Wilshire Center/Koreatown has a bus stop located on Vermont Avenue at the 1st Street intersection. It operates between approximately 7:30am and 7:10Pm on weekdays and between 9:30am and 6:30pm on weekends. It runs at about 20 minute headways during weekdays and weekends.

Bus Stops In the vicinity of the Project Site

Within three blocks of the Project Site, there are 11 bus stops, which are located at the following locations and shown in Figure 2.6:

- 101 Hwy & Vermont Ave
- Rosewood Ave & Vermont Ave
- Beverly Blvd & Vermont Ave
- 1st St & Vermont Ave
- Temple St & Virgil Ave
- Beverly Blvd & Virgil Ave
- 1st St & Virgil Ave

2.4 Bicycle Facilities

Bicycle Facilities

The Mobility Plan 2035 designates a network of bicycle lanes (Tier 1, Tier 2 and Tier 3) and bicycle paths in the area of project.

Tier 1 Bicycle Lanes are bicycle facilities on arterial roadways with physical separation.

Tier 2 and Tier 3 Bicycle Lanes are bicycle facilities on arterial roadways with striped separation.

Bicycle Paths are facilities outside of the roadway.

Bicycle Routes are identified routes for bikes and are streets signed to alert drivers to bicyclists sharing the roadway spaces – often with the use of "sharrow" symbols painted on the street.

Existing bicycle facilities in the project area comprise a Bicycle Lane or Bicycle Route on the following streets, as shown in Figure 2.7:

- New Hampshire Avenue south of Rosewood Avenue - Bicycle Route
- Rosewood Avenue between New Hampshire Avenue and Serrano Avenue - Bicycle Route
- 1st Street between Vermont Avenue and Beverly Boulevard - Bicycle Lane on both sides
- Hoover Street south of Council Street and north of Temple Street - Bicycle Route

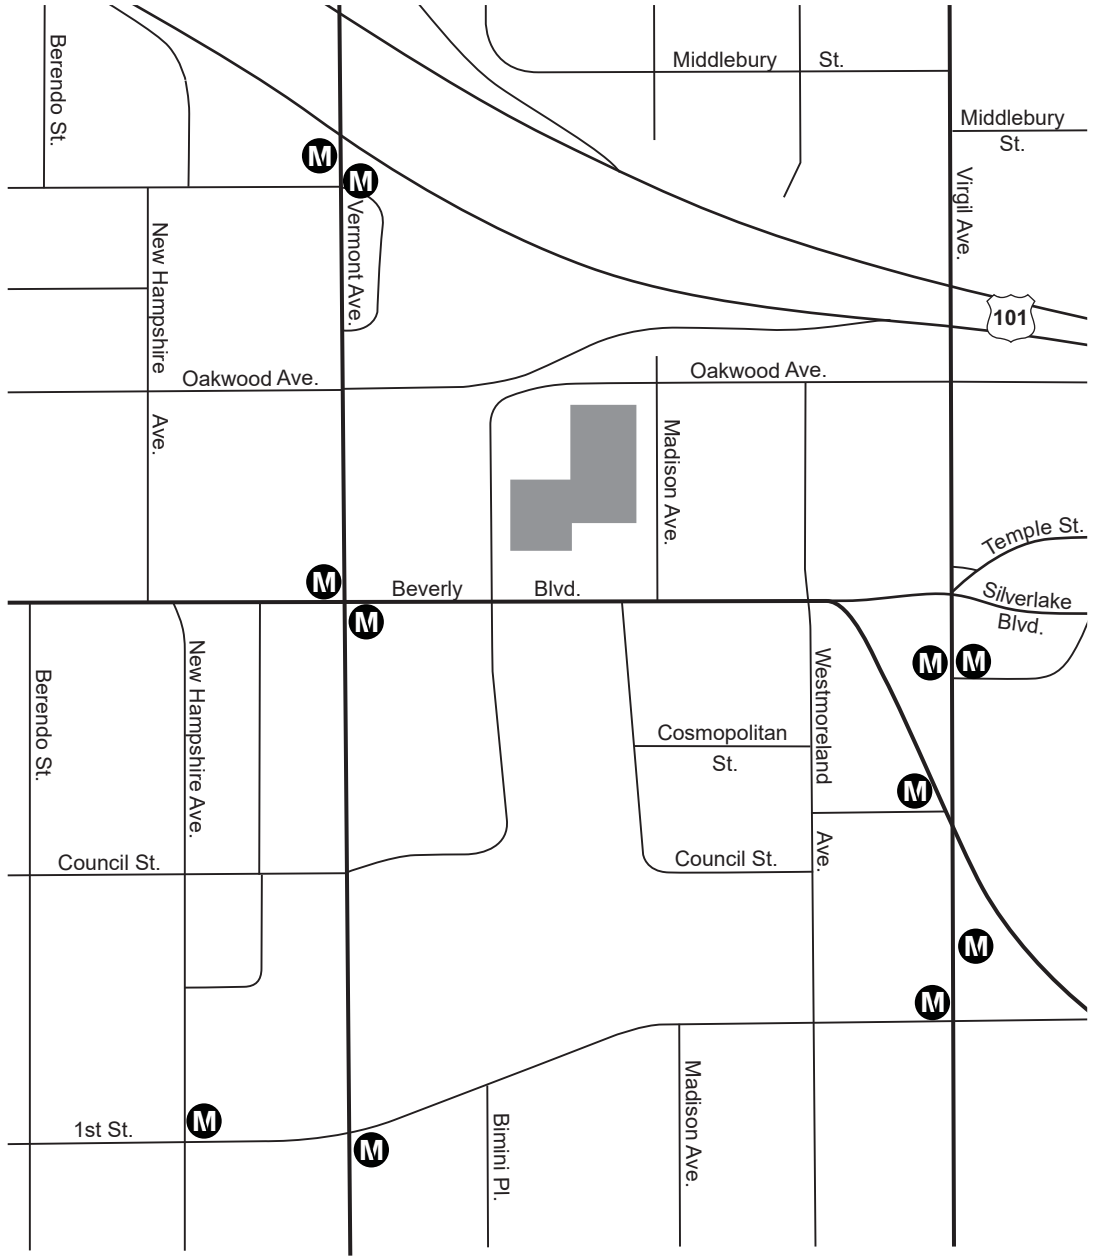

Figure 2.6

- Temple Street between Hoover Street and Robinson Street - Bicycle Route
- Robinson Street between Temple Street and Council Street - Bicycle Route
- Council Street between Hoover Street and Robinson Street - Bicycle Route
- Clinton Street between Heliotrope Drive and Hoover Street - Bicycle Route
- Bellevue Avenue east of Hoover Street - Bicycle Route
- Heliotrope Drive between Melrose Avenue and Rosewood Avenue - Bicycle Lane

The Mobility Plan 2035 identifies designated bicycle facilities planned for implementation over the longer term. For the area of the Project, these are discussed in Chapter 5 under Future Conditions.

2.5 Pedestrian Facilities

The Project Site is located in an area with well-developed pedestrian facilities, including sidewalks on all streets and crosswalks at all intersections. On the south side of the Project Site, there is currently a thirteen-foot sidewalk on Beverly Boulevard. Adjacent to the Project site there is a fifteen-foot sidewalk on Juanita Avenue west of the Project site, a twelve-foot sidewalk on Oakwood Avenue north of the Project Site, and an eight-foot sidewalk on Madison Avenue east of the Project Site.

According to Walkscore.com[1], the area of the Project has a walkability score of 96 (out of 100) – which is described as a "Walker's Paradise" where 'most errands can be accomplished on foot'. (Walkscore also allocates a transit score of 100 - 'riders paradise, world class public transportation', and a bike score of 63 – bikeable, flat as pancake, minimal bike lanes') to the area of the Project.

Vision Zero

The City of Los Angeles Department of Transportation is implementing a program called Vision Zero Los Angeles[2], which represents a citywide effort to eliminate traffic deaths in the City of Los Angeles by 2025. Vision Zero has two goals: a 20% reduction in traffic deaths by 2017 and zero traffic deaths by 2025. In order to achieve these goals, LADOT identified a network of streets, called the High Injury Network (HIN), which has a higher incidence of severe and fatal collisions, and where LADOT has determined that pedestrian enhancement improvements will be most effective in meeting these goals. The HIN is comprised of 386 corridors that represent 6% of Los Angeles' street miles, and 65% of all deaths and severe injuries involving people walking and biking occur on these 6% of streets.

[1] Walk Score is a large-scale, public access walkability index that assigns a numerical walkability score to any address in the United States, Canada, and Australia. Walk Score is based on analysis of walking routes to nearby amenities, as well as measuring pedestrian friendliness by analyzing population density and road metrics such as block length and intersection density.
[2] Vision Zero Los Angeles 2015-2025 – Action Plan, January 2017.

Figure 2.8 shows the High Injury Network in the Project area. The Project is located on Beverly Boulevard, which is on the High Injury Network (HIN). Other streets in the vicinity of the Project Site that are located on the High Injury Network are as follows:

- Vermont Avenue
- Temple Street – east of Robinson Street
- Virgil Avenue – north of Middlebury Street

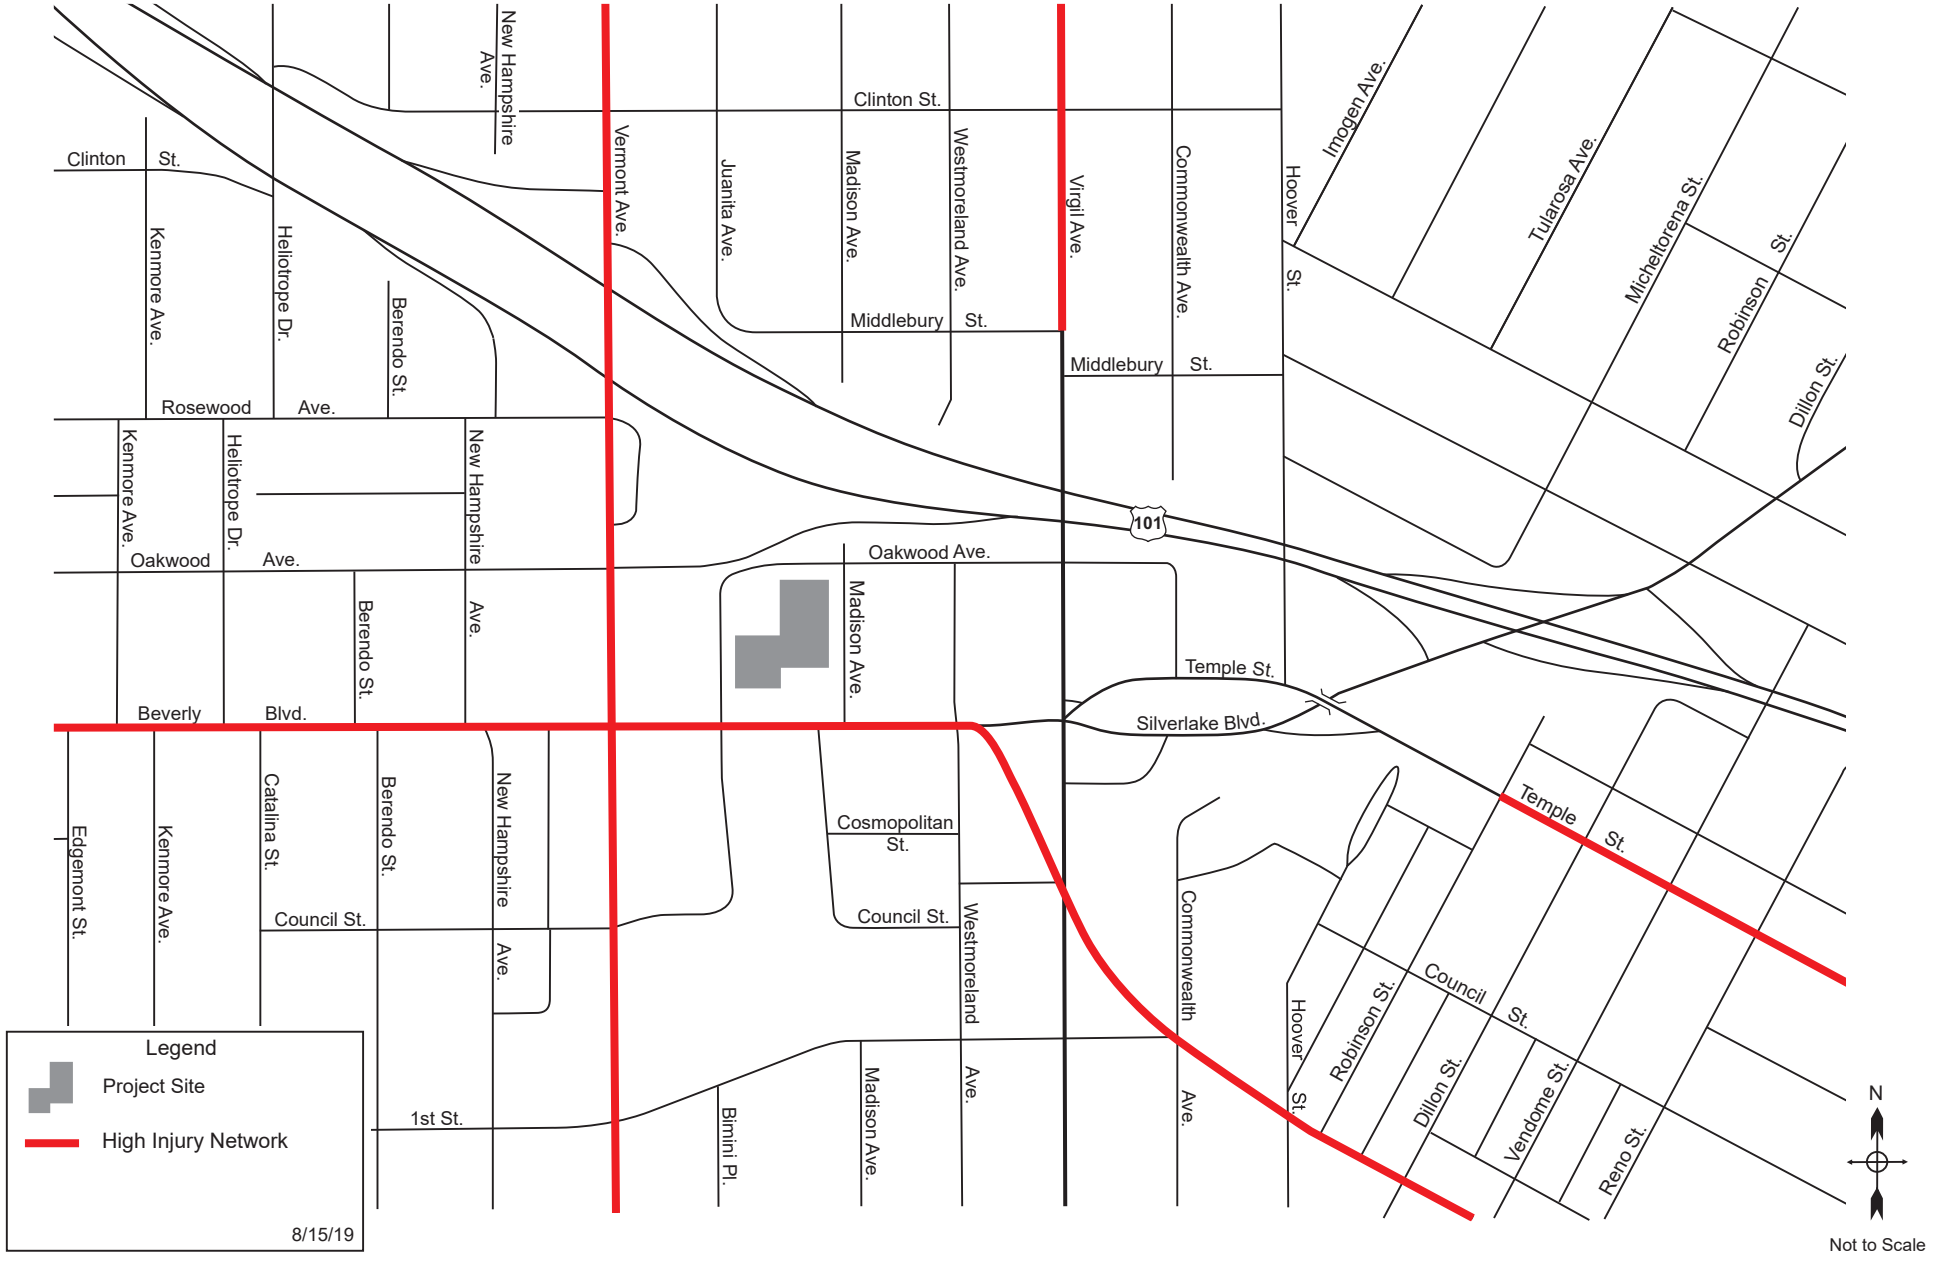

Figure 2.8
High Injury Network

Enlightenment Plaza Project

The **Mobility** Group
Transportation Strategies & Solutions

3. Project Description and Transportation Characteristics

This section of the report provides a description of, and identifies transportation characteristics of, the proposed project including trip generation and trip distribution characteristics.

3.1 Project Description

The Project Site is located at 321 N Madison Avenue in the Hollywood Area of Los Angeles and bounded by private property to the south, Juanita Avenue to the west, Madison Avenue to the east and Oakwood Avenue to the north. The Project location is shown in Figure 1.1 earlier in this report.

The Project Site is currently occupied by an AT&T Service Yard, with driveways on Juanita Avenue. The site also includes 3812 Oakwood which has 3 multi-family units. In addition, 3838 Oakwood at the corner of Oakwood / Juanita has an existing office building which will remain.

The Proposed Project, referred to as Enlightenment Plaza will consist of 449 units of housing dedicated to Permanent Supportive Housing (Restricted Affordable) for formerly homeless individuals in 5 buildings, including 5,700 sq.ft. of services (mental and physical health, financial, employment) for on-site residents, and 5 managers units.

The main vehicular access (ingress and egress) is to be provided from Madison Avenue. A centralized drop-off and pickup will also be provided on Madison Avenue. Vehicular access will also be provided from Oakwood Avenue and Juanita Avenue. A Site Plan is shown in Figure 1.2 earlier in this report.

3.2 Project Trip Generation

The trip generation estimates for the Project are shown in Table 3.1 which summarizes the trip generation estimates for the daily, AM peak & PM peak hour periods respectively. Trips for the existing uses to be removed (the AT&T Service Yard) were obtained from actual driveway counts. Trips estimates for the Proposed Project used trip rates from Table 5 of LADOT's Transportation Impact Study Guidelines, December 2016, for Permanent Supportive Housing. The Project would generate 409 net daily trips, 49 net AM peak hour trips and 37 net PM peak hour trips.

Table 3.1 Enlightenment Plaza Project - Trip Generation Estimates

Daily Trips

Land Use Assumptions		Source & Code	Quantity	Units	Daily

Permanent Supportive Housing (PSH) [3]		LADOT	449	DU	0.07	0.05	0.12	31	22	53
Apartments [4]		ITE 221	5	DU	0.13	0.05	0.18	1	0	1
(Reduction for internal trips) -	15%							0	0	0
(Reduction for transit trips) -	15%							0	0	0
Net Apartment								1	0	1
Total Proposed								32	22	54
Total Net								22	15	37

Notes:

1. Trips for existing uses (AT&T Service Yard) from driveway traffic counts, 2019.
2. Daily trips for existing uses calculated based on the assumption of 10 times PM peak hour traffic.
3. Trip rates for Permanent Supportive Housing are from Table 5 of LADOT's Transportation Impact Study Guidelines, December 2016.
4. Apartments analyzed as ITE 221 - Multifamily Housing (Mid-Rise). Used trip rates for Dense Multi-Use Urban.

Note : Some numbers may not add up precisely due to rounding.

3.3 Project Trip Distribution

The likely distribution of Project trips was identified based on the type of land uses in the Project, the likely destinations of Project residents based on the local and regional distributions of employment and commercial destinations, existing traffic volumes, and the characteristics of the street system in the area of the Project. The general trip distribution pattern was developed in consultation with LADOT and the following distribution was assumed:

- 20% of the trips towards the north
- 35% of the trips towards the south
- 20% of the trips towards the east
- 25% of the trips towards the west

3.4 Project Traffic Projections

Project traffic was assigned to the roadway network on the basis of the parameters described above. The Proposed Project traffic volumes forecast on the roadway network are shown in Figure 3.1 for the AM peak hour, and in Figure 3.2 for the PM peak hour.

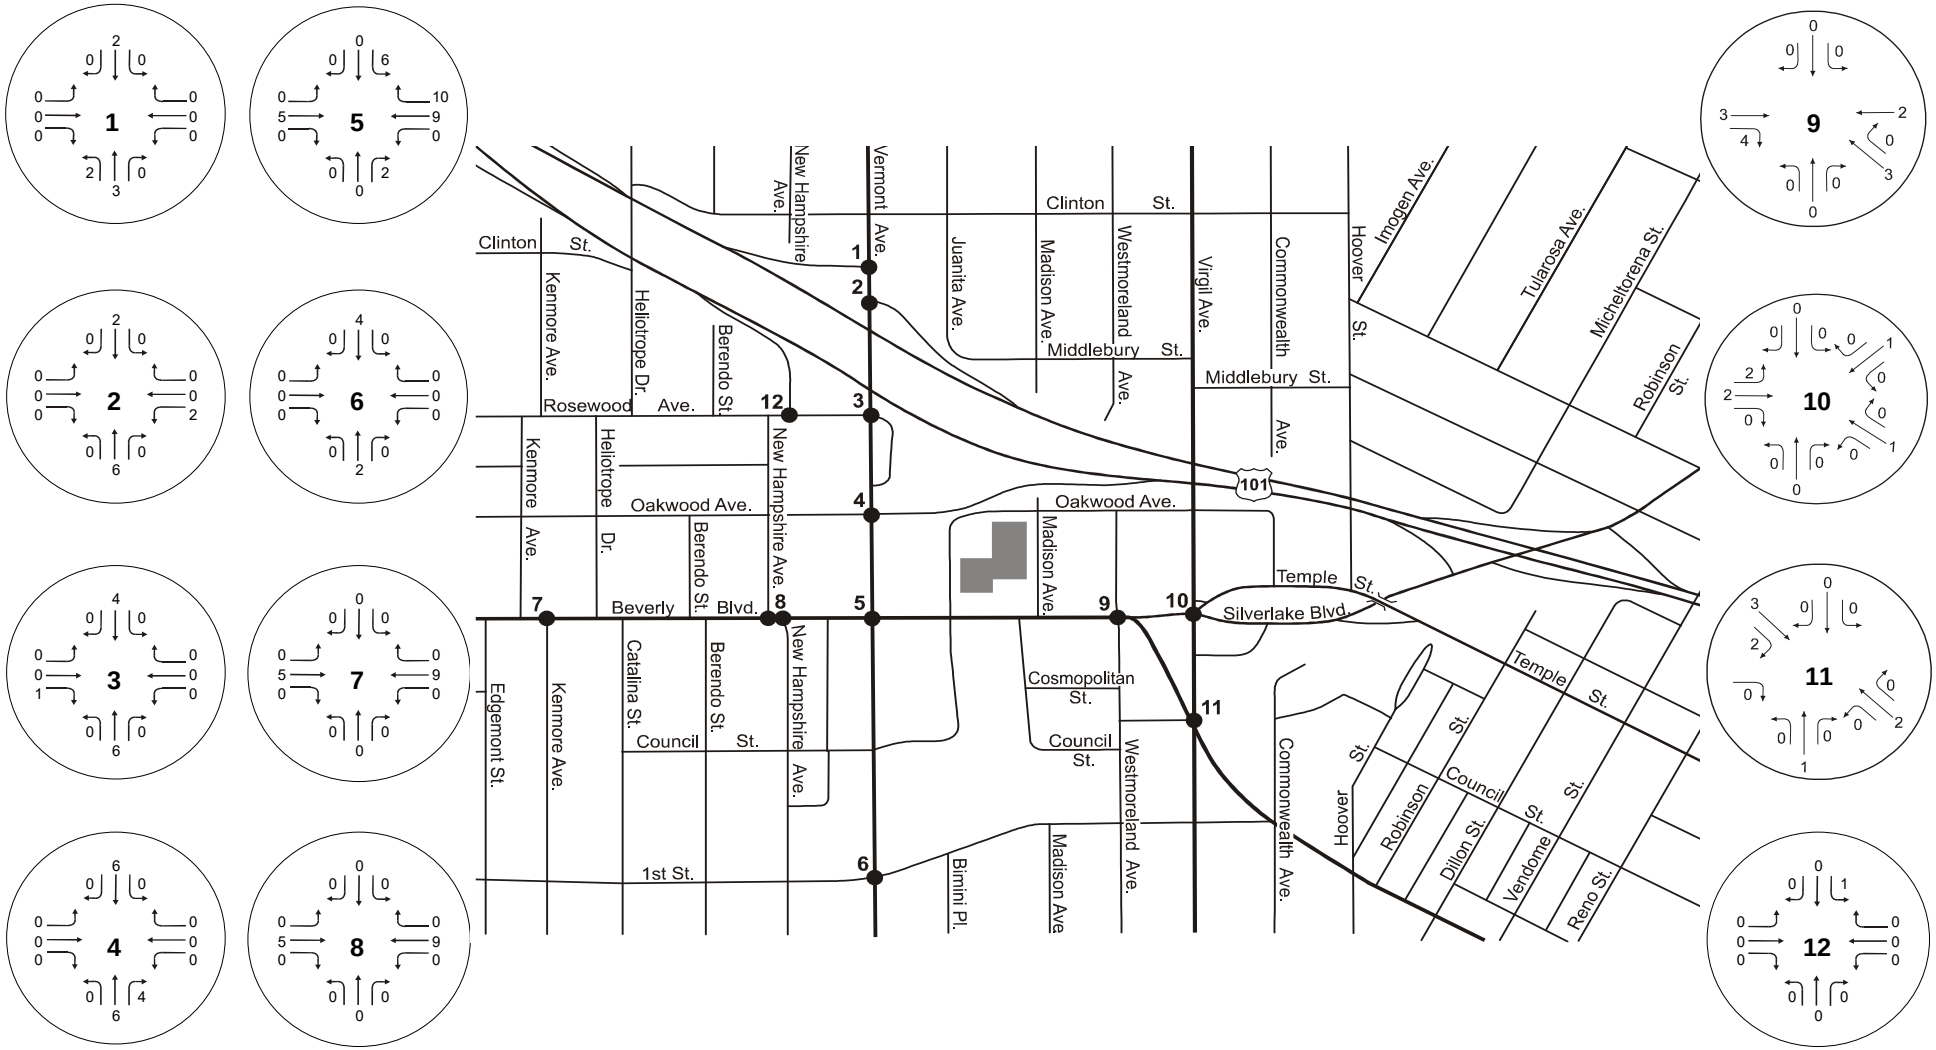

Figure 3.1

4. Existing With Project Conditions

This section of the report documents the analysis of potential Project traffic impacts in the study area for the Existing With Project conditions. Project traffic was added to existing traffic volumes and the potential for impacts evaluated. The total Existing With Project Conditions peak hour traffic volumes are illustrated in Figures 4.1 and 4.2 for the AM and PM peak hours respectively.

4.1 Project Impacts - Intersections

Significant Impact Thresholds

LADOT has established criteria to determine if project impacts are significant at an intersection. These criteria are shown below.

Definition of Significant Impact at Intersection

With Project Traffic		Project-Related Increase
LOS	V/C Ratio	in V/C Ratio
C	0.701 – 0.800	equal to or greater than 0.040
D	0.801 – 0.900	equal to or greater than 0.020
E, F	> 0.900	equal to or greater than 0.010

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS C after the addition of project traffic and the incremental change in the volume/capacity (V/C) ratio is less than 0.040. However, in another example, if the intersection is operating at LOS E or LOS F and the incremental change in V/C ratio is 0.010 or greater, then the project would be considered to have a significant impact at that location.

Existing With Project Intersection Level of Service

The total Existing With Project conditions peak hour traffic volumes are illustrated in Figures 4.1 and 4.2 for the AM and PM peak hours. Tables 4.1 and 4.2 summarize the level of service for the Existing With Project conditions at the analyzed intersections for the AM and PM peak hours respectively, as well as the increase in V/C ratio at each intersection, and identify if the increase constitutes a significant impact.

AM Peak Hour

The analysis summarized in Table 4.1 indicates that for the AM peak hour, the addition of project traffic would not cause the level of service to change at any of the study intersections, except at the intersection of Vermont Avenue & Beverly Boulevard where it would change from LOS B to LOS C. All increases in volume/capacity (V/C) ratios would be less than the threshold for a significant impact to occur. It is therefore concluded that the Project would cause no significant traffic impacts in the AM peak hour.

PM Peak Hour

The analysis summarized in Table 4.2 indicates that for the PM peak hour, the addition of project traffic would not cause the level of service to change at any of the study intersections. All increases in volume/capacity (V/C) ratios would be less than the threshold for a significant impact to occur. It is therefore concluded that the Project would cause no significant traffic impacts in the PM peak hour.

5. Future Conditions Without The Project

5.1 Traffic Forecasts

In order to evaluate the potential traffic impacts of the Project, it was necessary to first estimate and then analyze future traffic conditions without the Project. The year selected for this analysis was 2023, which is the expected year of completion of the Project.

Future traffic forecasts were estimated by forecasting two separate components of traffic growth in the study area.

The first component is the ambient growth that represents a general growth in traffic volumes due to minor new developments in the Project Area, and regional growth and development outside the study area. A growth rate of 1.0 percent per year was applied for this ambient traffic growth based on historical trends and in conjunction with LADOT[1]. The existing traffic counts were therefore adjusted upward by a total of 1.0 percent a year for five years to represent the ambient growth to the Project completion year.

The second component of future growth relates to specific development projects located in the study area. These developments are projects located within an approximately 0.65-mile radius from the Project Site (per guidelines in LADOT Memo of November 28, 2018) that are currently under construction, have received formal approval, or are under formal planning consideration and potentially could be in place by the year 2023 when the Project will be completed, and that could add traffic growth to the roadways in the study area. The following section of this chapter describes the process of estimating traffic from these related projects.

This approach is consistent with procedures outlined in Section 15130 of the CEQA Guidelines which provide two options for developing future traffic forecasts:

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
> "(B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions

[1] It is noted that the CMP provides growth factors based on regional modeling. For the Central Los Angeles area the CMP estimates an average ambient growth factor of approximately 0.2% per year. between the years of 2018 and 2023 (Exhibit D-1 of the CMP). However. an ambient growth factor of 1% per year, compounded annually, was conservatively used to adjust the existing traffic volumes to reflect the effects of the regional growth and development by year 2023, following agreement with LADOT through the MOU process,. The total ambient growth adjustment applied over the five-year period was 5.1%.

> contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency."

As described above and further below, the methodology used in this study incorporates both Option A – through the incorporation of a related project list, and Option B – through the incorporation of an ambient growth factor. This approach is conservative because the analysis includes both a list of specific related projects and a general background growth factor, and also in that not all of the related projects may be ultimately built, and not all may be built by 2023 (the buildout year of the Project). The analysis therefore likely overstates the future growth in traffic for the horizon year without the Project.

5.2 Related Projects

Project List

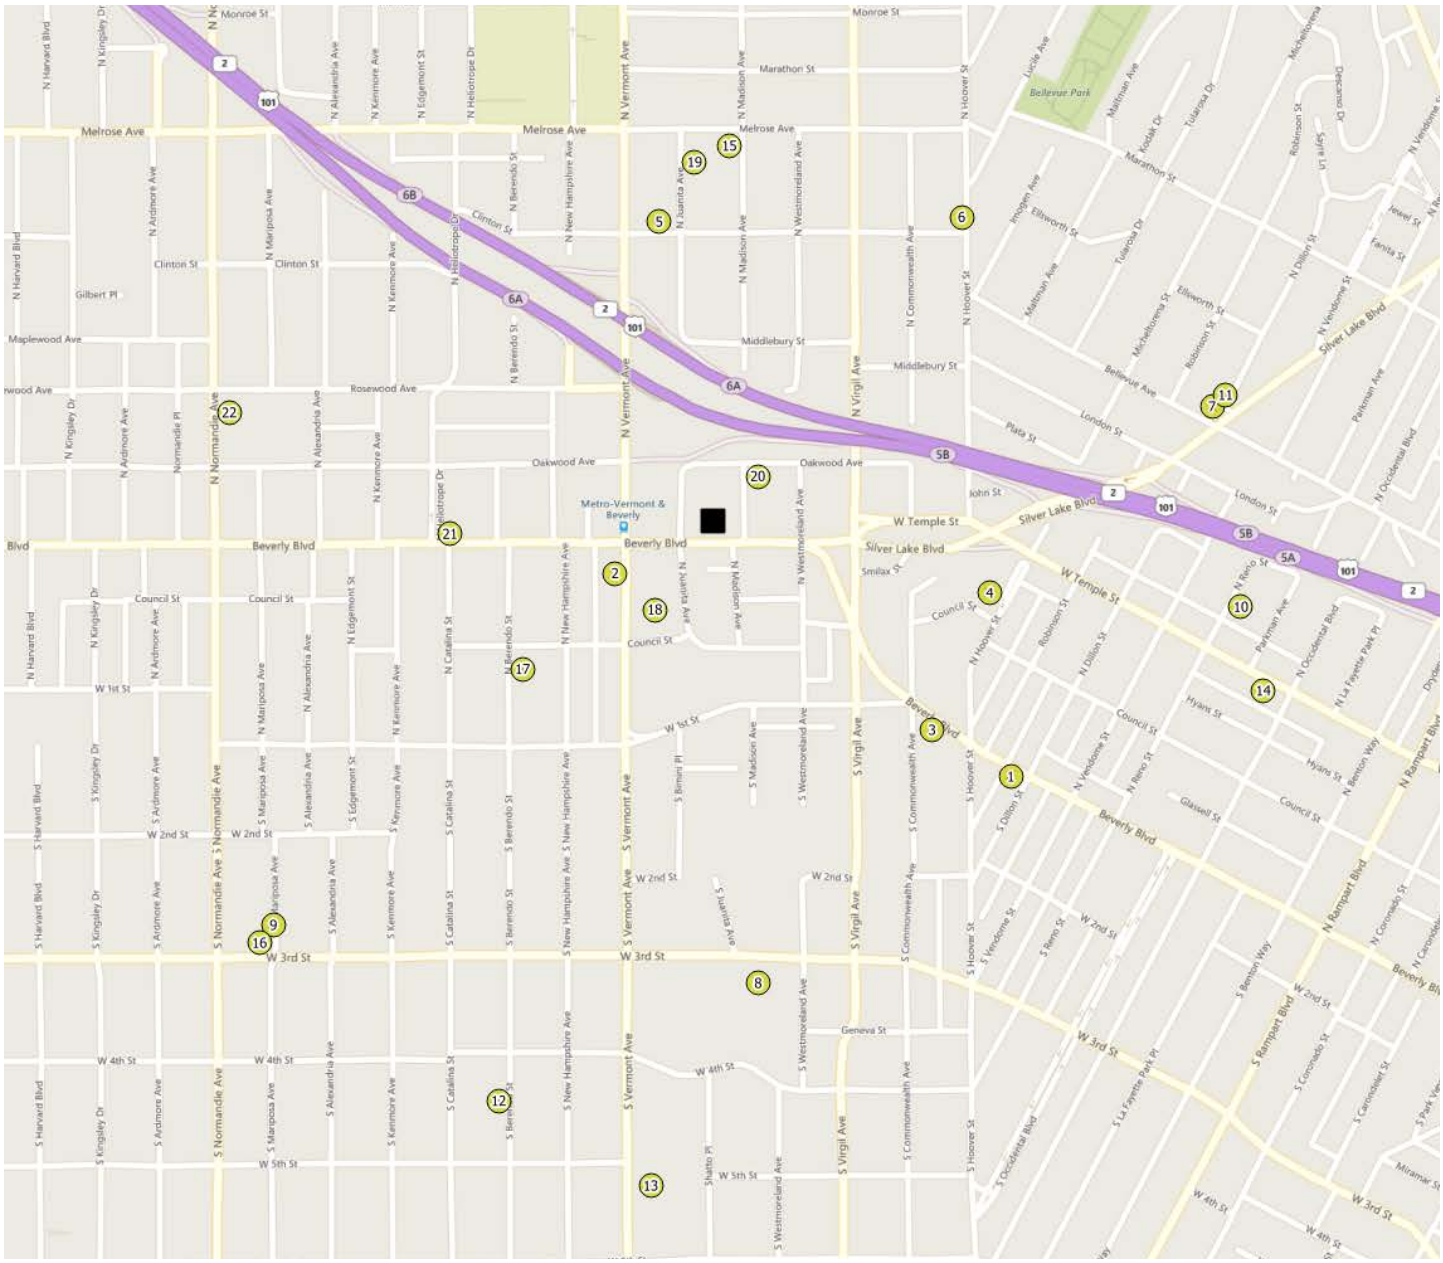
A list of proposed development projects that could affect traffic conditions in the Project Area by adding traffic volumes to study area intersections was prepared based on information obtained from LADOT, Department of City Planning, other studies and reports. A total of 22 potential development projects were identified, the locations of which are shown in Figure 5.1 and are listed in Appendix A. This list was verified and approved by the Department of City Planning and LADOT.

It should also be noted that, again for purposes of preparing a conservative analysis, no potential street improvements or transportation mitigation measures that might be associated with any of the related projects were included in the future conditions traffic analysis.

Project Trip Generation and Distribution

Trip generation estimates for the related projects were prepared, as shown in Appendix B. These were generally taken from the lists provided by the City, and from environmental and/or traffic studies prepared for the individual projects. Where the information was not available from previous reports, the trip generation was estimated using standard trip rates. These estimates are considered conservative in that they do not account for trip interaction between projects, and they do not in every case account for the possible use of non-auto modes such as transit, walk and bicycling.

Similarly, trip distribution estimates were also taken from the environmental/traffic studies conducted for the individual projects where available or were estimated based on an



N

Not to Scale

Location of Related Projects

Enlightenment Plaza Project

The **Mobility** Group
Transportation Strategies & Solutions

understanding of the type of the project, its location, the geographic distribution of population and employment from which project trips may be drawn, and the surrounding roadway and circulation system. It should be noted that because of the large geographic distribution of these projects, that not all of the related project trips would travel through the study area and traverse the study intersections.

Future Traffic Forecasts for 2023 Without Project Condition

The trip estimates shown in Appendix B were then added to the roadway network and combined with existing volumes and ambient traffic growth (described earlier) to provide forecasts of future baseline traffic conditions in the study area in 2023, for both the AM and PM peak periods, representing the Future Without Project conditions.

The Future Without Project peak hour traffic volumes are illustrated in Figures 5.2 and 5.3 for the AM and PM peak hours respectively.

Transportation System Changes

Planned Bicycle Facilities

The Mobility Plan 2035 designates approximately 1,200 miles of street in the City's Bicycle Network that includes a Bicycle Enhanced Network and a Bicycle Lane Network. The Bicycle Enhanced Network consists of Bicycle Paths, Tier 1 Bicycle Lane (Protected Bicycle Lane) and Neighborhood Enhanced Network. The Bicycle Lane Network consists of Tier 2 and Tier 3 Bicycle Lanes.

As shown in Figure 5.4, In the area of the Project, the Mobility Plan 2035 recommends Tier 2 bike lanes along Beverly Boulevard east of Westmoreland Avenue, on Silverlake Boulevard east of Virgil Street, on 1st Street between Virgil Street and Beverly Boulevard; Tier 3 bike lanes along Beverly Boulevard west of Westmoreland Avenue, on Temple Street east of Westmoreland Avenue, and along Virgil Avenue. These are in addition to, or change to the existing bicycle facilities shown in Figure 2.7.

Transportation Strategies & Solutions

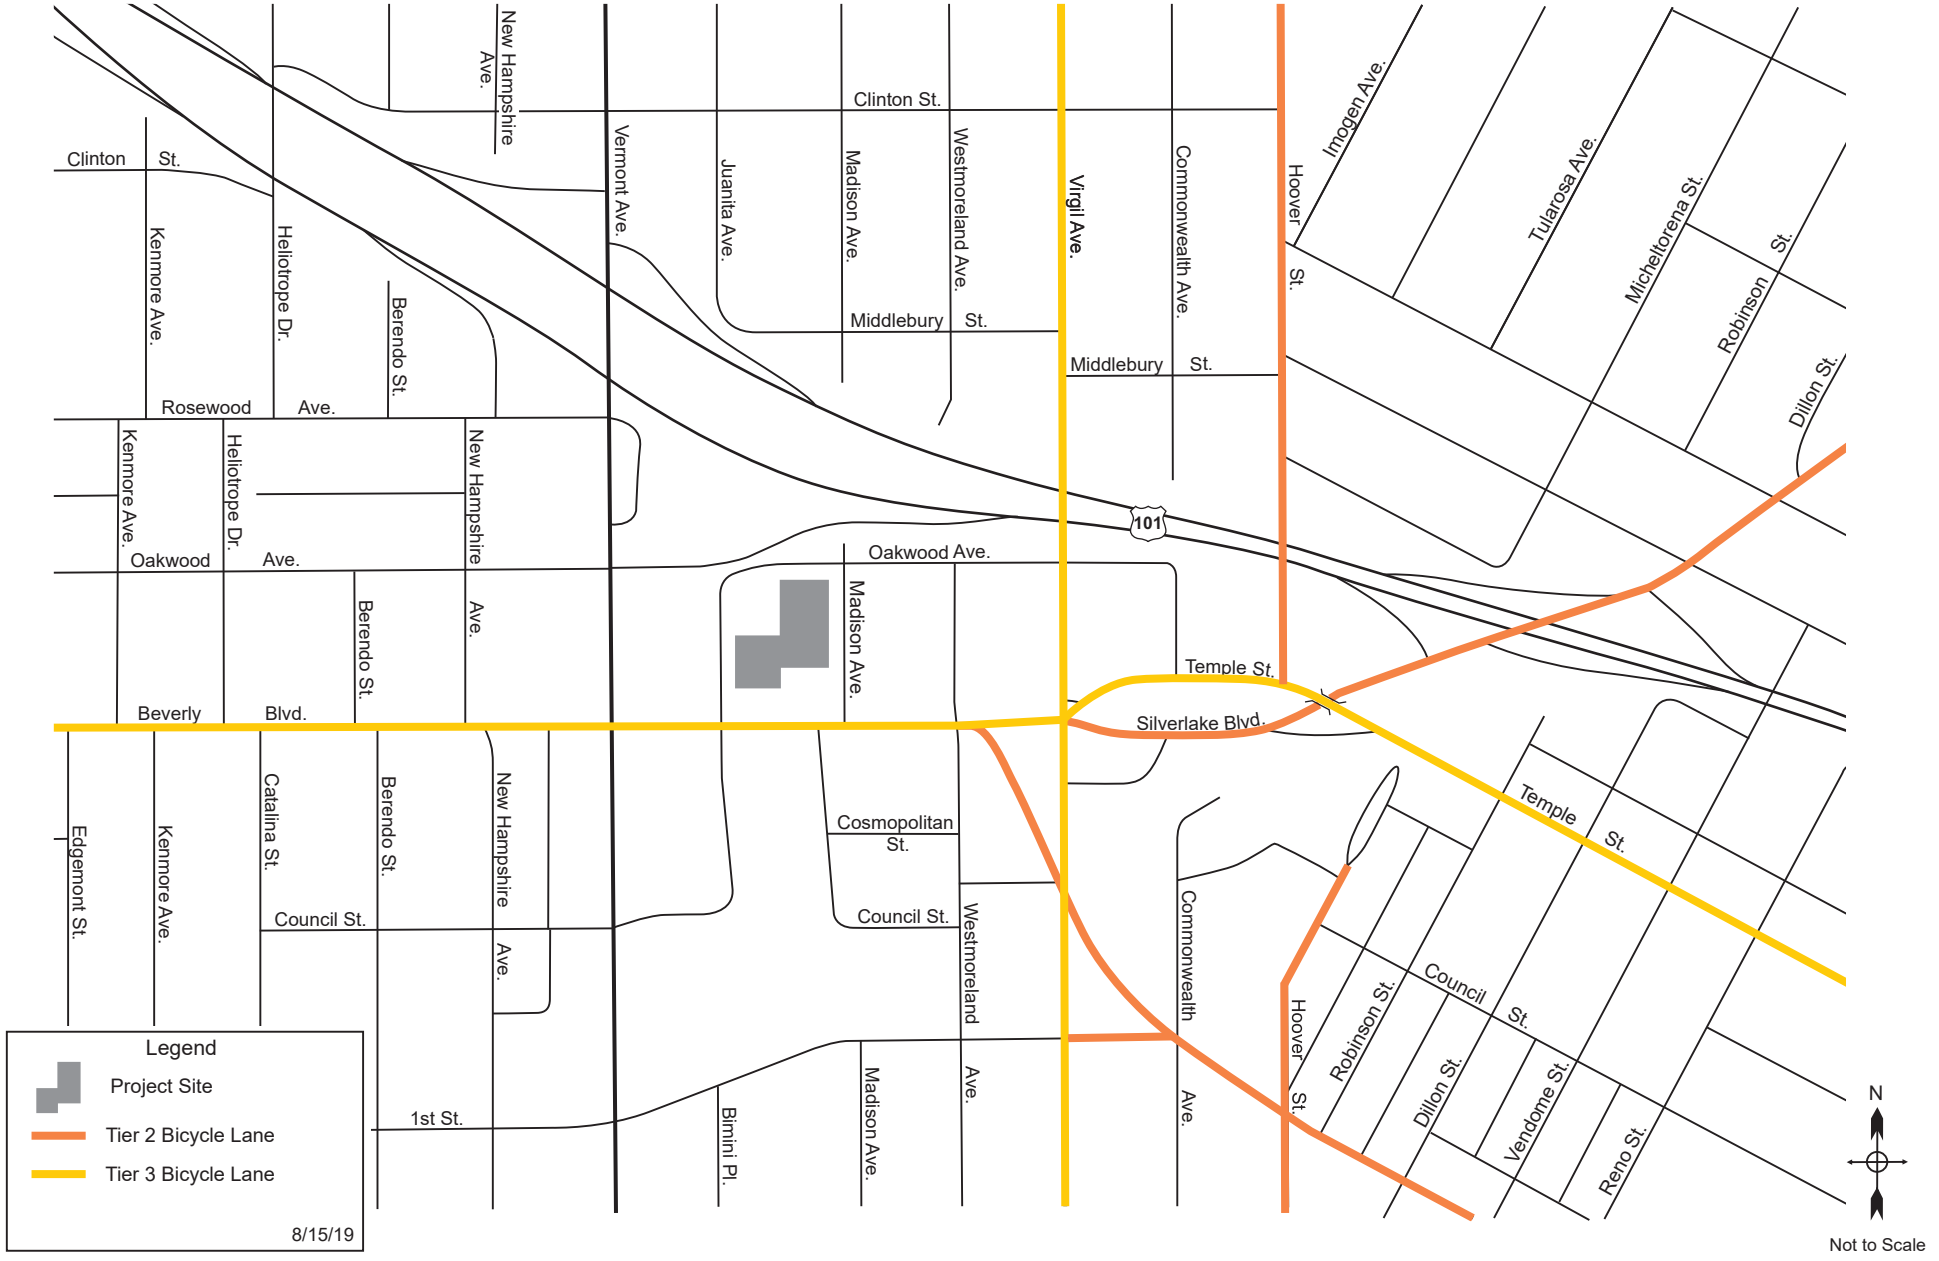

Figure 5.4
Designated Bicycle Facilities (In addition to or changes from Existing Facilities)

Enlightenment Plaza Project

The **Mobility** Group
Transportation Strategies & Solutions

For the remaining facilities, the Mobility Plan 2035 will implement the overall list of improvements in phases over many years, and in many cases the proposals are conceptual and the plan does not identify the specific street configurations or geometries that will be necessary to accommodate the proposed bike lanes on those streets – which are details to be worked out in the future.

At the time of preparing this report, none of the designated planned facilities in the area as identified above and shown in Figure 5.4 are programmed for completion before the Project design year of 2023 so there are no definitive details on roadway layouts to accommodate the improvements, and they are not included in the following analysis. These facilities will be evaluated by LADOT over time as the Mobility Plan 2035 is implemented in future phases.

Pedestrian Network

The Mobility Plan 2035 defines Pedestrian Enhanced Districts to identify "where pedestrian improvements on arterial streets could be prioritized to provide better walking connections to/from manor destinations within communities." The Mobility Plan 2035 aims to promote walking and reduce reliance on other modes for shorter trips by providing more attractive and wider sidewalks, and adding pedestrian signalization, street trees, and other design features that encourage people to take trips on foot instead of by car.

The Mobility Plan 2035, in identifying Pedestrian Enhanced Districts, has designated the following arterial streets in the area of the Project as Pedestrian Street Segments:

- Beverly Boulevard
- Virgil Avenue
- Hoover Street
- Temple Street
- Silver Lake Boulevard
- 3rd Street

5.3 Future Intersection Conditions Without the Project

Future Without Project Intersection Level of Service

The Future Without Project traffic forecasts were evaluated to determine the V/C ratio and LOS for the analyzed intersections for both the AM peak hour and the PM peak hour. The results are shown in Table 5.1 and Table 5.2, which summarize the intersection levels of service calculated for the Future Without Project conditions, and compares them to existing conditions levels of service.

AM Peak Hour

All studied intersections would operate at LOS D or better during the AM peak hour.

PM Peak Hour

All of the studied intersections would operate at LOS D or better during the PM peak hour, except the following intersection that would operate at LOS E:

10. Temple St & Virgil Ave & Silver Lake Blvd LOS E

6. Future With Project Conditions

This section of the report documents the analysis of potential Project traffic impacts in the study area for the Future With Project conditions. Traffic generated by the Project was added to the Future Without Project traffic volumes and the potential for impacts evaluated. The total Future With Project conditions peak hour traffic volumes are illustrated in Figures 6.1 and 6.2 for the AM and PM peak hours, respectively. These traffic forecasts were then used to evaluate potential Project traffic impacts, as described in the following sections.

6.1 Project Impacts - Intersections

Significant Impact Thresholds

LADOT has established criteria to determine if project impacts are significant at an intersection. These criteria are shown below.

Definition of Significant Impact at Intersection

With Project Traffic		Project-Related Increase in V/C Ratio
LOS	V/C Ratio	
C	0.701 – 0.800	equal to or greater than 0.040
D	0.801 – 0.900	equal to or greater than 0.020
E, F	> 0.900	equal to or greater than 0.010

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS C after the addition of project traffic and the incremental change in the volume/capacity (V/C) ratio is less than 0.040. However, in another example, if the intersection is operating at LOS E or LOS F and the incremental change in V/C ratio is 0.010 or greater, then the project would be considered to have a significant impact at that location.

Project Impact Analysis - Future With Project Intersection Level of Service

The intersection level of service analysis for the Future With Project conditions is summarized in Table 6.1 for the AM peak hour and in Table 6.2 for the PM peak hour. These tables also compare the level of service for Without Project and With Project conditions, show the increase in V/C ratios at each intersection due to the Project, and identify if the increase constitutes a significant impact.

AM Peak Hour

As shown in Table 6.1 the intersection levels of service would not change between the Future Without Project and Future With Project conditions. The analysis summarized in Table 6.1 indicates that for the AM peak hour, all increases in volume/capacity (V/C) ratios would be less than the threshold for a significant impact to occur.

It is therefore concluded that the Project would cause no significant impacts in the AM peak hour.

PM Peak Hour

As shown in Table 6.2 the intersection levels of service would not change between the Future Without Project and Future With Project conditions. The analysis summarized in Table 6.2 indicates that for the PM peak hour, all increases in volume/capacity (V/C) ratios would be less than the threshold for a significant impact to occur.

It is therefore concluded that the Project would cause no significant impacts in the PM peak hour.

Unsignalized Intersection Analysis

LADOT Traffic Study guidelines indicate that unsignalized intersections adjacent to the Project or integral to the Project's site access and circulation that are expected to operate at LOS E or F in the "Future With Project" scenario should be evaluated solely to determine the need for installation of a traffic signal or other traffic control device. Level of service analysis for the Future With Project scenario was conducted at the following unsignalized intersections in the vicinity of the Project:

- Juanita Avenue & Beverly Boulevard
- Madison Avenue (South) & Beverly Boulevard
- Madison Avenue (North) & Beverly Boulevard
- Oakwood Avenue & Virgil Avenue

These locations were chosen as the closest unsignalized intersections to the Project Site that would provide vehicular access to the Project Site.

The analysis results are shown in Appendix B. As shown in Table B.1, in the Future With Project scenario, the following intersection controlled approaches would operate at LOS E or LOS F in the AM peak hour.

- Juanita Avenue southbound at Beverly Boulevard LOS F
- Juanita Avenue northbound at Beverly Boulevard LOS F
- Madison Avenue northbound at Beverly Boulevard LOS E

- Oakwood Avenue eastbound at Virgil Avenue LOS F

Also, the following controlled approaches would operate at LOS E or LOS F in the PM peak hour.

- Juanita Avenue southbound at Beverly Boulevard LOS F
- Juanita Avenue northbound at Beverly Boulevard LOS F
- Oakwood Avenue eastbound at Virgil Avenue LOS F
- Oakwood Avenue westbound at Virgil Avenue LOS E

All the above approaches would also operate at the same LOS condition under Future Without Project conditions (as shown in Table B.2) except Juanita Avenue southbound at Beverly Boulevard which would operate at LOS D in the AM peak hour and PM peak hour, and Madison Avenue northbound at Beverly Boulevard which would operate at LOS D in the AM peak hour.

All the above approaches also currently operate at the same LOS condition under Existing Conditions (as shown in Table B.3) except Juanita Avenue southbound at Beverly Boulevard which currently operates at LOS D in the AM peak hour and LOS C in the PM peak hour, and Madison Avenue northbound at Beverly Boulevard which currently operates at LOS D in the AM peak hour.

With the Proposed Project, the Madison Avenue southbound approach at Beverly Boulevard, and the eastbound and westbound left turns on Beverly Boulevard at Juanita Avenue and Madison Avenue, would all operate at LOS D or better in both peak hours, as shown in Table B.1 in Appendix B. The Madison Avenue northbound approach at Beverly Boulevard would operate at LOS C in the PM peak hour.

A traffic signal warrant analysis was conducted at the intersections operating at LOS E and LOS F based on the peak hour traffic volumes and level of service. As shown in Appendix B Table B.4, the analysis showed that the future volumes with the Project would not warrant a traffic signal at the Juanita Avenue & Beverly Boulevard, Madison Avenue (North) & Beverley, Madison Avenue (South) & Beverly or Oakwood Avenue & Virgil Avenue intersections, in either peak hour. The project therefore does not cause the need for a new traffic signal.

6.2 Project Impacts – CMP Analysis

The Los Angeles County Congestion Management Program (CMP) requires that new development projects analyze potential project impacts on CMP monitoring locations if an EIR is prepared for the Project. When a CMP analysis is needed, the CMP methodology requires that the Traffic Study analyze traffic conditions at all CMP arterial monitoring intersections where the Project will add 50 or more trips during either the AM or PM weekday peak hours of adjacent street traffic. The CMP also requires that traffic studies analyze mainline freeway monitoring stations where the Project will add 150 or more trips in either direction during either AM or PM weekday peak hours. If, based on these criteria, the Traffic Study identifies no facilities for study then no further traffic analysis is required.

6.3 Driveway and Site Circulation

As previously described in Chapter 3, the main vehicular access (ingress and egress) is to be provided from Madison Avenue. A centralized drop-off and pickup will also be provided on Madison Avenue. Vehicular access will also be provided via driveways on Oakwood Avenue and Juanita Avenue to parking for those components of the Project. Project traffic will therefore use Madison Avenue, Juanita Avenue and Oakwood Avenue to access the Project.

All Project driveways will be designed according to LADOT standards, so there will be no significant impacts due to roadway design hazards.

6.4 Pedestrian Circulation

The Project introduces various streetscape improvements to encourage more pedestrian-friendly street edges along Juanita and Madison Avenues. Along Madison Avenue, a new on-site passenger loading zone with turn-around will be centrally located between Enlightenment Plaza & PATH Metro Villas on the east side of the street. The sidewalk on Madison Avenue adjacent to the Project, will be widened to up to 12ft wide in most locations. On Juanita Avenue existing 12ft sidewalks will be retained. Existing sidewalk widths will also be maintained on Oakwood Avenue. Utility poles fronting the property along Madison, Oakwood & Juanita Avenues will be relocated underground creating more continuous sidewalks. Additionally, nine new street trees will be placed along these three street frontages. Fourteen new bike racks will be strategically located along both Juanita & Madison Avenues. These streetscape improvements will aid in all streets adjacent to the Project becoming more pedestrian oriented. These improvements, along with the vacation of part of Madison Avenue will also help seamlessly engage the campuses of PATH Metro Villas and Enlightenment Plaza.

6.5 Freeway Analysis

An MOU between LADOT and Caltrans (Agreement Between the City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures (December 2015)) sets forth criteria for when a freeway impact analysis should be conducted. This requires an initial evaluation of freeway mainline segments and freeway off-ramps to determine if Project volumes exceed certain thresholds that would require further analysis of the freeway system. A freeway evaluation of Project volumes against these thresholds was conducted according to the procedures in the MOU and is included in the MOU in Appendix A. The initial evaluation concluded that neither the freeway mainline thresholds nor the freeway off-ramp threshold were met by Project traffic volumes, so no further analysis of the freeway system was necessary.

7. Future Conditions With Potential Street Vacations

7.1 Description of Potential Street Vacations

The Applicant may also desire to vacate sections of the following two streets, as shown in Figure 7.1:

- Madison Avenue – the northern portion of Madison Avenue between the project main entrance turnaround and Oakwood Avenue
- Oakwood Avenue - from Juanita Avenue to Westmoreland Avenue.

The approval of the Proposed Project is not contingent upon, and does not require, these street vacations. The following analysis is being provided for informational purposes.

It is anticipated that the vacated portions of Madison Avenue and Oakwood Avenue would not be available for general public use, and would be controlled by a control arm type device. Access would be retained for the Proposed Project and for land uses adjacent to the vacated street sections. Project residents and employees would pass through the vacated street sections with use of key card or similar device to operate the control barrier. A similar option would be provided for the adjacent PATH project on the east side of Madison Avenue to Oakwood Avenue. These would be the only two properties affected by the vacations. The public would not however be able to use these sections of Madison Avenue or Oakwood Avenue.

Other than traffic from the Proposed Project and from the adjacent PATH project, traffic volumes currently using this segment of Madison Avenue are negligible, and as Juanita Avenue and Oakwood Avenue offer alternate access routes to Beverly Boulevard and Virgil Avenue, the street vacation is not expected to cause significant traffic impacts.

7.2 Traffic Forecasts

The analysis addressed the same horizon year, 2023, as the traffic analysis for the Proposed Project. It also included the same list of related projects, and traffic from the Proposed Project. The future conditions therefore represent the Future with Proposed Project as analyzed in Chapter 6, but with the potential partial street vacations.

As discussed above, the Potential Street Vacations would not affect traffic access to the Proposed Enlightenment Plaza Project or to the PATH Project and would not cause traffic diversion of traffic to/from these projects. However, traffic using these street segments but not

stopping at adjacent land uses (i.e. traffic passing through) would divert to alternate routes – to Virgil Avenue, Westmoreland Avenue, and Beverly Boulevard.

Based on existing traffic counts at intersections and driveways along Oakwood Avenue, likely traffic diversions were estimated for the Potential Street Vacations. A growth rate of 1.0 percent a year for five years was applied to traffic diversion volumes to represent the future horizon year of analysis. No traffic diversions for related projects were necessary (there would be no related project trips on the street segments to be vacated), and as described above no diversions would occur for the Proposed Project or for adjacent projects. The estimated traffic volumes for the Potential Street Vacations are shown in Figure 7.2 for the AM peak hour and Figure 7.3 for the PM peak hour. The traffic diversions would only affect traffic volumes at Intersection #9 – Beverly Blvd & Temple St & Westmoreland Ave, and Intersection #10 – Temple St & Virgil Avenue & Council Street. Traffic volumes at the other studied intersections would remain the same.

7.3 Impacts - Intersections

Future With Partial Street Vacations - Intersection Level of Service

The intersection level of service analysis for the Future With Potential Street Vacation conditions is summarized in Table 7.1 for the AM peak hour and in Table 7.2 for the PM peak hour. These tables also compare the level of service for Without and With the Potential Street Vacation conditions, show the increase in V/C ratios at each intersection due to the Project, and identify if the increase constitutes a significant impact. The Without Street Vacation condition represents the Future With (Development) Project condition discussed in Chapter 6.

AM Peak Hour

As shown in Table 7.1 the intersection levels of service would not change between the Future Without Project and Future With Project conditions. The analysis summarized in Table 7.1 also indicates that for the AM peak hour, there would be no changes in the volume/capacity (V/C) ratios. This is because the volume of diverted traffic is very small, and diverted traffic would be added to the non-critical movements at the affected intersection (i.e. those movements not affecting the V/C ratio).

It is therefore concluded that the Potential Street Vacations would cause no significant impacts in the AM peak hour.

PM Peak Hour

As shown in Table 7.2 the intersection levels of service would not change between the Future Without Project and Future With Street Vacation conditions. The analysis summarized in Table

7.2 indicates that for the PM peak hour, all increases in volume/capacity (V/C) ratios would be less than the threshold for a significant impact to occur.

It is therefore concluded that the Potential Street Vacations would cause no significant impacts in the PM peak hour.

Unsignalized Intersection Analysis

LADOT Traffic Study guidelines indicate that unsignalized intersections adjacent to the Project or integral to the Project's site access and circulation that are expected to operate at LOS E or F in the "Future With Street Vacation" scenario should be evaluated solely to determine the need for installation of a traffic signal or other traffic control device. The following analysis used the same procedures and methodology as was used for the Proposed Project analysis and shown in Section 6.1 of Chapter 6. Level of service analysis for the Future With Potential Street Vacation scenario was conducted at the following unsignalized intersections in the vicinity of the Project:

- Juanita Avenue & Beverly Boulevard
- Madison Avenue (South) & Beverly Boulevard
- Madison Avenue (North) & Beverly Boulevard
- Oakwood Avenue & Virgil Avenue

These locations were chosen as the closest unsignalized intersections to the Project Site that would provide vehicular access to the Project Site.

The analysis results are shown in Appendix E. As shown in Table E.1, in the Future With Street Vacation scenario, the following intersection controlled approaches would operate at LOS E or LOS F in the AM peak hour.

- Juanita Avenue southbound at Beverly Boulevard LOS F
- Juanita Avenue northbound at Beverly Boulevard LOS F
- Madison Avenue northbound at Beverly Boulevard LOS E
- Oakwood Avenue eastbound at Virgil Avenue LOS F

Also, the following controlled approaches would operate at LOS E or LOS F in the PM peak hour.

- Juanita Avenue southbound at Beverly Boulevard LOS F
- Juanita Avenue northbound at Beverly Boulevard LOS F
- Oakwood Avenue eastbound at Virgil Avenue LOS F
- Oakwood Avenue westbound at Virgil Avenue LOS F

All the above approaches would also operate at the same LOS under Future Without Street Vacations conditions (as shown in Table E.2).

All the above approaches also currently operate at the same LOS condition under Existing Conditions (as shown in Table E.3) except Juanita Avenue southbound at Beverly Boulevard which currently operates at LOS D in the AM peak hour and LOS C in the PM peak hour, and Madison Avenue northbound at Beverly Boulevard which currently operates at LOS D in the AM peak hour, and Oakwood westbound at Virgil Avenue which currently operates at LOS E in the PM peak hour.

With the Potential Street Vacations, the Madison Avenue southbound approach at Beverly Boulevard, and the eastbound and westbound left turns on Beverly Boulevard at Juanita Avenue and Madison Avenue, would all operate at LOS D or better in both peak hours, as shown in Table E.1 in Appendix E. The Madison Avenue northbound approach at Beverly Boulevard would operate at LOS C in the PM peak hour.

A traffic signal warrant analysis was conducted at the intersections operating at LOS E and LOS F based on the peak hour traffic volumes and level of service. As shown in Appendix E Table E.4, the analysis showed that the future volumes with the Potential Street Vacations would not warrant a traffic signal at the Juanita Avenue & Beverly Boulevard, Madison Avenue (North) & Beverley, Madison Avenue (South) & Beverly or Oakwood Avenue & Virgil Avenue intersections, in either peak hour. The Potential Street Vacations therefore would not cause the need for a new traffic signal.

7.4 CMP Analysis

The potential street vacations would not change any traffic volumes at the CMP locations described in Chapter 6. The CMP analysis in Chapter 6 would remain unchanged and the potential street vacations would therefore not have any significant CMP impacts.

7.5 Driveway and Site Circulation

All vehicular access to the Proposed Project would remain the same with the potential street vacations. As previously described in Chapter 3, the main vehicular access (ingress and egress) is to be provided from Madison Avenue. A centralized drop-off and pickup will also be provided on Madison Avenue. Vehicular access will also be provided via driveways on Oakwood Avenue and Juanita Avenue to parking for those components of the Project. Project traffic will therefore use Madison Avenue, Juanita Avenue and Oakwood Avenue to access the Project.

It is anticipated that the vacated portions of Madison Avenue and Oakwood Avenue would not be available for general public use, and would be controlled by a control arm type device. Project residents and employees would pass through the vacated street section with use of key

card or similar device to operate the control barrier. A similar option would be provided for the adjacent PATH project on the east side of Madison Avenue to Oakwood Avenue. The public would not however be able to use the vacated sections of Madison Avenue and Oakwood Avenue.

Access and circulation for the Proposed Project would there remain unchanged with the potential street vacations.

7.5 Pedestrian Circulation

The potential street vacations would not change any pedestrian facilities, so pedestrian circulation would not be affected and would be unchanged.

8. Mitigation Measures

As the preceding analysis has determined that there would be no significant traffic impacts at intersections, no access impacts, no CMP or freeway impacts, and no CMP transit impacts caused by the Project, no mitigation measures are necessary.

The analysis has further determined that the potential street vacations would not cause any significant traffic impacts, so no mitigations would be necessary.

Project Description & Site Plan

Flexible Enlightenment Plaza Project - Project Description

The proposed project site is located in the Hollywood Area of Los Angeles and bounded by Beverly Boulevard to the south, Juanita Avenue to the west, Madison Avenue to the east and Oakwood Avenue to the north.

The Project, referred to as Enlightenment Plaza Apartments will consist of 454 units of housing dedicated to Permanent Supportive Housing (Restricted Affordable) for formerly homeless individuals in 5 buildings, including 5,127 sq.ft. of services (mental and physical health, financial, employment) for on-site residents. The main vehicular access (ingress and egress) is to be provided from Madison Avenue. A centralized drop-off and pickup will also be provided on Madison Avenue. Vehicular access will also be provided from Oakwood Avenue and Juanita Avenue.

The project will include the following street vacations: The northern portion of Madison Avenue between Oakwood Avenue and the project turnaround; Oakwood Avenue between Juanita Avenue and Westmoreland Avenue

The site is currently occupied by an AT&T Service Yard, with driveways on Juanita Avenue. The project site plan is shown in Figure A.2. The site also includes 3812 Oakwood which has 3 multi-family units. In addition, 3838 Oakwood at the corner of Oakwood / Juanita has an existing office building which will remain.

Notes:

1. Trips for existing uses (AT&T Service Yard) from driveway traffic counts, 2019.
2. Daily trips for existing uses calculated based on the assumption of 10 times PM peak hour traffic.
3. Trip rates for Permanent Supportive Housing are from Table 5 of LADOT's Transportation Impact Study Guidelines, December 2016.

Note : Some numbers may not add up precisely due to rounding.

Attachment C

Trip Distribution

Flexible Enlightenment Plaza Project – Trip Distribution

The likely distribution of Project trips was identified based on the type of land uses in the Project, the likely origins and destinations of Project users, and the characteristics of the street system in the area of the Project. The following distribution was assumed:

- 20% of the trips towards the north
- 35% of the trips towards the south
- 20% of the trips towards the east
- 25% of the trips towards the west

Attachment D

Related Projects

Flexible Enlightenment Plaza Project – Related Projects

The attached list represents the most currently available information (as of mid-April 2019). The list has been coordinated with LADOT's project list of 4-9-2019, previous related projects lists from other projects in the area, and with coordination with DCP through 4-13-2019, regarding project application submittals and information.

The following criteria were also followed regarding inclusion of projects in the list, based on LADOT guidelines and previous direction from DCP:

- Projects within a 0.65 mile radius from the Project Site. (per guidelines in LADOT Memo of November 28, 2018)
- Only includes projects resulting in a net increase in floor area and which meet/exceed DOT threshold criteria.
- Projects comprising a standalone change of use have not be included, however adaptive reuse projects requiring a planning application have been included.
- Projects comprising a standalone CUB for alcohol have not been included.
- Projects that have been constructed and have a Certificate of Occupancy have not been included.
- Projects that have been withdrawn or terminated have not been included.
- Trip generation from LADOT's project list. For projects where more recent trip generation data is available, this has been used instead of the trip generation data in LADOT's project list.

The list was coordinated with and reviewed by DCP.

Study Intersections

Flexible Enlightenment Plaza Project – Study Intersections

After a review of the project location, surrounding street network and location of signalized intersections, the following study intersections are proposed for the impact analysis:

1. 101 NB off-ramp & Vermont Ave
2. 101 NB on-ramp & Vermont Ave
3. Rosewood Ave & Vermont Ave
4. Oakwood Ave & Vermont Ave
5. Beverly Blvd & Vermont Ave
6. W 1st St & Vermont Ave
7. Beverly Blvd & Kenmore Ave
8. Beverly Blvd & New Hampshire Ave
9. Beverly Blvd & Temple St & Westmoreland Ave
10. Temple St & Virgil Ave
11. Beverly Blvd & Virgil Ave
12. 101 SB off-ramp & New Hampshire Ave & Rosewood Ave

We believe it may be necessary to evaluate the following unsignalized intersections to see if they meet signal warrants:

1. Juanita Ave & Beverly Blvd
2. Madison Ave & Beverly Blvd
3. Oakwood Ave & Virgil Ave

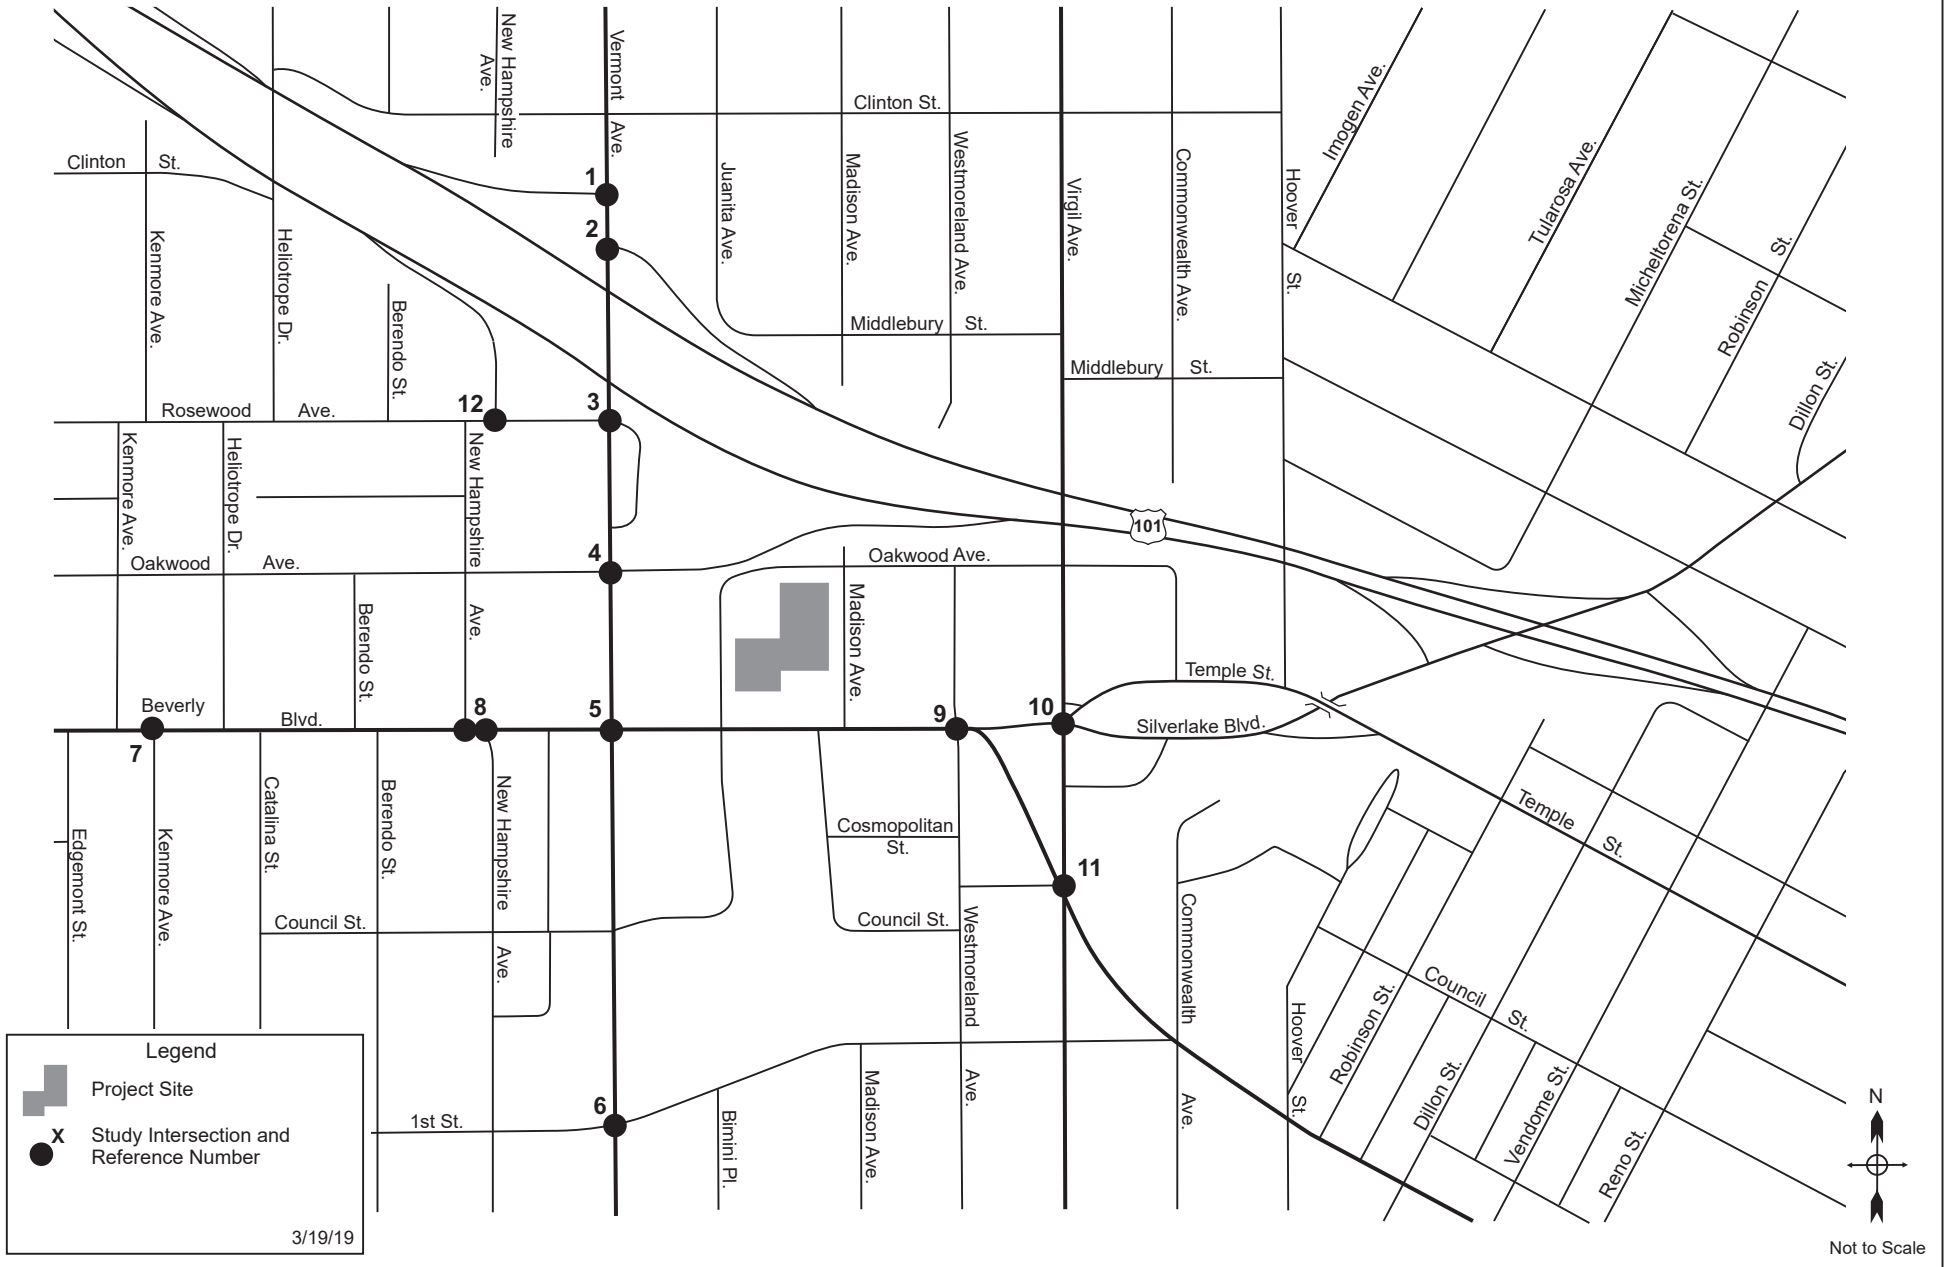

Figure 2

Transportation Strategies & Solutions

Attachment F

Freeway Threshold Check

Flexible Enlightenment Plaza Project – Freeway Threshold Check

The following freeway mainline and off-ramp locations were evaluated as part of the Freeway Threshold Check required by the December 2015 LADOT/Caltrans MOU.

This MOU between LADOT and Caltrans (Agreement Between the City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures, December 2015) sets forth criteria for when a freeway impact analysis should be conducted, including that if certain thresholds are exceeded then analysis of the freeway system is required.

The Agreement outlines the specific criteria and thresholds designed to identify if a Project is required to conduct the additional freeway analysis. Per the Agreement executed by LADOT and Caltrans, if a Project exceeds any of the following thresholds then the additional freeway analysis would be required:

Freeway Mainline

- The Project's peak hour trips would result in a 1 percent or more increase to the freeway mainline capacity of a freeway segment operating at LOS E or F (based on an assumed capacity of 2,000 vehicles per hour per lane); or

- The Project's peak hour trips would result in a 2 percent or more increase to the freeway mainline capacity of a freeway segment operating at LOS D (based on an assumed capacity of 2,000 vehicles per hour per lane); or

Freeway Ramps

- The Project's peak hour trips would result in a 1 percent or more increase to the capacity of a freeway off-ramp operating at LOS E or F (based on an assumed ramp capacity of 850 vehicles per hour per lane); or

- The Project's peak hour trips would result in a 2 percent or more increase to the capacity of a freeway off-ramp operating at LOS D (based on an assumed ramp capacity of 850 vehicles per hour per lane).

An evaluation threshold check was conducted for the two freeway mainline locations and two freeway off-ramp locations closest to the Project. The evaluation tables are included in the following pages.

Freeway Mainline Locations:

The freeway mainline check was conducted at the following locations.

- US-101 west of Vermont Avenue
- US-101 east of Vermont Avenue

The number of Project vehicle trips expected to travel along these freeway mainline segments was estimated based on the Project trip generation and Project trip distribution. The freeway mainline volume increase that would be created by Project vehicle trips was compared against the thresholds provided in the LADOT/Caltrans Agreement.

The analysis shown in Table F-1 and Table F-2 for the AM and PM peak hours respectively, shows that the threshold would not be exceeded at any of the freeway segments in either peak hour. It is concluded that no further analysis is necessary.

Freeway Ramp Locations:

The freeway ramp check was conducted for the following off-ramps.

- US-101 SB off-ramp at New Hampshire Avenue
- US-101 NB off-ramp at Vermont Avenue

The number of Project vehicle trips expected to travel on these freeway off-ramps was estimated based on the Project trip generation and Project trip distribution. A simple check compared the increase in ramp volumes to the threshold at LOS E for a conservative analysis. The analysis shown in Table F-3 shows that the increase would not exceed the thresholds at any of the freeway off-ramps.

It is therefore concluded that a freeway analysis will not be necessary.

Table F-1 **Flexible Enlightenment Plaza Project - Freeway Segment - Threshold Check**
AM Peak Hour

3/13/2019

No.	Location	DIR	No of Lanes	Capacity	Project Trips	Project Trip %	Threshold %	Exceed Threshold ?

		PM	2 L	1,700	5	0.3%	17	1%	No

Note: The freeway Off-Ramp analysis shown in the above table was conducted assuming the subject freeway Off-Ramps were operating at LOS E or F. This methodology was chosen to represent the most conservative conditions.

Attachment G

CMP Analysis Locations

Flexible Enlightenment Plaza Project - CMP Analysis Locations

The Los Angeles County Congestion Management Program (CMP) requires that new development projects analyze potential project impacts on CMP monitoring locations if an EIR is prepared for the Project. When a CMP analysis is needed, the CMP methodology requires that the Traffic Study analyze traffic conditions at all CMP arterial monitoring intersections where the Project will add 50 or more trips during either the AM or PM weekday peak hours of adjacent street traffic. The CMP also requires that traffic studies analyze mainline freeway monitoring stations where the Project will add 150 or more trips in either direction during either AM or PM weekday peak hours. If, based on these criteria, the Traffic Study identifies no facilities for study then no further traffic analysis is required.

Based on the estimated project trip generation from Table B-1, the number of Project vehicle trips expected to pass through any individual CMP arterial monitoring location or CMP freeway monitoring station are well below the CMP thresholds, so by definition no CMP analysis is required.

APPENDIX I-2:

SUPPLEMENTAL VMT ANALYSIS

The Mobility Group,
Enlightenment Plaza Project VMT Analysis,
February 5, 2020

FORM GEN. 160A (Rev. 1/82)

CITY OF LOS ANGELES

INTER-DEPARTMENTAL CORRESPONDENCE

321 N Madison Av
DOT Case No. CEN19-48497

Date: March 3, 2020

To: Debbie Lawrence, Senior City Planner
Department of City Planning

From: Wes Pringle, Transportation Engineer
Department of Transportation

Subject: **UPDATED TRANSPORTATION IMPACT ASSESSMENT FOR THE PROPOSED FLEXIBLE ENLIGHTENMENT PLAZA AFFORDABLE HOUSING PROJECT AT 321 NORTH MADISON AVENUE (CPC-2019-5596-GPAJ-ZCJ-SP-SPP-SPR/VTT-82798/ENV-2019-5597-SE)**

On October 22, 2019, the Department of Transportation (DOT) issued a traffic assessment report to the Department of City Planning for the affordable housing project at 321 North Madison Avenue, which was subject to a transportation analysis dated September 2019 prepared by The Mobility Group. However, since the report was released, the project has changed slightly and a January 14, 2020 revised transportation analysis was prepared and submitted by The Mobility Group. Additionally, the applicant submitted a VMT analysis dated February 5, 2020 for the proposed project pursuant to the City of Los Angeles adoption of vehicle miles traveled (VMT) as the criteria by which to determine transportation impacts under CEQA Senate Bill (SB) 743 and due to the recent changes to Section 15064.3 of the State's California Environmental Quality Act (CEQA) Guidelines. Please replace the previous DOT assessment report dated October 22, 2019, in its entirety, with this report, which addresses the totality of the transportation analysis.

The DOT has reviewed the transportation analyses prepared by The Mobility Group, dated January 14, 2020 and February 3, 2020, for the proposed Enlightenment Plaza Affordable Housing Project located at 321 North Madison Avenue within the Central Area Planning Commission (APC) and a Transit Oriented Community (TOC) Tier 4. In compliance with SB 743 and the CEQA guidelines, a VMT analysis is required to identify the project's ability to promote the reduction of green-house gas emissions, the access to diverse land uses, and the development of multi-modal networks. The significance of a project's impact in this regard is measured against the VMT thresholds established in DOT's Transportation Assessment Guidelines (TAG), as described below.

DISCUSSION AND FINDINGS

A. Project Description

The project proposes to remove the existing AT&T Service Yard at 316 North Juanita Avenue and three multi-family dwelling units at 3812 West Oakwood Avenue and construct five buildings with Affordable Housing units and mental and physical health, financial, employment services for on-site residents who were formerly homeless. The project land uses have been slightly modified since the October 22, 2019 DOT report was released:

Land Use	Original Project	Revised Project
Affordable Housing (Permanent Supportive)	454 units	449 units
Apartment (Manager)	-	5 units
Residential Services	5,127 square feet	5,700 square feet

Madison Avenue will provide the main vehicular access (ingress and egress) as well as serve as a centralized drop-off and pick-up area zone. Vehicular access will also be provided from Oakwood Avenue and Juanita Avenue as illustrated in **Attachment A**. In the future, the project may request vacation of the northern portion of Madison Avenue between the project main entrance and Oakwood Avenue and the portion of Oakwood Avenue from Juanita Avenue to Westmoreland Avenue. The vacated street sections would have a control barrier and would be accessible to project residents and employees with use of a key card or similar device to operate the control barrier. A similar option would be provided for the adjacent PATH Metro Villas project on the east side of Madison Avenue at 320-340 North Madison Avenue. The proposed project is expected to be completed by 2023.

B. CEQA Screening Threshold

Prior to accounting for trip reductions resulting from the application of Transportation Demand Management (TDM) Strategies, a trip generation analysis was conducted to determine if the project would exceed 250 daily vehicle trips screening threshold. Using the City of Los Angeles VMT Calculator tool, which draws upon trip rate estimates published in the Institute of Transportation Engineers (ITE) Trip Generation Manual, 9th Edition as well as applying trip generation adjustments when applicable, based on sociodemographic data and the built environment factors of the project's surroundings, it was determined that the project **does** exceed the net 250 daily vehicle trips threshold. It should be noted that because the project Memorandum of Understanding (MOU) was approved prior to July 2019, the project is not required to use the new TAG, but the project has voluntarily submitted a VMT analysis. A copy of the VMT calculator version 1.2 screening page, with the corresponding net daily trips estimate, is provided as **Attachment B** to this report.

C. Transportation Impacts

On July 30, 2019, pursuant to SB 743 and the recent changes to Section 15064.3 of the State's CEQA Guidelines, the City of Los Angeles adopted VMT as a criteria in determining transportation impacts under CEQA. The new DOT TAG provide instructions on preparing transportation assessments for land use proposals and defines the significant impact thresholds.

The DOT VMT Calculator tool measures project impact in terms of Household VMT per Capita, and Work VMT per Employee. DOT identified distinct thresholds for significant VMT impacts for each of the seven Area Planning Commission (APC) areas in the City. For the Central APC area, in which the project is located, the following thresholds have been established:

- Household VMT per Capita: 6.0
- Work VMT per Employee: 7.6

As cited in the February 5, 2020 VMT Analysis report, prepared by The Mobility Group, the proposed project is projected to have a Household VMT per capita of 5.4 and Work VMT per employee of 0. Therefore, it is concluded that implementation of the Project would result in no significant VMT impact. A copy of the VMT Calculator summary report is provided as **Attachment B**.

D. Access and Circulation

During the preparation of the new CEQA guidelines, the State's Office of Planning and Research stressed that lead agencies can continue to apply traditional operational analysis requirements to inform land use decisions provided that such analyses were outside of the CEQA process. The authority for requiring non-CEQA transportation analysis and requiring improvements to address potential circulation deficiencies, lies in the City of Los Angeles' Site Plan Review authority as established in Section 16.05 of the Los Angeles Municipal Code (LAMC). Therefore, DOT continues to require and review a project's site access, circulation, and operational plan to determine if any access enhancements, transit amenities, intersection improvements, traffic signal upgrades, neighborhood traffic calming, or other improvements are needed. In accordance with this authority, the project has completed a circulation analysis using a "level of service" screening methodology that indicates that the trips generated by the proposed development will not likely result in adverse circulation conditions at several locations. DOT has reviewed this analysis and determined that it adequately discloses operational concerns. A copy of the circulation analysis table that summarizes these potential deficiencies is provided as **Attachment C** to this report. Additionally, the study included a circulation analysis considering the potential street vacations of Madison Avenue and of Oakwood Avenue as previously mentioned in this report. These street vacations would not change the outcome of the circulation analysis or the VMT analysis.

PROJECT REQUIREMENTS

A. Non-CEQA Related Requirements and Considerations

To comply with transportation and mobility goals and provisions of adopted City plans and ordinances, the applicant should be required to implement the following:

1. Parking Requirements

The study does not specify the number of parking spaces that will be provided onsite. The applicant should check with the Departments of Building and Safety and City Planning on the number of Code-required parking spaces required for this project within a TOC Tier 4.

2. Highway Dedication and Street Widening Requirements

Per the new Mobility Element of the General Plan, **Madison Avenue**, **Juanita Avenue**, and **Oakwood Avenue**, Local Streets, would require an 18-foot half-width roadway within a 30-foot half-width right-of-way. The applicant should check with BOE's Land Development Group to determine if there are any other applicable highway dedication, street widening and/or sidewalk requirements for this project.

3. Project Access and Circulation

The conceptual site plan for the project (see **Attachment A**) is acceptable to DOT. However, the review of this study does not constitute approval of the dimensions for any new proposed driveway. This requires separate review and approval and should be coordinated with DOT's Citywide Planning Coordination Section (201 North Figueroa Street, 5th Floor, Room 550, at 213-482-7024). In order to minimize and prevent last minute building design changes, the applicant should contact DOT for driveway width and internal circulation requirements prior to the commencement of building or parking layout design.

4. Worksite Traffic Control Requirements
DOT recommends that a construction work site traffic control plan be submitted to DOT's Citywide Temporary Traffic Control Section or Permit Plan Review Section for review and approval prior to the start of any construction work. Refer to http://ladot.lacity.org/what-we-do/plan-review to determine which section to coordinate review of the work site traffic control plan. The plan should show the location of any roadway or sidewalk closures, traffic detours, haul routes, hours of operation, protective devices, warning signs and access to abutting properties. DOT also recommends that all construction related truck traffic be restricted to off-peak hours to the extent feasible.

5. Development Review Fees
Section 19.15 of the LAMC identifies specific fees for traffic study review, condition clearance, and permit issuance. The applicant shall comply with any applicable fees per this ordinance.

If you have any questions, please contact Eileen Hunt of my staff at (213) 972-8481.

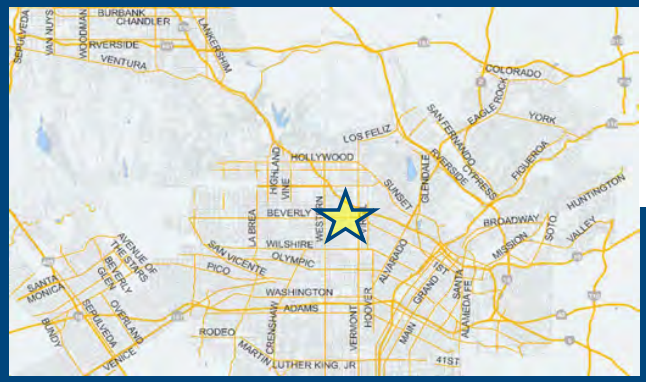
Project Screening Criteria: Is this project required to conduct a vehicle miles traveled analysis?

Project Information

Project: Enlightenment Plaza
Scenario: Proposed Project
Address: 321 N MADISON AVE, 90004



If the project is replacing an existing number of residential units with a smaller number of residential units, is the proposed project located within one-half mile of a fixed-rail or fixed-guideway transit station?

○ Yes ○ No

Existing Land Use

Land Use Type	Value	Unit
Housing | Single Family		DU
(custom) Light Industrial | Retail/Non-Retail	Non-Retail	LU type
(custom) Light Industrial | Residents	0	Person
(custom) Light Industrial | Employees	30	Person
(custom) Light Industrial | Daily	170	Trips
(custom) Light Industrial | HBW-Attraction Split	19	Percent
(custom) Light Industrial | HBO-Attraction Split	41	Percent
(custom) Light Industrial | NHB-Attraction Split	20	Percent
(custom) Light Industrial | HBW-Production Split	0	Percent
(custom) Light Industrial | HBO-Production Split	0	Percent
(custom) Light Industrial | NHB-Production Split	20	Percent

☑ Click here to add a single custom land use type (will be included in the above list)

Proposed Project Land Use

Land Use Type	Value	Unit
Housing | Multi-Family	5	DU
Housing | Affordable Housing - Permanent Suppor	449	DU
Housing | Multi-Family	5	DU

☐ Click here to add a single custom land use type (will be included in the above list)

Project Screening Summary

Existing Land Use	Proposed Project
0 Daily Vehicle Trips	544 Daily Vehicle Trips
0 Daily VMT	3,228 Daily VMT

Tier 1 Screening Criteria

Project will have less residential units compared to existing residential units & is within one-half mile of a fixed-rail station. ☐

Tier 2 Screening Criteria

The net increase in daily trips < 250 trips	544 Net Daily Trips
The net increase in daily VMT ≤ 0	3,228 Net Daily VMT
The proposed project consists of only retail land uses ≤ 50,000 square feet total.	0.000 ksf

The proposed project is required to perform VMT analysis.

Transportation Strategies & Solutions

Memorandum

To: Wes Pringle, LADOT

From: Michael Bates

Subject: Enlightenment Plaza Project – VMT Analysis

Date: February 5, 2020

Introduction

This memorandum provides an analysis of vehicle-miles traveled (VMT) for the Enlightenment Plaza Project using the most recent version of the City of Los Angeles VMT Calculator Version 1.2. The analysis shows that with applying the VMT impact criteria established by LADOT, the Proposed Project would not have significant VMT impacts. The project has an approved Transportation Impact Study (TIS). This information is being provided to supplement that study.

Background to VMT Analysis

State of California Senate Bill 743[1], requires the Governor's Office of Planning and Research to change the California Environmental Quality Act (CEQA) guidelines regarding transportation impact analysis. Under SB 743, the focus of transportation analysis will shift from driver delay – typically measured by traffic level of service (LOS) – to a new measurement that better address the state's goals on reduction of greenhouse gas emission (GHG), creation of multimodal transportation and promotion of mixed-use developments. Since 2014, the Governor's Office of Planning and Research has been developing guidelines and has recommended that vehicle-miles traveled (VMT) replace LOS as the primary measure of transportation impacts. Fully implemented guidelines were originally scheduled to be in place by January 1, 2016. However, an extension has allowed cities more time to establish an analysis methodology. The City of Los Angeles has updated its travel demand model, and has developed and calibrated to local conditions an impact evaluation methodology and transportation impact thresholds based on VMT. This is called the VMT Calculator. The City of Los Angeles has adopted the new CEQA methodology and thresholds as of July 30, 2019.

[1] SB 743(Steinberg, 2013).

VMT Analysis

VMT Screening

In accordance with LADOT, an initial assessment of the development project is conducted to determine if a VMT transportation assessment is required. A Development Project is defined as any proposed land use project that changes the use within an existing structure, creates an addition to an existing structure, or new construction, which includes any occupied floor area.

With respect to VMT, a VMT transportation assessment is required for Development Projects or Transportation Projects that meet the following criteria:

- If the Development Project is estimated to generate a net increase of 250 or more daily vehicle trips and requires discretionary action.

For the purpose of screening for daily vehicle trips, a proposed project's daily vehicle trips should be estimated using the VMT Calculator tool or the most recent edition of the ITE Trip Generation Manual. TDM strategies should not be considered for the purpose of screening. If existing land uses are present on the project site or there were previously terminated land uses that meet the criteria for trip credits, the daily vehicle trips generated by the existing or qualified terminated land uses can be estimated using the VMT Calculator tool and subtracted from the Project's daily vehicle trips to determine the increase in daily vehicle trips.

In accordance with these provisions, the project is expected to generate a net increase of 374 daily trips and thus a project VMT analysis is required. The summary results of the project screening are provided in Table 1 below. The VMT Calculator results for existing trips are shown on Appendix A.

VMT Thresholds

The LADOT VMT Calculator analyses in terms of Household VMT per Capita, and Work VMT per Employee. LADOT has identified thresholds for significant VMT impacts by sub-area of the city. For the area of the Proposed Project he following thresholds have been identified:

Household VMT per Capita: 6.0
Work VMT per Employee: 7.6

Table 1. Trip Generation – Project Screening

	Land Use	*Scale*	*Daily Vehicle Trips*
Proposed	Permanent Supportive Housing	449 DU	
	Apartments	5 DU	
	Sub-total		544
Existing	AT&T Yard		
	Sub-total		170
	Net Difference [Proposed – Existing]		374
	Analysis Required (Net Difference > 250)		Yes

VMT with Project

The VMT results are summarized in Table 2. The results show that with the Proposed Project, the Household VMT per Capita would be 5.4 compared to the threshold of 6.0, and the Work VMT per Capita would be 0.0 compared to the threshold of 7.6. Therefore, it is concluded that the Project would not cause significant VMT impacts. Appendix B provides the analysis results. The detailed application of the VMT calculator is described below.

Table 2 Summary of VMT Results

Category	*Household*			*Work*		
Scenario	*Household VMT Threshold*	*Household VMT Per Capita*	*Impact*	*Work VMT Threshold*	*Work VMT per Employee*	*Impact*
VMT With Proposed Project	6.0	5.4	No	7.6	0.0	No

Application of the LADOT VMT Calculator

Input on Project Land Use Information

This part of the VMT Calculator includes entering the Project location address by its latitude and longitude (to identify the specific location of the Project for the correct application of the VMT Calculator localized data), and the type and quantity of proposed land uses. Table 3 shows the land use quantities used for the traffic impact analysis in the Enlightenment Plaza Project Transportation Study (as shown in Table 3.1 of the Transportation Study), and input to the Calculator. Note that the existing AT&T Service Yard was entered into the Calculator with the trip totals in Table 3.1 of the Transportation Study.

Table 3. Project Land Uses

Land Use	*Quantity*
Existing Land Uses	
AT&T Service Yard Light Industrial	7,862 SF
Proposed Land Uses	
Permanent Supportive Housing Apartments	449 DU's 5 DU's

Input on Project Design Features and Mitigation Measures

The VMT Calculator allows input of various TDM strategies as either Project Design Features or as Mitigation Measures. No Project Design Features or Mitigation Measures that would affect trips for the Enlightenment Plaza Project were identified in the approved Traffic Study. The Calculator indicated the Proposed Project would not cause a significant VMT impact. For these two reasons, none were input into the VMT calculator.

Appendix A

VMT Analysis Results

VMT Calculator Inputs and Outputs

CITY OF LOS ANGELES VMT CALCULATOR Version 1.2

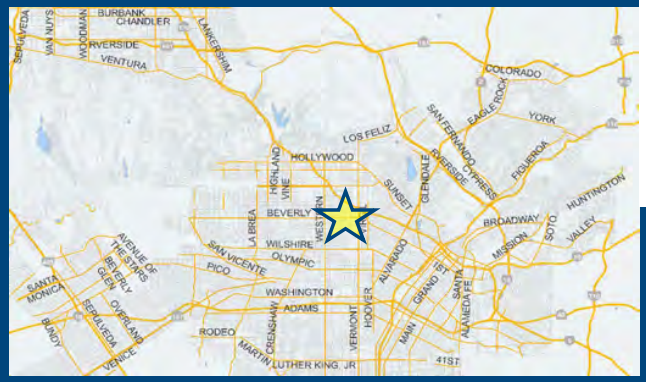
Project Screening Criteria: Is this project required to conduct a vehicle miles traveled analysis?

Project Information

Project: Enlightenment Plaza

Scenario: Proposed Project

Address: 321 N MADISON AVE, 90004



If the project is replacing an existing number of residential units with a smaller number of residential units, is the proposed project located within one-half mile of a fixed-rail or fixed-guideway transit station?

( ) Yes ( ) No

Existing Land Use

Land Use Type	Value	Unit
Housing | Single Family		DU
(custom) Light Industrial | Retail/Non-Retail	Non-Retail	LU type
(custom) Light Industrial | Residents	0	Person
(custom) Light Industrial | Employees	30	Person
(custom) Light Industrial | Daily	170	Trips
(custom) Light Industrial | HBW-Attraction Split	19	Percent
(custom) Light Industrial | HBO-Attraction Split	41	Percent
(custom) Light Industrial | NHB-Attraction Split	20	Percent
(custom) Light Industrial | HBW-Production Split	0	Percent
(custom) Light Industrial | HBO-Production Split	0	Percent
(custom) Light Industrial | NHB-Production Split	20	Percent

[x] Click here to add a single custom land use type (will be included in the above list)

Proposed Project Land Use

Land Use Type	Value	Unit
Housing | Multi-Family	5	DU
Housing | Affordable Housing - Permanent Suppor	449	DU
Housing | Multi-Family	5	DU

[ ] Click here to add a single custom land use type (will be included in the above list)

Project Screening Summary

Existing Land Use	Proposed Project
0 Daily Vehicle Trips	544 Daily Vehicle Trips
0 Daily VMT	3,228 Daily VMT

Tier 1 Screening Criteria

Project will have less residential units compared to existing residential units & is within one-half mile of a fixed-rail station. [ ]

Tier 2 Screening Criteria

The net increase in daily trips < 250 trips	544 Net Daily Trips
The net increase in daily VMT ≤ 0	3,228 Net Daily VMT
The proposed project consists of only retail land uses ≤ 50,000 square feet total.	0.000 ksf

The proposed project is required to perform VMT analysis.

EXECUTIVE SUMMARY

Flexible PSH Solutions, Inc. retained Dudek to conduct a Tribal Cultural Resources (TCRs) study for the 316 North Juanita Avenue Project (proposed Project) for compliance with the California Environmental Quality Act (CEQA). The proposed Project site is located in the Wilshire Community Plan Area and the northwest corner of the Rampart Village neighborhood of the City of Los Angeles, approximately 12.4 miles northeast of the Pacific Ocean. The approximately 1.93-acre project site is located within a heavily developed area at 312-328 North Juanita Avenue, 317-345 North Madison Avenue, and 3810-3838 West Oakwood Avenue. The proposed Project site is bound by development to the north, south, and west, and east. For the purposes of this report, the entire block in which the proposed Project site is situated is considered the Study Area. The Study Area falls on public land survey system (PLSS) Section 18 of Township 1 South, Range 13 West, within the *Hollywood*, CA 7.5-minute USGS Quadrangle.

The present study documents the results of a California Historical Resources Information Systems (CHRIS) records search conducted at the South Central Coastal Information Center (SCCIC), and a search of the Native American Heritage Commission's (NAHC's) Sacred Lands File (SLF). Tribal consultation has not been required by the City of Los Angeles Department of City Planning (City); it is the understanding of the applicant that the Project is not subject to California Assembly Bill (AB) 52. This report further includes a cultural context and in-depth review of archival, academic, and ethnographic information. No Native American resources were identified within the proposed Project site or the Study Area through the SCCIC records search (completed April 8, 2019) or through a search of the NAHC's SLF (completed April 25, 2019). A review of historic aerials indicates that the Study Area was developed by the 1920s and was redeveloped between the 1950s and 1960s. These development episodes may have impacted or destroyed potential TCRs that may have been present on or immediately below the surface. However, there does not appear to have been any subsurface structures, such as a below-ground parking lot or basement, identified as a result of this study and the proposed Project site is predominately covered by an asphalt parking lot, which may have capped unknown TCRs below the surface.

Given that the areas is substantially developed and no known TCRs have been identified through research that would be affected, no mitigation beyond standard regulatory statutes relating to TCRs appears to be necessary. Should additional information be presented result in the identification of a TCR that may be impacted by the project, appropriate measures must be included in the environmental document. The City is likely to adopt a standard condition of approval for unanticipated tribal cultural resources which is sufficient to avoid significant impacts. Based on current information, impacts to TCRs as a result of the proposed Project would be less than significant.

INTENTIONALLY LEFT BLANK

1 INTRODUCTION

Flexible PSH Solutions, Inc. retained Dudek to complete a Tribal Cultural Resources (TCRs) study for the proposed 316 North Juanita Avenue Project (proposed Project) for compliance with the California Environmental Quality Act (CEQA). The present study documents the results of a California Historical Resources Information System (CHRIS) records search, and a search of the Native American Heritage Commission's (NAHC's) Sacred Lands File (SLF).. This report further includes a cultural context and in-depth review of archival, academic, and ethnographic information.

1.1 Project Personnel

Adam Giacinto, MA, RPA, acted as principal archaeological and ethnographic investigator, as well as finalized the present report. Erica Nicolay, MA, drafted components of the present report and completed the SCCIC records search. Linda Kry, BA, contributed to the present report and provided management oversight. Samantha Murray, MA, contributed to portions of the cultural context. Micah Hale, PhD, RPA, reviewed the report recommendations for regulatory compliance.

1.2 Project Location and Present Uses

The proposed Project site is located in the Wilshire Community Plan Area and in the northwest corner of the Rampart Village neighborhood of the City of Los Angeles, approximately 12.4 miles northeast of the Pacific Ocean. The proposed Project site, located at 312-328 North Juanita Avenue, 317-345 North Madison Avenue, and 3810-3838 Oakwood Avenue includes approximately 7,499.9 square feet of lot area (1.93 acres. The proposed Project site is bound by Oakwood Avenue to the north, Beverly Boulevard to the south, North Madison Avenue to the east, and North Juanita Avenue to the west. For the purposes of this report, the entire block where the proposed Project site is situated is considered the Study Area. The Study Area falls on public land survey system (PLSS) Section 18 of Township 1 South, Range 13 West, within the *Hollywood*, California 7.5-minute USGS Quadrangle (Figure 1).

The Study Area is located within a fully urbanized area devoted mainly to residential and commercial developments immediately south of the Hollywood Freeway (US-101). Surrounding uses in the immediate vicinity of the proposed Project site include commercial uses to the east, west, and south and residential uses to the north. The Study Area encompasses eight parcels and include Assessor's Parcel Numbers (APNs) 5501-001-016, -019, -023, -025, -026, -027, -028, and -800 (Figure 2). Of these eight parcels, three parcels are within the proposed Project site (APNs 5501-001-023, -025, and -800). The Study Area is currently developed with a total of 11 buildings while the undeveloped portions are covered with an asphalt parking lot. Of these 11 extant buildings, seven are within the proposed Project site. Table 1, below, provides a summary of all 11 extant buildings within the Study Area and identifies which of those properties are within the proposed Project site.

Table 1. Extant Buildings Within the Study Area

APN	Street Address	Current Uses	Number of Buildings Present	Within Proposed Project Site?
5501-001-016	311 North Madison Ave	Commercial: Dewey Pest Control	None	No
5501-001-019	3725 Beverly Boulevard	Commercial: Midway Car Rental Hollywood	1 Building	No
5501-001-023	3812 Oakwood Avenue	Residential	3 Buildings	Yes
5501-001-025	3820 Oakwood Avenue	Commercial: Mackintosh & Mackintosh Structural Engineer	1 Building	Yes
5501-001-026	340 North Juanita Avenue	Commercial: MZ Collision Center	1 Building	No
5501-001-027	307 Madison Avenue	Commercial: Dewey Pest Control	1 Quonset Hut Structure	No
5501-001-027	3701 Beverly Boulevard	Commercial: Dewey Pest Control	1 Building	No
5501-001-800	316 North Juanita Avenue	Commercial: AT&T Yard	3 Buildings	Yes

1.3 Project Description

The proposed Project includes the development of a four-phase Restricted Affordable development referred to as Enlightenment Plaza Apartments. The Project proposes to construct five 7- and 8-story multifamily buildings over 2-3 story levels of ground floor parking. The proposed Project will contain approximately 454 units and 5,800 square feet of Resident Service floor area. Phase 1 will include one building in the northeastern portion of parcel 5501-001-800 containing 96,170 square feet of residential floor area, 1,164 square feet of support services, and 6,092 square feet of common area with a total of 166 units. Phase 2 will include one building in the northwestern portion of parcel 5501-001-800 containing 50,936 square feet of residential floor area, 957 square feet of support services, and 2,829 square feet of common area with a total of 72 units. Phase 3 will include one building in the southeastern portion parcel 5501-001-800 containing 57,211 square feet of residential floor area, 861 square feet of support services, and 1,865 square feet of common area with a total of 101 units. Phase 4 will include two buildings in the southwestern portion of parcel 5501-001-800 with 46,661 and 34,344 square feet residential floor area, 1,255 and 1,179 square feet of support services, and 2,421 and 2,981 square feet of common area with a total of 115 units. Additionally, the proposed project will provide 23 vehicle parking spaces as well as 227 bicycle parking spaces. The proposed Project will focus on providing housing and supportive social serviced for formerly homeless individuals.

2 REGULATORY SETTING

This section includes a discussion of the applicable state laws, ordinances, regulations, and standards governing cultural resources, which must be adhered to before and during construction of the proposed Project.

2.1 State

2.1.1 The California Register of Historical Resources (CRHR)

In California, the term "historical resource" includes, but is not limited to, "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code (PRC), Section 5020.1(j)). In 1992, the California legislature established the California Register of Historical Resources (CRHR) "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the National Register of Historic Places (NRHP), enumerated below. According to PRC Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

(2) Is associated with the lives of persons important in our past.

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

(4) Has yielded, or may be likely to yield, information important in prehistory or history.

In order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 California Code of Regulations [CCR] 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

2.1.2 California Environmental Quality Act

As described further, the following CEQA statutes (PRC Section 21000 et seq.) and CEQA Guidelines (14 CCR 15000 et seq.) are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- PRC Section 21083.2(g) defines "unique archaeological resource."
- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource"; it also defines the circumstances when a project would materially impair the significance of a historical resource.
- PRC Section 21074(a) defines "tribal cultural resources."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; CEQA Guidelines Section 15064.5(b)). If a site is listed or eligible for listing in the CRHR, or included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1(q)), it is an "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project does any of the following:

(1) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the CRHR or

(2) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

(3) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA (CEQA Guidelines Section 15064.5(b)(2)).

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a)–(c)).

Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

(1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

(2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.

(3) Is directly associated with a scientifically recognized important prehistoric or historic event or person (PRC Section 21083.2(g)).

Impacts on non-unique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as a TCR (PRC Sections 21074(c) and 21083.2(h)), further consideration of significant impacts is required.

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in PRC Section 5097.98.

California State Assembly Bill 52

AB 52 of 2014 amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 established that TCRs must be considered under CEQA and also provided for additional Native American consultation requirements for the lead agency. Section 21074 describes a TCR as a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American Tribe and that is either:

- On or determined to be eligible for the CRHR or a local historic register; or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the project site, including tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on TCRs should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to tribal cultural resources, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

2.1.3 California Health and Safety Code Section 7050.5

CEQA Guidelines section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in PRC section 5097.98.

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the county coroner has examined the remains (Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact NAHC within 24 hours (Section 7050.5(c)). NAHC will notify the "most likely descendant" (MLD).

With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

2.1.4 California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, requires all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

2.2 Local Regulations

2.2.1 Los Angeles Historic-Cultural Monuments

Local landmarks in the City of Los Angeles are known as Historic-Cultural Monument (HCMs) and are under the aegis of the Planning Department, Office of Historic Resources. They are defined in the Cultural Heritage Ordinance as follows (Los Angeles Municipal Code Section 22.171.7, added by Ordinance No. 178,402, effective April 2, 2007):

> Historic-Cultural Monument (Monument) is any site (including significant trees or other plant life located on the site), building or structure of particular historic or cultural significance to the City of Los Angeles, including historic structures or sites in which the broad cultural, economic or social history of the nation, State or community is reflected or exemplified; or which is identified with historic personages or with important events in the main currents of national, State or local history; or which embodies the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period, style or method of construction; or a notable work of a master builder, designer, or architect whose individual genius influenced his or her age.

This definition has been broken down into four HCM designation criteria that closely parallel the existing NRHP and CRHR criteria – the HCM:

1. Is identified with important events in the main currents of national, State or local history, or exemplifies significant contributions to the broad cultural, political, economic or social history of the nation, state, city, or community; or
2. Is associated with the lives of Historic Personages important to national, state, city, or local history; or

3. Embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder or architect whose genius influenced his or her age; or possesses high artistic values; or
4. Has yielded, or has the potential to yield, information important to the pre-history or history of the nation, state, city or community.

2.2.2 City of Los Angeles General Plan

The Conservation Element of the City of Los Angeles General Plan specifically addresses potential impacts to archaeological, paleontological, cultural, and historical resources (City of Los Angeles 2001). The General Plan addresses the City's rich archaeological and paleontological history; discusses regulations for site protection; and provides the following objectives, policies, programs:

Objective: protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.

Policy: continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are identified during land development, demolition or property modification activities.

Program: permit processing, monitoring, enforcement and periodic revision of regulations and procedures.

Responsibility: departments of *Building and Safety, *City Planning and Cultural Affairs and/or the *lead agency responsible for project implementation."

2.2.3 Historic Preservation Overlay Zones

As described by the City of Los Angeles Office of Historic Resources, the Historic Preservation Overlay Zone (HPOZ) Ordinance was adopted in 1979 and amended in 2004 to identify and protect neighborhoods with distinct architectural and cultural resources. HPOZs, commonly known as historic districts, provide for review of proposed exterior alterations and additions to historic properties within designated districts.

Regarding HPOZ eligibility, City of Los Angeles Ordinance Number 175891 states (Los Angeles Municipal Code, Section 12.20.3):

> Features designated as contributing shall meet one or more of the following criteria:
>
> 1. adds to the Historic architectural qualities or Historic associations for which a property is significant because it was present during the period of significance, and possesses Historic integrity reflecting its character at that time; or
> 2. owing to its unique location or singular physical characteristics, represents an established feature of the neighborhood, community or city; or

3. retaining the building, structure, Landscaping, or Natural Feature, would contribute to the preservation and protection of an Historic place or area of Historic interest in the City.

Regarding effects on federal and locally significant properties, Los Angeles Municipal Code states the following (Section 91.106.4.5, Permits for Historical and Cultural Buildings):

> The department shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated, or has been determined by state or federal action to be eligible for designation, on the National Register of Historic Places, or has been included on the City of Los Angeles list of historic cultural monuments, without the department having first determined whether the demolition, alteration or removal may result in the loss of or serious damage to a significant historical or cultural asset. If the department determines that such loss or damage may occur, the applicant shall file an application and pay all fees for the California Environmental Quality Act Initial Study and Check List, as specified in Section 19.05 of the Los Angeles Municipal Code. If the Initial Study and Check List identifies the historical or cultural asset as significant, the permit shall not be issued without the department first finding that specific economic, social or other considerations make infeasible the preservation of the building or structure.

INTENTIONALLY LEFT BLANK

3 ENVIRONMENTAL SETTING

3.1 Environmental Setting and Current Conditions

The Study Area is on a relatively flat lot and is currently developed with nine buildings. The Study Area is situated within a residential and commercial zone in the northeastern corner of the Wilshire Community Plan Area and the northwest corner of the Rampart Village of the City of Los Angeles. Surrounding uses in the immediate vicinity of the Study Area include commercial uses to the east, west, and south and residential uses to the north. The Study Area is also located immediately south of the US-101 Freeway. The entirety of the Study Area is developed with exposed ground surface and a few trees identified within APNs 5501-001-016 and 5501-001-019. Additionally, the proposed Project site includes a tree well situated in the west portion of the parking lot within APN 5501-001-800.

The Study Area is situated in the valley representing Downtown Los Angeles, approximately 12.4 miles northeast of the Pacific Ocean. Existing development is underlain by older alluvial sediments and marine sediments. Soils are dominated by the urban land-Montebello complex, associated with low-slope conditions and soils derived from older alluvium and human transported soils. Urban land soils make up the majority (70%) of Urban land-Montebello complex and are characterized by areas that have been developed with structures, parking lots, buildings, etc. and are underlain by disturbed natural soils. Montebello soils make up 20% of the Urban land-Montebello complex and are characterized by grayish brown silt loam on a graded alluvial fan remnant. The remaining 10% of soils present within the Urban land-Montebello complex are made up of various loamy soils derived from alluvial and granitic sources (UC Davis 2019; USDA 2019). Any cultural deposits that are or may have been present within the proposed Project site would likely have been located on or near the surface, within the younger quaternary alluvium that makes up the surficial deposits within the entire Study Area. However, given that the entire surface of the proposed Project site has been disturbed for the extant developments, cultural resources located on or near the surface may have been adversely impacted or destroyed, though it is possible that the asphalt covering the proposed Project site has capped deeper cultural deposits.

4 CULTURAL SETTING

4.1 Prehistoric Overview

Evidence for continuous human occupation in Southern California spans the last 10,000 years. Various attempts to parse out variability in archaeological assemblages over this broad period have led to the development of several cultural chronologies; some of these are based on geologic time, most are based on temporal trends in archaeological assemblages, and others are interpretive reconstructions. To be more inclusive, this research employs a common set of generalized terms used to describe chronological trends in assemblage composition: Paleoindian (pre-5500 BC), Archaic (8000 BC–AD 500), Late Prehistoric (AD 500–1769), and Ethnohistoric (post-AD 1769).

4.1.1 Paleoindian Period (pre-5500 BC)

Evidence for Paleoindian occupation in the region is tenuous. Our knowledge of associated cultural pattern(s) is informed by a relatively sparse body of data that has been collected from within an area extending from coastal San Diego, through the Mojave Desert, and beyond. One of the earliest dated archaeological assemblages in the region is located in coastal Southern California (though contemporaneous sites are present in the Channel Islands) derives from SDI-4669/W-12 in La Jolla. A human burial from SDI-4669 was radiocarbon dated to 9,590–9,920 years before present (95.4% probability) (Hector 2006). The burial is part of a larger site complex that contained more than 29 human burials associated with an assemblage that fits the Archaic profile (i.e., large amounts of ground stone, battered cobbles, and expedient flake tools). In contrast, typical Paleoindian assemblages include large stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of ground stone tools. Prime examples of this pattern are sites that were studied by Emma Lou Davis (1978) on Naval Air Weapons Station China Lake near Ridgecrest, California. These sites contained fluted and unfluted stemmed points and large numbers of formal flake tools (e.g., shaped scrapers, blades). Other typical Paleoindian sites include the Komodo site (MNO-679)—a multi-component fluted point site, and MNO-680—a single component Great Basined Stemmed point site (see Basgall et al. 2002). At MNO-679 and -680, ground stone tools were rare while finely made projectile points were common.

Warren et al. (2004) claimed that a biface (prehistoric stone tool that has been flaked on both faces), manufacturing tradition present at the Harris site complex (SDI-149) is representative of typical Paleoindian occupation in the region that possibly dates between 10,365 and 8,200 BC (Warren et al. 2004). Termed San Dieguito (see also Rogers 1945), assemblages at the Harris site are qualitatively distinct from most others in region because the site has large numbers of finely made bifaces (including projectile points), formal flake tools, a biface reduction trajectory, and relatively small amounts of processing tools (see also Warren 1968). Despite the unique assemblage composition, the definition of San Dieguito as a separate cultural tradition is hotly debated. Gallegos (1987) suggested that the San Dieguito pattern is simply an inland manifestation of a broader economic pattern. Gallegos's interpretation of San Dieguito has been widely accepted in recent years, in part

because of the difficulty in distinguishing San Dieguito components from other assemblage constituents. In other words, it is easier to ignore San Dieguito as a distinct socioeconomic pattern than it is to draw it out of mixed assemblages.

The large number of finished bifaces (i.e., projectile points and non-projectile blades), along with large numbers of formal flake tools at the Harris site complex, is very different than nearly all other assemblages throughout the region, regardless of age. Warren et al. (2004) made this point, tabulating basic assemblage constituents for key early Holocene sites. Producing finely made bifaces and formal flake tools implies that relatively large amounts of time were spent for tool manufacture. Such a strategy contrasts with the expedient flake-based tools and cobble-core reduction strategy that typifies non-San Dieguito Archaic sites. It can be inferred from the uniquely high degree of San Dieguito assemblage formality that the Harris site complex represents a distinct economic strategy from non-San Dieguito assemblages.

San Dieguito sites are rare in the inland valleys, with one possible candidate, RIV-2798/H, located on the shore of Lake Elsinore. Excavations at Locus B at RIV-2798/H produced a toolkit consisting predominately of flaked stone tools, including crescents, points, and bifaces, and lesser amounts of groundstone tools, among other items (Grenda 1997). A calibrated and reservoir-corrected radiocarbon date from a shell produced a date of 6630 BC. Grenda (1997) suggested this site represents seasonal exploitation of lacustrine resources and small game and resembles coastal San Dieguito assemblages and spatial patterning.

If San Dieguito truly represents a distinct socioeconomic strategy from the non-San Dieguito Archaic processing regime, its rarity implies that it was not only short-lived, but that it was not as economically successful as the Archaic strategy. Such a conclusion would fit with other trends in Southern California deserts, where hunting-related tools were replaced by processing tools during the early Holocene (see Basgall and Hall 1990).

4.1.2 Archaic Period (8000 BC – AD 500)

The more than 2,500-year overlap between the presumed age of Paleoindian occupations and the Archaic period highlights the difficulty in defining a cultural chronology in Southern California. If San Dieguito is the only recognized Paleoindian component in the coastal Southern California, then the dominance of hunting tools implies that it derives from Great Basin adaptive strategies and is not necessarily a local adaptation. Warren et al. (2004) admitted as much, citing strong desert connections with San Dieguito. Thus, the Archaic pattern is the earliest local socioeconomic adaptation in the region (see Hale 2001, 2009).

The Archaic pattern, which has also been termed the Millingstone Horizon (among others), is relatively easy to define with assemblages that consist primarily of processing tools, such as millingstones, handstones, battered cobbles, heavy crude scrapers, incipient flake-based tools, and cobble-core reduction. These assemblages occur in all environments across the region with little variability in tool composition. Low assemblage variability over time and space among Archaic sites has been equated with cultural conservatism (see Basgall and Hall 1990; Byrd and Reddy 2002; Warren 1968; Warren et al. 2004). Despite enormous

amounts of archaeological work at Archaic sites, little change in assemblage composition occurred until the bow and arrow was adopted around AD 500, as well as ceramics at approximately the same time (Griset 1996; Hale 2009). Even then, assemblage formality remained low. After the bow was adopted, small arrow points appear in large quantities and already low amounts of formal flake tools are replaced by increasing amounts of expedient flake tools. Similarly, shaped millingstones and handstones decreased in proportion relative to expedient, unshaped ground stone tools (Hale 2009). Thus, the terminus of the Archaic period is equally as hard to define as its beginning because basic assemblage constituents and patterns of manufacturing investment remain stable, complemented only by the addition of the bow and ceramics.

4.1.3 Late Prehistoric Period (AD 500–1769)

The period of time following the Archaic and before Ethnohistoric times (AD 1769) is commonly referred to as the Late Prehistoric (Rogers 1945; Wallace 1955; Warren et al. 2004); however, several other subdivisions continue to be used to describe various shifts in assemblage composition. In general, this period is defined by the addition of arrow points and ceramics, as well as the widespread use of bedrock mortars. The fundamental Late Prehistoric assemblage is very similar to the Archaic pattern, but includes arrow points and large quantities of fine debitage from producing arrow points, ceramics, and cremations. The appearance of mortars and pestles is difficult to place in time because most mortars are on bedrock surfaces. Some argue that the Ethnohistoric intensive acorn economy extends as far back as AD 500 (Bean and Shipek 1978). However, there is no substantial evidence that reliance on acorns, and the accompanying use of mortars and pestles, occurred before AD 1400. Millingstones and handstones persisted in higher frequencies than mortars and pestles until the last 500 years (Basgall and Hall 1990); even then, weighing the economic significance of millingstone-handstone versus mortar-pestle technology is tenuous due to incomplete information on archaeological assemblages.

4.2 Ethnographic Overview

The history of the Native American communities prior to the mid-1700s has largely been reconstructed through later mission-period and early ethnographic accounts. The first records of the Native American inhabitants of the region come predominantly from European merchants, missionaries, military personnel, and explorers. These brief, and generally peripheral, accounts were prepared with the intent of furthering respective colonial and economic aims and were combined with observations of the landscape. They were not intended to be unbiased accounts regarding the cultural structures and community practices of the newly encountered cultural groups. The establishment of the missions in the region brought more extensive documentation of Native American communities, though these groups did not become the focus of formal and in-depth ethnographic study until the early twentieth century (Bean and Shipek 1978; Boscana 1846; Geiger and Meighan 1976; Harrington 1934; Laylander 2000; Sparkman 1908; White 1963). The principal intent of these researchers was to record the precontact, culturally specific practices, ideologies, and languages that had survived the destabilizing effects of missionization and colonialism. This research, often understood as "salvage ethnography," was driven by the understanding that traditional knowledge was being lost due to the impacts of modernization and cultural

assimilation. Alfred Kroeber applied his "memory culture" approach (Lightfoot 2005: 32) by recording languages and oral histories within the region. Ethnographic research by Dubois, Kroeber, Harrington, Spier, and others during the early twentieth century seemed to indicate that traditional cultural practices and beliefs survived among local Native American communities.

It is important to note that even though there were many informants for these early ethnographies who were able to provide information from personal experiences about native life before the Europeans, a significantly large proportion of these informants were born after 1850 (Heizer and Nissen 1973); therefore, the documentation of pre-contact, aboriginal culture was being increasingly supplied by individuals born in California after considerable contact with Europeans. As Robert F. Heizer (1978) stated, this is an important issue to note when examining these ethnographies, since considerable culture change had undoubtedly occurred by 1850 among the Native American survivors of California. This is also a particularly important consideration for studies focused on TCRs; where concepts of "cultural resource" and the importance of traditional cultural places are intended to be interpreted based on the values expressed by present-day Native American representatives and may vary from archaeological values (Giacinto 2012).

Based on ethnographic information, it is believed that at least 88 different languages were spoken from Baja California Sur to the southern Oregon state border at the time of Spanish contact (Johnson and Lorenz 2006, p. 34). The distribution of recorded Native American languages has been dispersed as a geographic mosaic across California through six primary language families (Golla 2007).

Victor Golla has contended that one can interpret the amount of variability within specific language groups as being associated with the relative "time depth" of the speaking populations (Golla 2007: 80) A large amount of variation within the language of a group represents a greater time depth then a group's language with less internal diversity. One method that he has employed is by drawing comparisons with historically documented changes in Germanic and Romantic language groups. Golla has observed that the "absolute chronology of the internal diversification within a language family" can be correlated with archaeological dates (2007: 71). This type of interpretation is modeled on concepts of genetic drift and gene flows that are associated with migration and population isolation in the biological sciences.

The tribes of this area have traditionally spoken Takic languages that may be assigned to the larger Uto–Aztecan family (Golla 2007: 74). These groups include the Gabrieleño, Cahuilla, and Serrano. Golla has interpreted the amount of internal diversity within these language-speaking communities to reflect a time depth of approximately 2,000 years. Other researchers have contended that Takic may have diverged from Uto–Aztecan ca. 2600 BC–AD 1, which was later followed by the diversification within the Takic speaking tribes, occurring approximately 1500 BC–AD 1000 (Laylander 2010).

4.2.1 Gabrieleño/Tongva

Based on evidence presented through past archaeological investigations, the Gabrieleño appear to have arrived in the Los Angeles Basin around 500 B.C. Surrounding native groups included the Chumash and Tataviam to the northwest, the Serrano and Cahuilla to the northeast, and the Juaneño and Luiseño to the southeast.

The names by which Native Americans identified themselves have, for the most part, been lost and replaced by those derived by the Spanish people administering the local Missions. These names were not necessarily representative of a specific ethnic or tribal group, and traditional tribal names are unknown in the post-Contact period. The name "Gabrielino" was first established by the Spanish from the San Gabriel Mission and included people from the established Gabrieleño area as well as other social groups (Bean and Smith 1978; Kroeber 1925). Many modern Native Americans commonly referred to as Gabrieleño identify themselves as descendants of the indigenous people living across the plains of the Los Angeles Basin and refer to themselves as the Tongva (King 1994). This term is used here in reference to the pre-Contact inhabitants of the Los Angeles Basin and their descendants.

The Tongva established large, permanent villages along rivers and streams, and lived in sheltered areas along the coast. Tongva lands included the greater Los Angeles Basin and three Channel Islands, San Clemente, San Nicolas, and Santa Catalina and stretched from the foothills of the San Gabriel Mountains to the Pacific Ocean. Tribal population has been estimated to be at least 5,000 (Bean and Smith 1978), but recent ethnohistoric work suggests a much larger population, approaching 10,000 (O'Neil 2002). Archaeological sites composed of villages with various sized structures have been identified through the Los Angeles Basin. Within the permanent village sites, the Tongva constructed large, circular, domed houses made of willow poles thatched with tule, each of which could hold upwards of 50 people (Bean and Smith 1978). Other structures constructed throughout the villages probably served as sweathouses, menstrual huts, ceremonial enclosures, and communal granaries. Cleared fields for races and games, such as lacrosse and pole throwing, were created adjacent to Tongva villages (McCawley 1996).

The largest, and best documented, ethnographic Tongva village in the vicinity was that of *Yanga* (also known as *Yaangna*, *Janga*, and *Yabit*), which was in the vicinity of the downtown Los Angeles. It is important to note that the village was reported to have been identified multiple times throughout the 19th century within the area located north of present day Temple Street as far as Union Station. This falls approximately 1.2 miles to 2 miles north of the Project site, as will be discussed in greater detail in following sections (McCawley 1996: 56-57; NEA and King 2004). This village was reportedly first encountered by the Portola expedition in 1769. In 1771, Mission San Gabriel was established. Yanga provided a large number of the recruitments to this mission; however, following the founding of the Pueblo of Los Angeles in 1781, opportunities for local paid work became increasingly common, which had the result of reducing the number of Native American neophytes from the immediately surrounding area (NEA and King 2004). Mission records indicate that 179 Gabrieleño

inhabitants of Yanga were recruited to San Gabriel Mission (NEA and King 2004: 104). Based on this information, Yanga may have been the most populated village in the Western Gabrieleño territory.

Father Juan Crespi passed through the area near this village on August 2-3, 1769. The pertinent sections from his translated diary are provided here:

> Sage for refreshment is very plentiful at all three rivers and very good here at the Porciúncula [the Los Angeles River]. At once on our reaching here, eight heathens came over from a good sized village encamped at this pleasing spot among some trees. They came bringing two or three large bowls or baskets half-full of very good sage with other sorts of grass seeds that they consume; all brought their bows and arrows but with the strings removed from the bows. In his hands the chief bore strings of shell beads of the sort that they use, and on reaching the camp they threw the handfuls of these beads at each of us. Some of the heathens came up smoking on pipes made of baked clay, and they blew three mouthfuls of smoke into the air toward each one of us. The Captain and myself gave them tobacco, and he gave them our own kind of beads, and accepted the sage from them and gave us a share of it for refreshment; and very delicious sage it is for that purpose.
>
> We set out at a half past six in the morning from this pleasing, lush river and valley of Our Lady of Angeles of La Porciúncula. We crossed the river here where it is carrying a good deal of water almost at ground level, and on crossing it, came into a great vineyard of grapevines and countless rose bushes having a great many open blossoms, all of it very dark friable soil. Keeping upon a westerly course over very grass-grown, entirely level soils with grand grasses, on going about half a league we came upon the village belonging to this place, where they came out to meet and see us, and men, women, and children in good numbers, on approaching they commenced howling at us though they had been wolves, just as before back at the spot called San Francisco Solano. We greeted them and they wished to give us seeds. As we had nothing at hand to carry them in, we refused [Brown 2002:339-341, 343].The environment surrounding the Tongva included mountains, foothills, valleys, deserts, riparian, estuarine, and open and rocky coastal eco-niches. Like most native Californians, acorns (the processing of which was established by the early Intermediate Period) were the staple food source. Acorns were supplemented by the roots, leaves, seeds, and fruits of a wide variety of flora (e.g., islay, cactus, yucca, sages, and agave). Fresh water and saltwater fish, shellfish, birds, reptiles, and insects, as well as large and small mammals, were also consumed (Bean and Smith 1978:546; Kroeber 1925; McCawley 1996).

Tools and implements used by the Tongva to gather and collect food resources included the bow and arrow, traps, nets, blinds, throwing sticks and slings, spears, harpoons, and hooks. Trade between the mainland and the Channel Islands Groups was conducted using plank canoes as well as tule balsa canoes. These canoes were also used for general fishing and travel (McCawley 1996). The collected food

resources were processed food with hammerstones and anvils, mortars and pestles, manos and metates, strainers, leaching baskets and bowls, knives, bone saws, and wooden drying racks. Catalina Island steatite was used to make ollas and cooking vessels (Blackburn 1963; Kroeber 1925; McCawley 1996).

The Chinigchinich cult, centered on the last of a series of heroic mythological figures, was the basis of religious life at the time of Spanish contact. The Chinigchinich cult not only provided laws and institutions, but it also taught people how to dance, which was the primary religious act for this society. The Chinigchinich religion seems to have been relatively new when the Spanish arrived. It was spreading south into the Southern Takic groups even as Christian missions were being built. This cult may be the result of a mixture of native and Christian belief systems and practices (McCawley 1996).

Inhumation of deceased Tongva was the more common method of burial on the Channel Islands while neighboring mainland coast people performed cremation (Harrington 1942; McCawley 1996). Cremation ashes have been found buried within stone bowls and in shell dishes (Ashby and Winterbourne 1966), as well as scattered among broken ground stone implements (Cleland et al. 2007). Supporting this finding in the archaeological record, ethnographic descriptions have provided an elaborate mourning ceremony. Offerings varied with the sex and status of the deceased (Johnston 1962; McCawley 1996; Reid 1926). At the behest of the Spanish missionaries, cremation essentially ceased during the post-Contact period (McCawley 1996).

4.3 Historic-Period Overview

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1848), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

4.3.1 Spanish Period (1769–1821)

Spanish explorers made sailing expeditions along the coast of southern California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríquez Cabrillo stopped in 1542 at present-day San Diego Bay. With his crew, Cabrillo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica Bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica Bays, giving each location its long-standing name. The Spanish crown laid claim to California based on the surveys conducted by Cabrillo and Vizcaíno (Bancroft 1885; Gumprecht 1999).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish settlement in Alta California. In July of 1769, while Portolá was exploring southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823.

The Portolá expedition first reached the present-day boundaries of Los Angeles in August 1769, thereby becoming the first Europeans to visit the area. Father Crespi named "the campsite by the river Nuestra Señora la Reina de los Angeles de la Porciúncula" or "Our Lady the Queen of the Angels of the Porciúncula." Two years later, Friar Junípero Serra returned to the valley to establish a Catholic mission, the Mission San Gabriel Arcángel, on September 8, 1771 (Kyle 2002). Mission San Fernando Rey de España was established nearly 30 years later on September 8, 1797.

4.3.2 Mexican Period (1821–1846)

A major emphasis during the Spanish Period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period, only two of which were successful and remain as California cities (San José and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population. After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. The secularization of the missions (enacted 1833) following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos.

During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

4.3.3 American Period (1848–Present)

War in 1846 between Mexico and the United States precipitated the Battle of Chino, a clash between resident Californios and Americans in the San Bernardino area. The Mexican-American War ended with the Treaty of Guadalupe Hidalgo in 1848, ushering California into its American Period.

California officially became a state with the Compromise of 1850, which also designated Utah and New Mexico (with present-day Arizona) as U.S. Territories (Waugh 2003). Horticulture and livestock, based primarily on cattle as the currency and staple of the rancho system, continued to dominate the southern California economy through 1850s. The Gold Rush began in 1848, and with the influx of people seeking gold, cattle were no longer desired mainly for their hides but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. Cattle were at first driven along major trails or roads such as the Gila Trail or Southern Overland Trail, then were transported by trains when available. The cattle boom ended for southern California as neighbor states and territories drove herds to northern California at reduced prices. Operation of the huge ranchos became increasingly difficult, and droughts severely reduced their productivity (Cleland 2005).

4.4 Project Site Historic Context

4.4.1 City of Los Angeles

In 1781, a group of 11 Mexican families traveled from Mission San Gabriel Arcángel to establish a new pueblo called El Pueblo de la Reyna de Los Angeles (The Pueblo of the Queen of the Angels). This settlement consisted of a small group of adobe-brick houses and streets and would eventually be known as the Ciudad de Los Angeles (City of Angels), which incorporated on April 4, 1850, only two years after the Mexican-American War and five months prior to California achieving statehood. Settlement of the Los Angeles region continued in the early American Period. The County of Los Angeles was established on February 18, 1850, one of 27 counties established in the months prior to California acquiring official statehood in the United States. Many of the ranchos in the area now known as Los Angeles County remained intact after the United States took possession of California; however, a severe drought in the 1860s resulted in many of the ranchos being sold or otherwise acquired by Americans. Most of these ranchos were subdivided into agricultural parcels or towns (Dumke 1944). Nonetheless, ranching retained its importance, and by the late 1860s, Los Angeles was one of the top dairy production centers in the country (Rolle 2003). By 1876, Los Angeles County reportedly had a population of 30,000 persons (Dumke 1944).

Los Angeles maintained its role as a regional business center and the development of citriculture in the late 1800s and early 1900s further strengthened this status (Caughey and Caughey 1977). These factors, combined with the expansion of port facilities and railroads throughout the region, contributed to the impact of the real estate boom of the 1880s on Los Angeles (Caughey and Caughey 1977; Dumke 1944).

By the late 1800s, government leaders recognized the need for water to sustain the growing population in the Los Angeles area. Irish immigrant William Mulholland personified the city's efforts for a stable water supply (Dumke 1944; Nadeau 1997). By 1913, the City of Los Angeles had purchased large tracts of land in the Owens Valley and Mulholland planned and completed the construction of the 240-mile aqueduct that brought the valley's water to the city (Nadeau 1997).

Los Angeles continued to grow in the twentieth century, in part due to the discovery of oil in the area and its strategic location as a wartime port. The county's mild climate and successful economy continued to draw new residents in the late 1900s, with much of the county transformed from ranches and farms into residential subdivisions surrounding commercial and industrial centers. Hollywood's development into the entertainment capital of the world and southern California's booming aerospace industry were key factors in the county's growth in the twentieth century.

5 BACKGROUND RESEARCH

5.1 SCCIC Records Search

On April 8, 2019, Dudek completed a CHRIS records search conducted at the SCCIC, located on the campus of California State University, Fullerton of the Study Area and a 0.5-mile (804 foot) record search area. This search included their collections of mapped prehistoric, historic, and built environment resources, Department of Parks and Recreation Site Records, technical reports, and ethnographic references. Additional consulted sources included historical maps of the Study Area, the NRHP, the CRHR, the California Historic Property Data File, and the lists of California State Historical Landmarks, California Points of Historical Interest, and the Archaeological Determinations of Eligibility. The results of the records search are presented in Confidential Appendix A.

5.1.1 Previously Conducted Cultural Resource Studies

The SCCIC records indicate that 22 cultural resources investigations have been conducted within a half-(0.5)-mile of the Study Area (Table 2). Of these, two studies have been conducted within a portion of the Study Area, including LA-05349 and LA-07061. Both of these reports are cultural resource studies prepared by LSA Associates, Inc. in support of a proposed wireless service facilities to be developed by AT&T Fixed Wireless Services. Neither study identified archaeological resources within a 0.5-mile of the Study Area and neither project required ground disturbance. Therefore, it was determined that there would be no potential to impact any unrecorded archaeological resources (Duke 2001a, Duke 2001b).

5.1.2 Previously Recorded Cultural Resources

SCCIC records indicate that a total of 16 previously recorded cultural resources fall within the records search area, none of which are within the Study Area. All 16 resources are historic-era buildings or structures. Table 3, below, summarize all 16 resources. No prehistoric sites or resources documented to be of specific Native American origin have been previously recorded within a 0.5-mile of the Study Area.

Table 3. Previously Recorded Cultural Resources Within a 0.5-Mile of the Study Area

Primary Number (P-19-)	Age and Type	Description	NRHP Eligibility	Recorded By and Year	Proximity to Study Area
173422	Historic: Built Environment	Korea Times; OHP Property Number - 064891	Originally 2S2 (Individual Property determined eligible for NRHP by a consensus through Section 106 process. Listed in the CRHR; Has since been demolished	1986 (S. Bourstein, SCRTD)	Outside

5.2 Review of Historic Aerials and Maps

Dudek consulted historic maps and aerial photographs to understand development of the Study Area and surrounding properties. Topographic maps are available for the years 1894, 1896, 1898, 1900, 1902, 1904, 1906, 1908, 1910, 1913, 1915, 1921, 1928, 1931, 1932, 1955, 1963, 1968, 1975, 1982, 1995 and 2012 (NETR 2019a). Historic Aerial maps are available for the years 1927, 1941, 1948, 1952, 1954, 1956, 1960, 1962, 1964, 1965, 1968, 1971, 1972, 1976, 1979, 1980, 1983, 1989, 1994, 2003, 2004, 2005, 2009, 2010, 2012, and 2014 (Aerial Map Industries 1983; Fairchild Aerial Survey 1927, 1927, 1941, 1952, 1956, 1960, 1962, 1965, 1968; Teledyne Geotronics 1971, 1976, 1979; U.S. Geological Survey 1994; NETR 2019b).

The first USGS topographic map showing the Study Area dates to 1894 and shows that there was at least one structure within the Study Area and a few other structures in the general vicinity. Additionally, the topographic map from 1894 shows a railroad line running in an east-west alignment south of the Study Area and several streets in the general vicinity. Topographic maps show no changes to the Study Area or the general vicinity until 1921. The 1921 map shows a dramatic increase in development within the Study Area and the general vicinity. In 1921, the Study Area was extensively developed and the extant streets had been laid out. Between 1921 and 1928 there was a general increase in development throughout the area. There are no discernible changes to the Study Area visible on the 1928 map. The next visible changes to the Study Area and vicinity can be seen on the 1955 map which shows that the entire area had been completely built out and that the US-101 freeway had been developed immediately to the north of the Study Area. Topographic maps from later decades do not show extensive changes within the Study Area aside from a general increase in density in the city overall.

The historic aerial from 1927 shows the Study Area as completely developed with many small residential structures. The quality of the aerial makes it difficult to determine the exact number of structures within the Study Area. The next aerial, dating to 1941, shows that the Study Area has been developed with approximately 15 residential structures, some of which have associated ancillary buildings. The three extant residential structures developed within APN 5501-0001-023 are visible on this aerial. In addition to the homes, there is one rectangular building present on the southeast corner of the Study Area, in APN 5501-001-028, depicted on the 1941 aerial. This building appears to be part of the extant building, which was later expanded to include an addition along the western wall. The 1941 aerial indicates that there is some type of commercial development in the southeast corner, consisting of a large parking lot, a small hexagon-shaped structure, and a small building. There are two large areas of undeveloped land in the central portion and in the southeast quadrant of the Study Area, both of these undeveloped sections of the Study Area are within the proposed Project site. The aerial from 1948 shows the Study Area in much the same state as in 1941. To the northeast of the Study Area, the initial demolitions associated with the development of the US-101 Freeway are visible on the 1948 aerial. The aerial from 1952 shows the US-101 Freeway in its current state. By 1952, the Quonset Hut, in APN 5501-001-027, is visible. There is still one large vacant area in the center of the Study Area, within a portion of the proposed Project site. There are no discernible changes to the Study Area or general vicinity visible on the 1954 or 1956 aerial.

The most extensive changes to the Study Area occurred between 1956 and 1960; these changes consisted of the demolition of all of the structures within the site except for the extant structures in the southeast corner and several residential structures in the northwest corner. One of these extant structures, the rectangular building in APN 5501-001-028, was expanded to its current extent during this time. The majority of the site was paved, the rectangular building within the center of APN 5501-001-800 was built, and three rectangular structures within APN 5501-001-019, one of which is the extant structure, were built. Additionally, there were two structures directly north of the Quonset Hut visible on the 1960 aerial. Between 1962 and 1965, all but the three existing houses in the northwest corner were demolished and the existing structures were built. There are no visible changes on the aerials between 1965 or 1972 aerial. Between 1972 and 1976 the small rectangular building in the center of the Study Area, in APN 5501-001-800, was built. Between 1980 and 1989 the small shed-like structure in the northeastern most corner of the Study Area within APN 5501-001-800 was built. There are no discernible changes on the aerials until 2003, when it appears that four structures, two in the southwest corner of the Study Area and two in the southeast, had been demolished. The remaining aerials do not show any significant changes to the Study Area.

The review of historic aerials and topographic maps indicates that of the seven structures existing within the proposed Project site, the three extant residential structures at 3812 Oakwood Avenue in APN 5501-001-023, were constructed by at least 1941. At 316 North Juanita Avenue, within APN 5501-001-800 there are currently three structures. The rectangle structure along the western boundary, associated with was built between 1956 and 1960. The smaller rectangle structure in the center of APN 5501-001-800, directly east of the building developed between 1956 and 1960, was built after 1972. Prior to this time the center of APN 5501-001-800 was paved or undeveloped. The small shed-like structure in the northeastern most corner of APN 5501-001-800 was built between 1980 and 1989. The seventh building within the proposed Project site, located at 3820 Oakwood Avenue, within APN 5501-001-025 was built between 1962 and 1965.

Within the Study Area, the large structure currently associated with the MZ Collision Center, within APN 5501-001-026 was built between 1965 and 1972. The rectangular structure currently associated with Dewey Pest Control within APN 5501-001-027 was initially developed between 1927 and 1941 and was later renovated between 1956 and 1960. The Quonset Hut currently associated with Dewey Pest Control, within APN 5501-001-028, was built between 1948 and 1952. Finally, the building currently associated with Midway Car Rental Hollywood, within APN 5501-001-019, was built between 1956 and 1960.

5.3 Native American Correspondence

5.3.1 NAHC Sacred Lands File Search

Dudek contacted the NAHC on April 4, 2019 and requested a review of the SLF. The NAHC replied via email on April 25, 2019 stating that the SLF search was completed with negative results. Because the SLF search does not include an exhaustive list of Native American cultural resources, the NAHC suggested contacting Native American individuals and/or tribal organizations who may have direct knowledge of cultural resources

in or near the Study Area. No additional tribal outreach was conducted by Dudek. Tribal consultation has not been required by the City of Los Angeles Department of City Planning (City); it is the understanding of the applicant that the Project is not subject to A) 52.

5.4 Ethnographic Research and Review of Academic Literature

Dudek cultural resources specialists reviewed pertinent academic and ethnographic literature for information pertaining to past Native American use of the Study Area. This review included consideration of sources commonly identified though consultation, notably the 1938 Kirkman-Harriman Historical Map often referenced by the Gabrieleño Band of Mission Indians-Kizh Nation (Figure 3). Based on this map, the Study Area is located directly west of a north-south trending creek or river and directly east of El Camino Real, which ran roughly the same route as the present US-101 and Ventura Freeway (State Route (SR)-134). Additionally, this map shows the La Brea Tar Pit, which is also indicated as a location of a battle between Europeans and Indians in August 1770, approximately 2.25 miles to the west of the Study Area. The nearest mapped Native American settlements, identified as red teepees on the map, is two miles north of the Study Area at the base of the Santa Monica Mountains. The map also shows several other Native American settlements mapped along the foothills of the Santa Monica Mountains, including two that are between two and three miles northwest of the Study Area, mapped at the base of the Cahuenga Pass. It should be noted that this map is highly generalized due to scale and age, and may be somewhat inaccurate with regard to distance and location of mapped features. Additionally, this map was prepared based on review of historic documents and notes more than 100 years following secularization of the missions (in 1833). Although the map contains no specific primary references, it matches with the details documented by the Portola expedition (circa 1769-1770). While the map is a valuable representation of post-mission history, substantiation of the specific location and uses of the represented individual features would require review of archaeological or other primary documentation on a case-by-case basis.

At the time of Portola's expedition, and through the subsequent mission period, the area surrounding the Study Area would have been occupied by Western Gabrieleño/Tongva inhabitants (Figure 4 and Figure 5). Use of Gabrieleño as a language has not been documented since the 1930s (Golla 2011). One study made an effort to map the traditional Gabrieleño/Tongva cultural use area through documented family kinships included in mission records (NEA and King 2004). This process allowed for the identification of clusters of tribal villages (settlements) with greater relative frequencies of related or married individuals than surrounding areas (Figure 6). Traditional cultural use area boundaries, as informed by other ethnographic and archaeological evidence, were then drawn around these clusters. The relative sizes of these villages were also inferred from their relative number of mission-period recruits. The nearest village site to the Study Area was *Yaanga* (also called *Yabit* in NEA and King 2004), located in roughly the same area as the extant Los Angeles Plaza Church just west of Union Station, approximately 4 miles southeast of the Study Area. Yaanga, though not depicted on the Kirkman-Harriman map, is referenced in several archaeological and ethnographic works including Dakin 1978, Johnston 1962, McCawley 1996, and Morris et al. 2016. Yaanga is described as being the "Indian precursor of modern Los Angeles" as the city was originally established within its boundaries

(McCawley 1996: 57). This map also identifies the village of *Cahuepet,* approximately 7 miles to the northwest of the Study Area near the northern opening of the Cahuenga Pass, near what is now Universal Studios, and *Jajamobit*, approximately 5.5 miles north of the Study Area, at the intersection of Interstate (I)-5 and SR-134, near Griffith Park (NEA and King 2004).

The village of Jajamobit is referenced in McCawley, and though it has not been substantiated through archaeological evidence, Mission records do indicate that there were Gabrieleño individuals at both San Fernando and San Gabriel Mission who came from Jajamobit (NEA & King 2004: 105-106). Mission records indicate that 123 Native American neophytes came from this village, second only to the number of recruits from Yanga in the Western Gabrieleño territory (NEA and King 2004). Campo de Cahuenga was also in this vicinity, which is the site where the 1847 treaty between General Andres Pico and Lieutenant-Colonel John C. Fremont marked the surrender of Mexican California to the United States (Westec 1983). The La Brea Tar Pits area (CA-LAN-159) was a known area of Native American use for hunting and the gathering of tar (Westec 1983). The largest village in the vicinity was likely Yaanga. Mission records indicate 179 Gabrieleño inhabitants of Yanga were recruited to San Gabriel Mission, indicating that it may have been the most populated village in the Western Gabrieleño territory (NEA and King 2004: 104). In general, the mapped position of both Yaanga and Cahuenga have been substantiated through archaeological evidence, although the archaeological record has been substantially compromised by rapid and early urbanization throughout much of the region. No archaeological evidence of the nearest villages on the 1938 Kirkman-Harriman map was provided in the SCCIC records search results or review of other archaeological information, however these fell outside of the archaeological records search area.

No archaeological evidence of the nearest village depicted on the 1938 Kirkman-Harriman map was provided in the SCCIC records search results or through a review of other archaeological information, however these fell outside of the archaeological records search area. Based on review of pertinent academic and ethnographic information, the Study Area falls within the boundaries of the Gabrieleño/Tongva traditional territory, however, no Native American resources have been previously documented in areas that may be impacted by the proposed Project. Although the Study Area is not documented within the noted boundaries of any mapped villages, it is located near several natural resources that may have been utilized by prehistoric and protohistoric peoples, such as a creek, trails or trade routes, and the La Brea Tar Pits.

6 FINDINGS AND RECOMMENDATIONS

6.1 Summary of Impacts to Tribal Cultural Resources

A project with an effect that may cause a substantial adverse change in the significance of a TCR is a project that may have a significant effect on the environment (PRC Section 21084.2.). AB 52 requires a TCR to have tangible, geographically defined properties that can be impacted by an undertaking. No Native American resources have been identified within the proposed Project site, Study Area, or the surrounding 0.5-mile records search radius through the SCCIC records (completed April 8, 2019) or through a search of the NAHC SLF records (completed April 25, 2019). Ethnographic research indicates that the proposed Project site is located between four and seven miles from the believed location of three Native American villages, and near natural resources which would have been important to Native Americans in prehistoric and protohistoric times. However, the proposed Project site and surrounding neighborhoods have been extensively developed throughout the twentieth century.

6.2 Recommendations

Tribal consultation has not been required by the City of Los Angeles Department of City Planning (City); it is the understanding of the applicant that the Project is not subject to AB 52. Any information that may be provided or regarding TCRs that could be affected by the Project should be appropriately considered. Based on review of ethnographic and archaeological information, if the following recommendations are followed, impacts to TCRs would be less-than-significant. Given that no TCR has been identified, no specific mitigation measures pertaining to known TCRs are necessary. Management strategies for cultural resources and human remains will provide for management of related resources of Native American origin.

While no TCRs are anticipated to be affected by the proposed Project, the City has established a standard condition of approval to address inadvertent discovery of TCRs. Should TCRs be inadvertently encountered, this condition of approval provides for temporarily halting construction activities near the encounter and notifying the City and Native American tribes that have informed the City they are traditionally and culturally affiliated with the geographic area of the proposed Project. If the City determines that a potential resource appears to be a TCR (as defined by PRC Section 21074), the City would provide any affected tribe a reasonable period of time to conduct a site visit and make recommendations regarding the monitoring of future ground disturbance activities, as well as the treatment and disposition of any discovered TCRs. The Applicant would then implement the tribe's recommendations if a qualified archaeologist reasonably concludes that the tribe's recommendations are reasonable and feasible. The recommendations would then be incorporated into a TCR monitoring plan and once the plan is approved by the City, ground disturbance activities could recommence. In accordance with the condition of approval, all activities would be conducted in accordance with regulatory requirements. As a result, potential impacts to TCRs would continue to be less-than-significant.

Project Description:

The Juanita Avenue Project involves the development of between 400-500 units of housing dedicated to Permanent Supportive Housing for formerly homeless individuals. The plan currently includes 4-5 buildings of housing with services (mental & Physical health, financial, employment). The project site is located at 312-328 North Juanita Avenue, 317-345 North Madison Avenue, and 3810-3838 West Oakwood Avenue.

RE: Juanita Avenue Project, Los Angeles County

Dear Ms. Nicolay:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our lists contain current information. If you have any questions or need additional information, please contact me at my email address: steven.quinn@nahc.ca.gov.

Sincerely,

Steven Quinn
Associate Governmental Program Analyst

TREE REPORT

316 N Juanita Ave,
Los Angeles, CA 90004

SUMMARY

PROJECT OVERVIEW	
Site Address	**312-328 N Juanita Ave, 3810-3838 W Oakwood Ave, and 317-345 N Madison Avenue, Los Angeles, CA 90004**
Location and/or Specific Plan	**East Hollywood**
Project Description	**454 PSH Units Plus Support Services**
Number of Protected Trees on Site	**0**
Number of Recommended Protected Tree Removals	**0**

This Tree Report was prepared at the request of the property owner, Flexible PSH Solutions, INC., who are preparing to build a 454-unit Permanent Supportive Housing (PSH) project on this property. The subject property is 94,623 square feet and is located in the East Hollywood area of Los Angeles.

PROTECTED TREES, URBAN FORESTRY DIVISION

This property is under the jurisdiction of the City of Los Angeles and guided by the Native Tree Protection Ordinance No. 177,404. **Protected Trees** are defined by this ordinance as oaks (*Quercus* sp) indigenous to California but excluding the scrub oak (*Quercus dumosa*); Southern California black walnut (*Juglans californica* var. californica); Western sycamore *(Platanus racemosa)* and California bay laurel (*Umbellularia californica*) trees with a diameter at breast height (DBH) of four inches (4") or greater.

There are NO trees on this property that would be considered protected within the City of Los Angeles Native Tree Protection Ordinance.

NEIGHBOR TREES

I have also inspected the neighboring properties to confirm there are no protected tree species that are adjacent to the construction zone, or in areas of impact.

NON-PROTECTED SIGNIFICANT TREES, DEPARTMENT OF CITY PLANNING

The Department of City Planning requires the identification of the location, size, type and condition of all existing trees on the site with a DBH of 8 inches (8") or greater. These trees will be identified as **Non-Protected Significant Trees.**

At this time, I observed three (3) **Non-Protected Significant Trees** on the property. These trees will be impacted by construction and are recommended for removal and replacement to the satisfaction of the City of Los Angeles Department of City Planning.

CITY OF LOS ANGELES STREET TREES, URBAN FORESTRY DIVISION

At this time, I observed four (4) **City of Los Angeles Street Trees.** Three (3) of these trees will be retained and protected in place. One is recommended for removal.

ASSIGNMENT

The Assignment included a field observation and inventory of the trees on site; an evaluation of potential construction impacts; and recommendations for the protection of trees to remain. A Tree Location Plot Map is included in Appendix A. Photographs of the subject trees are included in Appendix B.

LIMITS OF THE ASSIGNMENT

The field inspection was a visual, grade level tree assessment. No special tools or equipment were used. No tree risk assessments were performed. My site examination and the information in this report is limited to the date and time the inspection occurred. The information in this report is limited to the condition of the trees at the time of my inspection.

TREE CHARACTERISTICS AND SITE CONDITIONS

Detailed information with respect to size, condition, species and recommendations are included in the Summary of Field Inspections in Appendix C. The trees are numbered on the Tree Location Map in Appendix A.

IMPACT ANALYSIS AND SPECIFIC RECOMMENDATIONS

NON-PROTECTED TREES

Three (3) non-protected significant trees are in the direct footprint of the new construction and will be removed and replaced at a one-to-one (1:1) ratio, to the satisfaction of the City of Los Angeles Department of City Planning.

STREET TREES

Street tree Weeping Fig *(Ficus benjamina)* #3 was intentionally planted by someone, possibly in the adjacent office buildings as evidenced by the surrounding cactus garden and lack of space between the actual street trees. This tree should be removed to allow for proper growing distance and preservation for the actual street trees. Even though this is an intentionally installed tree by someone other than the city the client is proposing eight replacement street trees.

APPENDIX B - PHOTOGRAPHS

PHOTO 1: Shows street trees #1, #2, and #4 on Oakwood Avenue. These trees will be retained and protected in place. Street tree Weeping Fig *(Ficus benjamina)* #3 was intentionally planted by someone, possibly in the adjacent office buildings as evidenced by the surrounding cactus garden and lack of space between the actual street trees. This tree should be removed to allow for proper growing distance and preservation for the actual street trees.

APPENDIX B - PHOTOGRAPHS

PHOTO 2: Shows street tree #1 a Red Cedar *(Thuja plicata)* on Oakwood. This tree will be retained and protected in place.

APPENDIX B - PHOTOGRAPHS

PHOTO 3: Shows non-protected trees #5, #6 and #7. These trees will be impacted by construction and are recommended for removal and replacement to the satisfaction of the City of Los Angeles Department of City Planning.

APPENDIX C - SUMMARY OF FIELD INSPECTION

Rating Code: A = Excellent, B = Good, C = Fair, D = Poor, E = Nearly Dead, F = Dead

Tree #	Species	Location	Status	DBH (")	Height (')	Spread (')	Summary of Condition	Retain or Remove
1	Red Cedar *Thuja plicata*	Oakwood Ave	Street	12, 12	30	15	C	Retain
2	Canary Island Palm *Phoenix canariensis*	Oakwood Ave	Street	24	60	30	C	Retain
3	Weeping Fig *Ficus benjamina*	Oakwood Ave	Street	8	20	5	C	Remove
4	Canary Island Palm *Phoenix canariensis*	Oakwood Ave	Street	24	60	30	C	Retain
5	Queen Palm *Syagrus romanzoffiana*	Private Property	Non-Significant	8	15	10	D	Remove
6	Queen Palm *Syagrus romanzoffiana*	Private Property	Non-Significant	8	15	10	D	Remove
7	Queen Palm *Syagrus romanzoffiana*	Private Property	Non-Significant	8	15	10	D	Remove

APPENDIX D - SUMMARY OF DATA

Table 3. Summary of Replacement

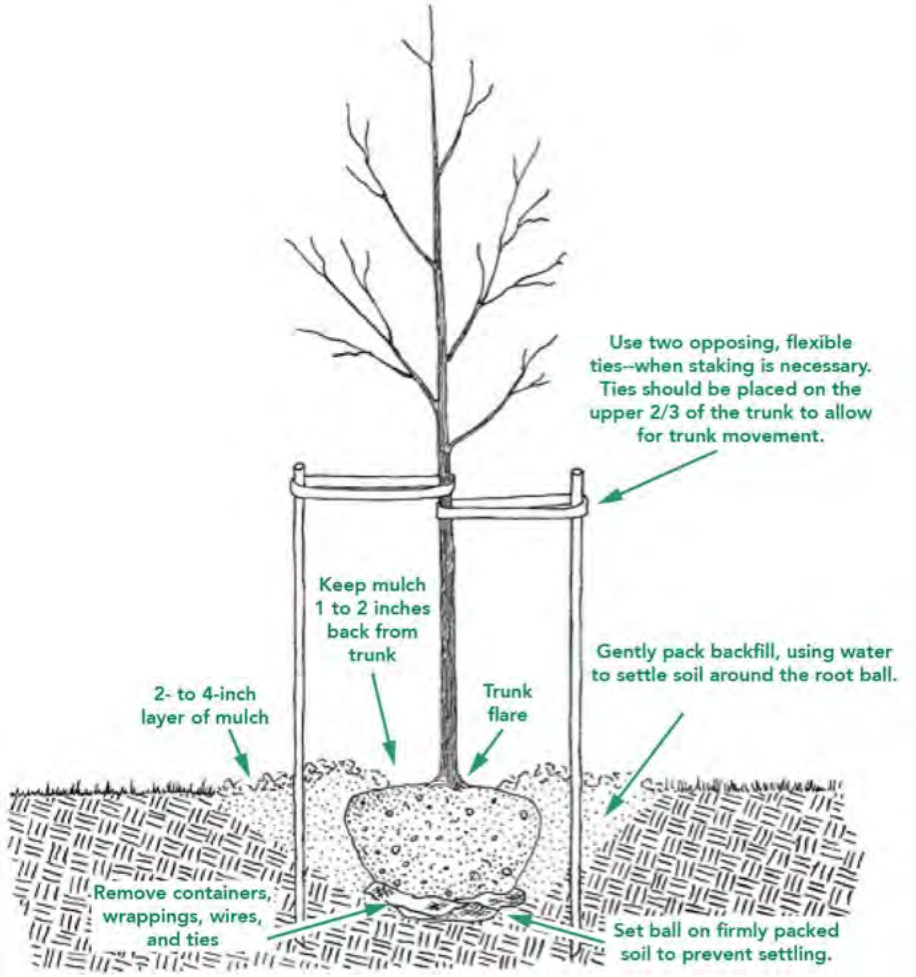
	Existing Trees to Be Removed	Trees to be Planted in Replacement
NON-PROTECTED SIGNIFICANT TREES 8" + DBH Replaced 1:1	3	3
CITY OF L.A. STREET TREES Replaced 2:1	1	2
TOTAL	4	5

Recommended Species and Size of Replacement Trees

Non-Protected Trees are replaced at a one-to-one (1:1) ratio, to the satisfaction of the City of Los Angeles Department of City Planning.

Street trees are replaced at a two-to-one (2:1) ratio, to the satisfaction of the Urban Forestry Division.

NEW TREE PLANTING



The ideal time to plant trees and shrubs is during the dormant season, in the fall after leaf drop or early spring before budbreak. Weather conditions are cool and allow plants to establish roots in the new location before spring rains and summer heat stimulate new top growth. Before you begin planting your tree, be sure you have had all underground utilities located prior to digging.

If the tree you are planting is balled or bare root, it is important to understand that its root system has been reduced by 90 to 95 percent of its original size during transplanting. As a result of the trauma caused by the digging process, trees commonly exhibit what is known as transplant shock. Containerized trees may also experience transplant shock, particularly if they have circling roots that must be cut. Transplant shock is indicated by slow growth and reduced vigor following transplanting. Proper site preparation before and during planting coupled with good follow-up care reduces the amount of time the plant experiences transplant shock and allows the tree to quickly establish in its new location. Carefully follow nine simple steps, and you can significantly reduce the stress placed on the plant at the time of planting.

NEW TREE PLANTING, continued

1. Dig a shallow, broad planting hole. Make the hole wide, as much as three times the diameter of the root ball but only as deep as the root ball. It is important to make the hole wide because the roots on the newly establishing tree must push through surrounding soil in order to establish. On most planting sites in new developments, the existing soils have been compacted and are unsuitable for healthy root growth. Breaking up the soil in a large area around the tree provides the newly emerging roots room to expand into loose soil to hasten establishment.

2. Identify the trunk flare. The trunk flare is where the roots spread at the base of the tree. This point should be partially visible after the tree has been planted (see diagram). If the trunk flare is not partially visible, you may have to remove some soil from the top of the root ball. Find it so you can determine how deep the hole needs for proper planting.

3. Remove tree container for containerized trees. Carefully cutting down the sides of the container may make this easier. Inspect the root ball for circling roots and cut or remove them. Expose the trunk flare, if necessary.

4. Place the tree at the proper height. Before placing the tree in the hole, check to see that the hole has been dug to the proper depth and no more. The majority of the roots on the newly planted tree will develop in the top 12 inches of soil. If the tree is planted too deeply, new roots will have difficulty developing because of a lack of oxygen. It is better to plant the tree a little high, 1-2 inches above the base of the trunk flare, than to plant it at or below the original growing level. This planting level will allow for some settling.

5. Straighten the tree in the hole. Before you begin backfilling, have someone view the tree from several directions to confirm that the tree is straight. Once you begin backfilling, it is difficult to reposition the tree.

6. Fill the hole gently but firmly. Fill the hole about one-third full and gently but firmly pack the soil around the base of the root ball. Be careful not to damage the trunk or roots in the process. Fill the remainder of the hole, taking care to firmly pack soil to eliminate air pockets that may cause roots to dry out. To avoid this problem, add the soil a few inches at a time and settle with water. Continue this process until the hole is filled and the tree is firmly planted. It is not recommended to apply fertilizer at time of planting.

7. Stake the tree, if necessary. If the tree is grown properly at the nursery, staking for support will not be necessary in most home landscape situations. Studies have shown that trees establish more quickly and develop stronger trunk and root systems if they are not staked at the time of planting. However, protective staking may be required on sites where lawn mower damage, vandalism, or windy conditions are concerns. If staking is necessary for support, there are three methods to choose among: staking, guying, and ball stabilizing. One of the most common methods is staking. With this method, two stakes used in conjunction with a wide, flexible tie material on the lower half of the tree will hold the tree upright, provide flexibility, and minimize injury to the trunk (see diagram). Remove support staking and ties after the first year of growth.

8. Mulch the base of the tree. Mulch is simply organic matter applied to the area at the base of the tree. It acts as a blanket to hold moisture, it moderates soil temperature extremes, and it reduces competition from grass and weeds. A 2- to 3-inch layer is ideal. More than 3 inches may cause a problem with oxygen and moisture levels. When placing mulch, be sure that the actual trunk of the tree is not covered. Doing so may cause decay of the living bark at the base of the tree. A mulch-free area, 1 to 2 inches wide at the base of the tree, is sufficient to avoid moist bark conditions and prevent decay.

TREE MAINTENANCE AND PRUNING

Some trees do not generally require pruning. The occasional removal of dead twigs or wood is typical. Occasionally a tree has a defect or structural condition that would benefit from pruning. Any pruning activity should be performed under the guidance of a certified arborist or tree expert.

Because each cut has the potential to change the growth of the tree, no branch should be removed without a reason. Common reasons for pruning are to remove dead branches, to remove crowded or rubbing limbs, and to eliminate hazards. Trees may also be pruned to increase light and air penetration to the inside of the tree's crown or to the landscape below. In most cases, mature trees are pruned as a corrective or preventive measure.

Routine thinning does not necessarily improve the health of a tree. Trees produce a dense crown of leaves to manufacture the sugar used as energy for growth and development. Removal of foliage through pruning can reduce growth and stored energy reserves. Heavy pruning can be a significant health stress for the tree.

Yet if people and trees are to coexist in an urban or suburban environment, then we sometimes have to modify the trees. City environments do not mimic natural forest conditions. Safety is a major concern. Also, we want trees to complement other landscape plantings and lawns. Proper pruning, with an understanding of tree biology, can maintain good tree health and structure while enhancing the aesthetic and economic values of our landscapes.

Pruning Techniques – From the I.S.A. Guideline

Specific types of pruning may be necessary to maintain a mature tree in a healthy, safe, and attractive condition.

Cleaning is the removal of dead, dying, diseased, crowded, weakly attached, and low- vigor branches from the crown of a tree.

Thinning is the selective removal of branches to increase light penetration and air movement through the crown. Thinning opens the foliage of a tree, reduces weight on heavy limbs, and helps retain the tree's natural shape.

Raising removes the lower branches from a tree to provide clearance for buildings, vehicles, pedestrians, and vistas.

Reduction reduces the size of a tree, often for clearance for utility lines. Reducing the height or spread of a tree is best accomplished by pruning back the leaders and branch terminals to lateral branches that are large enough to assume the terminal roles (at least one-third the diameter of the cut stem). Compared to topping, reduction helps maintain the form and structural integrity of the tree.

TREE MAINTENANCE AND PRUNING, continued

How Much Should Be Pruned?

Mature trees should require little routine pruning. A widely accepted rule of thumb is never to remove more than one-quarter of a tree's leaf-bearing crown. In a mature tree, pruning even that much could have negative effects. Removing even a single, large- diameter limb can create a wound that the tree may not be able to close. The older and larger a tree becomes, the less energy it has in reserve to close wounds and defend against decay or insect attack. Pruning of mature trees is usually limited to removal of dead or potentially hazardous limbs.

Wound Dressings

Wound dressings were once thought to accelerate wound closure, protect against insects and diseases, and reduce decay. However, research has shown that dressings do not reduce decay or speed closure and rarely prevent insect or disease infestations. Most experts recommend that wound dressings not be used.

DISEASES AND INSECTS

Continual observation and monitoring of your tree can alert you to any abnormal changes. Some indicators are: excessive leaf drop, leaf discoloration, sap oozing from the trunk and bark with unusual cracks. Should you observe any changes, you should contact a Tree specialist or Certified Arborist to review the tree and provide specific recommendations. Trees are susceptible to hundreds of pests, many of which are typical and may not cause enough harm to warrant the use of chemicals. However, diseases and insects may be indication of further stress that should be identified by a professional.

GRADE CHANGES

The growing conditions and soil level of trees are subject to detrimental stress should they be changed during the course of construction. Raising the grade at the base of a tree trunk can have long-term negative consequences. This grade level should be maintained throughout the protected zone. This will also help in maintaining the drainage in which the tree has become accustomed.

INSPECTION

The property owner should establish an inspection calendar based on the recommendation provided by the tree specialist. This calendar of inspections can be determined based on several factors: the maturity of the tree, location of tree in proximity to high-use areas vs. low-use area, history of the tree, prior failures, external factors (such as construction activity) and the perceived value of the tree to the homeowner.

Assumptions and Limiting Conditions

No warranty is made, expressed or implied, that problems or deficiencies of the trees or the property will not occur in the future, from any cause. The Consultant shall not be responsible for damages or injuries caused by any tree defects, and assumes no responsibility for the correction of defects or tree related problems.

The owner of the trees may choose to accept or disregard the recommendations of the Consultant, or seek additional advice to determine if a tree meets the owner's risk abatement standards.

The Consulting Arborist has no past, present or future interest in the removal or retaining of any tree. Opinions contained herein are the independent and objective judgments of the consultant relating to circumstances and observations made on the subject site.

The recommendations contained in this report are the opinions of the Consulting Arborist at the time of inspection. These opinions are based on the knowledge, experience, and education of the Consultant. The field inspection was a visual, grade level tree assessment.

The Consulting Arborist shall not be required to give testimony, perform site monitoring, provide further documentation, be deposed, or to attend any meeting without subsequent contractual arrangements for this additional employment, including payment of additional fees for such services as described by the Consultant.

The Consultant assumes no responsibility for verification of ownership or locations of property lines, or for results of any actions or recommendations based on inaccurate information.

This Arborist report may not be reproduced without the express permission of the Consulting Arborist and the client to whom the report was issued. Any change or alteration to this report invalidates the entire report.

Should you have any further questions regarding this property, please contact me at (310) 663-2290.

Respectfully submitted,

Lisa Smith

Description

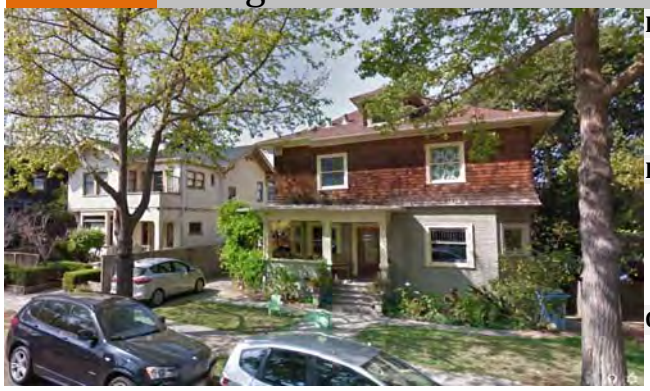
Village Mixed Use areas are the walkable and transit accessible mixed-use cores of traditional neighborhoods. Typical buildings are between 2 and 6 stories tall, with ground-floor retail space, and offices and/or residences on the floors above. Parking is typically structured, tucked under, or placed behind buildings so that it does not detract from the pedestrian environment.

Village Residential



Land Use Mix		Residential Mix	
Residential	74%	*SF Large Lot*	26%
Employment	0%	*SF Small Lot*	26%
Mixed Use	1%	*Townhome*	49%
Open Space/Civic	26%	*MultiFamily*	0%
Built Environment		**Employment Mix**

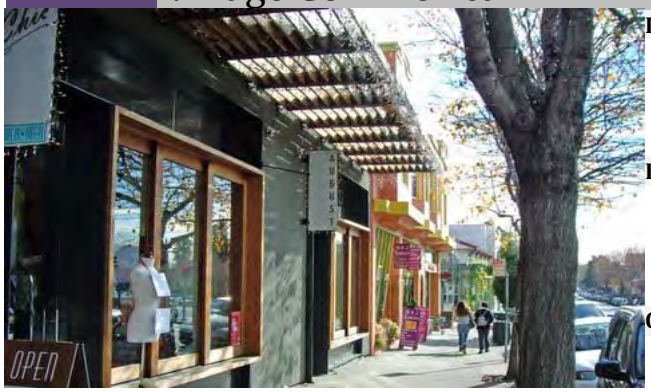
Total Net FAR	0.9		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	8-12	*Household*	10
Employee	0-5	*Employee*	2

Description

Containing a mix of single-family homes on small lots and townhomes, Village Residential is characterized by traditional neighborhoods, designed to be supportive of transit service, walking and bicycling. Typical buildings are 2-3 stories tall, with small yards and an active focus on the public realm.

Village Commerical



Land Use Mix		Residential Mix	
Residential	0%	*SF Large Lot*	0%
Employment	61%	*SF Small Lot*	0%

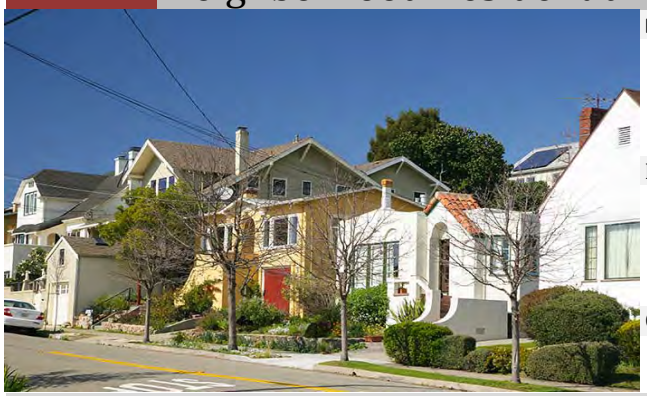
Total Net FAR	1.2		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	0-5	*Household*	2
Employee	1-60	*Employee*	40

Description

Equivalent to the center of a small town or district, or a lower-intensity employment-focused transit-oriented development, Village Commercial contains a mix of buildings set in a walkable context. Typical structures are between 2 and 5 stories tall, with some ground-floor retail, and offices, services, and some residential on upper floors.

UrbanFootprint Place Types

Neighborhood Residential



Land Use Mix		Residential Mix	
Residential	76%	*SF Large Lot*	0%
Employment	0%	*SF Small Lot*	95%
Mixed Use	2%	*Townhome*	0%
Open Space/Civic	23%	*MultiFamily*	5%
Built Environment		**Employment Mix**	
Intersections per mi²	180	*Office*	86%

Total Net FAR	1.1		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	0	*Household*	0
Employee	35-150+	*Employee*	65

Description

Representing the most intense auto-oriented single-use office areas, Office Focus is characterized by mid and high-rise office towers. Typical buildings are between 2 and 9 stories tall. Parking can be either structured or provided on surface lots. Workers tend to arrive by auto, though densities are high enough to support suburban transit service.

Mixed Office and R&D

Land Use Mix		Residential Mix	
Residential	0%	*SF Large Lot*	0%
Employment	89%	*SF Small Lot*	0%
Mixed Use	0%	*Townhome*	0%

Intersections per mi²	130	*Office*	20%
Average Floors	5	*Retail*	80%
Floors Range	5 – 40	*Industrial*	0%
Total Net FAR	2.5		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	0.5-200+	*Household*	24
Employee	3-250+	*Employee*	69

Description

High Intensity Activity Centers include a mix of moderate to intense densities of retail, office, and residential uses. They are often anchored by major regional retail centers or office parks, and while they can contain a robust mix of uses, they are most often oriented within an auto-oriented and non-walkable street and land use pattern. Parking can be structured and/or provided on surface lots.

Mid Intensity Activity Center

Land Use Mix		Residential Mix	
Residential	23%	*SF Large Lot*	0%
Employment	64%	*SF Small Lot*	0%
Mixed Use	5%	*Townhome*	51%

Intersections per mi²	60	*Office*	73%
Average Floors	4	*Retail*	16%
Floors Range	1 – 17	*Industrial*	11%
Total Net FAR	2		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	18-200+	*Household*	45
Employee	3-250+	*Employee*	42

Description

Industrial/Office/Residential Mixed High is characterized by a wide-ranging, intensely developed mix of uses located in close proximity and set in an automobile-oriented context. Building heights can range from 1 to 15+ stories, and uses can include but are not limited to industrial, warehouses, offices, residential, and retail.

UrbanFootprint Place Types

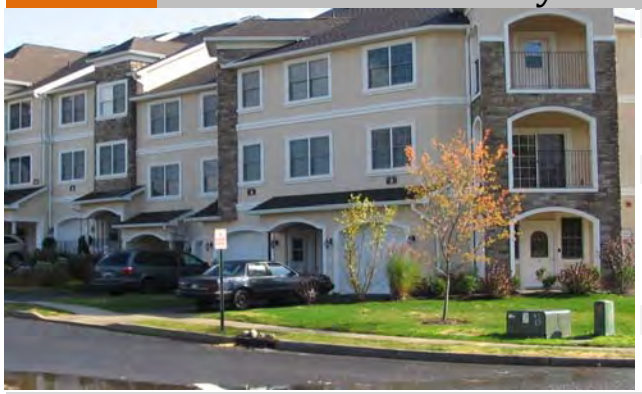
Industrial/Office/Residential Mixed Low

Land Use Mix		Residential Mix	
Residential	42%	*SF Large Lot*	8%
Employment	51%	*SF Small Lot*	8%
Mixed Use	0%	*Townhome*	43%
Open Space/Civic	7%	*MultiFamily*	40%
Built Environment		**Employment Mix**	
Intersections per mi²	60	*Office*	32%
Average Floors	2	*Retail*	0%
Floors Range	1 – 3	*Industrial*	68%
Total Net FAR	0.9		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	5-18	*Household*	10
Employee	1-35	*Employee*	18

Description

Industrial/Office/Residential Mixed Low is characterized by a wide-ranging, less-intensely developed mix of uses located in close proximity and set in an automobile-oriented context. Building heights can range from 1 to 3 stories, and uses can include but are not limited to industrial, warehouses, offices, residential, and retail.

Suburban Multifamily



Land Use Mix		Residential Mix	
Residential	87%	*SF Large Lot*	0%
Employment	0%	*SF Small Lot*	0%
Mixed Use	0%	*Townhome*	11%
Open Space/Civic	13%	*MultiFamily*	89%
Built Environment		**Employment Mix**	
Intersections per mi²	90	*Office*	85%
Average Floors	3	*Retail*	15%
Floors Range	2-5	*Industrial*	0%
Total Net FAR	1.2		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	18-150+	*Household*	32
Employee	0-6	*Employee*	2

Description

Predominantly containing apartments, condos, and town homes, Suburban Multifamily represents developments that may have internal walking paths but are set in an automobile-oriented context. While densities can be high enough to support bus transit, residents are likely to drive for most trips. Typical buildings are 2-5 stories tall, surrounded by surface parking lots.

Suburban Mixed Residential

Land Use Mix		Residential Mix

Intersections per mi²	15	*Office*	0%
Average Floors	2	*Retail*	0%
Floors Range	2 – 2	*Industrial*	100%
Total Net FAR	0.04		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	0.1-0.3	*Household*	0.2
Employee	0-0.02	*Employee*	0.01

Description

Homes in a Rural Residential area tend to be set on lots with average sizes of 1-2 acres. Within this rural context, residents are likely to drive for most trips. Typical houses are 1-2 stories tall.

UrbanFootprint Place Types

Rural Ranchettes

Land Use Mix		Residential Mix	
Residential	96%	*SF Large Lot*	100%
Employment	1%	*SF Small Lot*	0%
Mixed Use	0%	*Townhome*	0%
Open Space/Civic	3%	*MultiFamily*	0%
Built Environment		**Employment Mix**	
Intersections per mi²	10	*Office*	0%
Average Floors	2	*Retail*	0%
Floors Range	1 – 2	*Industrial*	100%
Total Net FAR	0.01		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	0-0.12	*Household*	0.1
Employee	0-0.02	*Employee*	0.01

Description

Rural Ranchettes are homes on very large lots. They could include active agricultural uses, and are typically located at the edges of urban areas. Within this rural context, residents are likely to drive for most trips. Typical houses are 1-2 stories tall.

Rural Employment

Land Use Mix		Residential Mix	
Residential	5%	*SF Large Lot*	100%
Employment	92%	*SF Small Lot*	0%
Mixed Use	0%	*Townhome*	0%
Open Space/Civic	3%	*MultiFamily*	0%
Built Environment		**Employment Mix**	
Intersections per mi²	10	*Office*	0%
Average Floors	1	*Retail*	0%
Floors Range	1 – 2	*Industrial*	100%
Total Net FAR	0.001		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	0-0.02	*Household*	0.01
Employee	0-0.05	*Employee*	0.01

Description

Rural Employment areas contain a variety of land uses, including working farms, ranches, agriculturally-supportive land uses, solar installations, oil fields, and gravel pits. While the rural context is automobile-oriented, and thus residents and employees are likely to drive for most trips, the low-intensity of land uses tends to keep traffic volumes low. Typical buildings are 1-2 stories tall.

Campus/University

Land Use Mix		Residential Mix	
Residential	32%	*SF Large Lot*	0%
Employment	2%	*SF Small Lot*	0%
Mixed Use	0%	*Townhome*	0%
Open Space/Civic	67%	*MultiFamily*	100%
Built Environment		**Employment Mix**	
Intersections per mi²	150	*Office*	64%
Average Floors	8	*Retail*	36%
Floors Range	3 – 17	*Industrial*	0%
Total Net FAR	1.7		
Gross Density Range *(per acre)*		**Average Density** *(per acre)*	
Household	1-50	*Household*	31
Employee	10-100	*Employee*	22

Description

College/University areas tend to be internally walkable, though they can be located in either a walkable or auto-oriented context. Buildings can range from 1 to 20+ stories, depending on the design of the campus. Parking may be plentiful or restricted; housing may be provided on-site in large amounts, or students may commute from homes in other locations.

Description

Parks & Open Space areas include larger trunk open spaces, community and regional parks, and other large undeveloped areas.

Terminology

Land Use Mix	
Residential	Percent of land dedicated to residential uses
Employment	Percent of land dedicated to commercial uses
Mixed Use	Percent of land dedicated to a mix of residential and commercial uses
Open Space/Civic	Percent of land dedicated to civic, park, and utility uses
Residential Mix	
SF Large Lot	Percent of households that are Single family, large lots (> 5500 square feet per lot)
SF Small Lot	Percent of households that are Single family, small lots (< 5500 square feet per lot)
Townhome	Percent of households that are Townhome/Single Family Attached
MultiFamily	Percent of households that are Multifamily types
Employment Mix	
Office	Percent of Employment that is Office
Retail	Percent of Employment that is Retail
Industrial	Percent of Employment that is Industrial
Built Environment	
Intersections per mi ^{2}	Intersections per square mile is an indicator of the connectivity of an area. Walkable areas are considered to have greater than 150 intersections per square mile.
Average Floors	The average building height measued in number of floors
Floors Range	The range of building heights measured in number of floors
Total Net FAR	The average net floor-to-area ratio
Gross Density Range	
Household	The range of household density per acre present in a given place type
Employee	The range pf employee densities per acre present in a given place type
Average Density	
Household	The average gross household density per acre
Employee	The average gross employee density per acre

ADOPTED | MARCH 2016

SCS BACKGROUND DOCUMENTATION

SCS REQUIREMENTS MATRIX

The passage of California Senate Bill 375 (SB 375) in 2008 requires that a Metropolitan Planning Organization such as SCAG prepare and adopt a Sustainable Communities Strategy (SCS) that sets forth a forecasted regional development pattern which, when integrated with the transportation network, measures, and policies, will reduce greenhouse gas emissions from automobiles and light duty trucks (Govt. Code §65080(b)(2)(B)). The SCS outlines certain land use growth strategies that provide for more integrated land use and transportation planning, and maximize transportation investments. The SCS is intended to provide a regional land use policy framework that local governments may consider and build upon. The following matrix outlines the statutory requirements of a SCS and where the requirements are addressed in both the 2012 RTP/SCS and the 2016 RTP/SCS.

TABLE 1 SCS Requirements Matrix

Required Element	Reference (2012)	Reference (2016)
California Government Code (CGC) Section 65080(b) (2)(B): Each metropolitan organization shall prepare a sustainable communities strategy, subject to the requirements of Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, including the requirement to utilize the most recent planning assumptions considering local General Plans and other factors.	2012–2035 RTP/SCS Chapter 4: Sustainable Communities Strategy	2016-2040 RTP/SCS Chapter 5: The Road to Greater Mobility and Sustainable Growth 2016-2040 RTP/SCS Appendix: SCS Background Documentation
CGC Section 65080(b) (2)(B)(i): Identify the general location of uses, residential densities, and building intensities within the region	2012–2035 RTP/SCS Chapter 4: Sustainable Communities Strategy 2012–2035 RTP/SCS Appendices: SCS Background Documentation; Growth Forecast	2016-2040 RTP/SCS Appendices: SCS Background Documentation; Demographics and Growth Forecast
CGC Section 65080(b) (2)(B)(ii): Identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth	2012–2035 RTP/SCS Chapter 4: Sustainable Communities Strategy 2012–2035 RTP/SCS Appendices: SCS Background Documentation; Growth Forecast	2016-2040 RTP/SCS Appendices: SCS Background Documentation; Demographics and Growth Forecast
CGC Section 65080(b) (2)(B)(iii): Identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to Section 65584	2012–2035 RTP/SCS Chapter 4: Sustainable Communities Strategy 2012–2035 RTP/SCS Appendix: SCS Background Documentation	2016-2040 RTP/SCS Appendices: SCS Background Documentation; Demographics and Growth Forecast
CGC Section 65080(b) (2)(B)(iv): Identify a transportation network to service the transportation needs of the region	2012–2035 RTP/SCS Chapter 4: Sustainable Communities Strategy; Chapter 2: Transportation Investments	2016-2040 RTP/SCS Chapter 5: The Road to Greater Mobility and Sustainable Growth

FORECASTED REGIONAL DEVELOPMENT TYPES BY LAND DEVELOPMENT CATEGORIES (LDCS)

Given the number of square miles the SCAG region encompasses, SCAG developed a simplified series of Land Development Categories (LDCs) to represent the dominant themes taken from the region's many General Plans. This was developed in order to facilitate regional modeling of land use information from nearly 200 distinct jurisdictions.

The LDCs employed in the RTP/SCS are not intended to represent detailed land use policies, but are used to describe the general conditions likely to occur within a specific area if recently emerging trends, such as transit-oriented development, were to continue in concert with the implementation of the 2016 RTP/SCS. These forecasted regional development types are shown in Exhibits 1 through 34 by county and subregion.

SCAG 2016 RTP/SCS SCENARIOS

OVERVIEW OF THE SCENARIOS

To develop a preferred scenario for the region in 2040, SCAG first generated four preliminary "sketch scenarios" for our region's future - each one representing a different vision for land use and transportation in 2040. More specifically, each scenario was designed to explore and convey the impact of where the region would grow, to what extent the growth would be focused within existing cities and towns, and how it would grow - the shape and style of the neighborhoods and transportation systems that would shape growth over the period. The following are descriptions of the four scenarios that were presented to the regional council, stakeholders, and at workshops throughout the region.

SCENARIO 1: TREND

Scenario 1 was a base case scenario that represented "business-as-usual" growth to 2040, based on the region's population, household and employment trends. By "base case" SCAG meant all existing regionally significant highway and transit projects, all ongoing Transportation Demand Management (TDM) and Transportation System Management (TSM) activities, and all projects which are undergoing right-of-way acquisitions, are currently under construction, have completed the federal environmental process (NEPA), or will be in the first two years of the previously conforming Federal Transportation Improvement Plan (FTIP). This scenario served as a yardstick to compare with the three other scenarios in this Plan. Growth and land use under the baseline scenario followed previous trends. Significant transportation investments or new policies regarding land use, housing or transportation were not introduced.

SCENARIO 2: 2012 RTP/SCS UPDATED WITH LOCAL INPUTS

Scenario 2 updated SCAG's established 2012 RTP/SCS with inputs from local jurisdictions, and included the adopted plan's suite of land use and transportation strategies, investments and policies. Scenario 2 envisioned future regional growth coordinated with the transportation system improvements of the approved 2012 RTP/SCS, as well as anticipated new transportation projects planned by the region's County Transportation Commissions (CTCs) and transit providers. This scenario reflected land use patterns as depicted by local general plan land use policies and refined by jurisdictions through SCAG's extensive bottom-up local review input process and outreach effort.

SCENARIO 3 (POLICY A): MAKING FURTHER PROGRESS

Scenario 3 (also known as Policy A) built upon Scenario 2 and incorporated additional best practices to increase transportation mode choice and reduce personal automobile dependency. This scenario included expanded regional investment in Transit Integration strategies to increase transit ridership. This scenario assumed that first/last mile improvements will be made at all fixed-guideway transit stations (i.e. commuter rail, subway, light rail and bus rapid transit (BRT) stations) across the region. Scenario 3 tested a new concept called Livable Corridors, comprised of arterial roadways where jurisdictions are planning for some combination of high-quality bus service, increased opportunities for active transportation, and higher density residential and employment at key intersections. Scenario 3 also tested the concept of "Neighborhood Mobility Areas." This concept is built on a set of policies and complete street investments to encourage replacing automobile trips less than three miles in length with walking, bicycling and slow-speed electric vehicles. Scenario 3 incorporated new technology and innovations such as bike share and car sharing, and assumed growth of these shared mobility services in urban areas predominantly through private sector actions. This scenario built upon SCAG policies from the 2012 Plan, and allowed for more future growth in walkable, mixed-use communities and in High Quality Transit Areas (HQTAs).

SCENARIO 4 (POLICY B): EXCEEDING EXPECTATIONS

Scenario 4 (or Policy B) built upon Scenario 3, and represented an ambitious and holistic slate of public policies and investments. This scenario was intended to determine what policies would be required to achieve maximum per-capita greenhouse gas reductions, in order to inform a comprehensive discussion during outreach and deliberation. Scenario 4 assumed improved bus transit services throughout identified HQTAs, as well as land use policies that encourage density along those routes. There was added emphasis on higher density residential and mixed-use infill along arterials with high-quality bus service, and more robust active transportation infrastructure or Livable Corridors, as described in Scenario 3. This scenario directed new growth away from undeveloped high-quality habitat areas to promote resource conservation, and it assumed no new residential growth in areas vulnerable to future sea level rise. Scenario 4 included a mix of housing options, with even more focus on infill development in towns and urban centers. Multifamily development in HQTAs was emphasized throughout the region.

URBANFOOTPRINT/SPM

UrbanFootprint is the software modeling platform behind the SCAG Scenario Planning Model (SPM). It has been used by SCAG and its RTP/SCS consultants (Calthorpe Analytics is the developer of UrbanFootprint) to build and analyze the 2016 RTP/SCS scenarios and the Draft Preferred RTP/SCS plan.

UTILIZING URBANFOOTPRINT

UrbanFootprint starts with a detailed base data 'canvas' of existing buildings, land uses, and other details of the built environment. A suite of Place Types and Building Types are used to create scenarios of future development at a city, county or regional scale. Scenarios are then analyzed using UrbanFootprint's suite of analysis modules, which estimate building energy and water use, vehicle travel, public health consequences, and fiscal impacts.

Description of LDCs can be found on page 43.

Note: The forecasted land use development patterns by LDCs shown are based on Transportation Analysis Zone (TAZ) level data utilized to conduct required modeling analyses. Data at the TAZ level or at a geography smaller than the jurisdictional level are advisory only and non-binding, because SCAG sub-jurisdictional forecasts are not to be adopted as part of the 2016 RTP/SCS. For purposes of qualifying for future funding opportunities and/ or other incentive programs, sub-jurisdictional data and/or maps used to determine consistency with the Sustainable Communities Strategy shall only be used at the discretion and with the approval of the local jurisdiction. However, this does not otherwise limit the use of the sub-jurisdictional data and/or maps by SCAG, CTCs, Councils of Governments, SCAG Subregions, Caltrans and other public agencies for transportation modeling and planning purposes. Any other use of the sub-jurisdictional data and/or maps not specified herein, shall require agreement from the Regional Council, respective policy committees and local jurisdictions.

ROLE OF URBANFOOTPRINT SCENARIOS FOR THE 2016 RTP/SCS

Scenarios enable broad analysis of the implications of potential future conditions. Forecasts and many other models attempt to predict or identify the most likely future conditions. By contrast, normative or sketch-level scenarios let users assert future conditions to test "what if" scenarios. Instead of saying, "this is the future that will most likely happen," UrbanFootprint is designed to help users say "if we develop in this way, here are the impacts to travel behavior, energy use, public health outcomes, and other important metrics."

To this end, the scenarios developed for the 2016 RTP/SCS process are designed to inform conversations about the impacts of varying land use, policy, and investment decisions. They should be used to compare the implications of scenarios for important impacts on water and energy use, public health, fiscal impacts, regional vehicle miles traveled (VMT), travel and building-related greenhouse gas emissions, and household costs for transportation and utilities. This comparative information complements the outputs from the SCAG regional travel, air quality, and economic models (i.e. ABM, REMI) and can help the public and decision makers understand the relative impacts of varying land use and transportation investment strategies. UrbanFootprint models are calibrated and verified using these critical conformity models, but are not meant to replace them – rather, UrbanFootprint allows for rapid comparisons of scenario impacts for a range of critical indicators. How much more or less energy, water, or VMT will result if the region moves in one direction or another? Scenario modeling with UrbanFootprint brings meaningful, comprehensible, and timely results to those wanting to understand how growth and development choices will impact the region in the coming years and decades.

PEER REVIEW OF URBANFOOTPRINT

The UrbanFootprint model has gone through an extended peer review process at the state and regional levels. In October 2012, the "UrbanFootprint State and Regional Agency Review" group agreed that UrbanFootprint was a step forward from the existing scenario planning toolkits. The group agreed it was also a step forward for use by state, regional, and local governments. The model met and surpassed the requirement of being at least consistent with the current state of practice in scenario planning and could reasonably be expected to advance the state of the practice.

Since 2012, the various components of the UrbanFootprint model have been presented and discussed at length with agencies and stakeholders across the state. Among those agencies at the state level are the Air Resources Board (ARB), Office of Planning and Research (OPR), Strategic Growth Council (SGC), California Technology Agency (CTA), California Energy Commission, Department of Water Resources, Lawrence Berkeley National Labs and Caltrans. Developers of UrbanFootprint have also met with regional agencies, such as SCAG, Sacramento Area Council of Governments (SACOG), and San Diego Association of Governments (SANDAG). Among the stakeholders that have actively participated in the review process are the: American Lung Association, ClimatePlan, Transform, faculty from UC Berkeley and UC Davis, Resources Legacy Fund, Policy in Motion and the Nature Conservancy and the SCAG Scenario Planning Model (SPM) Working Group.

SCENARIO DEVELOPMENT RULES

This section summarizes the processes utilized in the development and analysis of SCAG's 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) "scenarios". It provides an overview of the primary components of each of the four scenarios as well as the primary "rules" and methods used to develop them.

The SCAG regional scenario development process is designed to explore alternative land use distributions and transportation networks as a critical step in the process of drafting the 2016 RTP/SCS. Four scenarios were developed and analyzed. For the 'Trend' and '2012 RTP Updated' scenarios, SCAG provided its consultant, Calthorpe Analytics, with key scenario data and controlling mechanisms. Two additional scenarios, the Policy A and B scenarios were built and analyzed by Calthorpe Analytics to explore land use and transportation system variations. Using the UrbanFootprint Scenario Planning Model (SPM), all scenarios were normalized to a standardized data framework and analyzed using the model's peer reviewed analytical modules. More information on the Urban Footprint model can be found in the Reference Documents section at the end of this Appendix.

Each land use-transportation scenario explores a different policy framework for the 2040 horizon year. All four scenarios assumed the same growth in population, housing and employment at the county and regional scales. All four scenarios utilized the latest growth projections for population, household and employment. All four scenarios were built with 2012 as the base year, and all were developed at the same geographic scale, the Scenario Planning Zone (SPZ). A high level summary of the characteristics of each of the scenarios is provided in **TABLE 2**.

Each scenario was assessed for land consumption, passenger vehicle travel, greenhouse gas emissions, energy and water use, household costs, public health impacts and local infrastructure costs using SPM analytical models. More information on the Building Energy, Transportation Impacts, Transportation Model and Water Analysis can be found in the Reference Documents section at the end of this Appendix. These metrics highlight the impacts of varying residential and commercial growth patterns around High-Quality Transit Areas (HQTAs)[1] and Transit Priority Area (TPAs)[2] . These metrics are also sensitive to the nature of the development patterns in terms of walkability and mix of use. The scenarios were built to reflect the impact of UrbanFootprint's Land Development Categories (LDCs)[4] that relate the impact of investment in active transportation measures and land pattern relationships to changes in the regional transportation network.

TABLE 2 2016 RTP/SCS Scenarios Summary

	Scenario 1 - Trend	Scenario 2 - 2012 RTP Updated	Scenario 3 - Policy A	Scenario 4 - Policy B
Growth Projections	**Projections 2012–2040**: 21% Population Growth 2012 Base Year: 18.3 million population, 5.9 million households, 7.4 million jobs 26% Housing Growth 2012 – 2040 Change: 3.8 million population, 1.5 million households, 2.4 million jobs 33% Job Growth 2040 End State: 22.1 million population, 7.4 million households, 9.8 million jobs			
Scenario Theme	Past trends extrapolated forward	How does the 2012 RTP plan work with local land use planning 4 years later?	More focused land use based on shifting demographics and preference.	Pushing the envelope with more aggressive transit investments, land use coordination, and technology change.
Transportation Network	2012 RTP Network	Updated 2012 RTP Network	Updated 2012 RTP Network	Updated 2012 RTP Network Strategic plan Projects
Housing Mix	Growth Increment:	Growth Increment:	Growth Increment:	Growth Increment:
	64% single family	48% single family	34% single family	28% single family
	36% multifamily	52% multifamily	66% multifamily	72% multifamily
Land Use & Transit Policy Themes	Past trend	HQTA/TPA focus per existing plans	Additional HQTA focus	Additional HQTA and TPA focus
			Active transportation investments	Active transportation investments
			Improved walkability	Improved walkability
			'First/Last' Mile focus	First/Last' Mile focus
Land Use & Transit Coordination	High Quality Transit Areas	High Quality Transit Areas	High Quality Transit Areas	High Quality Transit Areas
	36% Homes	39% Homes	46% Homes	53% Homes
	44% Employees	48% Employees	55% Employees	66% Employees
	Transit Priority Areas	Transit Priority Areas	Transit Priority Areas	Transit Priority Areas
	16% Homes	19% Homes	23% Homes	27% Homes
	23% Employees	27% Employees	31% Employees	36% Employees
Land Use Pattern Focus	2012-2040 New growth:	2012-2040 New growth:	2012-2040 New growth:	2012-2040 New growth:
	3% Urban Infill	13% Urban Infill	13% Urban Infill	13% Urban Infill
	11% Compact Walkable	32% Compact Walkable	49% Compact Walkable	59% Compact Walkable
	86% Standard Suburban	55% Standard Suburban	38% Standard Suburban	28% Standard Suburban
Climate Resilience	No Policy	No Policy	No Policy	Avoided growth in:
				Critical habitat areas
				2100 5 foot sea level rise zones

Source: SCAG

Each of the scenarios analyzed by Calthorpe Analytics incorporates a specific set of parameters and scenario "rules." One of the key differences between each scenario is the relative proportion of housing and employment in TPAs and HQTAs. TABLE 3 and TABLE 4 detail the proportion of households and employment within TPAs and HQTAs for each scenario and for each county at the 2040 out year.

The following section describes the Land Development Categories (LDCs) and Place Types used to build the scenarios. The sections after detail the process used to translate the 'Trend' and '2012 RTP Plan Updated' scenarios provided by SCAG into the SPM data framework, and the steps used by Calthorpe Analytics to build the Policy A and Policy B scenarios.

LAND DEVELOPMENT CATEGORIES (LDCS) AND PLACE TYPES

The SPM employs a series of LDCs and Place Types to describe the different types of land uses in the region. These LDCs and Place Types are comprised of a mix of different types of buildings along with assumptions about characteristics such as the amount of land devoted to streets, parks and civic areas. There are two levels of detail. The first level, LDCs, is a simplified classification intended for conveying land use alternative and maps to the broader public. At a more detailed level, the Place Types are intended for modeling purposes at the SPZ level.

LAND DEVELOPMENT CATEGORIES (LDCS)

As previously mentioned, the future forecasted development types of the region also employs a series of Land Development Categories (LDCs), which serve as a simplified classification used to describe the general conditions likely to occur within a specific area. These LDCs are aggregations of the 35 Place Types used for modeling purposes. A table of how the 35 Place Types were categorized into the three LDCs can be found in the Reference Documents section of the SCS Background Documentation Appendix. Following is a list of the three LDCs employed in the 2016-2040 RTP/SCS Plan Scenarios.

- **Urban**

Often found within and directly adjacent to moderate and high density urban centers. Virtually all 'Urban' growth would be considered infill or redevelopment. The majority of housing units are multifamily and attached single family (townhome), which tend to consume less water and energy than the larger types found in greater proportion in less urban locations. These areas are supported by high levels of regional and local transit service. Well-connected street networks and the mix and intensity of uses result in a highly walkable environment. Enhanced access and connectivity for people who choose not to drive or do not have access to a vehicle.

- **Compact Walkable**

Less intense than Urban LDC, but highly walkable with rich mix of retail, commercial, residential and civic uses. Most likely to occur as new growth on the urban edge, or large-

scale redevelopment. Rich mix of housing, from multifamily and attached single family (townhome) to small- and medium-lot single family homes. Well served by regional and local transit service, but may not benefit from as much service as Urban growth, and is less likely to occur around major multimodal hubs. Streets are well connected and walkable, and destinations such as schools, shopping and entertainment areas can typically be reached via a walk, bike, transit or short auto trip.

- **Standard Suburban**

Reflects the separate-use auto-oriented development of the American suburban landscape over the past five decades. Densities tend to be lower than in Compact Walkable LDC, and land uses are generally not highly mixed - medium- and larger-lot single family homes comprise the majority of this development form. Standard areas are not typically well served by regional transit service and most trips are made via automobile.

Place Types

The Place Types were virtually "painted" onto the map of the region using the SPM. Each Place Type carries with it values that describe the characteristics of the place it represents. It was important to establish a set of Place Types that represent the full range of development patterns and forms that make up the region today and into the future. In addition, these Place Types must be easy to communicate to the public and key policy decision makers. The Place Types contain a large amount of information relating to the characteristics of the landscape, including jobs and housing density, urban design and mix of land uses, and lend themselves to clear communication through photo-simulations and other types of renderings.

Through use of the SPM, Place Types are the foundation of the forecasted regional development types scenarios. The SPM uses the typologies to calculate results for a range of evaluation criteria, in advance of the four-step travel demand model including housing and job mix, densities and VMT. The scenarios are built upon, and provide data at the SPZ level including households and employment. This represents the data that is fed into the regional transportation model to determine how the potential land use pattern impacts travel behavior.

Within the SPM, Place Types were assigned a mix of building types, each having an associated job and housing density. Examples of building types include mixed-use residential four stories, garden apartment, compact single-family home, office, main street retail, business flex and many others. Because Place Types make it possible to measure evaluation criteria that rely on information tied directly to individual buildings and uses, many of the assumptions are built into the individual building spreadsheets (called prototype buildings) that were then grouped together to form Place Types. More information on the Place Types, such as summaries and descriptions, can be found in the Reference Documents section at the end of this Appendix.

SCENARIO 1 (TREND) AND SCENARIO 2 (2012 RTP-UPDATED) SCENARIO TRANSLATION

SCENARIO 1 (TREND SCENARIO) AND SCENARIO 2 (2012 RTP UPDATED SCENARIO) TRANSLATION METHODOLOGY

SCAG provided Calthorpe Analytics with land use and forecast allocation data for the Scenario 1 (Trend) and Scenario 2 (2012 RTP Updated) scenarios as csv formatted tables at the SPZ and Tier 2 TAZ scales.
This data was processed to conform to the UrbanFootprint/SPM data schema and normalized to the SPZ scale using the following steps:

- **Step 1: Place type translation**

  Every SPZ that contained households or employment was assigned a qualitative land use designation known as a place type. There are 35 Place Types in the UrbanFootprint/SPM library (see Reference Documents section). Place types are assigned by one of two methods, utilizing either a density-based or a rule-based approach. Density classification utilizes dwelling unit density, employment density, street intersection density, and the proportion of retail employment to classify a given SPZ to a place type designation. Rule-based place type assignment is used for locations which cannot be classified by density, such as parks, civic institutions, and military bases. Rule-based assignment uses parcel data and other spatial datasets to assign place types based on spatial location.

- **Step 2: Deriving dwelling units from households**

  The standardized UrbanFootprint/SPM schema requires that both unoccupied and

TABLE 5 SCAG to UrbanFootprint Residential Types

UrbanFootprint Type	SCAG Type
Single Family Large Lot	Single Family
Single Family Small Lot	Single Family
Attached Single Family	Multifamily
Multifamily	Multifamily

Source: SCAG

occupied dwelling units are tracked through the system. For SPZs experiencing no change, the base year (2012) occupancy rate was applied to estimate the number of dwelling units. For SPZs with growth in households or employment into the future, a combination of the base year occupancy rate and the occupancy rate derived from the UrbanFootprint translated place type were used to estimate dwelling units from SCAG-provided occupied-household data. Dwelling units were calculated for each county independently so that county controls of dwelling units were equivalent across scenarios.

- **Step 3: Establishing residential units by type**

  SCAG provided the number of single family and multifamily households at the SPZ scale. These were disaggregated into the four UrbanFootprint/SPM residential classifications according to the crosswalk in **TABLE 6.** For SPZs that had no residential growth from the base to the future, the base year distribution was used to disaggregate the four types. For SPZs with future growth, a combination of the base year distribution and place type distribution was used to disaggregate the residential types. This process utilized the following rules:

  If growth in total households was less than five households between 2012 and 2040 in a given SPZ, the base year UrbanFootprint/SPM residential distribution was utilized.

  If growth in total units was greater than five households between 2012 and 2040 in a given SPZ, the classified place type household distribution was utilized.

  For all households in SPZs classified as Institutional, Parks or Military place types, the base year 2012 distribution of households was utilized.

  For all remaining undistributed units (<5 percent of new units), these were allocated to UrbanFootprint residential types using ACS 2013 five year block group housing distributions at the Census Block Group scale.

  Once all units were allocated to the four types, these were controlled to county level control totals by household type while maintaining total household totals at the Tier 2 TAZ scale.

- **Step 4: Disaggregating SCAG employment to the UrbanFootprint/SPM NAICS schema**

  SCAG provided a detailed employment breakdown at the SPZ scale for both the 2012 RTP Updated and Trend scenarios. This data was cross-walked into the UrbanFootprint/SPM schema using the relationship contained in **TABLE 6** and the following process steps:

  Employment categories that cross-walked directly to UrbanFootprint categories were assigned directly.

Source: Calthorpe Analytics, 2015

For categories that needed to be disaggregated (such as the SCAG 'art_ entertainment' category), if growth in new employment was less than 20 employees between 2012 and 2040, base year employment distributions were applied to disaggregate these employment categories.

For categories that needed to be disaggregated, if growth in new employment was greater than 20 employees between 2012 and 2040, the classified place type-based employment distribution was utilized.

For categories that needed to be disaggregated, all remaining unclassified SPZs had Longitudinal Employer-Household Dynamics (LEHD) 2010 rates applied from the Census Block Group scale.

- **Step 5: Estimating building square feet**

  Having populated the UrbanFootprint schema for residential units by type and employment by type, building square footage at the SPZ scale was estimated. For each SPZ, building square footage was estimated using assumptions for square footage by residential type, square footage per employee by employment type, and street intersection density (to distinguish urban versus suburban street connectivity and associated building categories). The building square footage factors are contained in **TABLE 7**.

- **Step 6: Estimating parcel acreage**

  The UrbanFootprint/SPM schema tracks residential, commercial, mixed use, and no-use parcel acreage fields through the system. Parcel acreage was estimated for each SPZ using a combination of base 2012 parcel-derived acreages as well as acreage distributions sourced from translated place type attributes. The following rules were utilized to assign parcel acreage at the SPZ scale.

  For SPZs which had less than five new households or 20 new employees between 2012 and 2040, parcel acreage by type was taken from the 2012 base dataset as long as those SPZs continued to have households or employment that corresponded with the acreage type from the base year. In other words, if the 2040 dataset continued to have households, residential parcel acreage was taken from the 2012 dataset.

  For SPZs which had greater than five new households and 20 new employees between 2012 and 2040, the acreage by type distribution was taken from the place type acreage distribution.

- **Step 7: Estimating outdoor irrigated area**

  Irrigated area was estimated using place type derived per household and per employee by type densities at the SPZ-scale. Sourced from the place type attribute table, residential irrigated area densities were multiplied by the number of households at the SPZ scale to estimate the residential portion of SPZ area that was irrigated. Commercial irrigated area was calculated with a similar method, utilizing the place type look-up of irrigated area per employee multiplied by the number of employees at the SPZ-scale.

SCENARIO 1 (TREND) RESULTS

The Trend scenario is a representation of the land use patterns and transportation policies of the past decades projected out to 2040. A significant proportion of housing growth in this scenario is made up of single family large lot units (> 5,500 sqft / parcel). A high percentage of growth takes place in suburban areas in and around the urban edges of the region. A visual representation of new growth in the Trend Scenario is provided in **EXHIBIT 35**: Trend Scenario Growth with TPA/HQTA transit network. **FIGURE 1** and **FIGURE 2** provide the residential unit type distribution of growth to 2040, and the breakdown of growth by land development category (LDC).

Scenario 2 (2012 RTP Updated) Results
The 2012 RTP Updated scenario represents SCAG's regional 'stitch' of the jurisdictional general plans, paired with the transportation network from the 2012 RTP. The growth in residential units in this scenario is more evenly split between single family and multifamily types, and nearly 40 percent of residential units in 2040 are within a TPA or HQTA. A visual representation of new growth in the 2012 RTP/SCS Updated scenario is provided in **EXHIBIT 36**: RTP 2012 Updated Scenario Growth with TPA/HQTA transit network. **FIGURE 3** and **FIGURE 4** provide the residential unit type distribution of growth to 2040 and the breakdown of growth by land development category (LDC).

SCENARIO 3 (POLICY A) AND SCENARIO 4 (POLICY B) SCENARIO CREATION

The Scenario 3 (Policy A) and Scenario 4 (Policy B) scenarios were created by Calthorpe Analytics based on the five guiding principles identified in Chapter 4 of the Plan. Following these guiding principles, 'rules' were developed in collaboration with SCAG staff. Both scenarios were constructed as 'pivots' from the '2012 RTP Updated' dataset to match their established rules frameworks. The resulting land use scenarios distribute housing and employment in response to changes in transportation networks, varying demand for residential types by county, and the incorporation of policy assumptions related to active transportation investments, walkability and climate adaptation and resilience.

The process by which scenarios are created in the UrbanFootprint/SPM follows the general flow illustrated in **FIGURE 5**. Utilizing a detailed and standardized canvas of built form, residential and commercial use and street connectivity, change is applied via the allocation of place types which are distributed using rule-based spatial queries. Once applied, place types are used to calculate new residential and commercial growth and changes in street connectivity using their density, use and other characteristics.

Source: Calthorpe Analytics, 2015

SCENARIO 3 (POLICY A) SCENARIO RULES AND ALLOCATION METHODOLOGY

Scenario 3 (Policy A) closely resembles the development types distribution of the 2012 SCS, but has an increased focus on active transportation investments within one mile of major transit stops, and improved walkability proximate to transit corridors (as designated by TPAs and HQTAs). It has a notable increase in the growth of multifamily and attached single family (townhome) units across the region as compared to the 2012 RTP Updated scenario and a larger focus on compact walkable and urban land use types.

Scenario 3 (Policy A) Scenario Rules

The rules that governed the allocation and type of growth in Scenario 3 (Policy A) are described below.

- **Focus on HQTAs and TPAs:** The Scenario 3 (Policy A) scenario sees a modest increase in the proportion of growth allocated to HQTAs and TPAs, with 46 percent of households and 55 percent of jobs within an HQTA or TPA by 2040. This represents a 7 percent increase in the number of households and a 7 percent increase in jobs in an HQTA when compared to the 2012 Updated scenario.
- **Residential Distribution:** The distribution of households by type closely resembles the SCAG 2012 SCS distribution, with 66 percent of new growth in multifamily households and 34 percent as single family households. This is a significant increase in the relative proportion of multifamily households to single family households as compared with 2012 RTP Updated scenario which was more evenly split in household growth between single family and multifamily types.
- **Transit Network:** The Scenario 3 (Policy A) scenario uses the same updated 2012 RTP transit network and operational characteristics as used in the 2012 RTP Updated scenario.
- **Walkability, First and Last Mile-Focus, and Active Transportation Investment:** The Scenario 3 (Policy A) scenario sees significant active transportation investments above and beyond the 2012 RTP/SCS, and improvement in walkability within and around one mile of major transit stations. To represent this increase in investments and walkability, "walkable" Urban and Compact place types are focused in and around HQTAs and TPAs throughout the region; walkable place types are those that have a street intersection density greater than 150 intersections per square mile, which is generally correlated with an increase in walk, bike, transit and non-auto mode share.
- **County/Jurisdiction Control Totals.** For each county, the high level totals for population, households and employment were controlled at the jurisdictional level to ensure comparability across the scenarios. For residential units by type, each county was controlled to specific totals in order to ensure that changes in unit type were comparable both regionally and sub-regionally across the scenarios.

Scenario 3 (Policy A) Allocation Methodology

Scenario 3 (Policy A) was developed using the translated 2012 RTP Updated scenario as a starting point. Modifications were made using Python and PostgreSQL programming languages to implement the UrbanFootprint/SPM modeling framework. The following steps highlight the process that was executed by the scripted templates to quantitatively build out the Policy A rules framework.

- **Step 1: Allocate new residential growth in HQTA/TPAs.**

  The first pass was to roughly allocate new residential growth in the HQTA/TPA areas to match the portion of households within HQTAs by county. Using the county-level percent of households within HQTAs, factors were derived to increase household HQTA totals to match the county distribution. Of the new units added to HQTA areas through this process, only multifamily and attached single family types experienced growth (66 percent were multifamily and 34 percent attached single family); detached single family unit totals stayed constant within these areas.

- **Step 2: Control residential units to county controls.**

  Following the initial allocation of new residential units to HQTAs, households by type (single family, attached single family, and multifamily) were adjusted by factors so that sum of each household type matched the county control total. Any SPZ that showed losses in households when comparing 2040 to the 2012 base year were set to the 2012 base year household distribution.

- **Step 3: Allocate new employee growth in HQTA/TPAs.**

  This pass allocated the correct proportion of employees to HQTA/TPA areas to match county-level distribution of employees within HQTA/TPA zones. New employee growth in HQTAs took the form of Retail and Office employees; industrial employment did not occur within the HQTA/TPA zones.

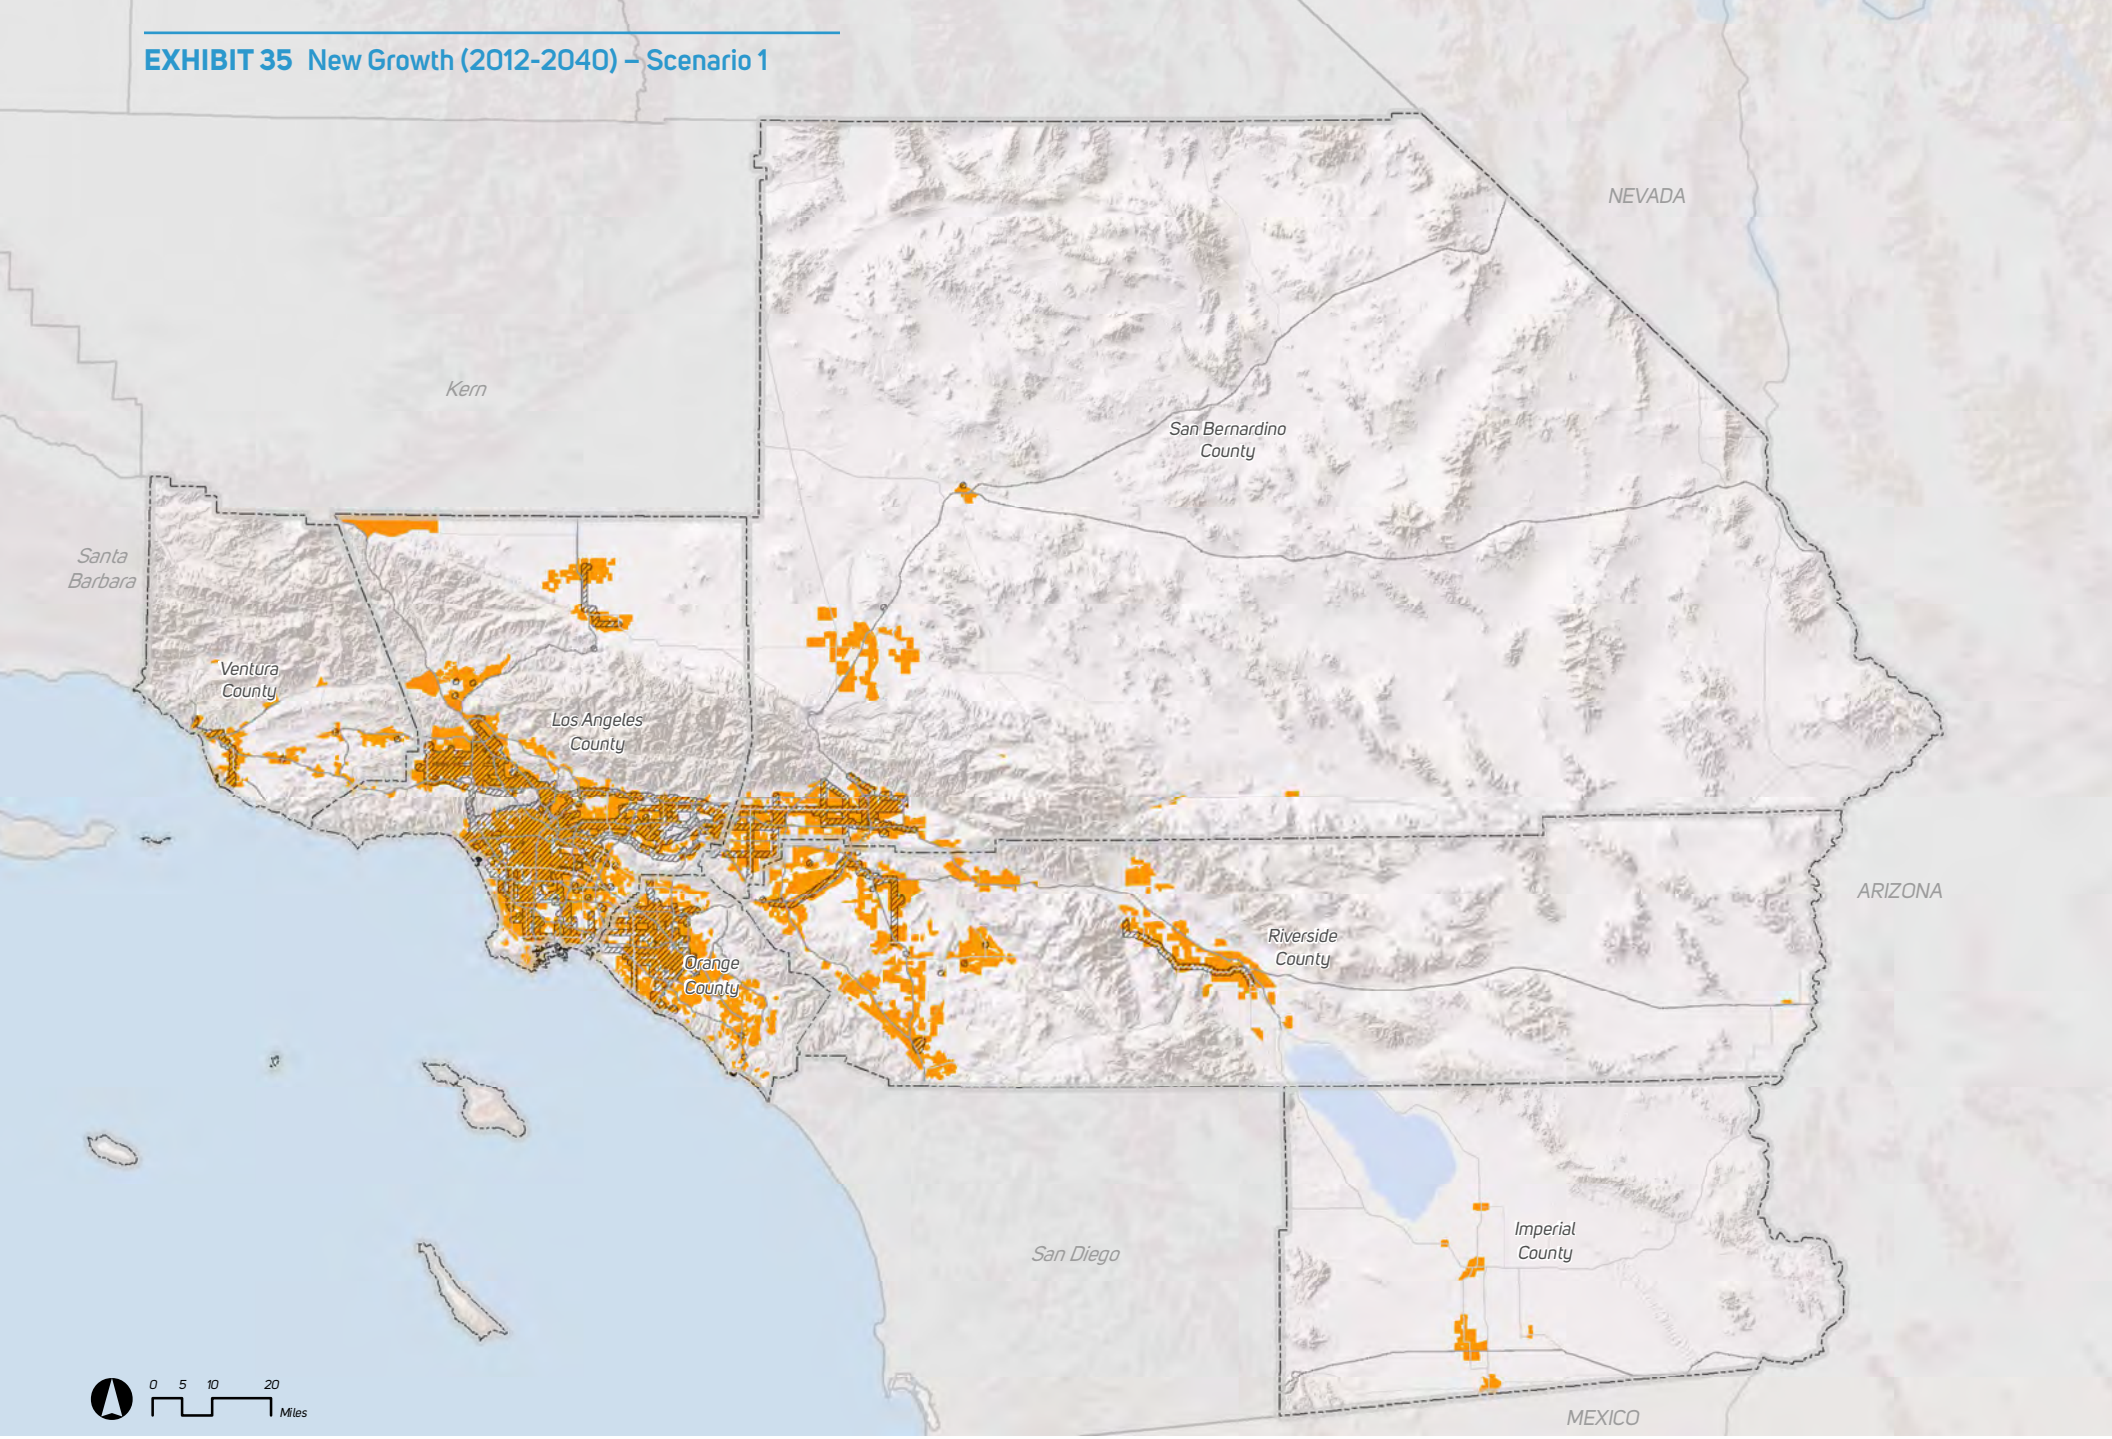
- **Step 4: Control employees to county controls.**

  Following the initial allocation of new employees to HQTA/TPAs, factors were derived to adjust the total number of employees to match county totals. Any SPZ that showed losses in the 2012 base year were set to the 2012 base year employment distribution.

- **Step 5: Assign 'Compact Walkable' and 'Urban' place types.**

  Having allocated the high-level distributions of households and employment, 'compact walkable' and 'urban' place types were assigned to increase density and walkability, as well as proxy first/last mile investment assumptions in and around HQTAs, TPAs and within one mile of major transit stops (as defined by SCAG).

EXHIBIT 35 New Growth (2012-2040) – Scenario 1



HQTA (2040)

New Growth (2012-2040) – Scenario 1

New growth represents household and commercial growth

Note: The forecasted land use development patterns by LDCs shown are based on Transportation Analysis Zone (TAZ) level data utilized to conduct required modeling analyses. Data at the TAZ level or at a geography smaller than the jurisdictional level are advisory only and non-binding, because SCAG sub-jurisdictional forecasts are not to be adopted as part of the 2016 RTP/SCS. For purposes of qualifying for future funding opportunities and/ or other incentive programs, sub-jurisdictional data and/or maps used to determine consistency with the Sustainable Communities Strategy shall only be used at the discretion and with the approval of the local jurisdiction. However, this does not otherwise limit the use of the sub-jurisdictional data and/or maps by SCAG, CTCs, Councils of Governments, SCAG Subregions, Caltrans and other public agencies for transportation modeling and planning purposes. Any other use of the sub-jurisdictional data and/or maps not specified herein, shall require agreement from the Regional Council, respective policy committees and local jurisdictions.

Source: SCAG, 2015

- **Step 6: Control population, households, and employment to jurisdictional controls.**

  Using jurisdictional control totals of population, households and employment sourced from the 2012 RTP Updated scenario, factors were derived so that Scenario 3 (Policy A) population, households and employment matched jurisdictional control totals.

- **Step 7: Iterate jurisdictional controls and county households by type until balanced.**

  The application of factors to match jurisdictional totals in the previous step altered the county distribution of households by type. In this step, the model iterated over the scenario to balance the growth in households by type with the requirement that jurisdictions maintain household totals. Using iteration, factors were derived for each pass to match county level control totals for households by type, weighted so that when households by type were summed they matched jurisdictional and county totals for households. Once balanced, the county totals for households by type match those of the scenario and the household control total at the jurisdictional level also match those of the scenario.

- **Step 8: Re-translate place types to adjust classification for controlling process.**

  The controlling process slightly adjusted the SPZ-level totals of households and employment, which in turn can have an impact on the corresponding place type assignment. This next process re-translated the assigned place type at the SPZ scale so that there was no quantitative deviation from the qualitative classification of place.

- **Step 9: Calculate derivative fields.**

  Having produced a "clean" household and employment distribution, this final process followed the steps detailed in the scenario translation section for populating building square feet, acres by type, and irrigated area.

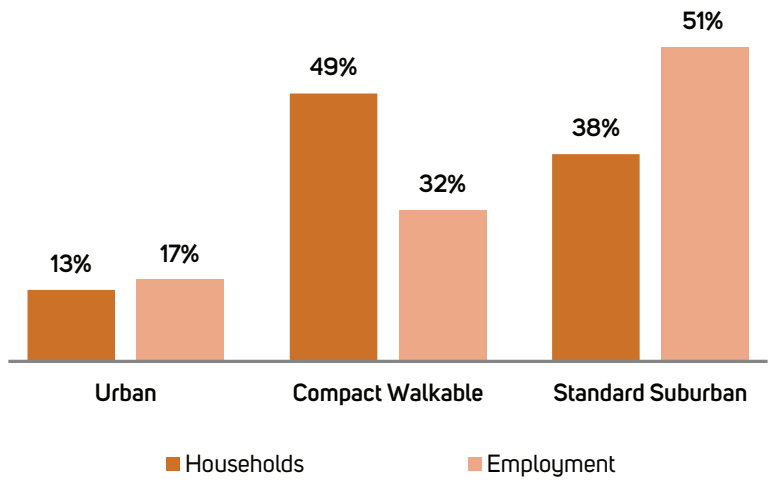
Scenario 3 (Policy A) Scenario Results

Scenario 3 (Policy A) sees a significant portion of residential and commercial growth in High Quality Transit Areas (HQTAs) and Transit Priority Areas (TPAs). A visual representation of new household and commercial growth can be seen in **EXHIBIT 37**: Policy A Scenario Growth with TPA/HQTA transit network below, while **FIGURE 6** and **FIGURE 7** provide the the residential unit type distribution of growth to 2040 and breakdown of growth by land development category (LDC).

SCENARIO 4 (POLICY B) RULES AND ALLOCATION METHODOLOGY

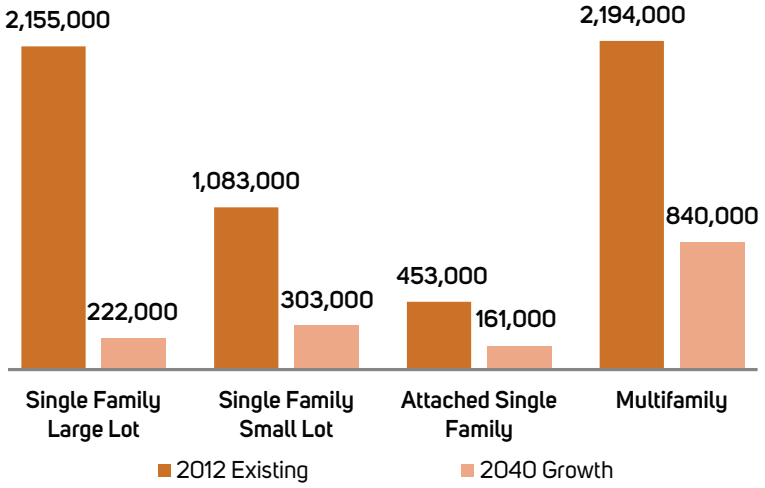
Scenario 4 (Policy B) used the Policy A scenario as a foundation, but expanded the transportation network with a greater focus on transit oriented development, incorporated climate resilience strategies, enhanced focus on active transportation investments within

FIGURE 6 Policy A, Proportion of New Growth by Land Development Category (LDC), 2012 - 2040



Source: SCAG

FIGURE 7 Policy A, Residential Growth by Unit Type, 2012 - 2040



Source: SCAG

one mile of major transit stops and improved walkability proximate to transit corridors (as designated by TPAs and HQTAs). The majority of new growth takes the form of 'Compact Walkable' and 'Urban' types, with only 28 percent of new residential growth taking the 'Standard Suburban' form.

SCENARIO 4 (POLICY B) RULES

The rules that governed the allocation and type of growth in Scenario 4 (Policy B) are described below.

- **Increased focus on TPAs.** Scenario 4 (Policy B) increases the number of households and jobs within TPAs beyond the levels in Policy A. This was accomplished by both increasing the number of major transit station areas and their associated TPAs and allocating additional growth in households and employment within the majority of TPAs across the region. By 2040, the Policy B scenario has 27 percent of households and 36 percent of jobs within TPAs.
- **Focus on HQTAs:** As with TPAs, scenario 4 (Policy B) sees a significant increase in the proportion of growth allocated to HQTAs, with 53 percent of households and 66 percent of jobs within an HQTA by 2040. With additional transit alignments, there are more HQTAs in the Policy B scenario and a larger portion of growth is allocated to HQTAs across the region.
- **Residential Distribution:** The distribution of household growth sees only a modest increase in the relative proportion of multifamily households to single family households as compared with Policy A. The Policy B scenario has 72 percent of new growth in multifamily households and 28 percent as single family households.
- **2012 RTP Transit Network and Strategic Plan Projects:** The Policy B scenario utilizes the updated 2012 RTP Transit network and operational characteristics but includes additional strategic plan projects.
- **Climate Resilience – Sea Level Rise and Critical Habitat:** No growth is allowed in SPZs that intersect with the year 2100 five-foot sea level rise zones (as defined by NOAA and CalAdapt) and that intersect with 'High Quality Habitat Areas' (level 5) as defined by the Combined Habitat Assessment Protocol (CHAP) dataset.
- **Walkability, First and Last Mile-Focus, and Active Transportation Investment:** As in the Policy A scenario, the Policy B scenario sees significant active transportation investments above and beyond the 2012 RTP/SCS, and improvement in walkability within and around one mile of major transit stations. To represent this increase in investments and walkability, "walkable" Urban and Compact place types are focused in and around HQTAs and TPAs throughout the region; walkable place types are those that have a street intersection density greater than 150 intersections per square mile, which is generally correlated with increase walk, bike, transit, and non-auto mode share.
- **County/Jurisdiction Control Totals.** For each county, the high level totals for population, households, and employment were controlled at the jurisdictional scale to ensure comparability across the scenarios. For residential units by type, each county was controlled to specific control totals in order to ensure that changes in unit type were comparable both regionally and subregionally across the scenarios.

Scenario 4 (Policy B) Allocation Methodology

Scenario 4 (Policy B) used the Policy A scenario as a starting point which was then modified using Python and PostgreSQL programming languages to implement the UrbanFootprint/SPM modeling framework. The following steps highlight the process that was executed to quantitatively build out the Policy B rules framework.

- **Step 1: Allocate new residential and employment growth in TPAs.**

  The first pass in the script was to roughly allocate new residential and employment growth in the TPAs. New multifamily households were increased 20 percent within TPAs and new retail and office employees increased by 25 percent, as compared to the Policy A scenario. New units were allocated at 80 percent multifamily and 20 percent attached single family and new employment growth was allocated as retail and office employees.

- **Step 2: Allocate new residential growth in HQTAs.**

  The second pass was to roughly allocate new residential growth in the HQTA/TPA areas to match the Policy B portion of households within HQTAs by county. Using the county-level percent of households within HQTAs, factors were derived to increase household HQTA totals to match the county distribution. Of the new units added to HQTA areas through this process, only multifamily and attached single family types experienced growth (72 percent were multifamily and 28 percent attached single family), single family unit totals stayed constant within these areas.

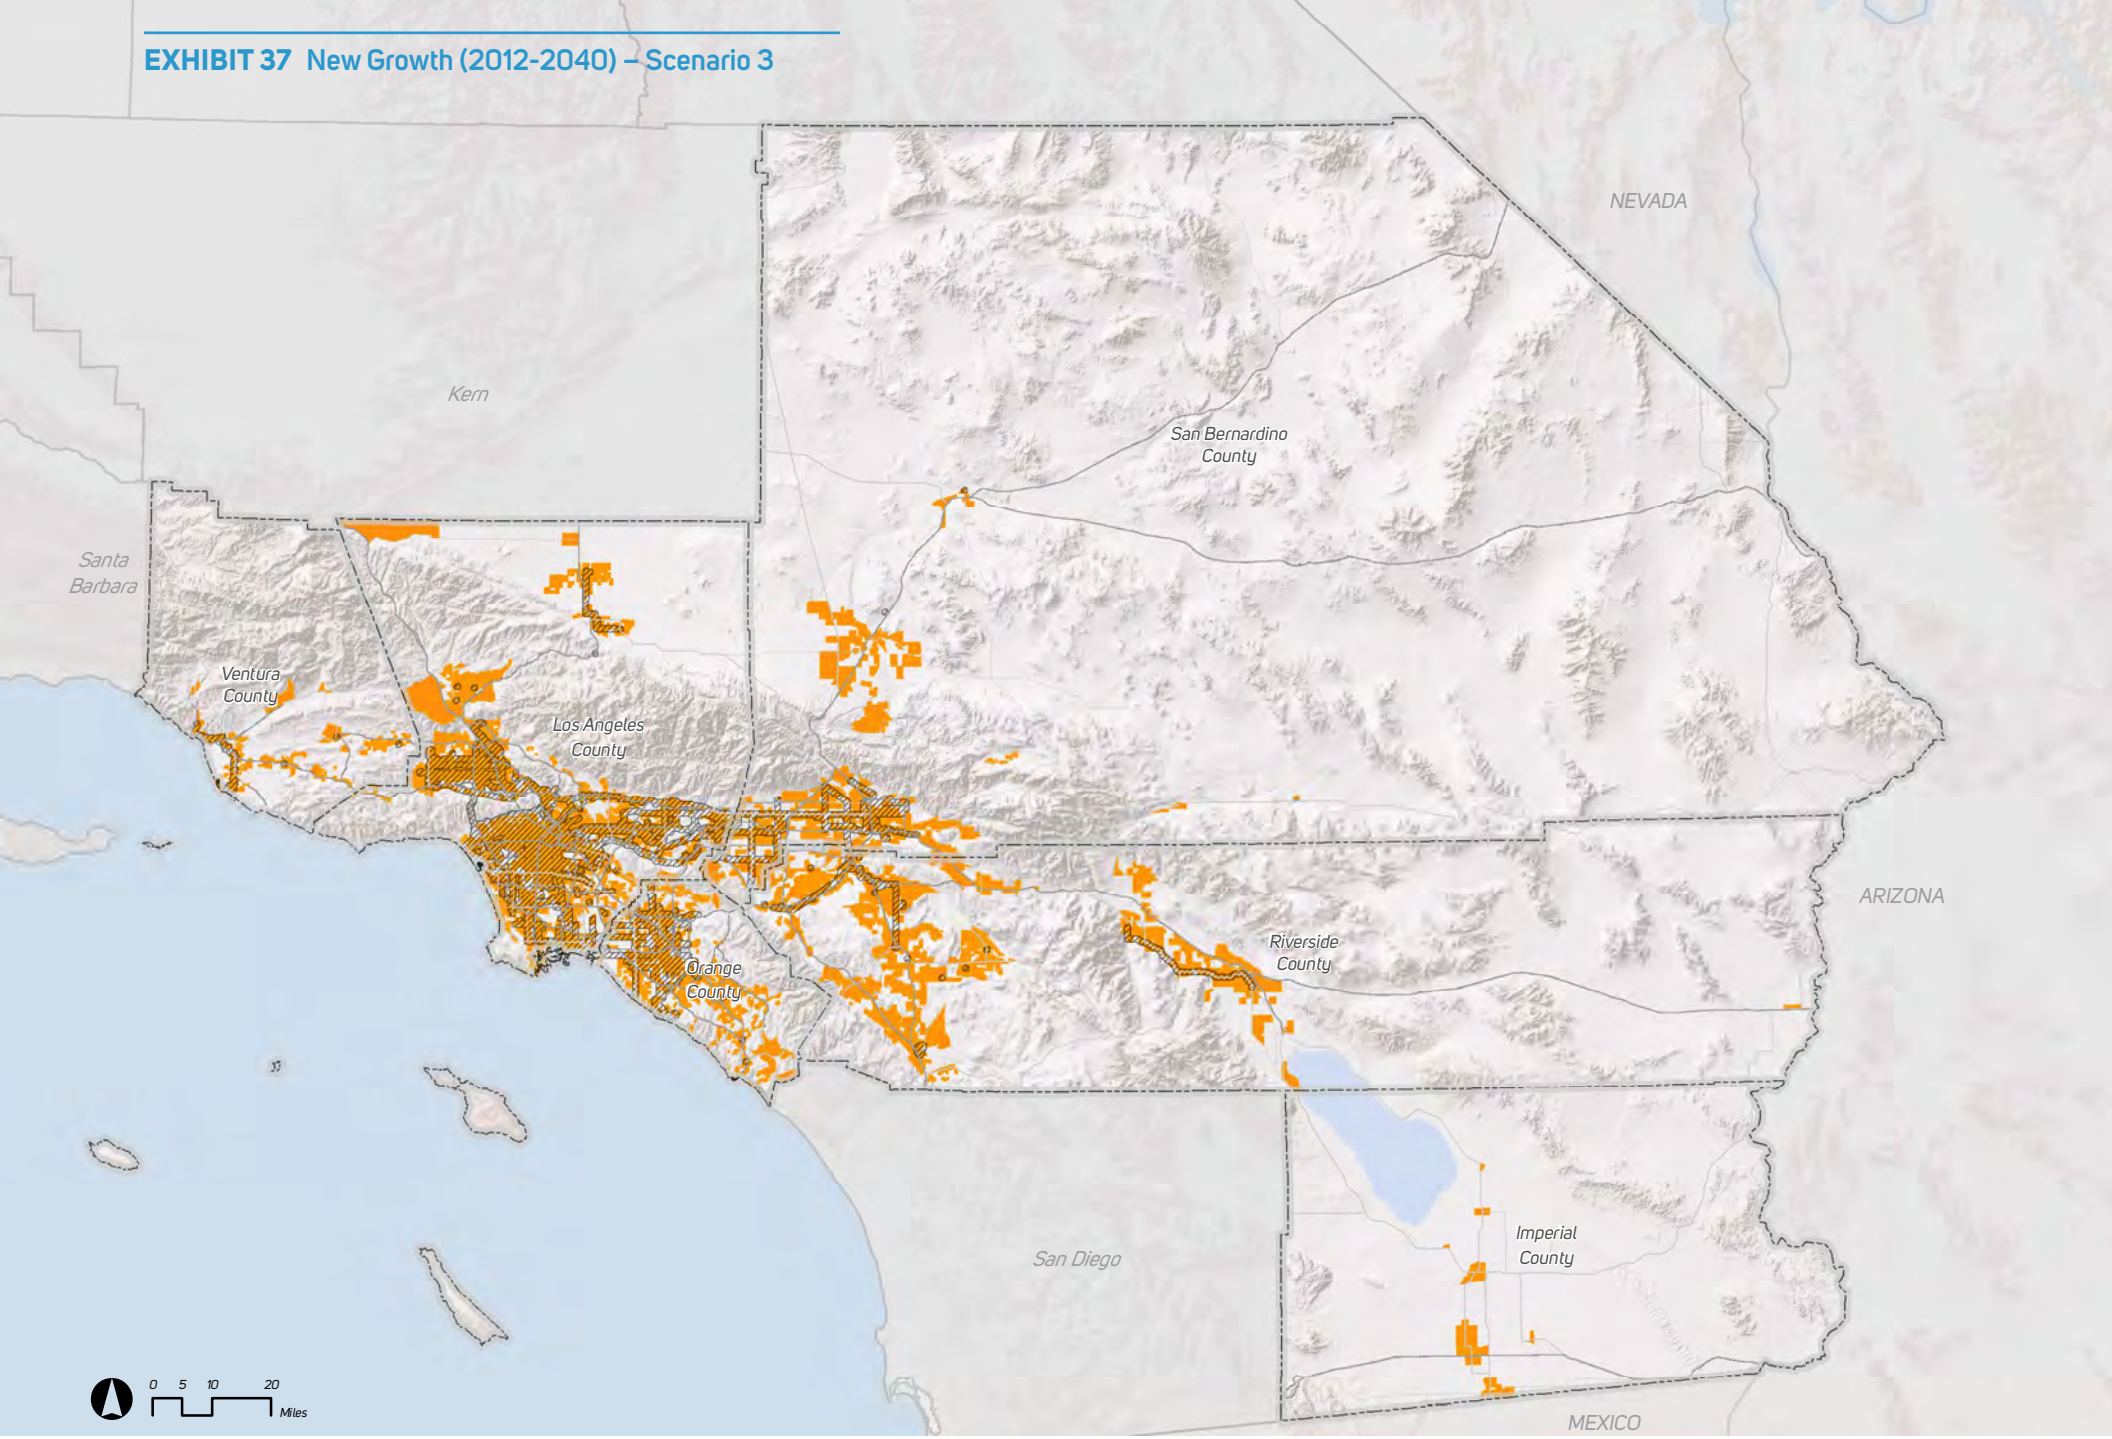
- **Step 3: Control residential units to county controls.**

  Following the initial allocation of new residential units to HQTAs and TPAs, households by type (single family, attached single family, and multifamily) were controlled to county control totals. With the controlling, any SPZ that showed losses to the 2012 base year were set to the 2012 base year household distribution.

- **Step 4: Allocate new employee growth in HQTAs.**

  This pass allocated the correct proportion of employees to HQTA/TPA areas to match county level distributions. New employee growth in HQTAs took the form of retail and office employees; industrial employment was not allocated within the HQTA/TPA zones.

EXHIBIT 37 New Growth (2012-2040) – Scenario 3



HQTA (2040)

New Growth (2012-2040) – Scenario 3

New growth represents household and commercial growth.

Note: The forecasted land use development patterns by LDCs shown are based on Transportation Analysis Zone (TAZ) level data utilized to conduct required modeling analyses. Data at the TAZ level or at a geography smaller than the jurisdictional level are advisory only and non-binding, because SCAG sub-jurisdictional forecasts are not to be adopted as part of the 2016 RTP/SCS. For purposes of qualifying for future funding opportunities and/ or other incentive programs, sub-jurisdictional data and/or maps used to determine consistency with the Sustainable Communities Strategy shall only be used at the discretion and with the approval of the local jurisdiction. However, this does not otherwise limit the use of the sub-jurisdictional data and/or maps by SCAG, CTCs, Councils of Governments, SCAG Subregions, Caltrans and other public agencies for transportation modeling and planning purposes. Any other use of the sub-jurisdictional data and/or maps not specified herein, shall require agreement from the Regional Council, respective policy committees and local jurisdictions.

Source: SCAG, 2015

- **Step 5: Control employees to county controls.**

  Following the initial allocation of new employees to HQTAs, the total number of employees was controlled to county control totals. With the controlling, any SPZ that showed losses to the 2012 base year were set to the 2012 base year employment distribution.

- **Step 6: Assign 'Compact Walkable' and 'Urban' place types.**

  Having allocated the high-level distributions of households and employment, 'compact walkable' and 'urban' place types were assigned to increase density and walkability, as well as proxy first/last mile investment assumptions in and around HQTAs, TPAs and within one mile of major transit stops (as defined by SCAG).

- **Step 7: Remove growth from sea rise and high quality habitat areas.**

  This step removed any of the growth that had been allocated to SPZs designated as sea rise zones or high quality habitat areas in Policy A. Households and employment were held constant to the 2012 base year in those SPZs.

- **Step 8: Control population, households, and employment to jurisdictional controls.**

  Using jurisdictional control totals of population, households, and employment sourced from the 2012 RTP Updated scenario, factors were derived so that Policy B population, households and employment matched jurisdictional control totals.

- **Step 9: Iterate jurisdictional controls and county households by type until balanced.**

  The application of factors to match jurisdictional totals in the previous step altered the county distribution of households by type. In this step, the model iterated over the scenario to balance the growth in households by type with the requirement that jurisdictions maintain household totals. Using iteration, factors were derived for each pass to match county level control totals for households by type, weighted so that when households by type were summed they matched jurisdictional and county totals for households. Once balanced, the county totals for households by type match those of the scenario and the household control total at the jurisdictional level also match those of the scenario.

- **Step 10: Re-translate place types to adjust classification for controlling process.**

  The controlling process slightly adjusted the SPZ level totals of households and employment which has an impact on the corresponding place type assignment. This next process re-translated the assigned place type at the SPZ scale so that there was no quantitative deviation from the qualitative classification of place.

- **Step 11: Calculate derivative fields.**

  Having produced a "clean" household and employment distribution, this step follows the steps detailed in the scenario translation section for populating building square feet, acres by type, and irrigated area.

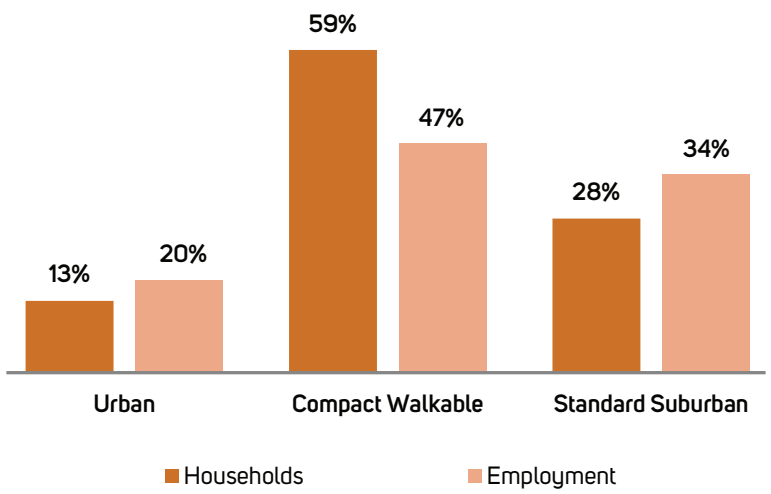
Source: SCAG

FIGURE 9 Policy B, Proportion of New Growth by Land Development Category (LDC), 2012 - 2040



Source: SCAG

Scenario 4 (Policy B) Results

Scenario 4 (Policy B) includes an expanded transit network and increased growth in and around HQTAs and TPAs. A visual representation of new household and commercial growth can be seen in **EXHIBIT 38**: Policy B Scenario Growth with TPA/HQTA transit network while **FIGURE 8** and **FIGURE 9** provide the residential unit type distribution of growth to 2040 and breakdown of growth by land development category (LDC).

These four scenarios were developed in early 2015 by SCAG and their consultant and shared with the CEHD Committee and SCAG's Technical Working Group (TWG). Using local population, household, and employment growth projections, these scenarios explored a range of potential regional development patterns using myriad land use and transportation inputs. In an effort to facilitate understanding of the impacts for policymakers and for the general public, a variety of scenario impacts were considered including land, energy, and water consumption; air quality; and household costs. Based on policy direction, as well as an extensive analysis of these scenarios using SCAG's Regional Travel Demand Model (RTDM) and Scenario Planning Model (SPM), and considering the substantial feedback received during the public input process, the Plan (Preferred Scenario) was developed utilizing elements of all scenarios that demonstrates progress over the 2012 RTP/SCS.

PREFERRED DRAFT ALTERNATIVE OUTCOMES

As mentioned in Chapter 8 of the Plan, the RTP/SCS's more focused land pattern, increased investments in transit, and support for communities that foster walk and bike modes as serious transportation options leads to additional benefits in fiscal, economic, environmental, and other quality-of-life performance measures. These results compare the RTP/SCS with a future trend-based scenario that more closely follows the development trends of the past decades. Unlike the RTP/SCS, this trend-based future scenario relies more heavily on growth in undeveloped lands at the edges of cities and beyond and focuses more new housing toward single-family products in suburban patterns. Different from the modeling process used for the mobility-based performance measures, these performance results were derived using the single framework model described above.

BETTER PLACEMAKING

The challenges of traffic congestion and long commutes make the value of including options for better places to live and work even more important. In 2040, the RTP/SCS envisions 46 percent of housing and 55 percent of jobs in areas served by high quality transit. This does not account for housing and jobs in other opportunity areas in existing main streets, downtowns and along corridors where infrastructure already exists. This more compact development type pattern, combined with the identified transportation network improvements and strategies, results in improved pedestrian and bicycle access to community amenities, lowers average trip length and reduces vehicle miles traveled. These outcomes not only reduce greenhouse gas emissions, but also support the development of more livable communities that provide more housing choices, conserve natural resources, offer transportation options, and promote a better quality of life.

LOWER COST TO TAXPAYERS AND FAMILIES

LOCAL INFRASTRUCTURE CAPITAL AND OPERATIONS AND MAINTENANCE COSTS

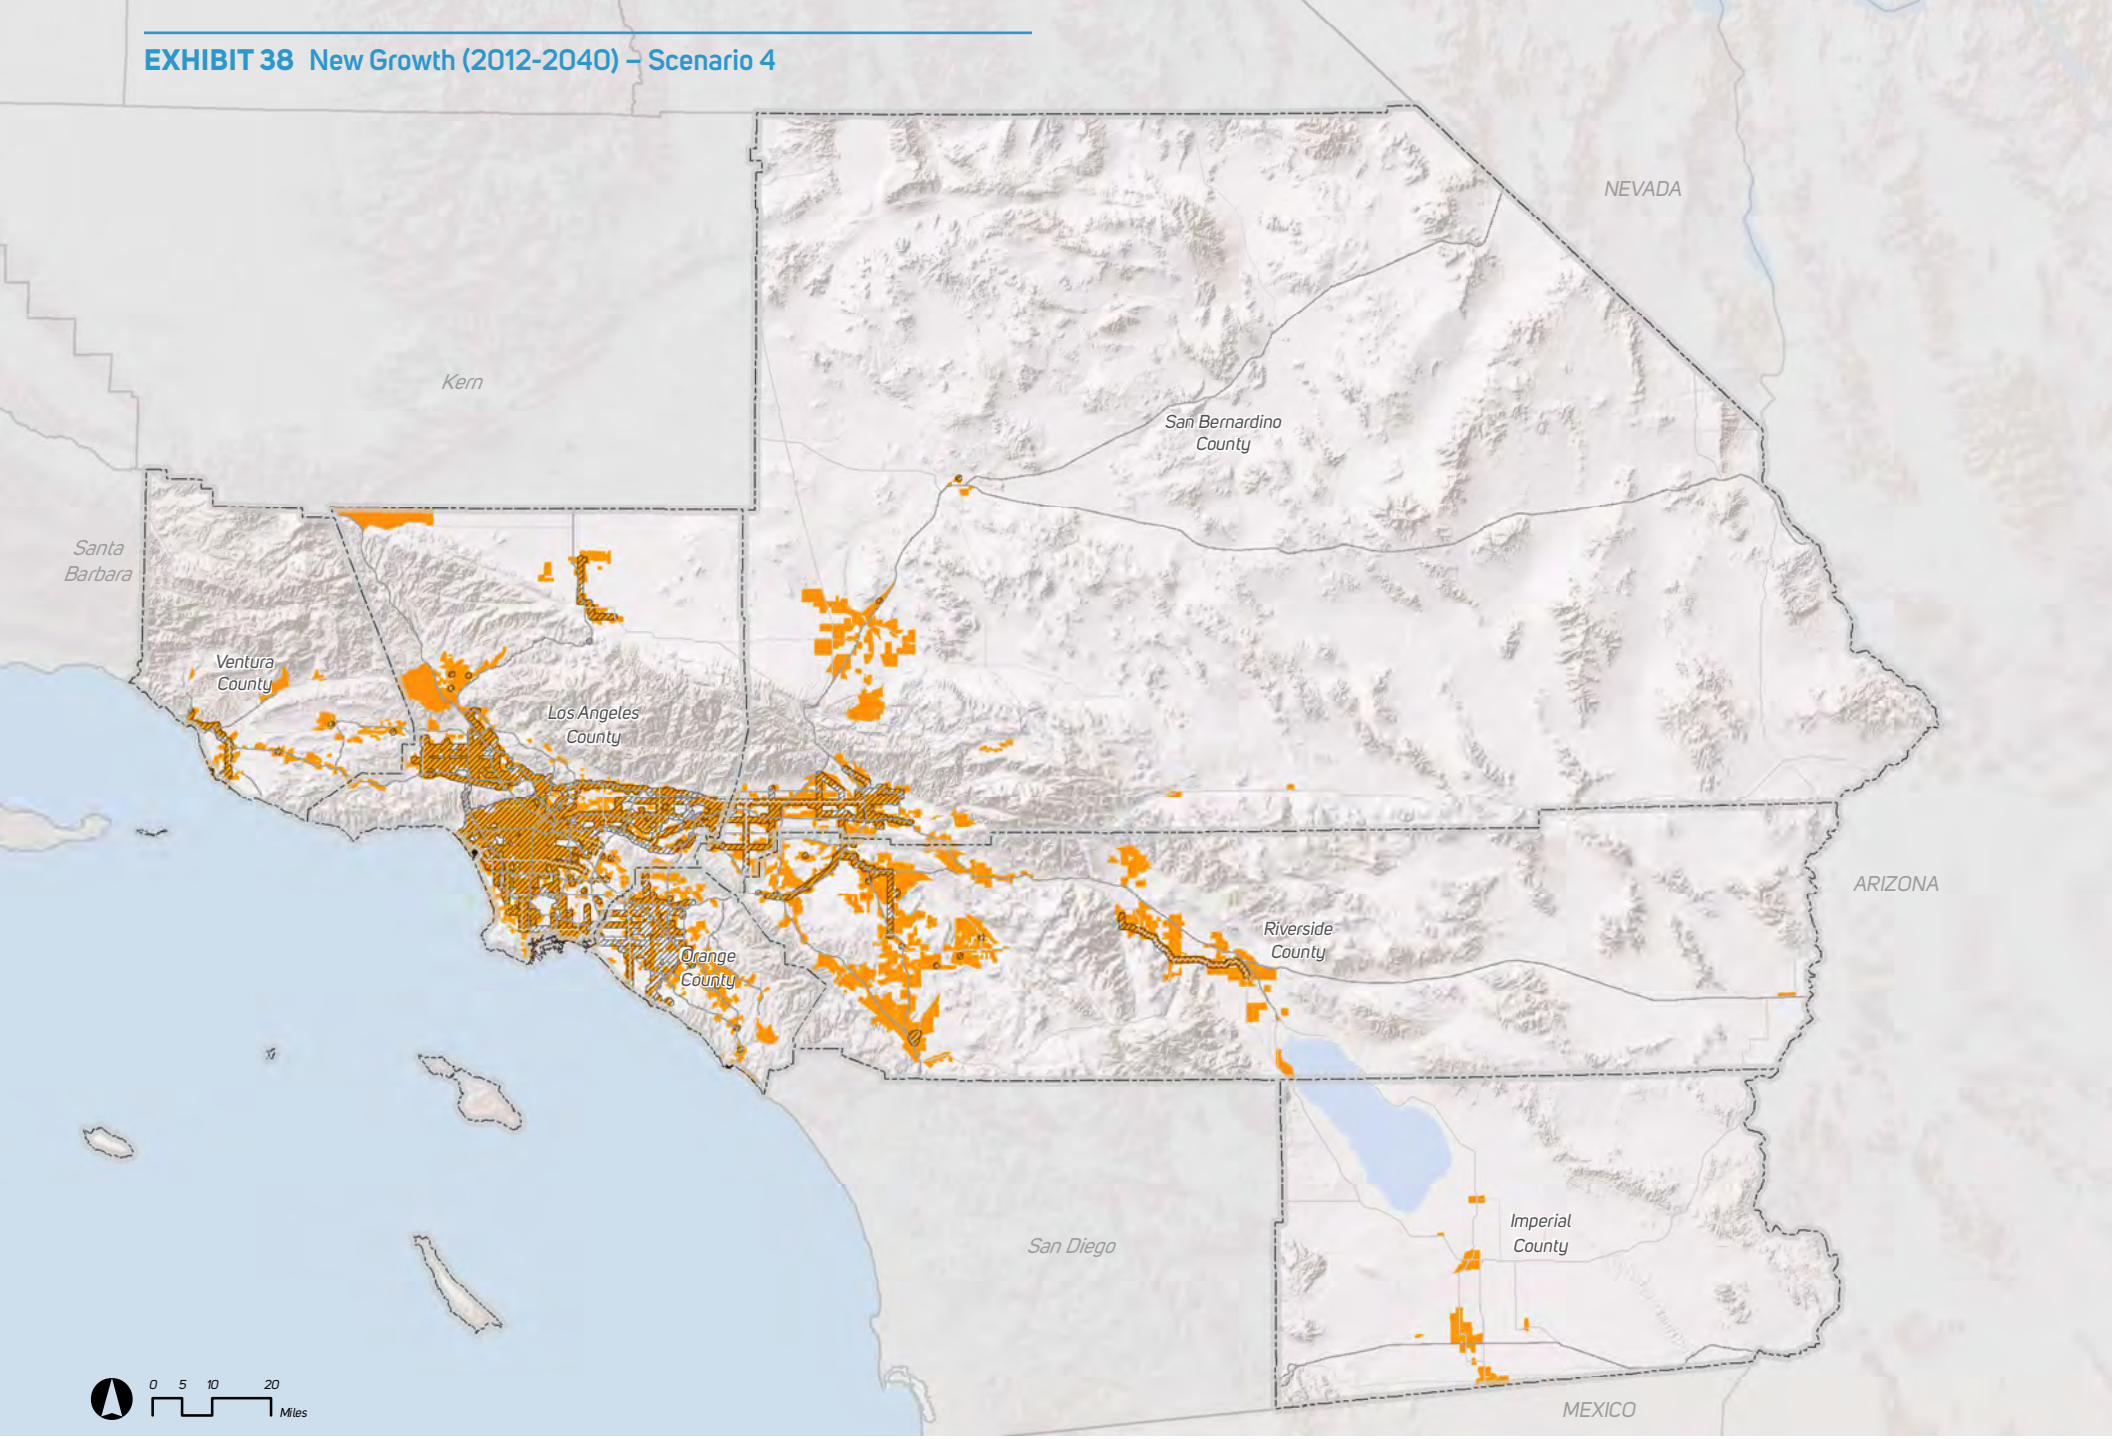
Increased land consumption can lead to higher costs for local and subregional infrastructure, as new development in greenfield lands (areas, including agricultural lands, not previously developed) requires significant capital investments to extend or build new local roads, water and sewer systems, and parks. Conversely, growth focused in urban areas often takes advantage of existing infrastructure and more efficient service to higher concentrations of jobs and housing. This cost difference increases when operations and maintenance (O&M) costs are taken into account. O&M costs include the ongoing jurisdiction expenditures required to operate and maintain the infrastructure serving new residential growth. More dispersed development, which requires greater lengths of roads and sewer pipes, incurs higher O&M costs to local jurisdictions than more compact development, which capitalizes on shared infrastructure capacity.

The 2016 RTP/SCS shows that growth in urban and mixed-use developments in already developed areas can reduce costs significantly, as demonstrated by adding up capital infrastructure and ongoing O&M costs to 2040. If the development trend of the past decades continues, new growth would require $40.6 billion in capital infrastructure and O&M costs. By contrast, local jurisdictions following the development type pattern included in the RTP/SCS leads to $37.3 billion in costs, representing a savings of $3.3 billion.

HOUSEHOLD COSTS

If the development type patterns of the past decades persist, average household costs associated with driving and residential energy and water use will be up to $16,000 annually in 2040. By comparison, the RTP/SCS would cost each household $14,000 annually. Over time, the differences in annual expenditures would amount to a significant sum for each household, which increases further if the effect of local infrastructure cost burdens, which are typically passed on to homeowners and renters in the form of taxes, fees, home prices and assessments is considered.

EXHIBIT 38 New Growth (2012-2040) – Scenario 4



HQTA (2040)

New Growth (2012-2040) – Scenario 4

New growth represents household and commercial growth.

Note: The forecasted land use development patterns by LDCs shown are based on Transportation Analysis Zone (TAZ) level data utilized to conduct required modeling analyses. Data at the TAZ level or at a geography smaller than the jurisdictional level are advisory only and non-binding, because SCAG sub-jurisdictional forecasts are not to be adopted as part of the 2016 RTP/SCS. For purposes of qualifying for future funding opportunities and/ or other incentive programs, sub-jurisdictional data and/or maps used to determine consistency with the Sustainable Communities Strategy shall only be used at the discretion and with the approval of the local jurisdiction. However, this does not otherwise limit the use of the sub-jurisdictional data and/or maps by SCAG, CTCs, Councils of Governments, SCAG Subregions, Caltrans and other public agencies for transportation modeling and planning purposes. Any other use of the sub-jurisdictional data and/or maps not specified herein, shall require agreement from the Regional Council, respective policy committees and local jurisdictions.

Source: SCAG, 2015

BENEFITS TO PUBLIC HEALTH AND THE ENVIRONMENT

LAND CONSUMPTION

Land consumption measures the amount of land that has changed from rural to more intensive development patterns to accommodate new growth. This land, also known as greenfield, refers to development that occurs on land that has not previously been developed for, or otherwise impacted by, urban uses, including agricultural lands, forests, deserts and other undeveloped sites. A development type pattern with a greater share of urban infill and compact development consumes less greenfield (undeveloped) land overall. By contrast, a pattern that places a greater share of new growth in dispersed standard development patterns consumes more greenfield land. The development trend of the past decades would consume about 154 square miles of land, about 23 percent more square miles more than the RTP/SCS, which consumes approximately 118 square miles, to accommodate growth through 2040.

BUILDING ENERGY USE AND COSTS

Building energy use is determined by the mix of housing and commercial types and the proportion of development in temperate climate zones within the SCAG region. A development type pattern that contains more mixed-use/walkable and urban infill development accommodates a higher proportion of growth in more energy-efficient housing types like townhomes, apartments, and smaller single-family homes, as well as more compact commercial building types. By contrast, standard suburban development leads to a higher proportion of larger single-family homes, which are typically less energy efficient. Location also comes into play—buildings in the warmer areas of the region use more energy each year, in part because they require more energy to cool during the summer months.

Differences in development type patterns lead to substantial differences in the amount of electricity and natural gas used. These differences will vary depending on policies regulating how efficient buildings become. Assuming the same efficiency standards, the RTP/SCS saves the average household in the SCAG region ten percent (10 percent) on electric and gas bills compared with a development type pattern that more closely aligns with the past development trend. This reduction in building energy use as a result from developing more compact walkable areas translates to meaningful savings in building energy costs. On average, the RTP/SCS saves households $2 billion in annual electricity and gas costs.

BUILDING WATER USE AND COSTS

Variations in development type patterns and their related building profiles also lead to substantial differences in building water use and cost. Building water use is a function of both indoor and outdoor water needs, with outdoor use (landscape irrigation) accounting for the majority of the difference among housing types. As it pertains to residential, homes with larger yards require more water for landscape irrigation, lot size is generally interrelated with a household's overall water consumption. Therefore, a development type pattern with a greater proportion of standard suburban development, which includes more large-lot single-family homes, requires more water than a development type pattern with a greater proportion of compact and urban infill development, which includes more attached and multifamily homes. And, as is the case for energy use, the location of new development has a significant bearing on water use—homes in warmer areas use more water to maintain lawns and other landscaping.

Water use will vary based on efficiency and conservation policies, which will be increasingly important as California faces future constraints to water supply. Assuming the same modest improvements, the RTP/SCS uses approximately 862,000 acre feet less water (133.2 million acre feet) when compared with past development trends (134 million acre feet). This would also result in a reduction of water-related electricity use and carbon emissions of one percent (one percent). Saving water also saves on costs, and the RTP/SCS saves about $1.2 billion over the span of the plan, and saves households in the SCAG region $93 million on annual water bills.

PUBLIC HEALTH ASSESSMENT

New to the 2016 RTP/SCS is the development of the California Public Health Assessment Model (C-PHAM) and its integration into the UrbanFootprint (UF)/Scenario Planning Model (SPM). As noted in the Public Health section and Appendix, Public Health has increasingly become an area of emphasis for Metropolitan Planning Organizations (MPOs) and Departments of Transportation (DOTs) across the country. During the 2012 RTP/SCS development process, SCAG received numerous comments from public health stakeholders and direction from the Regional Council to address public health more broadly in its planning process. Since the adoption of the 2012 RTP/SCS, SCAG has taken steps to integrate public health into its planning processes. One of the steps, in conjunction with the California Strategic Growth Council, Resources Legacy Fund and Sacramento Area Council of Governments, is the development of the C-PHAM.

The C-PHAM advances the ability to directly assess and predict how built environment (transportation and land use) strategies will impact public health in California. It draws upon built environment, travel and health outcome data, and integrates it into an innovative new scenario-planning platform with access to powerful cloud computing capabilities. The result is an enhanced ability to both understand and apply evidence on the connection between built environment factors, physical activity, and related public health outcomes. More information on the C-PHAM and its methods, data and application can be found in the Reference Documents section.

For more information on this analysis, please refer to the Public Health Appendix.

GREATER RESPONSIVENESS TO DEMOGRAPHICS AND THE CHANGING HOUSING MARKET

There is little question that the demographic profile of Southern California is changing, resulting in different housing and transportation needs. The traditional suburban development pattern that characterizes most of the region is still appropriate for many residents and homeowners, but the increasing demand for small-lot and multifamily housing, walkable and bikeable environments and shorter commutes calls for more varied housing options located in more compact developments.

The RTP/SCS responds to this emerging need through an overall development type pattern that focuses new housing growth in urban centers served by various transportation options, including high-quality transit and active transportation. About 70 percent of this new housing will be multifamily units.

While a majority of the new housing will be multi-family units as part of the RTP/SCS, the percentage of multifamily and single-family will not change drastically when compared with the existing housing stock. The housing stock split between single-family and multifamily is currently 55 percent single-family and 45 percent multi-family in the SCAG region. At the end state of the RTP/SCS (Year 2040), the housing stock split is projected to be 50 percent single-family and 50 percent multi-family. This small change in housing stock split is due to the majority of the existing homes in the SCAG region being single-family.

SB 375 AND GREENHOUSE GAS EMISSION TARGETS SET BY THE STATE

As previously noted, SB 375 requires SCAG to develop a Sustainable Communities Strategy to reduce per capita greenhouse gas emissions through integrated transportation, land use, housing, and environmental planning. Pursuant to SB 375, ARB set per capita greenhouse gas emission reduction targets from passenger vehicles for each of the state's 18 MPOs. For the SCAG region, the targets are set at eight percent below 2005 per capita emissions levels by 2020 and 13 percent below 2005 per capita emissions levels by 2035. Though ARB has not adjusted SCAG's regional targets since the 2012 RTP/SCS, SCAG anticipates the region's targets may change, considering Governor Brown's recent Executive Order (B-30-15) that establishes a California greenhouse gas reduction target of 40 percent below 1990 levels by 2030. Because the transportation sector is the largest contributor to California's greenhouse gas emissions (more than 36 percent), SCAG anticipates updated and more stringent regional greenhouse gas emissions goals are forthcoming. The 2016 RTP/SCS achieves per capita greenhouse gas emissions reductions relative to 2005 of eight percent (8 percent) in 2020, and 18 percent in 2035.

CEQA EXEMPTION CRITERIA

SB 375 amends CEQA to add Chapter 4.2 Implementation of the Sustainable Communities Strategy, which allows for CEQA exemption for certain projects, as well as reduced CEQA analysis. Lead agencies (including local jurisdictions) maintain the discretion and will be solely responsible for determining consistency of any future project with the 2016 RTP/SCS. Cities and counties maintain their existing authority over local planning and land use decisions, including discretion in certifying the environmental review for a project, regardless of eligibility for streamlining. SCAG staff may provide a lead agency at the time of its request readily available data and documentation to help support its finding upon request. In addition to a project's consistency with the 2016 RTP/SCS, below are additional criteria for CEQA streamlining eligibility.

TYPES OF CEQA STREAMLINING

CEQA EXEMPTION

A full CEQA exemption is proposed to provide for a special class of Transit Priority Project (TPP) determined to be a Sustainable Communities Project (SCP) (California Public Resources Code 21155.1 (a)). As a threshold matter, to qualify as a TPP, a project must be consistent with the general use designation, density, building intensity and applicable policies in an approved SCS or APS. The TPP must also:

- Be at least 50 percent residential use based on area;
- Be at least 20 units/acre; and
- Be within ½ mile of a major transit stop or high-quality transit corridor included in the RTP/SCS (a high-quality transit corridor is defined as one with 15-minute frequencies during peak commute hours)

Consequently, a Sustainable Communities Project (SCP) is a TPP that is consistent with the SCS or APS and meets additional criteria including numerous land use and environmental standards, such as being 15 percent more efficient than Title 24 standards and using 25 percent less water than the regional average household. In addition, the site cannot be more than eight acres or contain more than 200 units. The proposed project must be located within one half mile of rail transit station or ferry terminal included in RTP/SCS or a quarter mile from a high quality transit corridor. Lastly, the project must meet additional requirements for the provision of affordable housing and open space. After a public hearing where a legislative body finds that a TPP meets all the requirements, a project can be declared to be an SCP and be exempted from CEQA.

Sustainable Communities Environmental Assessment (SCEA)/Limited EIR CEQA relief is provided for TPPs that incorporate all feasible mitigation measures, performance standards,

or criteria set forth in the prior applicable environmental impact reports and adopted in findings as described in (California Public Resources Code 21155.2 (a), (b) and (c)). This type of streamlining applies to initial studies that meet the following criteria:

- Avoids or mitigates impacts to a level of less than significant;
- Incorporates all feasible mitigation measures, performance standards, or criteria set forth in applicable EIRs; and
- Identifies all significant/potentially significant impacts and identifies adequately addressed cumulative effects in prior applicable certified EIRs

An SCEA is not required to reference, describe or discuss growth-inducing impacts; project-specific impacts; and cumulative impacts from cars and light duty truck trips generated by the project. If a lead agency determines that a cumulative effect has been adequately addressed and mitigated, that cumulative effect shall not be treated as cumulatively considerable, and the SCEA will be reviewed under the substantial evidence standard. The lead agency is required to circulate the document for a 30-day comment period, consider all comments received, conduct a public hearing, and make findings that the project has fully mitigated impacts.

If a TPP requires an EIR, certain CEQA relief also applies for projects that incorporate all feasible mitigation measures, identify all significant and potentially significant impacts, and identify adequately addressed cumulative effects in prior applicable certified EIRs. The streamlined EIR is not required to analyze off-site alternatives to the TPP or discuss a reduced residential density alternative to address the effects of car and light duty truck trips generated by the project. Furthermore, the EIR is not required to include an analysis of growth inducing impacts or any project specific or cumulative impacts from cars and light duty truck trips generated by the project on global warming or the regional transportation network. The initial study must identify any cumulative effects that have been adequately addressed and mitigated in prior applicable certified EIRs and these cumulative effects are not to be treated as cumulatively considerable in the EIR. As with the SCEA, the Streamlined EIR will be reviewed under the substantial evidence standard. The certification process is consistent with CEQA Guidelines Section 15090.

LIMITED ANALYSIS FOR RESIDENTIAL/MIXED-USE PROJECTS

SB 375 also provides for general CEQA streamlining for residential and mixed-use residential projects as well as TPPs pursuant to Section 21159.28 of the Public Resources Code. It should also be noted that CEQA streamlining opportunities will be available once SB 743 guidelines are adopted. Projects that meet the following requirements can be eligible for streamlined CEQA review:

- A residential or mixed-use residential project (or a TPP) consistent with the designation, density, building intensity, and applicable policies specified for the project area in an accepted SCS or APS (a residential or mixed-use residential project is defined as one where at least 75 percent of the total building square footage consists of residential use or a project that is a transit priority project)
- A residential or mixed-use project that incorporates the mitigation measures required by an applicable prior environmental document.

If a project meets these requirements, any exemptions, negative declarations, mitigated negative declarations, SCEA, EIR or addenda prepared for the projects shall not be required to reference, describe or discuss:

- Any project specific or cumulative impacts from cars and light duty truck trips generated by the project on global warming or the regional transportation network;
- Growth inducing impact; nor
- A reduced density alternative (EIRs only)

TRAFFIC MITIGATION MEASURES

Pursuant to California Public Resources Code 21155.3, a legislative body or a local jurisdiction may adopt traffic mitigation measures that would only apply to TPPs which may include requirements for the installation of traffic control improvements, street or road improvements, and contributions to road improvement or transit funds, transit passes for future residents or other measures that will avoid or mitigate traffic impacts of TPPs. A TPP does not need to comply with any additional mitigation measures for the traffic impacts of that project on streets, highways, intersections or mass transit if the local jurisdiction has adopted these traffic mitigation measures. The traffic mitigation measures must be updated at least every five years.

SUSTAINABILITY PROGRAM

SUSTAINABILITY PLANNING GRANTS PROGRAM

SCAG offers direct funding of innovative planning initiatives for member agencies through the Sustainability Planning Grants Program. SCAG manages all of the funding and administrative duties, enabling the municipalities and retained consultants to focus on crafting forward-thinking planning efforts.

Since 2005, the program has grown rapidly, from nine projects in the first year to 70 projects funded from the 2013 call for applications. In addition to local municipalities, SCAG has worked in collaboration with county planning departments, County Transportation Commissions, as well as sub-regional Councils of Governments. SCAG has funded more than 200 Projects with $22 million dollars. **EXHIBIT 39** is a map of all the Sustainability

Planning Grant projects begun as of the adoption of the 2016 RTP/SCS. Table 8 shows all Sustainability Planning Grant Demonstration Projectssince 2005 to date.

SUSTAINABILITY AWARDS

Since 2007, SCAG has honored projects that best exemplify the core planning principles of mobility, livability, prosperity and sustainability with awards at the Annual Regional Conference & General Assembly. The SCAG Sustainability Awards recognize exemplary planning projects that support SCAG's core principles of mobility, livability, prosperity and sustainability. Each year, cities and public agencies are honored in one of four categories for their projects: Active Transportation, Green Region, Integrated Planning and the President's award for overall excellence.

TOOLBOX TUESDAYS

Toolbox Tuesdays training sessions are free educational opportunities for planning professionals from our member cities and agencies. The program was started in mid-2007 as a response to a pressing need for free accessible training in innovative, regionally responsive planning techniques. Popular presentation sessions cover a wide range of topics including corridor planning, parking policy reform, cutting-edge visualization tools and active transportation planning. Starting in Fall of 2010, SCAG began using video-conferencing technology to simulcast the sessions at SCAG regional offices in all six SCAG counties.

METHODOLOGY FOR CALCULATING SB 375 CO2 EMISSIONS PER CAPITA FOR 2016 RTP/SCS

SCAG'S TECHNICAL METHODOLOGY FOR ESTIMATING GREENHOUSE GAS EMISSIONS FOR THE 2016-2040 RTP/SCS

INTRODUCTION

Prior to a Metropolitan Planning Organization (MPO) formally taking credit for implementing the public participation plan required by SB 375, the MPO must submit to the California Air Resources Board (ARB) a description of the technical methodology it intends to use to estimate the greenhouse gas emissions from its Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) and, if necessary, its Alternative Planning Strategy (APS). SB 375 encourages the MPO to work with the ARB until the ARB Board concludes that the technical methodology operates accurately. [Government Code Section 65080(b)(2)(I)(i)]

For the purposes of SB 375 GHG analyses, the SCAG region greenhouse gas emissions reduction targets for the 2016 RTP/SCS remain the same as those adopted by ARB for the last round of RTP/SCS—the 8 percent in 2020 and 13 percent in 2035 per capita greenhouse gas emissions reduction compared with the level in 2005.

The following describes the technical methodology for SCAG's upcoming 2016 RTP/SCS, relating to the requirements of SB 375. SCAG's comprehensive technical methodology exists in tandem with the outreach, planning, forecasting, and the iterative scenario development process described below.

SCAG's comprehensive technical methodology for SB 375 implementation consists of the following elements:

- Developing the 2016 RTP/SCS
- Technical Methodology
- Data Development for the SCS
- Sustainable Community Strategies
- Models and Tools

A description of these elements is provided in the following sections.

DEVELOPING THE 2016 RTP/SCS

The 2016 RTP/SCS will have a horizon year of 2040 and will be adopted by SCAG's Regional Council in April 2016. To initiate the process, SCAG's Regional Council developed and approved updated goals to help carry out the vision for improved mobility, economy and sustainability. Performance Measures were then developed to implement and monitor the vision and provide guidance throughout the technical process. The Performance Measures consider the following critical items:

SCAG's Performance Measures:

1. Location Efficiency
2. Mobility & Accessibility
3. Reliability
4. Productivity
5. Safety and Health
6. Environmental Quality
7. System Sustainability
8. Resource Efficiency

TECHNICAL METHODOLOGY

The methodology for estimating transportation-related greenhouse gas emissions associated with the 2016 RTP/SCS is primarily based on SCAG's Trip-Based Regional Transportation Demand Model and the ARB's EMFAC Model. The affects and impacts of various land use scenarios on greenhouse gas emissions will be evaluated and accounted for by SCAG's SPM Model, the Trip-Based Model, and various off-model methodologies. An overview of the methodology is presented below:

TABLE 9 Analysis Years for SB 375

YEAR	PURPOSE
2005	Base year for SB 375 target setting
2012	Base year for 2016 RTP/SCS
2020	SB 375 GHG target year
2035	SB 375 GHG target year
2040	2016 RTP/SCS horizon year

1. **Develop land use portion of SCS**
   Growth forecasts, particularly the local input based growth forecasts, will be developed based on SCAG's bottom-up integrated growth forecasting process and will be used as the basis and starting point to develop the SCS. SCAG's SPM Model will be used to facilitate local input, develop and test land use scenarios, and evaluate potential impacts. The resulting datasets may or may not achieve the greenhouse gas emissions reduction target set by ARB. If additional strategies are necessary to achieve the target, SCAG will work with its jurisdictions and other stakeholders to develop a range of potential land use strategies for consideration in SCS development. Each of these strategies will be included in one or more draft scenarios and greenhouse gas emissions will be quantified to test their effectiveness. For the 2016 RTP/SCS, in addition to the local input based growth forecasts, SCAG, in collaboration with subregions and local jurisdictions, developed two sets of growth forecasts/land use scenarios based on different emphasis of land use and investment strategies.
2. **Identify related transportation investments/improvements and other RTP/SCS policies**
   The 2016 RTP/SCS will identify and examine new investments in transportation facilities, including toll facilities, HOV/mixed-flow, transit, rail, active transportation, etc., and improvements in TDM and TSM strategies as well as other relevant policies and strategies. These investments/improvements will be incorporated into the regional transportation demand model where feasible.
3. **Analyze RTP/SCS through modeling**
   SCAG will use the Trip-Based and the EMFAC models to test greenhouse gas emissions reduction scenarios as appropriate. The SCS and alternatives scenarios will be used as input to the regional transportation demand model for RTP/SCS conformity/CEQA analyses.
4. **Use off-model analyses to estimate VMT changes or greenhouse gas emissions reductions, if necessary**
   Per the RTAC and ARB recommendations, SCAG will use off-model analyses as necessary and appropriate to account for any voluntary efforts or other strategies that are not captured by the regional transportation demand model. The off-model analysis methodology will be informed by the on-going collaboration among MPOs and between MPOs and the ARB on this subject, as well as discussions with applicable technical working groups. SCAG anticipates that the off-model analysis technique will be primarily used for quantifying voluntary efforts from cities/counties and the business sector, and those policies and practices that are not readily applicable for modeling analyses. Descriptions of off-model measures are provided on Page 80.

5. **Run ARB's EMFAC Model**
   Pending U.S. EPA's approval of the updated emission model, SCAG will run EMFAC 2014 for baseline and SCS scenarios for the appropriate milestone years and greenhouse gas emissions will be calculated. Adjustments to EMFAC that account for recent state laws will be made per ARB direction.

6. **Next Generation Tools**
   SCAG has committed considerable effort to develop working versions of both the Activity-Based Model and PECAS Land Use Model. These tools should be available for use in the 2020 RTP/SCS development and greenhouse gas emissions evaluation. Both models require additional refinement, sensitivity testing, and review/outreach with modeling stakeholders before they will be available for use in RTP/SCS production.

DATA DEVELOPMENT FOR THE SCS

1. **Socio-Economic Growth Forecast**
   The process for developing growth and economic forecasts includes:
   - Initiate the SB 375 and 2016 RTP/SCS growth forecasting process (commenced June 2013)
   - Convene a panel of experts for technical assistance and advisory role in June 2013
   - Produce a range of growth forecasts
   - Release the draft growth forecast to all local jurisdictions
   - Build teams to conduct one-to-one meetings with local jurisdictions, subregions and all major stakeholders (February 2014 – January 2015)
   - Develop draft policy growth forecast, continue local and subregional review, comment, and input to refine and revise the policy growth forecast (June 2015 – September 2015)
   - Release the Draft policy growth forecast along with the draft RTP/SCS and PEIR for public review and comments (December 2015)
   - Adopt final forecasts as part of the SCS process

2. **SCS/RTP Datasets and Trend Baseline**
   To meet the requirements of SB 375 in developing a SCS by 2016, the following datasets will be developed in collaboration with subregions, local jurisdictions and CTCs:
   - 2012 base year for 2016 RTP/SCS
   - Trend baseline growth distribution and underlying land uses
   - General plan based growth forecast and distribution
   - Policy growth forecast/SCS

The "trend baseline" illustrates the most likely outcomes of growth distribution and land use in the absence of recent policy intervention, allowing the region and its jurisdictions to take credit for actions and policies adopted recently or in the near future. The "trend baseline" is a technical projection that provides a best estimate of future growth based on past trends and assumes no recent general plan land use policies. The Policy Forecast/SCS builds from local jurisdictional general plan land use stratregies, updated policies from local jurisdictions that may not be reflected in their general plan and additional regional policy assumptions.

3. **Data and GIS Maps**
   Data/GIS maps have been provided to subregions and local jurisdictions for their review. These data include the 2012 base year population, employment, and households estimates and their projections for 2020 and 2035 and 2040. GIS maps include existing land use for 2012, general plan land use and zoning, resource areas, and other important areas identified in SB 375.

The list of data/GIS maps provided to stakeholders includes:

- Existing land use (2012)
- General plan land use and zoning

Resource areas include:

- All publicly owned parks and open space;
- Open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;
- Habitat for species identified as candidate, fully protected, sensitive or species of special status by local, state or federal agencies or protected by the federal Endangered Species Act of 1973, the California Endangered Species Act or the Native Plant Protection Act;
- Lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code and lands under Williamson Act contracts;
- Areas designated for open space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;

- Areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy; and
- Areas subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.

4. Farmland
5. Spheres of influence
6. High Quality Transit Areas (HQTA) and transit priority areas (TPA)
7. City/Census tract boundary with ID
8. City/Tier2 Transportation Analysis Zone (TAZ) boundary with ID

SUSTAINABLE COMMUNITIES STRATEGIES

1. **Land Use Component**
The growth distribution, for SCS purposes, is the adopted growth forecast used for the RTP. SB 375 requires that this forecast be developed in such a way that it demonstrates reduced per capita greenhouse gas emissions due to land use strategies as compared to the per greenhouse gas level in 2005.

   SCAG will work with all jurisdictions and other stakeholders to develop a range of potential land use strategies for consideration in SCS development. Each of these strategies will be included in one or more draft scenarios and greenhouse gas emissions will be quantified. Prior to incorporating any strategies into a final SCS SCAG, in consultation with the applicable local government, will determine the political and market feasibility of said strategy.

   It should be noted, however, that as the same practice in the 2012 RTP/SCS, the final adoption of growth forecast is at the jurisdictional level, subjurisdictional level socioeconomic data set or growth forecast is advisory and non-binding, and for modeling and analysis purposes only to demonstrate for the attainment of greenhouse gas emissions reduction targets (See CEHD action in October 2015 regarding guiding principles for the development of policy growth forecast for the 2016 RTP/SCS).

2. **Transportation Investment**
The transportation network consists of existing and planned transportation projects. SB 375 requires the development of the future transportation network should proceed in such a way that it complements the anticipated growth strategy and distribution reflected in the SCS.

   Development of a SCS presents an opportunity for developing approaches to system management and operational improvements, implementing pricing policies, developing comprehensive bikeway networks, using complete streets as an active transportation funding strategy and improving the coordination between transit services and active transportation (first/last mile strategies), all with the goal of creating more livable communities. These efforts assume collaboration and voluntary participation among subregional stakeholders and CTCs in order to derive higher performance from the transportation system.

3. **Transportation Demand Management / Transportation Systems Management**
In addition to transportation projects, the RTP contains policies such as Transportation Demand Management (TDM) or Transportation System Management (TSM) policies. These include pricing, ridesharing, smart shuttles, preferential parking, freeway metering, etc. These policies can be layered with the other major elements of the SCS. It is anticipated that TDM/TSM policies will be used and applied in particular, in locales that do not have substantial existing or planned transit infrastructure.

4. **Other Economic Factors & Principles**
The following factors and principles are reflected in the growth forecasts and land use data set:
   - Align economic development with the land use and transportation investment strategies
   - Promote job-housing supply balance
   - Develop a "Land-use Strategy" that the market wants and can deliver

5. **Technology and Local Voluntary Efforts (Off-Model Analysis)**
In estimating emissions benefits from an SCS, the region may account for local voluntary efforts that result in reduced vehicle greenhouse gas emissions not limited to strategies aimed at reducing VMT.

   Examples of such efforts may include local neighborhood electric vehicle programs, local incentives for the purchase or use of electric or other alternative fuel vehicles (e.g., preferential parking), or increase in active transportation investments and capital projects. Any local voluntary effort to reduce emissions that are accounted for in the SCS should demonstrate additional benefits beyond what is already required in state law.

In accounting for the benefits of such efforts, SCAG may rely on any local analysis to determine emissions savings. In lieu of locally derived data, SCAG may use off-model analyses as necessary and appropriate to account for any voluntary efforts or other strategies that are not captured by the regional transportation demand model. SCAG has developed off-model tools and methodologies to estimate trip reductions related to active transportation improvements, zero emissions vehicle strategies, neighborhood electric vehicles policies, and shared mobility programs. Descriptions of measures that are considered are the following:

Active Transportation / Proximity

SCAG's Active Transportation Programs

The 2016 RTP/SCS contains 11 strategies designed to increase active transportation, as a share of all transportation modes. These strategies are established in four categories:

- Regional Trip Strategies
  - Regional Bikeway Network
  - Regional Greenway Network: designed to increase walking and biking for recreation, making use of available open space, such as rivers, drainage canals, cycle tracks and utility corridors.
- Transit Integration Strategies
  - First/Last Mile
  - Livable Corridors
  - Bike Share
- Short Trip Strategies
  - Sidewalk repair and upgrading
  - Local Bikeway Networks
  - Neighborhood Mobility Areas (integrated with NEV short-trip concept)
- Education and Encouragement
  - Safe Routes to School
  - SCAG Encouragement and Safety Campaigns

SCAG staff conducted GIS analysis to create a bike lane network, first/last mile areas, livable corridors, and neighborhood mobility areas. The GIS data and shapefiles are used to create active transportation infrastructure input for off-model analysis.

Methodology – Active Transportation Tool

SCAG developed a methodology to analyze the impact of active transportation infrastructure enhancement (AT enhancement) on mode share and VMT. A mode share model was developed based on 2012 California Household Travel Survey (CHTS) and zonal data from SCAG's Scenario Planning Zones (SPZs). A multinomial logit model was estimated with following modes: auto, transit, walk-to-transit, walk-to-activity and bike.
Independent variables of the mode share model include 1) individual and household socioeconomic characteristics from CHTS, 2) neighborhood land use characteristics by SPZs, and 3) neighborhood built environment and active transportation infrastructures by SPZs (including bike lane density, street density and percent of roadways with sidewalks). The model calculates the changes in mode share as well as the number of trips by modes by different AT infrastructure inputs. The number of walk and bike trips is expected to increase with enhanced AT infrastructure, such as bike lanes and sidewalks. Furthermore, AT enhancement programs near transit stops or stations, such as first mile/last mile, that enhance accessibility to transit service will increase the use of transit services. Since the methodology focuses on mode choice, it is assumed that increased AT trips and transit trips substitute for automobile trips (total trips remain the same). The reduction of vehicle trips and VMT is equal to the increased trips and travel distance by non-vehicle modes.

Zero-Emissions Vehicles

Zero Emissions Vehicle Strategies

SCAG has also provided specific planning and support for Plug-in Electric Vehicles (PEV) and electric vehicle charging stations (EVCS). Since SCAG adopted the 2012 RTP/SCS, the Governor's Office released the Zero Emissions Vehicle (ZEV) Action Plan for 2013 and 2015. These plans identified state level funding to support the implementation of Plug-in Electric Vehicle (PEV) and Hydrogen Fuel Cell refueling networks. ARB has provided aggressive growth projections for all ZEVs throughout the state. As part of the 2016 RTP/SCS, SCAG modeled PEV growth specific to Plug-in Hybrid Electric Vehicles (PHEV) in the SCAG region. These are electric vehicles that are powered by a gasoline engine when their battery is depleted. The SCAG program proposes a regional charging network that will increase the number of PHEV miles driven on electric power. This will allow SCAG to derive regionally specific greenhouse gas emissions reductions that will be achieved through increased usage of electric power relative to the gasoline power.

Methodology

SCAG applied a methodology developed by the Metropolitan Transportation Commission (MTC) to measure the greenhouse gas emissions reductions achievable through providing support for a regional network of charging stations. The investment plan will support enough charging stations to increase the PHEV usage of electric power by 10 percent.

Neighborhood Electric Vehicle (NEV) Policies

The 2016 RTP/SCS Neighborhood Mobility Areas (NMAs) strategy presents a set of state, regional, and local policies to encourage the use of alternatives to full size internal combustion engine vehicles for short trips. In the U.S., nearly 40 percent of urban and suburban auto trips are less than two miles. In SCAG region, 38 percent of trips are less

than three miles. Specifically, the 2016 RTP/SCS includes policies to encourage planning and promotion of Neighborhood Electric Vehicles (NEVs) in NMAs. A short trip using a Neighborhood Electric Vehicle (NEV) would have positive net impacts due to negligible greenhouse gas emissions (based on energy production) and zero local pollution, though this travel mode would not bring a reduction of VMT.

Methodology

SCAG prepared a New Mobility Areas Map that represents areas where local agencies should be encouraged to support short trip replacement. SCAG used a methodology based on various studies of observed NEV usage, such as methodology documented in CAPCOA and ARB documents. Within the Short Trip Concept areas, it is assumed that NEVs can be used to replace 1.5 percent of all automobile trips less than three miles of trip length. The number of automobile trips less than three miles in Short Trip Concept TAZs can be directly calculated from SCAG regional model output. VMT reduction is calculated as the number of substituted vehicle trips multiplying 1.5 miles (average of three miles).

Shared Mobility Programs

Shared Mobility modes include both new mobility paradigms as well as old models that are finding new markets and delivery methods thanks to new technology platforms. Shared Mobility encompasses a wide range of services including the following:

- Return Trip Car Sharing (Zipcar, Enterprise)
- Point-to-Point Car Sharing (Car-to-Go)
- Peer-to-Peer Car Sharing (Relayrides)
- Ridesourcing (Lyft, Uber, also known as Transportation Network Companies)
- Dynamic On-Demand Private Transit (Bridj, Leap)
- Vanpool and Private Employer Charters

The 2016 RTP/SCS includes policies to encourage Shared Mobility and to guide the region in maximizing the benefits and minimizing the potential for negative effects. The off-model methodology described below is the beginning of an ongoing process to develop modeling and off-model processes to achieve a better understanding of the costs and benefits that shared mobility services in particular will have in the SCAG region. For the 2016 RTP/SCS scenario development process, SCAG focused on geographic locations where shared mobility services are expected to accelerate, and on the attendant VMT reductions that will be realized through potential reduction in personal vehicle ownership.

Roundtrip car share is most known in the U.S. as membership-based programs where individuals can sign up to have hourly access to a pool of vehicles and then return them to the same place where they were picked up. Unlike traditional car rentals, vehicles can be picked up at designated spots around the city, usually in public parking lots. One-way car share allows members to take a vehicle and leave it at a different station, or anywhere within the allowed boundaries (roughly city boundaries).

Ridesourcing is a term coined by researchers at U.C. Berkeley to refer to the provision of rides sourced from application enabled networks of ride providers. This term is useful in distinguishing this innovation from car sharing, and from carpooling. For legal purposes, the California Public Utilities Commission defines the entities, referred to as Transportation Network Companies (TNC), as "companies or organizations, operating in California that provides transportation services using an online-enabled platform to connect passengers with drivers using their personal, non-commercial, vehicles". Essentially, TNCs add two new aspects to the vehicle for hire service model – peer drivers and smartphone dispatch.

Methodology for Carsharing Analysis

SCAG classified the 35 detailed place types in SPZs into six main groups of TAZs, based on land use characteristics such as density and diversity. SCAG applied higher car sharing programs household participation rate for place type with higher density/diversity. This assumption is consistent with methodology applied by MTC and applied in Caltrans' 2040 statewide plan. SCAG assumed a 30 percent reduction in VMT for households participating in car sharing based on empirical data noted in CAPCOA and ARB documents.

Methodology for Ridesourcing (TNCs) Analysis

For the analysis of ridesourcing, SCAG used the same six place type categories as the car sharing analysis. SCAG assumed higher percent of households using TNCs for place type with higher density/diversity. This assumption is consistent with summary data provided by Lyft, one of the major ridesourcing companies. SCAG programed a 30 percent reduction in VMT for households participating in ridesourcing based on similar assumption from car sharing analysis.

6. **Outreach/Stakeholder Input**
   A collaborative and inclusive bottom-up process is the key to ensure a successful development of SCAG's 2016 RTP/SCS. The following are the major tasks and associated objectives that SCAG has undertaken since 2012 to move the process forward to address the requirements of SB 375.

Program Setup

- Conduct SB 375 workshops throughout the region and provide information on requirements and concepts of SB 375, introduce different elements of the RTP/SCS, plus introduce the four preliminary scenarios, as part of the scenario planning exercise.
- Conduct initial outreach strategy kick-off.
- Develop and adopt Guidelines and Public Participation Plan.
- Finalize roles and responsibilities among regional partners, particularly subregions and County Transportation Commissions (CTCs).

RTP/SCS Scenario Development

- Review and gather local input on general plans, including growth forecast/ distribution and land use for 2020, 2035 and 2040.
- Set-up four preliminary scenarios for SB 375 workshops and SCAG Regional Council, Policy Committees, Technical Working Groups, Tasks Forces and other working groups to analyze and compare various policies and to provide their feedback:
  - Trend
  - 2012 Plan Update
  - "Policy A"
  - "Policy B"

- Determine and review RTP base year (2012) conditions.
- Develop growth projections for the four scenarios above for years 2020, 2035 and 2040.
- Develop outreach materials based on different elements of the RTP/SCS that were included in the scenarios.
- Develop survey questions for public feedback.
- Conduct outreach open house sessions based on SB 375 requirements.
- Publish materials online for broader outreach.
- Provide a summary of public input to SCAG's Regional Council.

Draft RTP/SCS Development

- Continue to collect input on additional local planning efforts.
- Outreach to develop policy assumptions for the Draft RTP/SCS.
- Perform technical analyses, including quantification of greenhouse gas emissions reductions achieved by the SCS.
- Develop and release the Draft RTP/SCS.

Final RTP/SCS Development and Approvals

- Develop the final RTP/SCS.
- SCAG Regional Council and regulatory agency approvals.

MODELS AND TOOLS

The diagram below provides an overview of SCAG's modeling system and how the various tools will be applied in the modeling of the 2016 RTP/SCS.

SCENARIO PLANNING MODEL

The SCAG Scenario Planning Model (SPM) is a web-based scenario development, modeling and data organization tool developed to facilitate informed and collaborative planning among counties/subregions, local jurisdictions, other stakeholders and the public. The SPM includes a suite of tools and analytical engines that help to quickly illustrate alternative plans and policies and to estimate their transportation, environmental, fiscal and public health regional impacts. Moreover, SPM provides a common data framework within which local planning efforts can be easily integrated and synced with regional plans.

SCAG SPM is built using UrbanFootprint, a scenario development and modeling platform based on open source software and tools, developed by Calthorpe Analytics. Several of the major MPOs in California are developing different facets of UrbanFootprint for their planning needs. Enhancement and customization of the UrbanFootprint system for SCAG's application involves local level data review, edit and management functionality via a web-based user interface, and regional-scale scenario development and modeling capacity. In order to make the tool more useful to subregions and local jurisdictions, SCAG formed a Working Group that includes representatives from all counties and subregions in the SCAG region to direct the tool's development. The SPM Working Group serves as an advisory group to SCAG staff and provides technical input on the aspects of the tool's functions and operations.

Within SCAG's integrated modeling and forecasting system, SPM serves as a conduit between local jurisdictions and key SCAG models. SPM analytical engines produce a range of critical metrics that allow for meaningful comparisons across different land use and transportation scenarios. Scenarios are run through model engines to measure their performance for the following co-benefits:

- mobility
- public health
- fiscal impacts
- energy usage
- water usage
- land consumption

The SPM will be the tool used to develop and analyze future land use scenarios for the 2016 RTP/SCS.

LAND USE/GROWTH FORECASTING

SCAG's growth forecast is developed using a series of computer programs and outreach to forecast growth first at the regional/county level and then disaggregate the county growth to the jurisdiction/TAZ level. The following description provides an overview of SCAG's growth forecasting process.

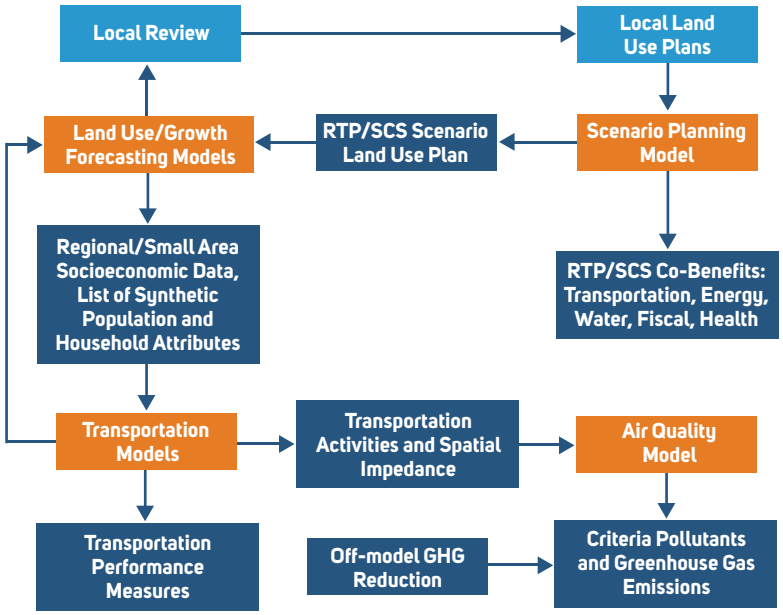
REGIONAL GROWTH ESTIMATION

The Regional Growth Forecast is the basis for developing the Regional Transportation Plan (RTP), Sustainable Communities Strategy (SCS), Program Environmental Impact Report (PEIR), and the Regional Housing Needs Assessment (RHNA). SCAG's 2016 RTP/SCS growth forecast includes our six county jurisdictional level population, household and employment for years 2012, 2020, 2035 and 2040.

The following major data sources are considered and used in the development of the growth forecast:

- California Department of Finance (DOF) population and household estimates;
- California Employment Development Department (EDD) jobs report by industry;
- Regional Housing Needs Assessment (RHNA) growth projections for years 2014-2021;
- 2012 existing land use and General Plans from local jurisdictions;
- 2010 Census and the latest American Community Survey (ACS) data; and
- 2011 Business Installment data from InfoGroup.

FIGURE 10 SCAG's Integrated Modeling & Forecasting Framework



Source: SCAG

SCAG's Regional Growth Forecast includes three major indicators: population, households and employment. SCAG's forecast maintains a balance between employment, population and households at the regional level, given their interrelationship. SCAG computes regional employment based on the SCAG region's share of the nation's employment. Future population is calculated by adding or subtracting to the existing population the number of group quarters population, births, migration and deaths during a projection period. Households are projected by applying headship rates, based on age-gender-racial/ethnic breakdowns, to the projected population. A panel of experts reviewed and provided input to the Regional Growth Projections for the 2016 RTP/SCS (June 2013). The regional forecast was then presented to the Community, Economic and Human Development (CEHD) Committee in August 2013 for their consideration and endorsement.

Based on the regional growth forecast, SCAG then projects jurisdictional level population, households and employment. The jurisdictions' latest existing and general plan land use serve as the basis for future year population and household allocations. Household growth rates and household size are estimated based on historical trends and the developable capacity from the local jurisdiction's general plan. Population projections are calculated based on household growth and household size. Future employment is estimated based on the jurisdiction's employment share of the county's employment by sector, using 2012 jobs data. Employment is further adjusted to account for population serving jobs, such as retail and service, which are highly correlated with population growth.

After the initial growth forecast was developed, SCAG's staff conducted one-on-one meetings with 197 jurisdictions to review the forecast and receive local input. This local input process provided an opportunity for jurisdictions to offer their local knowledge and input to inform SCAG's regional datasets. SCAG evaluated the comments and incorporated the adjustments into the population, household and employment growth distributions. The resulting 2016 RTP/SCS growth forecast will serve as the basis for the initial 2016 RTP/SCS evaluation. Additional refinements to the growth forecast may be made through the scenario planning process in the development of the final 2016 RTP/SCS growth alternative.

SMALL AREA GROWTH FORECASTING

The goal of the small area growth forecasting methodology is to allocate jurisdictional level population, household and employment into the smaller Transportation Analysis Zones (TAZs) utilized by SCAG's Transportation Model. The jurisdictional level household and

employment are developed using an independent projection methodology and review process with SCAG's cities and counties. Population projections are tied to household growth. The jurisdiction's forecast and the projection year are often referred to as the "control total" and the "target year", respectively.

The geographic levels utilized in the growth forecasting process range from the SCAG region as a whole to Tier 2 Transportation Analysis Zones. Each lower level is consistent with higher aggregation levels, i.e., a jurisdiction's values when summed to their respective county will equal the county projection. In addition, the combination of jurisdiction boundaries and Tier 2 (T2) zones when summed to their respective jurisdiction total must be consistent with their jurisdiction's projections.

SCAG's small area growth forecasting process is applied to develop base year and future year socio-economic data at the Tier 2 zone level. Below is a list of the data sources incorporated in the process.

Data Sources:

- SCAG's existing land use data
- SCAG's General Plan Database, processed based on jurisdictional General Plans
- SCAG's 2012 RTP/SCS growth forecast
- SCAG's 2016 RTP/SCS jurisdictional level population, household and employment
- 2013 Longitudinal Employer-Household Dynamics, Origin-Destination, Employment Statistics from the Census Bureau
- Employment Development Department (EDD) 2012, 3rd quarter jurisdictional jobs by sector
- 2011 InfoGroup firm-based employment data
- SCAG Intergovernmental Review (IGR) data
- Digital Mapping Product (DMP) parcel data (2010-2012) and new construction data (2010-2012)
- 2010 Decennial Census Summary File 1 (SF1)

The above approach distributes jurisdictional level population, household and employment into city/T2 level zones (15,000+ city/T2 zones), which work with SCAG's current databases and zonal systems. It creates the first cut of the small area forecast. The draft Tier2 level forecast is then shared with SCAG jurisdictions for further review and comment. Secondary variables, such as population/household characteristics, needed for various models, were developed using SCAG's population synthesis tool (POPsyn). Below is a graphic providing an overview of SCAG's growth forecasting process.

TRIP-BASED REGIONAL TRANSPORTATION DEMAND MODEL

SCAG's trip-based regional transportation demand model will be the primary transportation modeling tool utilized to evaluate the 2016 RTP/SCS's performance. The model was peer reviewed and updated based on the 2012 California Household Travel Survey. A comprehensive model validation was also performed to ensure the model properly replicates base-year (2012) travel conditions.

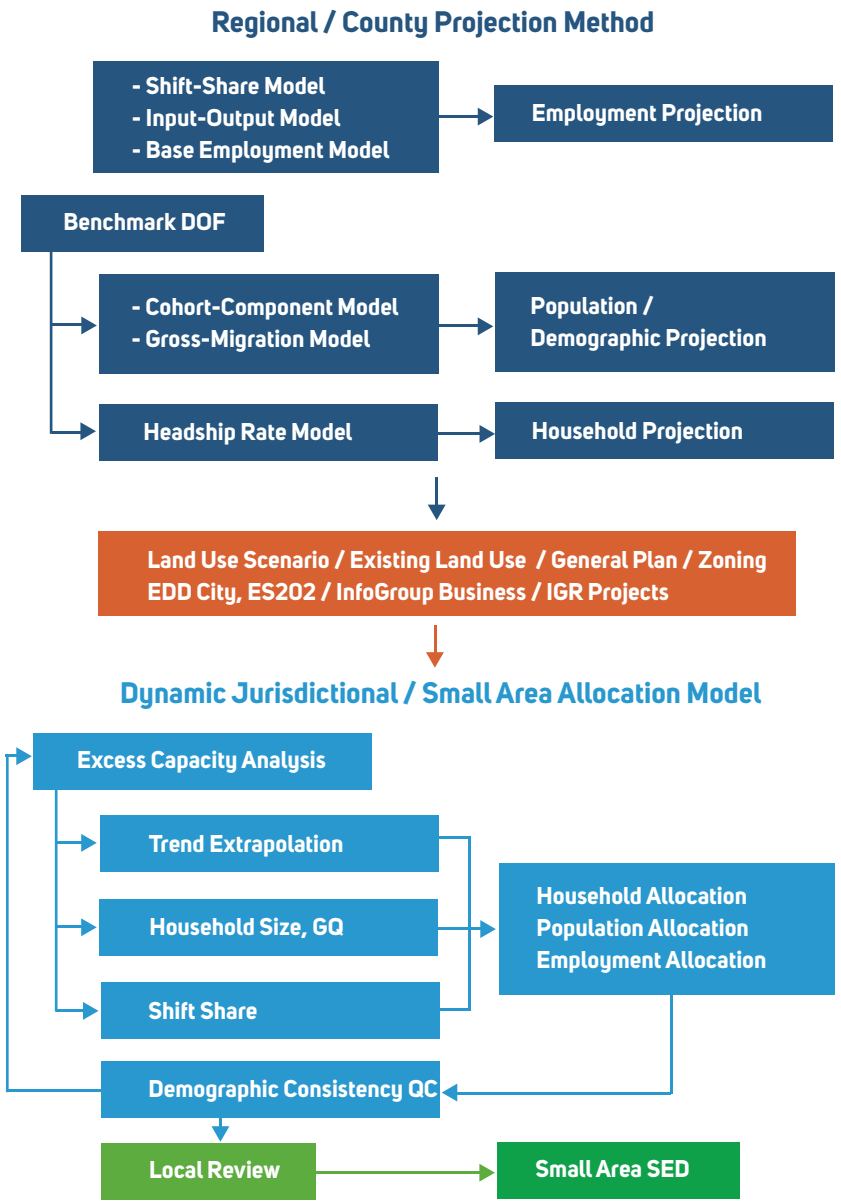
The model calculates vehicle miles and vehicle hour traveled (VMT and VHT), speeds and delay, and other performance measures for both passenger car and heavy-duty vehicles. The enhanced model utilizes Transportation Analysis Zones (TAZs) that are comparable to Census Block Groups as the analysis unit for most model components. There are 10,569 Census Block Groups and 11,267 Tier 2 TAZs in SCAG modeling area. Inter-regional and ports related travel are also included in the Model.

MODEL AND DATA ENHANCEMENTS

The trip-based model which is being utilized to analyze the 2016 RTP/SCS is basically the same model used in the 2012 RTP/SCS. The model framework is identical to the previous model with enhancements to selected modules, recalibrated using the 2012 Travel Survey, and validated to Year 2012 to replicate 2012 travel conditions. Below is a listing of the Trip-Based Model and data enhancements:

- **Model enhancements include:**
  - Comprehensive calibration and validation to 2012 travel conditions;
  - Trip market strata defined by car sufficiency and household income groups used throughout the entire demand models;
  - Re-estimated auto ownership model, sensitive to transit and non-motorized accessibility, multi-dwelling family housing, and residential and employment mixed use densities;
  - Updated trip production cross-classification models;
  - Re-estimated destination choice model, replacing the previous gravity models for all purposes except home-based college and school trips;
  - Re-calibrated nested mode choice model;
  - All cost variables updated to 2011 dollars; and
  - Updated the Heavy-Duty Truck Model.
- **Major Data Development and Acquisitions Include:**
  - 2012 CHTS and SCAG Travel Surveys;
  - Highway Network updated to 2012 base year conditions;

FIGURE 11 Overview of SCAG's Growth Forecasting Methodology



Source: SCAG

- Transit Network developed using the 2012 LA Metro's TripMaster database;
- Transit Level of Service Data obtained from the region's transit agencies;
- Working with other MPOs, updated auto operating costs;
- Year 2012 Screenline Count Database created, contains 640 traffic counts on the arterials and 33 video traffic counts on freeways;
- HPMS data from Caltrans for estimating regional and sub-air basin VMT;
- HERE / Google data for real-time network speed verification; and
- Airsage Data for alternative source of regional travel patterns.

HOUSEHOLD CLASSIFICATION AND POPULATION SYNTHESIZER

This module classifies zonal households into several household segments. Prior to the application of Auto Ownership module, households are classified across the following four attributes:

1. Household Size (4 categories): the number of one-person households, two-person households, three-person households, and four or more person households.
2. Number of Workers (4 categories): the number of households with no worker, with one worker, with two workers, and with three workers or more.
3. Household Income (4 categories): the number of households with annual household income (in 2011 dollars) less than $35K (Low), $35K-$75K (Medium), $75K-$150K (High), and $150K or more (Very High).
4. Type of Dwelling Unit (2 categories): single-family detached, and multifamily/ attached and group quarters.

For Home-Based-Work (HBW) trip generation, households are aggregated across the dwelling unit type and size attributes, and then further disaggregated into four Age of Head of Household groups (18 to 24 years old, 25 to 44 years old, 45 to 64 years old, and 65 years old or older).

The Population Synthesizer (PopSyn) is a module that generates a synthetic population by expanding the existing disaggregate sample data (from Census PUMS data) to mirror known aggregate distributions of household and person attributes (from SCAG zonal data). The control variables used in the population synthesizer are the above-mentioned four household variables. A synthetic population is generated for the entire SCAG region using this procedure.

AUTO OWNERSHIP MODEL

The auto ownership model predicts the number of households by auto ownership level (0, 1, 2, 3, 4 or more available vehicles) for each zone. This information is used in trip generation models to estimate zonal person trips. The auto availability model uses indicators for household size, household income, number of workers, residential and employment density, and transit and non-motorized accessibilities. The models were estimated in multinomial logit form. This is the very first model applied in the model chain.

TRIP GENERATION MODEL

Trip generation is the process of estimating daily person trips generated (i.e., trip production) and attracted to (i.e., trip attraction) by each TAZ on an average weekday. The trip generation model contains nine trip purposes: home-based work (HBW), home-based school (HBSC), home-based college/university (HBCU), home-based shopping (HBS), home-based social-recreational (HBSR), home-based serving-passenger (HBSP), home-based other (HBO), work-based other (WBO) and other-based other (OBO) trips. HBW trips are further split into eight types based on two trip categories ("Direct" versus "Strategic") and four income categories (less than $20,000, $20,000 to $49,999, $50,000 to $99,999, and $100,000 or more). "Direct" home-work trips go directly between home and work. "Strategic" home-work trips include one or more intermediate stops between home and work. In total, there are 16 trip types: eight types for home-based work, and one type for each of the other eight trip purposes.

TRIP DISTRIBUTION MODEL

The SCAG model includes two types of trip distribution models that estimate the number of trips from each TAZ to other TAZs. Destination choice models are developed for HBW, HBS, HBSR, HBSP, HBO, WBO and OBO trip purposes while a gravity model approach is used to distribute trips for school related purposes (HBSC and HBCU trip purposes). For each of the nine trip purposes, the productions and attractions are split into both peak and off-peak periods. The destination choice models are stratified by the car sufficiency/ income market segments and estimated in multinomial logit form. The following variables were examined and proved to be significant in the utility functions: mode choice logsum, distance between production and attraction zones, intra-zonal indicator and the mix of employment and households.

MODE CHOICE MODEL

Mode choice is the process of taking the zone-to-zone person trips by trip purpose from the trip distribution model, and determining how many of these trips are made by various travel modes. The SCAG mode choice model is a nested logit model. The top branch of the nesting structure includes Auto, Transit and Non-Motorized. The branch under Auto includes Drive Alone and Shared Ride which is further split into two-person carpool, three-person carpool, and four-or-more person carpool. The branch under Transit includes Local Bus, Rapid Bus, Express Bus, Bus Rapid Transit (BRT), Transit Way, Urban Rail, Commuter Rail and High-Speed Rail (HSR). The branch under Non-Motorized includes Walk and Bicycle. Separate mode choice models are estimated for each trip purpose and time period. Mode choice is a function of level of service attributes (in-vehicle travel time, out-of-vehicle travel time, fares, parking fees, roadway tolls and auto operating costs); household attributes such as income; and zonal attributes such as residential and employment densities.

NETWORK ASSIGNMENT MODEL

Prior to assignment, the mode choice output is converted from peak/off-peak production-attraction (PA) format to time-of-day OD format. The time-of-day procedure, employed for the 2016 RTP/SCS development, is based on trips-in-motion diurnal factors. Network assignment is the process of loading vehicle trips onto the appropriate networks. For highway assignment, the Regional Model consists of series of multi-class simultaneous equilibrium assignments for seven classes of vehicles (drive alone, two-person carpool, three-person carpool, four or more-person carpool, light HDT, medium HDT and heavy HDT) and for each of the five time periods. During this assignment process, trucks are converted to Passenger Car Equivalent (PCE) for each link and each truck type based on: 1) percentage of trucks, 2) percentage of grade, 3) length of the link, and 4) level of congestion (v/c ratios). Transit vehicles are also included in the highway assignment. For transit trip assignment, the final transit trips from the last loop mode choice models are aggregated by access mode and time period, and then assigned to transit networks for each time period. The vehicle trip tables obtained from mode choice, Airport and Heavy-Duty Truck models are aggregated to the 4,109 zone system (Tier-1 zones) prior to network assignment.

MODEL CONVERGENCE

In order to maintain consistency between the speeds predicted by the highway assignment and the travel times input to the entire travel demand model chain, the predicted speeds are used to re-compute highway and transit travel times, and the entire model sequence is repeated until input and output speeds are consistent with each other.

HEAVY-DUTY TRUCK MODEL

The Heavy-Duty Truck (HDT) Model produces forecasted trips for each of three HDT weight classes with gross vehicle weight (GVW) ranging from 8,500 to 14,000 lbs. for light-heavy

HDT, 14,001 to 33,000 lbs. for medium-heavy HDT, and more than 33,000 lbs. for heavy-heavy HDT. Below is an overview of the various HDT Model components:

- Internal HDT Model: This includes the development of all HDT trips that have both an origin and destination within the six-county modeling area. This component of the HDT Model estimates trip tables for intra-regional truck trips. Trip generation is based on trip rates (number of trips per employee or household) for 10 different land uses/industry sectors at the trip ends. The trip distribution process is based on a matrix of factors that indicate the trip interchange relationships among different land use types (i.e., what fraction of trips originating at a land use such as manufacturing sites go to warehouses vs. other manufacturing sites, etc.).
- External HDT Model: This includes how the external HDT trips are captured in the HDT model that come into, go out of, and pass through the region. This component estimates the trip table for all interregional truck trips based on commodity flow patterns that link Southern California with the rest of the nation. The model uses a commodity flow database obtained from outside sources and procedures for converting annual tonnage flows at the county level to daily truck trips at the TAZ level. Seaport and airport related truck trips were included as special generator truck trips.
- Port Related Truck Trips: The Port of Long Beach (POLB) and Port of Los Angeles (POLA) have developed detailed models to forecast port related truck trips. SCAG obtains outputs (trip tables) from the Port Model which predict the HDT trips coming out of and going into the San Pedro ports, which includes the POLB and POLA.
- Intermodal Trip Tables: This includes the intermodal trip tables which are integrated into the HDT Model.
- Time-of-Day Choice: This includes the derivation of time-of-day factors from various sources. The daily truck trips by truck types are allocated to five time periods and merged with the auto trips in trip assignment step.

EMFAC MODEL

The ARB's EMFAC2014 (short for "EMission FACtor", approved by the U.S. EPA in Fall 2015) Model is a computer model capable of estimating both current year, as well as back-cast and forecasted emission inventories for calendar years of 2000 to 2050. EMFAC estimates the emission rates of 1965 and newer vehicles, powered by gasoline, diesel or electricity. Emissions inventory estimates are made for over two hundred and 77 different technology groups and are reported for 51 broad vehicle classes segregated by usage and weight.

EMFAC calculates the emission rates of HC, CO, NOx, PM, lead, SO2 and CO2 for 45 model years for each vehicle class within each calendar year, for twenty-four hourly periods, for each month of the year, for each district, air basin, county and subcounty in California. EMFAC2014 can report the grams per mile emission rates of a single technology group or the ton per day inventory for the entire 37,000,000 vehicle California fleet.

To determine regional and air basin emissions, SCAG runs the ARB's EMFAC Model using the outputs from the trip-based regional transportation demand model including the HDT Model.

NOTES

[1] High Quality Transit Area: Generally a walkable transit village or corridor, consistent with the adopted RTP/SCS and is within one half-mile of a well-serviced transit stop or a transit corridor with 15-minute or less service frequency during peak commute hours. The definition that SCAG has been using for the HQTA is based on the language in SB375 which defines:

[2] Major Transit Stop: A site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (CA Public Resource Code Section 21064.3). Major Transit Stop A site containing an existing rail transit station, a ferry terminal served

[3] Transit Priority Area: An area within a ½-mile of high quality transit; a rail stop or a bus corridor that provides or will provide at least 15-minute frequency service during peak hours.

[4] Land Development Categories:
Urban Infill: Well-connected street networks and the mix and intensity of uses, often found within and directly adjacent to moderate and high density urban centers.
Compact Walkable: Less density than Urban Infill, but highly walkable with rich mix of uses.
Standard Suburban: Represents the majority of separate-use auto-oriented development and low walkability.

REFERENCE DOCUMENTS

As mentioned in this Appendix, below are reference documents on the analytical modules utilized as a part of the Urban Footprint Scenario Planning Model. These serve as documentation on the model, details on the assumptions and calculations the analytical modules utilize, and a summary of the "Place Types" Urban Footprint utilizes for analysis purposes.

DISCRETIONARY APPROVAL REQUESTS FOR
ENLIGHTENMENT PLAZA
312-328 NORTH JUANITA AVENUE, 317-345 NORTH MADISON AVENUE,
and 3810-3838 WEST OAKWOOD, LOS ANGELES, CA 90013

The Applicant, Flexible PSH Solutions, Inc., requests approval of the following discretionary actions:

1. Pursuant to **LAMC Section 11.5.6,** as authorized by the Los Angeles Charter Section 555, the Applicant requests approval of a General Plan Amendment to revise the land use designation in the Wilshire Community Plan from Limited Industrial[1] to Commercial Manufacturing to permit the construction of a new Permanent Supportive Housing project which combines Restricted Affordable[2] units with supportive social services for formerly homeless individuals. The proposed Project contains a maximum of 454 residential dwelling units, including 449 Restricted Affordable units and 5 managers' units with approximately 11,772 square feet of residential supportive services.
2. Pursuant to **LAMC Section 12.32 F,** the Applicant requests approval of a Zone Change from M1-1 Zone (Limited Industrial) to CM-1 Zone (Commercial Manufacturing) to permit the construction of new Permanent Supportive Housing project which combines Restricted Affordable units with supportive social services for formerly homeless individuals. The proposed Project contains a maximum of 454 residential dwelling units, including 449 Restricted Affordable units and 5 managers' units with approximately 11,772 square feet of residential supportive services.
    a. Pursuant to **LAMC Section 11.5.11 (e) and California Government Code 65915(k),** the Applicant is requesting the following incentives in connection with a 100 percent affordable project:
        i. A 20% reduction in overall open space requirement to permit 36,580 square feet of Open Space in lieu of providing 45,725 square feet.
        ii. The elimination of Section VI.6 of the Vermont/Western Transit Oriented District Station Neighborhood Area Specific Plan (SNAP) Development Standards and Design Guidelines along the front property line.
        iii. To utilize the side yard requirements for the RAS3 zone per LAMC 12.10.5 in lieu of the side yard requirements in the underlying CM zone.
3. Pursuant to **LAMC Section 11.5.7 G,** the Project Applicant requests approval of a Specific Plan Amendment to introduce a new Subarea within the SNAP, Subarea D.2 - Commercial Manufacturing/Permanent Supportive Housing, to permit the construction of qualified Permanent Supportive Housing project that includes Restricted Affordable housing units with supportive social services for formerly homeless. As mentioned previously, this Project proposes a maximum of 454

[1] The Wilshire Community Plan General Plan Map identifies the site with the land use designation of Limited Industrial. ZIMAS identifies the site with the General Plan land use designation of Limited Manufacturing.
[2] Per LAMC "A residential unit for which rental or mortgage amounts are restricted so as to be affordable to and occupied by Very Low, Low or Moderate Income households, as determined by the Housing and Community Investment Department. (Amended by Ord. No. 182,718, Eff. 10/30/13.)"

residential dwelling units including 449 Restricted Affordable units and 5 managers' units with approximately 11,772 square feet of residential supportive services.

4. Pursuant to **LAMC Section 11.5.7 C and Section 12.A.1** of the SNAP, the Project Applicant requests Project Permit Compliance review.
5. Pursuant to **LAMC. Section 16.05,** the Project Applicant requests the approval of Site Plan Review findings for a project that proposes more than 49 new residential dwelling units.
6. Pursuant to **California Government Code Sections 66473.1, 66474 (Subdivision Map Act) and LAMC Section 17.01 and 17.15**, the Applicant requests approval of a Vesting Tentative Tract Map to permit the merger and re-subdivision of the land and the creation of one ground lot containing 5 air space lots. The Project Applicant also requests to record the Final Map in phases. The requested Lots included:
    i. Lot 1: Master Ground Lot
    ii. Airspace Lot 2: Northeast
    iii. Airspace Lot 3: Southeast
    iv. Airspace Lot 4: Southwest B
    v. Airspace Lot 5: Southwest A
    vi. Airspace Lot 6: Northwest
7. The Applicant requests a Haul Route approval.

The Proposed Project would also request discretionary and ministerial permits and approvals that may be deemed necessary including, but not limited to, the following: shoring, grading, foundation, removal of existing street trees, and building and tenant improvements.

As a separate action, the Applicant may seek approval to vacate a portion of Madison Avenue (between the proposed driveway/round-about and Oakwood Avenue), Oakwood Avenue (between Westmoreland Avenue and Juanita Avenue) , and a portion of Juanita Avenue (fronting the property at 3838 Oakwood Avenue) to allow for a turnaround at the proposed new terminus of Juanita Avenue and Oakwood Avenue. The Proposed Project, as defined above, is not dependent upon this request. Nevertheless, it is being disclosed here and in the Sustainable Communities Environmental Assessment ("SCEA") prepared for the Project for informational purposes and potential future clearance under the California Environmental Quality Act ("CEQA"), if required.

PROJECT SUMMARY

Applicant

Flexible PSH Solutions, Inc. (the "Applicant") is a California 501(c)3 Not-for-Profit Public Benefit Corporation, created in 2018 to development of permanent supportive housing for the chronically homeless. The Applicant provides an easily replicable, cost-effective model for the provision of services required by tenants in order to stabilize their lives and remain housed long term. Their focus is to provide a highly supportive, caring environment for our tenants, keeping them off the streets.

Flexible PSH Solutions, Inc. is led by John E. Molloy, a veteran of urban planning with more than 30 years of experience in housing, commercial development, and community development programs. Prior to the foundation of Flexible PSH Solutions, Inc. Molloy served as Executive Director of PATH Ventures and led the organization in the development of 12 permanent supportive housing projects, totaling 1,272 units providing supportive housing and services to the (formerly) homeless of Southern California. Molloy also served as the Executive Director of the Sacramento Housing and Redevelopment Agency as well Administrator of the Los Angeles Community Redevelopment Agency.

Project Description

The Applicant proposes to redevelop an approximate 94,623 square foot (2.17 acre) area located at 312 - 328 N. Juanita Avenue, 317 - 345 N. Madison Avenue, and 3810 - 3838 W. Oakwood Avenue in the Wilshire Community Plan of the City of Los Angeles (the "Project Site"). The Project Site is located in the M1-1 zone with a Limited Industrial General Plan land use designation. The Project Site is also located within Subarea D of the Vermont/Western Transit Oriented District Station Neighborhood Area Specific Plan (the "SNAP"), a Specific Plan established by Ordinance No. 173,749 in 2001. The Project Site is currently improved with light industrial/commercial buildings, residential dwelling units and accessory surface parking.

The Applicant proposes to demolish the existing buildings and construct a new Permanent Supportive Housing development consisting of approximately 454 dwelling units and approximately 11,772 square feet of supportive services (the "Project" and "Enlightenment Plaza"). Exclusive of the five managers' units, the Project would be 100% Restricted Affordable housing serving Extremely Low to Low Income individuals, and available only to target population members.

In order to provide residential uses on the Project Site, the Applicant is requesting and General Plan Amendment to change the Land Use Designation from Limited Industrial to Commercial Manufacturing, a Zone Change to change the zoning from M1 to CM, a Specific Plan Amendment to add a new Subarea to the SNAP that allows both Commercial Manufacturing uses and Restricted Affordable Housing units with supportive services, a Specific Plan Project Permit and Site Plan Review.

The Applicant also requests approval of Vesting Tentative Tract Map No. 82798 for the merger of existing lots to create one master ground lot and the subdivision of five airspace lots. The subdivision area only includes 312-328 N. Juanita Avenue, 317-345 N. Madison Avenue, and 3810-3814 ½ W. Oakwood Avenue (the "Development Site"). Neither the subdivision nor the Development Site include the parcel at 3818 - 3838 W. Oakwood Avenue (APN 5501-001-025),

which is approximately 3,649 square feet in size and currently developed with a 5,663-square-foot two-story office building above a one-level partially subterranean garage. The Project includes renovations to the existing building on this lot, but no changes to the use or building envelope are proposed.

The Project would be constructed on the Development Site, which consists of 2.09-acre[3] area (90,974 square feet) within the Project Site improved with three detached dwelling units, three one-story light industrial/storage buildings and a surface parking lot. The Project would include five 8-story buildings: the Northeast Building, Northwest Building, Southeast Building, Southwest Building A and Southwest Building B.

The Project would contain approximately 247,812 square feet of floor area[4], or approximately 3 times the Buildable Area of the Development Site. The Northeast Building would contain approximately 78,812 square feet, the Northwest Building would contain approximately 49,000 square feet, the Southeast Building would contain approximately 47,000 square feet, the Southwest Building A would contain approximately 39,000 square feet and the Southwest Building B would contain approximately 34,000 square feet. The buildings would range from 92 feet and 3 inches to 95 feet to the highest building element.

Open Space would be provided in a ground floor courtyard, one podium deck and interior common areas. A total of 36,580 square feet for open space is planned for the Project. Courtyards and exterior open spaces would total 30,508 square feet. Interior common open space areas are located in each building providing fitness areas, computer rooms, and community gathering spaces and total 6,072 square feet. Approximately 7,627 square feet of landscaping is proposed throughout the courtyards and podium deck with 114 trees.

The Project would provide 23 parking spaces for the purposes of accommodating guests, supportive services, case management offices and the managers' units. Vehicle parking is proposed in the Southwest Building A, Southeast Building and Northeast Building. Vehicle access would be provided via a two-way driveway on Juanita Avenue to the Southwest Building A parking, via a two-way driveway on Madison Avenue to the Southeast Building parking and via a two-way driveway on Oakwood Avenue to the Northeast Building parking. The Project will provide 227 long-term bicycle parking spaces and one bike rack for every 50 feet of lot frontage of the Development Site, for a total of 24 short-term bicycle parking stalls and a combined total of 251 bicycle parking stalls.

The main access to the Project would be from Madison Avenue, where a roundabout for pick-up and drop-off opportunities is designed. The roundabout opens to a large central courtyard. The courtyard also informs building orientation, massing breaks, and material selection. The courtyard also creates a large common area that hopes to create a relationship with the PATH ventures project located across Madison Avenue. The Project intends to employ modular construction, which also informs the architectural design and façade rhythms.

Separate standalone Street Vacation applications may be pursued with the City of Los Angeles for portions of Madison, Oakwood and Juanita Avenues independent of the main entitlements. The future vacation of portions of Madison Avenue, Juanita Avenue, and Oakwood Avenue would allow for secured and controlled access to the Project Site and the adjacent PATH project, and to

[3] The gross lot area, to the centerline of the streets, includes 112,664 square feet of floor area. Buildable Area, as defined by LAMC Section 12.03, of the Development Site is approximately 87,466 square feet.
[4] See below Development Standards for floor area definition.

provide an opportunity to facilitate transit access, and enhance landscaping and open space features. The operation of the Project is not dependent upon the future vacation of these roadways.

Architectural Design Narrative

The proposed Enlightenment Plaza campus is designed to promote wellness and sustainability. Enlightenment Plaza has aligned the site planning and programming processes with a vision of promoting and protecting health, wellness and sustainability across community life. The site plan design focuses community, mind and nourishment to promote physical and mental wellness. The campus is designed with five multi-family residential buildings surrounding a large open park and paseo space (the "Park"). The multi-family residential buildings are Restricted Affordable housing units utilized as part of a Permanent Supportive Housing project for formerly homeless individuals that are combined with on-site supportive services.

The Park would provide physical well-being with community gardens, outdoor fitness areas and a dog run for activity and training. Mental wellness will be encouraged through resident supportive counseling services, nearby clinical assistance (outside of Enlightenment Plaza), meeting rooms for teaching and seminars, shower rooms for the homeless, butterfly-friendly gardens, sensory plantings, indoor/outdoor yoga spaces and water features. Enlightenment Plaza will continue to foster resiliency, equity, ownership and a sense of community to residents.

Architecture is informed by the open park and programmed social spaces. The Park is envisioned to influence the location of social spaces within each of the five Permanent Supportive Housing buildings. Later informing initial building orientation, massing breaks, and eventually material selection. The Park additionally influences building articulation. The design locates many of the common social spaces at the edges of the 5 buildings. These social spaces take many forms and scales varying from a common podium courtyard, to common decks and down to individual private balconies. Each of these upper social spaces provides visual connection back to the Park and Paseo. These decks not only provide an additional sense of security onto the Park and Paseo, but become the first level of articulation for each of the 5 buildings. Further building articulation is provided with building massing, fenestration locations, and material color and texture choices.

Additionally, the new Permanent Supportive Housing buildings will provide a sense of community and equity to residents via clean and accessible apartment homes, interior fitness areas, serene roof decks and safety through visually connected spaces. Redeveloping these parking lots to become Enlightenment Park, adjacent to PATH Metro Villas and La Kretz Villas, will transform this neighborhood into a sustainable collection of Permanent Supportive Housing supported by wellness programs and the community.

Residential Supportive Services

Enlightenment Plaza will offer a Service Plan dedicated to assisting the residents that are homeless individuals, including those experiencing chronic homelessness with special needs as defined by HUD, unaccompanied homeless persons with disabling conditions, and other homeless individuals with conditions of mental illness and/or chronic medical conditions, developmental disabilities, substance abuse, and HIV/AIDS or co-occurring disorders.

Each resident will be provided case management services as well as mental health services. The program would use the Housing First approach that prioritizes permanent housing for those experiencing homelessness so that the resident may pursue personal goals and improve their quality of life. This approach will be achieved by providing integrated services that allow for a wide range of mental health, substance abuse, and medical and functional needs of the resident to be addressed simultaneously and directly by on-site case managers or coordinated with the appropriate community provider.

Professional staff and community services providers will be on-site to ensure sufficient services and activities are available to meet the residents' needs. All service personnel are trained in evidence-based interventions and other case management approaches emphasizing housing stabilization, self-sufficiency and skill building, aging in place interventions, mainstream benefits assistance, peer advocacy, wellness, recovery and community integration.

Enlightenment Plaza will provide supportive services and amenities including:

- New tenant orientation to identify the types of services and activities that would benefit them.
- Case management services to develop an Individual Service Plan for each resident to identify short- and long-term goals to be achieved, along with a plan for monthly reviews, at a minimum, of the resident's progress.
- Mental health services on-site that include psychiatric assessments, individual and group therapy, and crisis intervention with a focus on achieving wellness, recovery and housing stability.
- Substance abuse treatment services that address recovery planning and relapse prevention strategies, along with outpatient and inpatient provider referral and treatment options.
- Recreational and educational activities to foster a sense of community within the building and engage the residents with the surrounding neighborhood. Residents will have the opportunity to participate in theatre classes and perform plays in the Project's outdoor amphitheater.
- Housing stabilization and retention are the primary goals for each resident. Residents with specific issues or barriers to complying with lease regulations or pay rent will be helped to overcome these issues in order to prevent eviction.

Enlightenment Plaza's general goals of the Service Plan are to assist the residents in 1) maintaining stable housing, 2) increasing skills and/or income, and 3) achieving self-determined life goals.

The Project will provide a total of 11,772 square feet of Residential Supportive Services including 5,700 square feet dedicated to case manager offices with meeting rooms and 6,072 square feet of interior common open space as permitted in Subarea D.2 of the SNAP.

PROJECT SITE

Project Site

The Project would redevelop an approximate 90,974 square foot area referred to as the Development Site. The Development Site is located within a greater Project Site, which encompasses the majority of the city block bounded by Beverly Boulevard to the south, Madison Avenue to the east, Oakwood Avenue to the north and Juanita Avenue to the west. The Project Site consists of twelve contiguous lots and three Assessor's Tax Parcels (APNs 5501-001-023, -025, -800).

The Project Site is located in the M1-1 Zone and height district and has a General Plan Land Use designation of Limited Industrial.[10] The Project Site is located in Subarea D of the SNAP which is subject to the use and area regulations of the CM Zone (LAMC Section 12.17.1), except that projects with hotel, motel, apartment hotel, and residential uses are prohibited. The Applicant is requesting approval of a Specific Plan Amendment to the SNAP to create a new Subarea D.2 (See Exhibit B for Specific Plan Amendment and Exhibit C Development Standards) to permit the construction of a Restricted Affordable housing units dedicated to a Permanent Supportive Housing project.

Table 2. Project Site Information

Address	Tract	Block	Lot	APN	Development Site
None	Dayton Heights Tract	V	FR 18	5501-001-025	No

322 N. Juanita Avenue			14		
316 N. Juanita Avenue			13		
312 N. Juanita Avenue			12		

The Development Site is currently developed with three small detached residential buildings (one is owner occupied), three small commercial buildings, and surface parking lots. The parcel at 3838 W. Oakwood Avenue, which is within the Project Site but outside of the Development Site, is currently developed with a two-story office building above a one-level partially subterranean garage that will be renovated.

Surrounding Uses

The adjacent properties are improved with a variety of residential, commercial and industrial uses. The Development Site and Project Site are surrounded by parcels that are zoned R4, C2, CM and M1. The adjoining properties to the south are developed with a used-car sales lot and a pest control company in the M1-1 zoned property. The adjoining properties to the west are improved with a manufacturer of stone furnishings and fireplace mantels. Across Madison Avenue to the east is improved with the PATH Affordable Housing Project that provides housing and supportive services similar to those in the proposed Project located in the M1-1 zone (CPC-2014-1602-CU-SPE-SPP-DB-SPR). Across Juanita Avenue to the west is improved with the La Kretz Villas, a 49-unit residential building that combines subsidized and affordable studio units for individuals who have experienced homelessness and/or disabilities located in the R4-1 zone. Also across Juanita Avenue to the west is improved with an office building on a parcel zoned C2-1. Other nearby buildings in the vicinity along Beverly Boulevard include auto repair shops and an animal hospital located on parcels zoned M1-1.

Transit Adjacency

The Project Site is located one block to the west of the Metro Red Line rail station at Vermont Avenue and Beverly Boulevard. The Metro Red Line rail station provides access to the Metro Purple Line at the Wilshire/Vermont station and access to the Metro Expo Line and Metro Blue Line at the 7th Street/Metro Center rail station in downtown Los Angeles. The Metro Rail Expo Line ends in downtown Santa Monica and the Metro Rail Blue Line ends in downtown Long Beach with a stop that connects to the Metro Green Line. The Metro Red Line runs from North Hollywood to Union Station, where riders may access the Metro Gold Line.

The most convenient Metro Rapid Bus stop to the Project Site is Metro Rapid Bus 754, which runs north-south on Vermont Avenue with a stop at Vermont Avenue and Beverly Boulevard, one block to the west of the Project Site. Metro Rapid Bus 754 runs from Sunset Boulevard to the north to the Vermont/Athens Metro Green Line stop to the south. Metro Rapid Bus 754 includes a stop at Exposition Boulevard that accesses the Expo/Vermont Metro Expo Line rail station.

Metro Rapid Bus 754 offers connections to several Metro Rapid Bus lines. To the north, Metro Rapid Bus 754 includes a stop at Hollywood Boulevard which includes a connection to Metro Rapid Bus 780 that runs from the Washington/Fairfax Transit Hub to the west to Colorado

Boulevard and Hill Avenue in Pasadena to the east. To the north at Santa Monica Boulevard, a connection is available to Metro Rapid Bus 704 which runs from Santa Monica to the west to the Patsaouras Bus Plaza/Union Station to the east. The Metro Rapid Bus 754 stop at Wilshire Boulevard provides access to Metro Rapid Bus 720 that runs from Santa Monica to the west to the Commerce Center to the east with stops on 5th and 6th Streets through downtown Los Angeles. At Olympic Boulevard and Vermont Avenue, Metro Rapid Bus 728 runs from Century City to the west to the Patsaouras Bus Plaza/Union Station to the east with stops on Hill and Spring Streets through downtown Los Angeles. At Venice Boulevard and Vermont Avenue, Metro Rapid Bus 733 runs from Santa Monica to the west to Patsaouras Bus Plaza/Union Station to the east with stops on Main and Spring Streets in downtown Los Angeles. Further to the south at Vernon Avenue, Metro Rapid Bus 705 runs from La Cienega Boulevard and Rodeo Road to the west and Santa Monica and San Vicente Boulevards to the north to Long Beach Boulevard and Vernon Avenue to the east.

Two Metro Local Bus lines with stops at Vermont Avenue and Beverly Boulevard are located one block to the west of the Project site. Metro Local Bus 204 runs north-south on Vermont Avenue along the same path as Metro Rapid Bus 754. Metro Local Bus 204 runs from Sunset Boulevard to the north to the Vermont/Athens Metro Green Line stop to the south. Metro Local Bus 204 includes a stop at Exposition Boulevard that accesses the Expo/Vermont Metro Expo Line rail station.

Metro Local Bus 14 runs east-west along Beverly Boulevard from Beverly Hills to the west, with stops at the Beverly Center, Farmer's Market/The Grove and Larchmont Village, to Adams Boulevard and Figueroa Street to the east, with stops at locations in downtown Los Angeles along Grand Avenue and Olive Street.

Street Designations

Juanita Avenue	The Mobility Plan 2035 designates Juanita Avenue as a Local Street - Standard with a requiring right-of-way width of 60 feet (30-foot half right-of-way) and a required roadway width of 36 feet (18-foot half roadway and 12-foot sidewalk). Juanita Avenue is currently improved with a 60-foot right-of-way.
Madison Avenue	The Mobility Plan 2035 designates Madison Avenue as a Local Street - Standard with a requiring right-of-way width of 60 feet (30-foot half right-of-way) and a required roadway width of 36 feet (18-foot half roadway and 12-foot sidewalk). Madison Avenue is currently improved with a 60-foot right-of-way.
Oakwood Avenue	The Mobility Plan 2035 designates Oakwood Avenue as a Local Street - Standard with a requiring right-of-way width of 60 feet (30-foot half right-of-way) and a required roadway width of 36 feet (18-foot half roadway and 12-foot sidewalk). Oakwood Avenue is currently improved with a varying width of 32 – 60 feet.

ZONING CONFORMANCE

Density

The Development Site is located within the M1-1 Zone and Subarea D of the SNAP. Residential units are not permitted in the M1 Zone unless an existing building is being converted either by way of a conditional use permit process or under the Adaptive Reuse Ordinance. Subarea D allows uses of the CM Zone, except that Projects with hotel, motel, apartment hotel, and residential uses are prohibited.

In order to provide residential uses on the Development Site, the Applicant is requesting a General Plan Amendment, Zone Change and Specific Plan Amendment to create a new Subarea (See Exhibit B for Specific Plan Amendment and Exhibit C Development Standards) that permits unlimited density for a qualified Permanent Supportive Housing Project. The Project proposes the development of 454 dwelling units as part of a Qualified Permanent Supportive Housing Project.

The Project provides five individual buildings. The Southwest Building A would include 74 units, the Southwest Building B would include 62 units, the Northwest Building would include 84 units, the Northeast Building would include 143 units and the Southeast Building would include 90 units. The Project would provide 370 studio units, 71 one-bedroom units and 13 two-bedroom units. These units offer private baths, kitchens and living spaces critical to promoting resident independence.

Table 3. Proposed Density and Unit Type by Building

Building	Northeast	Northwest	Southeast	Southwest A	Southwest B	Total
Studios	111	48	76	73	62	370
One-Bedroom	22	35	14	0	0	71
Two-Bedroom	10	1	0	1	1	13
Total	143	84	90	74	63	454

Affordability

The Applicant is requesting entitlements subject to affordability requirements outlined in Measure JJJ and codified in LAMC Section 11.5.11(a)(1)(iii), which requires no less than 5% of the total units at rents affordable to Extremely Low Income households, and either 11% of the total units at rents affordable to Very Low Income households or 20% of the total units at rents affordable to Lower Income households, inclusive of any Replacement Units. The Project would restrict 5% of the total units at the Extremely Low Income level and 11% of the total units at the Very Low Income level in accordance with California Department of Housing and Community Development (HCD) rent schedules.

To qualify for AB 1197, the Project must provide 100% of the units at Low Income levels in accordance with HCD rent schedules. The Project will satisfy all the affordability requirements by providing the aforementioned 5% of the total units at the Extremely Low Income level, 11% of the total units at the Very Low Income level and the remaining units, exclusive of five managers' units, as Restricted Affordable at the Low Income level.

The Project will also restrict affordable units consistent with the definition of a Qualified Permanent Supportive Housing Project in the proposed Subarea D.2 of the SNAP. Qualified Permanent

Supportive Housing is defined as a project where "where all of the total combined Dwelling Units or Guest Rooms, exclusive of any manager's units, are affordable. For the purposes of this subdivision, affordable means that rents or housing costs to the occupying residents do not exceed 30 percent of the maximum gross income of Extremely Low, Very Low or Low Income households, as those income ranges are defined by the United States Department of Housing and Urban Development (HUD) or any successor agency, as verified by the Housing & Community Investment Department (HCIDLA). A minimum of 50 percent of the total combined Dwelling Units or Guest Rooms is occupied by the Target Population."

By providing 5% of the total units at the Extremely Low Income level, 11% of the total units at the Very Low Income level and the remaining units as Low Income at the HCD rent levels, the Project also satisfies the proposed Subarea D.2 affordability requirements.

Additionally, 100% of the total units will be provided for members of the Target Population, who are persons, including persons with disabilities, and families who are homeless, exclusive of the managers' units.

Table 4. Affordability and Target Population

Program	Requirements	Proposed
Measure JJJ (General Plan Amendment and Zone Change) (LAMC § 11.5.11)	5% Extremely Low and 11% Very Low or 20% Low based on HCD rents	5% Extremely Low, 11% Very Low, 84% Low all based on HCD rents and 5 market rate managers' units. 100% set aside for the target population excluding manager's units
AB 1197	100% Low based on HCD rents	
SNAP Subarea D.2	100% Low and 50% target population based on HUD rents	

Floor Area

The Development Site is located within the M1-1 Zone, but the Applicant is requesting a Zone Change to the CM-1 Zone. The Height District 1 in the CM zone restricts the site to a Floor Area Ratio of 1.5 to 1, or one and one-half times the Buildable Area of the Development Site. The Applicant also proposes a Specific Plan Amendment to the SNAP to create Subarea D.2 that would permit Qualified Permanent Supportive Housing projects to not exceed a maximum Floor Area Ratio of 3 to 1, or three times the Buildable Area of the Development Site. Buildable Area, as defined by LAMC Section 12.03, is the Lot Area excluding those portions of the lot which must be reserved for yard spaces, building line, setback space that would apply to a one-story building. This means that the Buildable Area is less than the total Lot Area.

The Lot Area of the Development Site is 90,974 square feet, but the Buildable Area of the Development Site is approximately 87,466 square feet. With a 3 to 1 FAR, the maximum permitted floor area is approximately 262,398 square feet. The Project will provide 11,772 square feet of Residential Supportive Service areas consisting of 5,700 square feet of case management services offices with meeting rooms and 6,072 square feet interior common open space areas. This combines to provide 4.7% of the Projects floor area which exceeds the 3% standard.

The proposed Subarea D.2 modifies the definition of Floor Area. Floor Area as defined by LAMC Section 12.03 excludes exterior walls, stairways, shafts, rooms housing building-operating

equipment or machinery, parking areas with associated driveways and ramps, space dedicated to bicycle parking, space for the landing and storage of helicopters, and basement storage areas. Subarea D.2 standards additionally excludes from the overall calculation of Floor Area for Qualified Permanent Supportive Housing projects areas designated exclusively for supportive services uses or public areas accessible to all residents, including those for residential or supportive services uses, indoor open spaces, lobbies, and corridors. Subarea D.2 standards also require that the Floor Area be measured to the center line of wall partitions between public and non-public areas.

The Project provides five individual buildings. The Southwest Building A would include 39,000 square feet, the Southwest Building B would include 34,000 square feet, the Northwest Building would include 49,000 square feet, the Northeast Building would include 78,812 square feet and the Southeast Building would include 47,000 square feet. The Project, after all five buildings are constructed, would create a total of 247,812 square feet of new floor area consistent with the definition of Floor Area outlined in the proposed Subarea D.2 of the SNAP.

Table 4. Proposed Floor Area (SF) by Building

	Northeast	Northwest	Southeast	Southwest A	Southwest B	Total
LAMC 12.03 floor area	102,996	61,766	58,615	52,196	42,170	317,743
Subarea D.2 Deductions						
Supportive Services	1,215	1,000	860	1,350	1,275	5,700
Common Areas	5,994	1,263	4,196	1,202	1,945	14,600
Corridors	14,970	8,478	6,559	9,274	4,278	43,559
Interior Open Spaces	2,005	2,025	-	1,370	672	6,072
Total Deductions	24,184	12,766	11,615	13,196	8,170	69,931
SNAP Subarea D.2 Floor Area	**78,812**	**49,000**	**47,000**	**39,000**	**34,000**	**247,812**

Height

Subarea D.2 would establish unlimited height and story restrictions for Qualified Permanent Supportive Housing Projects. The Project would achieve a maximum building height of 95 feet.

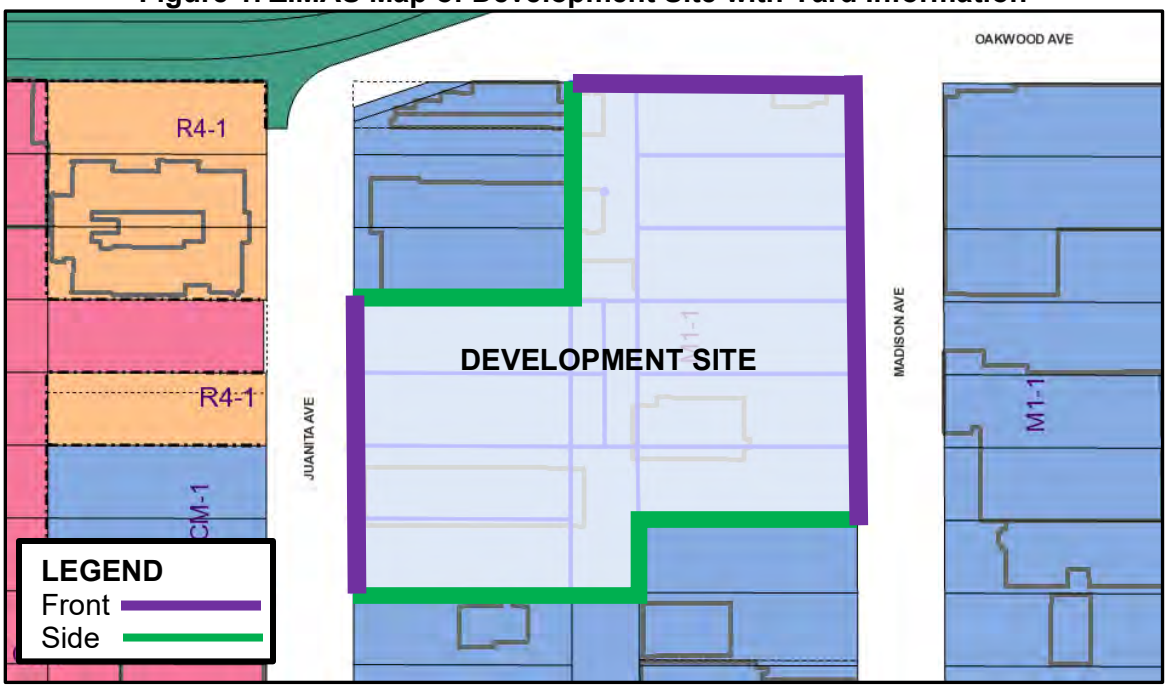
Table 5. Proposed Height by Building

	Northeast	Northwest	Southeast	Southwest A	Southwest B
Height (feet)	92' - 3"	94' - 3"	93' - 7"	94' 6"	95' - 0"
Stories	8	8	8	8	8

Yards and Setbacks

The Development Site has three separate street frontages and several internal property lines. Based on the Department of City Planning discussion with LADBS, all three street frontages are considered front yards and all internal property lines are considered side yards. There are no rear yards as part of the Development Site.

Figure 1. ZIMAS Map of Development Site with Yard Information



Based on the proposed SNAP Subarea D.2, yard provisions would be in accordance with the underlying zone. The Applicant is requesting a Zone Change from M1 to CM so the yard provisions of the CM zone would apply. However, the Applicant is also requesting a Developer Incentive pursuant to LAMC Section 11.5.11(e), which allows Projects that provide affordable housing consistent with LAMC Section 11.5.11 to be entitled to three incentives or concessions. Because the Project will restrict 100% of the total units, exclusive of manager's units, at rent levels consistent with LAMC Section 11.5.11, the Applicant requests to utilize the side yard requirements for the RAS3 zone per LAMC 12.10.5 in lieu of the side yard requirements in the underlying CM zone. The CM zone does not require front yard setbacks and the RAS3 zone requires 5-foot side yards. Thus, the Project is not required to provide a minimum front yard setback on and is required to provide side yard setbacks of at least 5 feet.

The Project includes varying setbacks from all property lines ranging from 0 feet to 37' - 6". Along street frontages, the Northeast Building would have a minimum setback of 0 feet from Oakwood Avenue, the Northeast Building would have a minimum setback of 0 feet from Madison Avenue, the Southeast Building would have a minimum 4' – 1" setback from Madison Avenue, the Northwest Building would have a minimum 17-foot setback from Juanita Avenue and the Southwest Building A would have a minimum 2' - 10" setback from Juanita Avenue. In multiple instances, varying building setbacks along street frontages are determined by the location requirements of the transformer so they are accessible to the public street.

The minimum interior yard setback would be 5' – 1" for a portion of the Southwest Building B between the building and the southwesterly property line. All other interior yard setbacks range from 10' – 2" to 13' – 11".

Open Space

According to the proposed SNAP Subarea D.2, which references LAMC Section 12.21.G, the Project is required to provide a minimum of 100 square feet of open space per unit with less than

3 habitable rooms, 125 square feet of open space per unit with three habitable rooms and 175 square feet of open space per unit with more than three habitable rooms. According to the LAMC definition of habitable rooms, a kitchen is not considered a habitable room for open space purposes.

The 454-unit Project would construct 441 units with less than three habitable rooms and 13 units with three habitable rooms. Thus, the required open space would be 45,725 square feet of open space. However, the Applicant is requesting a Developer Incentive pursuant to LAMC Section 11.5.11(e) for a 20% reduction in overall open space for a total requirement of 36,580 square feet.

The Project would provide the majority of open space in one large landscaped courtyard area throughout the entire Development Site. The Northeast Building would provide additional outdoor open space in a podium deck and a roof deck. Indoor common open space would be provided in community rooms in some buildings. Consistent with the proposed SNAP Subarea D.2 open space requirements, all common open space areas would have a minimum horizontal dimension of 20 feet and an overall minimum dimension of 600 square feet, and they make up less than 40 percent of the required open space. Additionally, 30,945 square feet (86.5%) of open space would be provided on the ground floor level.

Each building would provide sufficient open space for the dwelling units contained within, so each building can standalone with regard to open space.

Trees are required at the rate of one tree per every four residential dwelling units pursuant to Section 12.21.G. As a result, 114 trees are required and 114 trees would be provided. Additional landscaping provided would equal, at a minimum, 25% of the outdoor common open space or 7,627 square feet.

Table 6. Open Space Provided by Building

	Northeast	Northwest	Southeast	Southwest A	Southwest B	Total
Common Indoor						
Level 1 Community Rooms	2,005	2,025	-	-	672	4,702
Level 2 Community Room	-	-	-	1,370	-	1,370
Total						6,072
Common Outdoor						
Level 1 Courtyard (throughout)						26,243
Level 2 Podium Deck	3,279	-	-	-	-	3,279
Level 8 Deck	986	-	-	-	-	986
Total	4,265					30,508
Total	6,270	2,025	-	1,370	672	36,580

Vehicle Parking and Access

Pursuant to proposed Subarea D.2 of the SNAP, no parking spaces are required for dwelling units or guest rooms restricted to the Target Population of a Qualified Permanent Supportive Housing

Project. The Project would be limited to Target Population members. Thus, no residential parking is required for such units under the proposed Subarea D.2 of the SNAP.

Pursuant to proposed Subarea D.2 of the SNAP, all Qualified Permanent Supportive Housing Projects must provide: One (1) parking space for every 20 dwelling units or guest rooms shall be provided for the purpose of accommodating guests, supportive services, case management and managers' units. Up to 40% of the total required parking spaces may be provided as compact stalls. The Project's 454 dwelling units would result in a parking requirement of 23 spaces for such uses.

Under the State Density Bonus Law (Government Code Section 65915), a local agency cannot enforce any parking requirement on a project that 1) is 100 percent affordable to lower income households, exclusive of managers' units, and 2) provides supportive housing consistent with Health and Safety Code Section 50675.14. (Gov. Code § 56915(p)(4).) All of the Project's units will be affordable to lower income households, and the Project meets the requirements for supportive housing under Health and Safety Code Section 50675.14. Therefore, the Project is not required to provide any parking for its Restricted Affordable units.

Despite being exempt from any parking requirement, the Project would provide a total of 23 parking spaces. The Northeast Building would provide 13 parking spaces with vehicle access via a two-way driveway on Oakwood Avenue. The Southeast Building would provide 5 parking spaces with vehicle access via a two-way driveway on Madison Avenue. The Southwest Building would provide 5 parking spaces with vehicle access via a two-way driveway on Juanita Avenue.

Table 7. Required and Proposed Parking by Building

Required	Northeast	Northwest	Southeast	Southwest A	Southwest B	Total
1 space per 20 units	7	4	5	4	3	23
Proposed	**Northeast**	**Northwest**	**Southeast**	**Southwest A**	**Southwest B**	**Total**
Total	13	0	5	5	0	23

Bicycle Parking

The proposed SNAP Subarea D.2 requires 0.5 bicycle parking spaces per unit, notwithstanding the contrary provisions of Section 12.21 A 16 of the Code and regardless of the underlying zone, for Projects with two or more dwelling units. No bicycle parking shall be required for the non-residential uses in a Qualified Permanent Supportive Housing Project that consist of supportive services, case management offices, computer rooms and other non-residential uses related to providing services to the Target Population since these uses are considered accessory to the residential uses.

With 454 dwelling units, the required bicycle parking for the Project is 227 long-term bicycle parking stalls will be provided on the ground level of each residential building. In addition, pursuant to Development Standards in the proposed SNAP Subarea D.2, the Project would provide one bike rack per 50 feet of street frontage of the Development Site. The Development Site consists of approximately 597.75 feet of linear frontage along Juanita Avenue, Madison Avenue and Oakwood Avenue, so 12 bike racks would be required, which provides 24 short-term bicycle stalls.

HOMELESSNESS AND AFFORDABLE HOUSING

The California Department of Housing and Community Development (HCD) issued a February 2018 report entitled "California's Housing Future: Challenges and Opportunities, Final Statewide Housing Assessment 2025." The HCD report observes that challenges to housing affordability include the "existing system of land-use planning and regulation creates barriers to development," and the "people experiencing homelessness and other vulnerable populations face additional barriers to obtain housing." The HCD report's Executive Summary notes the housing challenges facing California include:

- Production averaged less than 80,000 new homes annually over the last 10 years, and ongoing production continues to fall far below the projected need of 180,000 additional homes annually.

- California is home to 12 percent of the homeless population, but a disproportionate 22 percent of the nation's homeless population.

The Legislative Analyst's Office, State of California, issued a report on February 21, 2019 to the Senate Budget and Fiscal Review Committee which also noted that California has a disproportionate share of the nation's homeless population. The report stated that "California has more people experiencing homelessness than any other state in the nation. As of January 2018, California had about 130,000 homeless individuals, which represented about 25 percent of the total homeless population in the nation. (California's overall population, however, is about 12 percent of the nation.)."[11] The Legislative Analyst's Office report, issued a year later than the HCD report, indicates that California now has one-quarter of the nation's homeless population, three percent higher than the previous year.

The production of new housing will be further aggravated in Southern California due to the high percentage of projected household growth that is expected in the foreseeable future. Households in the Southern California region (not including San Diego County) are expected to grow by 38% through 2025, representing the largest growth rate compared to the rest of the state.[12] The City of Los Angeles, making up a critical portion of Southern California, is at the forefront of experiencing the adverse impacts of the shortage of housing affordability, which further intensifies the existing and alarming homeless crisis.

The impact of a shortage of affordable housing for the formerly homeless is also illustrated by the severity of the homeless crisis in Los Angeles County. The HCD report notes that most of California's homeless population resides in major metropolitan areas. One-third of California's homeless population resides in Los Angeles County.[13]

Mayor Eric Garcetti has issued two Executive Directives that address support for affording housing development and implementation of the Comprehensive Homeless Strategy. Executive Directive No. 13 instructed City the departments that provide development services to streamline the permitting and entitlement process for all housing developments and to create priority processing incentives for housing developments that include targeted levels of affordable units.

[11] Legislative Analyst's Office report, "California's Housing and Homelessness Challenges in Context," page 6.
[12] Department of Housing and Community Development report, "California's Housing Future: Challenges and Opportunities, Final Statewide Housing Assessment 2025," Figure 1.4, page 8.
[13] Ibid, Figure 1.6, page10.

The Executive Directive refers to the Mayor's Sustainable City pLAn which sets forth goals of building 100,000 new housing units by 2021 and additional new housing units in subsequent years, leading to 150,000 new housing units by 2025. Executive Directive No. 16 directs the implementation of the City's Comprehensive Homeless Strategy which incorporates national best practices including a coordinated entry system to navigate people from the streets into housing, and a housing-first approach to prioritize placement of the homeless in permanent housing as a primary solution.

The City's Comprehensive Homeless Strategy notes that land use is "an inseparable factor creating additional opportunities to increase housing stock. Los Angeles has not responded to stronger housing demand by allowing for greater residential density in the nearly 500 square miles of our City. Land use and zoning restrictions can and have limited the supply of housing throughout the City."[14] The Comprehensive Homeless Strategy presents data that the City experiences a 9,049 bed deficit for permanent supportive housing for single individuals, which represents the highest need the City is facing relative to the housing gap for the homeless in Los Angeles.

The Comprehensive Homeless Strategy encourages greater density in areas of the City most capable of supporting it, and proposes that the City "should also investigate how well its various zoning density programs are doing to encourage or mandate additional residential development. Further study into reducing or removing parking minimums for affordable and homeless housing profiles, where residents own cars at much lower rates than market-rate housing, could lower the cost of affordable and homeless housing development and ensure efficient use of space for areas where more residential density is needed."[15]

In the Land Use chapter of the Comprehensive Homeless Strategy, the root cause of the affordability crisis is identified as the mismatch in the supply and demand for housing, which is observed as a result of the "limited supply of multi-family zoned housing sites and the difficulty of entitling multi-family housing projects throughout the City limits the creation of affordable housing units. A constrained affordable housing supply coupled with high rent burdens increases the likelihood low wage earners will fall into homelessness if their hours are reduced or if they encounter unavoidable/unforeseen costs……The constrained supply also makes finding affordable replacement housing more difficult and opens the door to homelessness."[16]

L.A.'s Green New Deal, the 2019 update to the Mayor's Sustainable City pLAn, sets targets to accomplish the following:

- End street homelessness by 2028.
- Ensure 57% of new housing units are built within 1,500 feet of transit by 2025; and 75% by 2035.
- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.
- Create or preserve 50,000 income-restricted affordable housing units by 2035 and increase stability for renters.

L.A.'s Green New Deal's targets include milestones and initiatives. These include the following:

[14] Comprehensive Homeless Strategy, page 17.
[15] Ibid, page 17.
[16] Ibid, page 183.

- Build 10,000 new permanent supportive housing units by implementing Prop HHH and streamlining the permitting process of permanent supportive housing.
- Build 100,000 new housing units by 2021.
- Build 15,000 units of affordable housing by 2021; and 45,000 by 2035.

The Los Angeles Homeless Services Authority (LAHSA) reports in its 2018 Greater Los Angeles Homeless Count that within the City of Los Angeles the homeless population consists of 31,285 persons, of which 22,887 are unsheltered and 8,398 are sheltered. The LAHSA report indicates that there has been a 6% decline in the number of homeless in the City of Los Angeles but the economic factors driving people in homelessness persist. Los Angeles has a growing affordable housing crisis. Los Angeles County needs over 565,000 new affordable housing units for low income renters – 16,000 more than the previous year. LAHSA also reports that more people are falling into homelessness for the first time, with a count of 9,205 new homeless persons in 2018 as opposed to 8,044 homeless persons for the first time in 2017.

In contrast to the 2018 report on the homeless count from LAHSA, on June 4, 2019, Peter Flynn, Executive Director of LAHSA, presented the results of its 2019 Greater Los Angeles Homeless Count to the Los Angeles County Board of Supervisors, noting that within the City of Los Angeles the homeless population consists of 36,300 persons, of which 27,221 are unsheltered and 9,079 are sheltered. The 2019 LAHSA report indicates that there has been a 16% increase in the number of homeless in the City of Los Angeles, thereby reversing the trend of the previous year. The LAHSA report states that 516,946 new affordable housing units are needed in the County, according to the May 2019 "Los Angeles County Annual Affordable Housing Outcomes Report" prepared by the California Housing Partnership Corporation.

California's high housing costs disproportionately affect extremely low-income and very low-income households. California experiences a 1.5 million shortfall of rental units affordable and available to very low-income and extremely low-income renter households.[17] The Joint Center for Housing Studies of Harvard University reported that Los Angeles is the least affordable housing market in the United States, with the City having the highest burden rate of 47% of households.[18]

In adopting Assembly Bill No. 2162 to address California's homelessness crisis by making it easier to build supportive housing, the State Legislature made findings that twenty-five percent of the nation's total homeless population and almost half of the nation's unsheltered population reside in California. The Legislature found that evidence shows "supportive housing – an affordable rental with intensive services promoting housing stability – works to reduce chronic homelessness." Additionally, AB 2162 notes that studies "reveal supportive housing benefits communities by reducing homelessness locally, addressing blight, and increasing property values. Yet one of the barriers to creating supportive housing has been local delays or denials of applications to build supportive housing, based on subjective local planning standards."

Assembly Bill No. 2162 requires that supportive housing be a use by right in zones where multi-family and mixed uses are permitted, including non-residential zones permitting multi-family uses, if the proposed development meets specific criteria, and would require a local government to approve a supportive housing development that complies with these requirements. The developer of supportive housing would have to provide the planning agency a plan for providing

[17] Department of Housing and Community Development report, "California's Housing Future: Challenges and Opportunities, Final Statewide Housing Assessment 2025," Figure 1.24, page 30.
[18] "The State of the Nation's Housing 2018," page 31

supportive services onsite for the residents. The legislation prohibits the imposition of minimum parking requirements for units occupied by supportive housing residents if the development is located within one-half mile of a public transit stop.

The Project would address housing opportunities for formerly homeless individuals by replacing expansive parking lots and small buildings used for storage and telecommunications purposes with five Restricted Affordable housing buildings at the Extremely Low to Low Income level with adequate space in each building for supportive social services for the residents. The supportive services for the residents would include case management, mental health services, independent living skills programs, substance abuse programs, and job training. The provision of supportive social services to homeless persons is a critical element to helping the at-risk population to seek personal betterment, and the Applicant is committed to these supportive service programs and affordable housing to be provided in a high-quality environment.

The Applicant's request for approval of a Zone Change to permit the construction of Restricted Affordable housing for the formerly homeless and supportive social services and approval of a new Subarea in the SNAP to construct the affordable housing project for the formerly homeless would be consistent with the City's Comprehensive Homeless Strategy, the Executive Directives issued by the Mayor, State law as the result of the adoption of AB 2162, and housing reports issued by the State and County.

In developing the Permanent Supportive Housing Ordinance for consideration by the City Planning Commission, Department of City Planning staff prepared a Recommendation Report to the City Planning Commission for its public hearing on December 14, 2017 for Case No. CPC-2017-3136-CA. The Report noted that the Permanent Supportive Housing (PSH) Ordinance was "drafted based on several key strategies provided in the City's Comprehensive Homeless Strategy, as well as through additional study of the common barriers facing the development of PSH in the City of Los Angeles."

Staff observed that as part of the Comprehensive Homeless Strategy and the Measure HHH expenditure plan, the City has "a goal of building 1,000 PSH units per year over the next ten years." In 2017, the need for PSH units was based on the January 2017 Greater Los Angeles Homeless Count which indicated that approximately 34,189 people were experiencing homelessness in the City, a number which grew by 20% since 2016. The homeless count dropped in 2018 to 31,285 but jumped 16% in 2019 to the current number of 36,300 homeless in 2019. The staff report indicates the City has been averaging a production rate of approximately 300 PSH units per year, prior to the adoption of Measure HHH which intended to streamline planning approvals for the 10,000 PSH units that are anticipated to be funded by Measure HHH over the next ten years.

The Recommendation Report observed that PSH has been "widely recognized and prioritized as one of the most effective solutions to ending homelessness. PSH is a type of affordable housing for the formerly or chronically homeless which incorporates supportive services such as mental health treatment, addiction therapy and vocational training. Integrating services with affordable housing provides formerly homeless individuals and families the ongoing help they need to remain housed and able to live independently. PSH has proven successful in providing long-term housing for individuals experiencing homelessness, and has been shown to have high retention rates of 90 percent and above, according to LAHSA and the Conrad N. Hilton Foundation Chronic Homelessness Initiative."

PREVIOUS CASES (on-site)

CPC-2000-1976-SP: Approved on September 25, 2000, the Vermont/Western Transit Oriented District Neighborhood and Specific Plan (SNAP).

CPC-1984-1-HD: Approved on June 25, 1985, Amendments to Height Districts with the Central parts of the City of Los Angeles.

CPC-7001: Approved on April 23, 1956, Zone Change from R4 and C2 on the Project Site to M1.

RELATED CASES (nearby properties)

DIR-2008-4275-SPP-DB. On December 31, 2008, the Director of Planning approved a Specific Plan Project Permit Compliance and a Density Bonus to allow the construction of a 49-unit low-income housing project with a 35% density bonus with a reduction of the required number of parking spaces to one-quarter parking spaces for each dwelling unit and a reduction of open space to 4,030 square feet. The project site is 335-339 N. Juanita Avenue.

CPC-2014-1602-CU-SPE-SPP-DB-SPR. On December 11, 2014, the City Planning Commission approved a Conditional Use Permit to allow density bonus increases for restricted affordable units; a Conditional Use Permit for reduced yards and increased FAR; a Specific Plan Exception to allow an expansion of the homeless shelter in Subarea D of the SNAP; a Specific Plan Project Permit Compliance with the SNAP; two Density Bonus on-menu incentives to reduce open space and to average open space over the project site; and Site Plan Review. The project site is located at 320-342 N. Madison Avenue; 3750-3766 W. Oakwood Avenue; and 333-345 N. Westmoreland Avenue.

CPC-2014-1947-CU-SPPA-SPP-DB-SPR. On February 26, 2015, the City Planning Commission approved a Conditional Use Permit and a Density Bonus with off-menu incentives to permit the construction of 100 residential units in lieu of 53 residential units with additional relief height requirements, loading requirements, stepback requirements and transparent building elements.

FINDINGS FOR GENERAL PLAN AMENDMENT
PURSUANT TO CITY CHARTER SECTIONS 555, 556 AND 558

The Applicant requests approval of a General Plan Amendment to revise the land use designation in the Wilshire Community Plan from Limited Industrial (corresponding to the M1 Zone) to Commercial Manufacturing (corresponding to the CM Zone). As part of the discretionary requests for this application, the Applicant is also requesting a Zone Change from the M1-1 Zone to the CM-1 Zone. The findings for the requested Zone Change are addressed in the sections below.

The requested General Plan Amendment from Limited Industrial to Commercial Manufacturing would create a development site compatible the Wilshire Community Plan's recognition of a residential community issue that there is a need to accommodate more affordable housing. The Project Site is located on the edge of M1 zoned properties, where adjoining parcels to the west, across Juanita Avenue, are zoned R4, C2 and CM and developed with residential and commercial uses. Properties in the M1 Zone that adjoin the Project Site are developed with commercial and residential uses, including the PATH Affordable Housing Project located directly across from the Project Site on the east side of Madison Avenue. The immediate vicinity has been transformed over the years from industrial uses to a mix of residential, commercial and industrial uses. On the Project Site's portion of Lot 19, the property was developed in 1924 with three small detached residences. The Project Site is also developed with three small commercial buildings, and surface parking lots. The proposed General Plan Amendment complies with City Charter Sections 556 and 558 in that the requested amendment reflects the land use patterns, trends and uses in the immediate area, which is developed with a mix of residential, commercial and light industrial projects on properties currently zoned for a mix of residential, commercial and industrial uses.

Charter Finding 555. The General Plan may be amended in its entirety, by subject elements or parts of subject elements, or by geographic areas, provided that the part or area involved has significant social, economic or physical identity.

The requested General Plan Amendment from Limited Industrial to Commercial Manufacturing would create a 2.09-acre geographic area that is compatible the Wilshire Community Plan's recognition of the dire need to accommodate more affordable housing.

The requested General Plan Amendment covers an 2.09 acre area that has, along with the neighboring properties, a significant social and economic identity. The character of the immediate area is defined by the diversity of uses including a cluster of affordable residential developments. To the east of the site is the 6-story PATH affordable housing development consisting of 122 residential units and supportive services. Across Juanita Avenue to the west is the La Kretz Villas building with 49 residential units consisting of subsidized affordable studio units and an office building. Located north of the site is the Delancey Street Foundation facility, which houses approximately 300 residents. The Foundation provides housing and services to homeless individuals and those at-risk of homelessness. Properties to the south are improved with office buildings, warehouse uses, and the Virgil Middle School campus. The Project will redevelop the underutilized Project Site, currently developed with three residential units along with commercial uses and surface parking, with a new affordable housing development and supportive services, consistent with the trends of the neighborhood. The Project's residential uses will complement the neighborhood-serving commercial uses. Because the Project residents are not expected to own a personal vehicle, it is expected that they will patronize these nearby commercial uses more frequently than traveling to another part of the City. Further, the Project will have synergy with the nearby affordable housing developments, some of which are also targeted to the homeless

population. The supportive services at the Project will complement those provided in the vicinity. Therefore, the requested General Plan Amendment, will support cohesion in this area with a significant social and economic identity.

The requested General Plan Amendment also covers an area that has, along with the neighboring properties, a physical identity as a transit-rich neighborhood within walking distance of the Vermont/Beverly Metro Red Line Rail Station. As discussed in detail in the SCEA prepared for the Project, state law, regional regulations and the City's General Plan and Municipal Code strongly encourage residential development, especially affordable housing, in transit-rich areas like the Project Site. Various incentives are provided to such developments, including but not limited to increased density bonuses, parking reductions and streamlined processes under CEQA, some of which Project is utilizing. Therefore, the requested General Plan Amendment, which covers an area with a significant physical identity as a transit-rich area, will implement state, regional and local goals to place housing within close physical proximity of transit.

The unique development of residential and commercial uses in the immediate neighborhood establishes social, economic, and physical identity appropriate to re-designate the Project Site from Light Industrial to Commercial Manufacturing for the construction of the proposed Project.

Charter Finding 556. When approving any matter listed in Section 558, the City Planning Commission and the Council shall make findings showing that the action is in substantial conformance with the purposes, intent and provisions of the General Plan. If the Council does not adopt the City Planning Commission's findings and recommendations, the Council shall make its own findings.

The amendment would re-designate the Project Site from Light Industrial to Commercial Manufacturing. The amendment of the land use designation, in conjunction with the recommended zone change to CM-1 Zone would allow the redevelopment of the site with a new affordable housing development. The site is located within an area that has been developed and continually utilized with a mixture of residential and commercial uses. The Project Site itself has been used for residential and commercial purposes. The three small detached residential units have been in existence since 1924. As discussed below, and in the Project SCEA under Appendix M (General Plan Consistency Findings) the amendment of the land use designation would be consistent with the purpose, intent and provisions of the General Plan.

Charter Finding 558. The proposed Amendment to the Wilshire Community Plan will be in conformance with public necessity, convenience, general welfare and good zoning practice.

The amendment to the Wilshire Community Plan would re-designate the land use designation of the Project Site from Light Industrial to Commercial Manufacturing. The amendment of the land use designation, in conjunction with the recommended zone change to CM-1 Zone would allow the development of much-needed Restricted Affordable housing units for the formerly homeless by demolishing an underutilized property that is occupied on the majority of its land mass for surface parking, while the existing buildings are either aging small residential buildings or small commercial buildings. The Project would provide a maximum of 454 residential dwelling units, of which 449 units would be Restricted Affordable units at Extremely Low to Low Income levels and 5 would be managers' units. The development would include on-site supportive social services for the residents. The new modern units, which would be deed restricted, would ensure that the permanent supportive housing for homeless persons is maintained well into the future, which is necessary considering that the lack of housing for the homeless remains a persistent problem in

light of the recent 2019 report from LAHSA that the homeless population in the City of Los Angeles has increased 16% since the 2018 homeless count.

Without the amendment, the property would remain underutilized by outmoded buildings that do not generate improved benefits for the homeless community and to the area at large. The immediate area, consisting of existing affordable housing projects and aging commercial properties and limited warehouse uses, is no longer viable for new industrial development. The current land use pattern of the surrounding area consists of a mixture of non-industrial uses including residential development and commercial buildings and lacks the necessary infrastructure and amenities for industrial uses.

The amendment would permit the construction of a residential development which is compatible with its surroundings (including similar housing developments adjacent to the subject property) and consistent with State and City planning goals. The amendment would allow this urban infill site to achieve numerous laudable planning goals, including construction of affordable housing proximate to mass transit and the introduction of supportive services that are much needed by the Extremely Low to Low Income homeless residents.

Public Necessity, Convenience, and General Welfare

The amendment would facilitate a vibrant residential development that would replace aging, outmoded small single-family residences and small commercial buildings. The new development would create a higher density affordable housing project that would be proximate to mass transit options and easily accessible to the commercial corridor of Vermont Avenue. A portion of the surrounding area has emerged as a neighborhood with affordable housing developments that have supportive services. In fact, properties immediately adjacent to the east and the west of the Project Site have been developed with affordable housing for low income and the homeless. Housing for the Extremely Low to Low homeless individuals is a public necessity, and the location of the proposed new affordable housing development provides a convenience for the public and helps to provide for the general welfare of the public.

The Housing Element 2013-2021 affirms in its Executive Summary that the need to accommodate growth results in the need not only for more housing but a "broader array of housing types to meet evolving household types and sizes." The development of more housing requires a strategy to accommodate residential development in a sustainable way. The Housing Element estimates that the Wilshire Community Plan has the capacity for 51,490 new housing units, which represents the second highest capacity for new residential units of the 35 Community Plan areas. The approval of the requested Zone Change, along with the General Plan Amendment and Specific Plan Amendment, would advance the City towards the goal of providing more housing by permitting the construction of a maximum of 449 Restricted Affordable Dwelling Units for Extremely Low to Low Income homeless persons in an area specifically contemplated by the City to help meet the City's housing shortage and comply with its RHNA requirement. As the Project Site is located in a Community Plan area that has the capacity for more new housing units than other parts of the City, the Project is consistent with the Housing Element's stated need to accommodate growth.

According to the Regional Housing Needs Assessment (RHNA), the City is expected to need an additional 82,002 new units through 2021, of which 46,590 units (57%) are designated for very low- and low-income households. The Housing Element notes that the "City will face significant challenges in meeting its RHNA income distribution if it is not able to secure additional funding for affordable housing production and preservation." The Applicant proposes to construct affordable

housing by proposing a maximum of 449 Restricted Affordable Dwelling Units at the Extremely Low to Low income level and five managers' units, which would assist the City to meet the challenge of the RHNA by maintaining and adding affordable housing units to the housing stock. Considering that the Wilshire Community Plan, as noted above, has the second highest capacity for new housing units of all 35 community plans, the approval of the Zone Change to CM-1 would facilitate the development of much needed housing for Extremely Low to Low Income homeless individuals that is a public necessity which may be fulfilled with the appropriate zoning designation.

The Community Plan further encourages new housing in proximity to transit, goods, services and facilities. In its introductory chapter, the Wilshire Community Plan observed as one of its residential issues that new "development needs to be coordinated with the availability of public infrastructure." Objective 1-2 of the Wilshire Community Plan proposes to "Reduce vehicular trips and congestion by developing new housing in close proximity to regional and community commercial centers, subway stations and existing bus route stops." This objective is supported by Policy 1-2.1 which seeks to "Encourage higher density residential uses near major public transportation centers." The Vermont/Beverly Metro Red Line Rail Station, which is within 500 feet of the Project Site, is the type of public infrastructure improvement that should be easily available to the residents of new residential projects. With a maximum of 454 residential units, the Project proposes a higher density residential use near a major public transportation center. The proposed Project's location near transit options would facilitate the residents' interaction with the community, activating the pedestrian environment and providing more customers to businesses on the commercial corridor of Vermont Avenue. The public convenience and general welfare is enhanced by offering homeless individuals the ability to live in close proximity to transit, job opportunities, various public and private facilities, shopping for necessities and other basic services.

The public necessity, convenience and general welfare are further enhanced by a well-designed campus, with the five buildings arranged to provide common open space areas in courtyards and passageways that serve to improve the quality of life in the neighborhood with improved security and an increased 24-hour population that activates the street. With the development of an attractive residential development consisting of a maximum of 449 Restricted Affordable units for Extremely Low to Low Income homeless individuals and five managers' units, the Project is not only compatible and complementary with the adjacent residential and commercial uses in the immediate vicinity, the Project would fulfill the need to provide clean, sanitary and safe housing for underserved segment of society. The need for this type of housing is greatly underscored by the report of the Los Angeles Homeless Services Authority in its 2019 Greater Los Angeles Homeless Count that the homeless population in the City of Los Angeles increased by 16% over the previous year, which now consists of 36,300 homeless persons, of which 27,221 need shelter.

The proposed CM zoning of the Project Site is consistent with the proposed General Plan land use designation of Commercial Manufacturing and supports higher density residential development within an affordable housing development for Extremely Low to Low Income homeless individuals. The Project is compatible with the Wilshire Community Plan's goals, objectives and policies, as discussed in the findings for the Community Plan. In general, these goals, objectives and policies encourage the development of higher density new housing in proximity to commercial centers and major transportation centers, along with providing more affordable and increased accessibility for the handicapped and senior citizens, many of which are within the Target Population for Permanent Supportive Housing, i.e., homeless individuals. The proposed Project would offer better housing choices for homeless individuals that are often relegated to shelters or transitional housing, or even worse, have no temporary housing options

at all. The proposed Project would also bring new residential units to an area that has a mix of residential, commercial and light industrial uses, but which offers several options to place residents within easy walking distance of several public transit alternatives and a major commercial corridor. The proposed Zone Change to the CM Zone would facilitate the much needed housing for an underserved segment of society, and as a result, the Zone Change would promote the public necessity, convenience and general welfare to accommodate a population that would benefit from housing and supportive services for those in the greatest need.

Good Zoning Practices

The General Plan Framework notes that the City of Los Angeles has "insufficient vacant properties to accommodate forecast population increases. Consequently, the City's growth will require the reuse and intensification of existing developed properties." The existing Project Site consists of three, small one-story residential buildings and three, small underutilized one-story commercial buildings. The Project Site also includes a large surface parking areas that should be utilized to accommodate an intensification of the land use in order to construct an affordable housing development.

A basic principle of good zoning practice, and State law as required by California Government Code Section 65860, is consistency between the General Plan land use designation and zoning designations. The General Plan Framework's Objective 3.1 seeks to accommodate a "diversity of uses that support the needs of the City's existing and future residents, businesses and visitors." The Objective is supported by Policy 3.1.6 which proposes to allow for the "adjustment of General Plan Framework Element land use boundaries to account for the changes in the location and introduction of new transit routes and stations…and, in such cases, consider the appropriate type and density of use generally within one-quarter mile of the corridor and station to reflect the principles of the General Plan Framework Element and the Land Use/Transportation Policy." The Project is located within 500 feet of the Metro Red Line Rail Station located at Vermont Avenue and Beverly Boulevard, and several Metro bus lines, including the Metro Rapid Bus Line 754, that have stops at Vermont Avenue and Beverly Boulevard. Additionally, Vermont Avenue is a commercial center within easy walking distance of the Project. The Project would replace underutilized buildings on a lot that is 2.09 acres in size in order to create a higher density residential use that is near the major transportation center at Vermont Avenue and Beverly Boulevard. The requested General Plan Amendment to Commercial Manufacturing would create a development site compatible with the Wilshire Community Plan's recognition of a residential community issue that there is a need to accommodate more affordable housing in transit-rich areas.

The Project reflects the existing land use patterns, trends and uses in the immediate area, which is developed with a mix of residential, commercial and light industrial projects on properties currently zoned for a mix of residential, commercial and industrial uses. The Project would create synergy with the existing residential properties for the lower income and homeless that are located to the immediate east and west of the Project Site. This, in turn, creates a vibrant, cohesive neighborhood that is greatly needed in very close proximity to a Metro Rapid Bus stop and the Vermont/Beverly Metro Red Line Rail Station, allowing the residents easy access within walking distance to several transit options. Based on the foregoing, the proposed Zone Change promotes good zoning practices by allowing the affordable housing development that is consistent with a coherent zoning pattern of establishing a CM Zone for parcels that are within close proximity to a commercial center and a major transportation corridor that includes a Metro Rail station and Metro Rapid Bus stop.

The development of a residential project for affordable housing on property with the land use designation of Commercial Manufacturing is supported by the various goals, objectives and policies of the General Plan Framework Element, the Housing Element 2013-2021, the Wilshire Community Plan, the Wilshire Center/Koreatown Redevelopment Project, the Mobility Plan 2035, and the Health and Wellness Element.

General Plan Framework

The General Plan Framework notes that the City of Los Angeles has "insufficient vacant properties to accommodate forecast population increases. Consequently, the City's growth will require the reuse and intensification of existing developed properties."[19] The proposed Project would replace three small one-story residential buildings, three small, underutilized one-story buildings used for the commercial operation of a telecommunications company and surface parking lots on M1-1 zoned land in order to develop a 100% Restricted Affordable housing Project consisting of 449 Restricted Afford Dwelling Units for Extremely Low to Low Income and homeless persons and 5 managers' units, with supportive social services.

Goal 3A of the General Plan Framework, Chapter 3 (Land Use):

A physically balanced distribution of land that contributes towards and facilitates the:

- *City's long-term fiscal and economic viability,*
- *Revitalization of economically depressed areas,*
- *Conservation of existing residential neighborhoods,*
- *Equitable distribution of public resources,*
- *Provision of adequate infrastructure and public services,*
- *Reduction of traffic congestion and improvement of air quality,*
- *Enhancement of recreation and open space opportunities,*
- *Assurance of environmental justice and a healthful living environment, and*
- *Achievement of the vision for a more livable city.*

The proposed affordable housing development for Extremely Low to Low Income homeless persons revitalizes a 2.09-acre property that is currently utilized by three small detached residential units, three small one-story commercial buildings, and surface parking lots. The new construction of an affordable residential Project with supportive social services for homeless persons would contribute to the City's long-term fiscal and economic viability. The Project does not divide any existing neighborhood, and in fact, connects the various residential uses surrounding the Project Site, including the nearby PATH development. In addition to the fact that the homeless residents would be less likely to own personal vehicles, traffic congestion also would be reduced by residents having easy access to multiple transit options, including the Metro Red Line Rail Station at Vermont Avenue and Beverly Boulevard as well as the Metro Rapid Bus Line at same intersection, which are within 500 feet of the Project Site. As a result of numerous transit options in the vicinity, including Metro Local Bus lines, less vehicle miles would be traveled, air quality would be improved and a healthful living environment would be created. Reduced traffic congestion, improved air quality, and a healthful living environment are created by a residential project where residents would have access by public transit to employment centers, retail centers and neighborhood services. A more livable city would be attained by constructing larger well-designed, energy efficient and modern structures in the five buildings that would provide the affordable dwelling units and supportive social services for the residents. Though the surrounding

[19] The Citywide General Plan Framework, page 3-4.

properties are zoned industrial, commercial and residential, the Project's surrounding neighborhood is evolving toward a greater mixture of residential, commercial and industrial uses. Moreover, additional affordable dwelling units are under construction on the adjacent property to the east of Madison Avenue.

> ***Objective 3.1 of the General Plan Framework, Chapter 3 (Land Use):*** *Accommodate a diversity of uses that support the needs of the City's existing and future residents, businesses, and visitors.*
>
> > ***Policy 3.1.6:*** *Allow for the adjustment of General Plan Framework Element land use boundaries to account for the changes in the location and introduction of new transit routes and stations….and, in such cases, consider the appropriate type and density of use generally within one-quarter mile of the corridor and station to reflect the principles of the General Plan Framework Element and the Land Use/Transportation Policy.*

The Project includes construction of five eight-story Permanent Supportive Housing residential buildings and the necessary support services. This 100 percent affordable residential development, exclusive of manager's units, would provide 449 lower-income dwelling units in Los Angeles, as well as new foot traffic for the existing surrounding commercial community, thus increasing business opportunities and economy of the Wilshire CPA.

The need for affordable housing for the homeless population has been well-established in the Housing Element and the City's Comprehensive Homeless Strategy. The Housing Element's Goal 4 of "Ending and Preventing Homelessness" notes the "vision for Los Angeles is to see every homeless individual and family housed by preventing them from becoming homeless and by rapidly rehousing those who do fall into homelessness. Permanent housing coupled with supportive services is central to combating homelessness."[20] The Project would provide permanent housing for the homeless with supportive services, thereby accommodating a diversity of uses that supports the needs of the City's existing and future residents. The Project would be located near major transit routes and stations where it is appropriate to have a development with higher density such as proposed by the Applicant. The Project Site is in close proximity to major transit as it is located within 500 feet of the Vermont/Beverly Metro Red Line rail station and the Metro Rapid Bus 754 stop at Vermont Avenue and Beverly Boulevard.

The City's Comprehensive Homeless Strategy observes that the City has not responded to stronger housing demand by allowing for greater residential density and that land use and zoning restrictions can and have limited supply throughout the City. Housing data indicates a significant shortfall of permanent supportive housing. The Mayor's Executive Directive No. 16 directs the implementation of the City's Comprehensive Homeless Strategy which incorporates national best practices including a coordinated entry system to navigate people from the streets into housing, and a housing-first approach to prioritize placement of the homeless in permanent housing as a primary solution. The Project would provide a higher density residential project of Restricted Affordable units for Extremely low and Low income and homeless persons.

Additionally, the State has enacted numerous laws, like Senate Bill 375, that prioritize the construction of new housing units within transit rich areas. The City has also adopted various incentives for residential projects in transit rich areas. One such program is the Transit Oriented

[20] Housing Element 2013-2021, page 6-11.

Communities (TOC) Affordable Housing Incentive Program which recognizes, following the voter approval of Measure JJJ, that housing development within a one-half mile radius of a Major Transit Stop qualifies for a variety of incentives. The TOC Program promotes the inclusion of restricted affordable units so that residential projects would qualify for incentives. Moreover, projects within 750 feet from the intersection of a Metro Rail Station and a Metro Rapid Bus line qualify for Tier 4 incentives. In Policy 3.1.6, the General Plan Framework would allow for adjustment of land use boundaries to account for the changes in the location and introduction of new transit routes and stations, and in such cases consider the appropriate type and density of use generally within one-quarter mile of the station.

Although the Project is not relying on the benefits of the TOC Program, it will provide 454 new residential units within one-half mile of a Major Transit Stop, and therefore the Project supports state and local objectives that connect land use and transportation planning. It is clear the need for homeless and affordable housing as well as density near transit is an urgent need during the current housing and climate crises. The Project satisfies the General Plan frameworks objective to a*ccommodate a diversity of uses that support the needs of the City's existing and future residents, businesses, and visitors* by addressing these urgent issues.

> ***Objective 3.2 of the General Plan Framework, Chapter 3 (Land Use):*** *Provide for the spatial distribution of development that promotes an improved quality of life by facilitating a reduction of vehicular trips, vehicle miles traveled, and air pollution.*

The Project would develop new residential uses in walking distance to numerous services, retail, commercial, and residential areas.. The Project Site is located in proximity to multiple transit options, including the Metro Red Line Rail Station at Vermont Avenue and Beverly Boulevard, the Metro Rapid Bus Line 754 with a stop at Vermont Avenue and Beverly Boulevard, and two Metro Local Bus Lines that run on Vermont Avenue and Beverly Boulevard. As a result of numerous transit options in the vicinity, less vehicle miles would be traveled, air quality would be improved and a healthful living environment would be created. Moreover, the residents of affordable units for Extremely Low to Low Income and homeless persons are much less likely to own personal vehicles and would avail themselves of the transit options. In addition, the transit options, along with neighborhood-serving uses, are within easy walking distance of the Project Site. The Project would provide Code-required bicycle parking that also facilitates the reduction of vehicular trips and air pollution.

The Project introduces various streetscape improvements to encourage more pedestrian-friendly street edges along Juanita and Madison Avenues. The sidewalk on Madison Avenue adjacent to the Project, will be widened to up to 12 feet wide in most locations. On Juanita Avenue existing 12 foot sidewalks will be retained. Existing sidewalk widths will also be maintained on Oakwood Avenue. Utility poles fronting the property along Madison, Oakwood & Juanita Avenues will be relocated underground creating more continuous sidewalks. Additionally, nine new street trees will be placed along these three street frontages. Fourteen new bike racks will be strategically located along both Juanita & Madison Avenues. These streetscape improvements will aid in all streets adjacent to the Project becoming more pedestrian and bicycle oriented. Thus, this diversity of transit options near the Project Site would facilitate a reduction of vehicular trips, vehicle miles traveled, and air pollution.

> ***Objective 3.4 of the General Plan Framework, Chapter 3 (Land Use):*** *Encourage new multi-family residential, retail commercial, and office development in the City's neighborhood districts, community, regional, and downtown centers as well as along primary transit corridors/boulevards, while at the same time conserving existing*

neighborhoods and related districts.

The Project Site is located in the Transit Oriented District of the Vermont/Western Station Neighborhood Area Plan (SNAP), an ordinance that was created, as noted in its preamble, for "the purpose of making the neighborhood more livable, economically viable, as well as pedestrian and transit friendly in an effort to heal the community of the disruptions of the Nineties, mitigate population growth and achieve maximum benefit from the subway stations as a valuable public asset." Also recorded in the preamble is that the "Plan is a document that describes the Neighborhood Vision to the year 2020 for more public facilities and services, jobs, housing, transit ridership, growth management and civic involvement." The Project would meet the vision of the SNAP to make bring new housing to an area that is pedestrian and transit friendly and to make the neighborhood more livable.

By providing permanent housing for the formerly homeless, the Project fulfills the Objective to encourage new multi-family residential development within 500 feet of a primary transit corridor. At the intersection with Beverly Boulevard one block to the west of the Project Site, Vermont Avenue offers several transit options for the residents of the Applicant's Project. These options include the Vermont/Beverly Metro Red Line rail station, a Metro Rapid Bus and two Metro Local Bus lines. The neighborhood is made more livable as the streets would be activated with more pedestrians having easy access to transit options. The Project Site is located on M1 zoned property where multi-family residential development for homeless individuals has already been established on property immediately to the east, across Madison Avenue. Similar affordable housing development has also occurred on R4 zoned property that adjoins the Project Site across Juanita Avenue to the west. The Project Site is also suitable for higher density given its proximity to several transit options. The proposed Project would offer housing opportunities for Extremely Low to Low Income homeless persons with the greatest need for new housing while providing necessary supportive services to the residents.

Goal 3K: *Transit stations to function as a primary focal point of the City's development.*

> ***Objective 3.15:*** *Focus mixed commercial/residential uses, neighborhood-oriented retail, employment opportunities, and civic and quasi-public uses around urban transit stations, while protecting and preserving surrounding low-intensity neighborhoods from the encroachment of incompatible uses.*

Transit stations are defined as the "intent by the General Plan Framework to encourage new development in proximity to rail and bus transportation corridors and stations….the highest development intensities are targeted generally within one quarter mile of the transit stations…..It is intended that a considerable mix of uses be accommodated to provide population support and enhance activity near the stations."[21] To make transit stations the focal point of development, the Project would fulfill this goal by replacing three small detached residential buildings, three small underutilized commercial buildings used for the commercial operation of a telecommunications company, and surface parking lots with 454 residential units and a higher density of a resident population that would have easy access to the Vermont/Beverly Metro Red Line Rail Station and the Metro Rapid Bus and Metro Local Bus lines that are located within 500 feet of the site at the intersection of Vermont Avenue and Beverly Boulevard. The Project would not result in an incompatible land use as neighboring residential and industrial parcels have been developed with affordable housing and there would be no encroachment of incompatible uses on low-intensity neighborhoods.

[21] General Plan Framework, page 3-35.

The definition of "industrial" in the General Plan Framework recognizes that "some existing industrially zoned lands may be inappropriate for new industries and should be converted for other uses."[22] Industrial Land Use Policy 3.14.6 (e) proposes to consider the potential to re-designate marginal industrial lands on the following criteria: "Where the conversion of industrial lands to an alternative use will not create a fragmented pattern of development and reduce the integrity and viability of existing industrial areas." Several parcels adjoining the Project Site or located within the surrounding neighborhood have been converted or developed with non-industrial uses. These non-industrial uses include an affordable housing project, an auto sales lot, and a pet hospital. The Project would be compatible with the pattern of development in the surrounding neighborhood and consistent with the City's focus to building higher intensity uses in close proximity to transit stations.

GOAL 4A of the General Plan Framework, Chapter 4 (Housing): *An equitable distribution of housing opportunities by type and cost accessible to all residents of the City.*

> ***Objective 4.1 of the General Plan Framework, Chapter 4 (Housing):*** *Plan the capacity for and develop incentives to encourage production of an adequate supply of housing units of various types within each City subregion to meet the projected housing needs by income level of the future population to the year 2010.*
>
> > ***Policy 4.1.1:*** *Provide sufficient land use and density to accommodate an adequate supply of housing units by type and cost within each City's subregion to meet the twenty-year projections of housing needs.*

Consistent with Goal 4A of the General Plan Framework's Housing chapter and the related objectives, the development would be a residential development providing a maximum of 449 Restricted Affordable Dwelling Units for Extremely Low to Low Income homeless individuals and 5 managers' units. The introduction of the Housing chapter of the General Plan Framework observes that the "City of Los Angeles has insufficient vacant properties to accommodate the cumulative amount of population growth which has been forecasted. The supply of land zoned for residential development is the most constrained in the context of population growth forecasts."[23] An equitable distribution of housing opportunities by type and cost accessible to all residents of the City would include the need to include affordable housing for Lower Income and homeless persons.

According to the Housing Element (adopted by the City Council on December 3, 2013 and approved by the California Department of Housing and Community Development on April 2, 2014), the population of the City of Los Angeles will grow by over 140,000 persons between 2014 and 2021. The Housing Element acknowledges that there is a need to support the development and preservation of more affordable housing and "to keep pace with the City's housing needs." Considering the City is expected to need an additional 82,002 new units through 2021, of which 46,590 units (57%) are designated for very low- and low-income households based on the Regional Housing Needs Assessment (RHNA), the Housing Element notes that the "City will face significant challenges in meeting its RHNA income distribution if it is not able to secure additional funding for affordable housing production and preservation." The Applicant proposes to build 449 Restricted Affordable Dwelling Units for Extremely Low to Low Income homeless persons and 5 managers' units, resulting in more units to be added to the City's housing stock.

[22] Ibid, page 3-32.
[23] Ibid, page 4-1.

The Wilshire Community Plan is identified in the Housing Element as having the capacity for 51,490 new housing units, which represents the second highest capacity for new residential units of the 35 Community Plan areas. The proposed CM-1 Zone would allow the development of 449 Restricted Affordable Dwelling Units and 5 managers' units that are much needed in an area in close proximity to transit options, including a Metro Rail Station and a Metro Rapid Bus Line, both of which are within 500 feet of the Project Site. The CM-1 Zone would permit new ground-up construction of the affordable housing units that are otherwise not permitted in the M1 Zone unless an existing building is being converted either by way of a conditional use permit process or under the Adaptive Reuse Ordinance. The existing commercial buildings on the Project Site are small, one-story structures that are not suitable for conversion to residential units, particularly for a project that would serve the homeless population with dwelling units and supportive social services. Likewise, the conversion of the three small detached residential buildings would not serve the homeless population with a sufficient number of dwelling units. The character of the neighborhood has been changing to include many more affordable housing units for low income and homeless persons. The PATH Affordable Housing Project is located adjacent to the Project Site to the east on industrially zoned land, across Madison Avenue, and the La Kretz Villas low-income housing project is adjacent to the Project Site to the west on residentially zoned land, across Juanita Avenue. Additional affordable housing units are currently under construction on M1 zoned land on the east side of Madison Avenue, across from the Project Site, by Path Ventures.

As the Project Site is located in a Community Plan area that is able to accommodate more new housing units than other parts of the City, the Project Site is the appropriate place to accommodate the type of density needed to provide an adequate supply of housing that is contemplated by the General Plan within this subregion of the City to meet the long-range projections of housing needs. The equitable distribution of housing opportunities for low income housing available to the formerly homeless that is proposed by Goal 4A would be accomplished by the approval of the General Plan Amendment to revise the land use designation in the Wilshire Community Plan from Limited Industrial (corresponding to the M1 Zone) to Commercial Manufacturing (corresponding to the CM Zone) to permit the construction of the restricted affordable housing development requested by the Applicant.

> ***Policy 4.1.6:*** *Create incentives and give priorities in permit processing for low- and very-low income housing developments throughout the City.*

The requested General Plan Amendment to revise the land use designation in the Wilshire Community Plan from Limited Industrial (corresponding to the M1 Zone) to Commercial Manufacturing (corresponding to the CM Zone) would permit the development of the affordable housing project for Extremely Low to Low Income homeless persons on industrially zoned land. The General Plan Amendment would create the incentive for the location of the Applicant's Project to provide 449 Restricted Affordable Dwelling Units for the type of housing that is contemplated by the General Plan to be situated throughout the City.

The General Plan Amendment to revise the land use designation to Commercial Manufacturing would permit new ground-up construction of the affordable housing units that are otherwise not permitted by the land use designation of Limited Industrial that corresponds to the M1 Zone unless an existing building is being converted either by way of a conditional use permit process or under the Adaptive Reuse Ordinance. The existing commercial buildings on the Project Site are small, one-story structures that are not suitable for conversion to residential units, particularly for a project that would serve the homeless population with dwelling units and supportive social

services. Likewise, the conversion of the three small detached residential buildings would not serve the homeless population with a sufficient number of dwelling units.

The character of the neighborhood has been changing to include many more affordable housing units for Extremely Low to Low Income homeless persons. The PATH Affordable Housing Project is located adjacent to the Project Site to the east, across Madison Avenue and the La Kretz Villas low-income housing project is adjacent to the Project Site to the west, across Juanita Avenue. Additional affordable housing units are currently under construction on M1 zoned land on the east side of Madison Avenue, across from the Project Site. Notwithstanding the adjacent affordable housing developments, the surrounding neighborhood maintains a mix of residential, commercial and industrial uses so that the neighborhood would retain its existing character without any adverse impacts from the proposed Project.

> ***Objective 4.2 of the General Plan Framework, Chapter 4 (Housing):*** *Encourage the location of new multi-family housing development to occur in proximity to transit stations, along some transit corridors, and within some high activity areas with adequate transitions and buffers between higher-density developments and surrounding lower-density residential neighborhoods.*

As previously discussed, the Project's residential units would be provided in close proximity to several mass transit options with easy access to employment centers, retail uses and neighborhood-serving uses throughout the City. The Extremely Low to Low Income homeless persons that would reside in the Project are unlikely to own personal vehicles, and as a result, because of the close proximity to the Vermont/Beverly Metro Red Line Rail Station, the Metro Rapid Bus 754 and two Metro Local Bus lines, the location of the proposed affordable housing project should be encouraged to be developed in this location. The neighborhood is a high activity area with a mix of multi-family residential, commercial and industrial developments that are proximate to the busy commercial corridor of Vermont Avenue. The commercial and industrial properties that are located within the surrounding neighborhood are buffered from lower-density residential neighborhoods. The properties that are designated residential in the immediate vicinity are developed with multi-family residential housing. The Project Site is to the east of Vermont Avenue, where the few residential parcels are zoned R4. To the west of Vermont Avenue, the residential parcels beyond the commercial parcels fronting Vermont Avenue are zoned R3 and R4, and therefore, any lower-density residential neighborhoods are not located in the surrounding neighborhoods so that adequate transitions and buffers are already in place.

L.A.'s Green New Deal, the 2019 update to the Mayor's Sustainable City pLAn, has the vision to to "end homelessness, preserve and expand affordable housing, and shorten the distance between new homes and transit." A target of the Sustainable City pLAn is to ensure 57% of new housing units are built within 1,500 feet of transit by 2025; and 75% by 2035. Other targets include increasing the cumulative new housing unit construction to 150,000 by 2025 and to create or preserve 50,000 income-restricted affordable housing units by 2035. Building housing near transit will help Angelenos use public transportation and reduce emissions from vehicle use. These targets are helped to be fulfilled by the 100% affordable housing development that adds 454 units within 500 feet of several transit options, including the Vermont/Beverly Metro Red Line Rail Station, Metro Rapid Bus 754 and two Metro Local Bus lines.

Industrial Land Use & Economic Development Policies

GOAL 3J*: Industrial growth that provides job opportunities for the City's residents and maintains*

the City's fiscal viability.

***Objective 3.14**. Provide land and supporting services for the retention of existing and attraction of new industries*

Policies	*Project Consistency*
Policy 3.14.1 Accommodate the development of industrial uses in areas designated as "Industrial-Light," "Industrial-Heavy," and "Industrial-Transit" in accordance with Tables 3-1 and 3-9. The range and intensities of uses permitted in any area shall be determined by the community plans.	The Community Plan designates the Project Site as the Industrial – Light land use category. According to Table 3-1 of the Framework Element, typical uses in the Industrial – Light designation include: • Industrial uses with potential for a low level of adverse impacts on surrounding land uses • Increased range of commercial uses that support industrial uses (through zoning amendments) • Possible consideration for other uses where parcels will not support viable industrial uses (determined by community plan) The Project would re-designate the Project Site from Light Industrial (corresponding to the M1 Zone) to Commercial Manufacturing (corresponding to the CM Zone). The CM Zone would permit affordable housing while still allowing development of light industrial uses and a range of commercial uses that are compatible with the surrounding area. The surrounding properties are zoned R4, C2, CM and M1. The adjoining properties to the south are zoned M1-1 and developed with a used-car sales lot and a pest control company. The property across Madison Avenue to the east is improved with the PATH Affordable Housing Project that provides housing and supportive services similar to those in the proposed Project located in the M1-1 zone (CPC-2014-1602-CU-SPE-SPP-DB-SPR). Across Juanita Avenue to the west is improved with the La Kretz Villas, a 49-unit residential building that combines subsidized and affordable studio units for individuals who have experienced homelessness and/or disabilities located in the R4-1 zone. Another property across Juanita Avenue to the west is an office building on a parcel zoned C2-1. Other nearby buildings in the vicinity along Beverly Boulevard include auto repair shops and an animal hospital located on parcels zoned M1-1. A map was prepared to identify the current land uses of the surrounding area within a 500-foot

	radius of the Project Site ("Study Area"). The land uses are based on the available building permits and Certificates of Occupancy from the Los Angeles Department of Building and Safety ("LADBS") archives. The Study Area is approximately 1.2 million square feet, or 28 acres, and consist of parcels generally bounded by Virgil Avenue to the east, the US-101 Freeway to the north, Vermont Avenue to the west, and Council Street and Cosmopolitan Street to the south. As evident by the Land Use Map, attached as Exhibit D, the surrounding area within 500 feet of the Project Site is comprised of a mix of residential uses (30%), office uses (14%), and commercial retail uses (13%). The remaining land uses include vacant lots and buildings (14%), the Virgil Middle School campus (9%), mixed-use with residential units (2%), mixed-uses with commercial uses[24] (5%), warehouse uses (5%), automotive uses (6%), and the Metro transit station entrance (2%). The current snapshot of the immediate area indicates a land use pattern for mixed-use and transit-oriented development. The Project Site is located within one block of the Metro Red Line transit station at Vermont Avenue and Beverly Boulevard. It also demonstrates that while traditional manufacturing uses have left the area, they have been replaced by other job creating uses. The immediate vicinity does not contain any industrial infrastructure or uses other than access to US-101 (The Hollywood Freeway). Moreover, the existing improvements on the site are obsolete, and the size of the space is not in demand in the market. Indeed, the market for industrial uses in the area is limited; currently, there are only two industrial properties listed as available for rent less than three miles from the site. Both of those properties are significantly larger than the Project Site and are likely to receive higher rents than the Project Site. Overall, new industrial development in the Los Angeles market is infeasible where land costs are greater than approximately $101 per sq. ft. The current asking price of $21.72 per sq. ft. per year is below replacement costs for new construction and would therefore not be feasible as a reuse. Moreover, the project site has minimal features that

[24] This land use type includes a combination of office and warehouse uses.

	would support industrial use, is not located in an active industrial district, and is surrounded by incompatible land uses. Current market conditions effectively foreclose the possibility of redeveloping the project site for industrial use. (See Exhibit E - Industrial Feasibility Memo dated April 15, 2020 prepared by MR+E) The Project is consistent with the City's desire to encourage the residential uses near transit as demonstrated by its inclusion in the CM Zones permitted uses. The proposed General Plan Amendment would be consistent and compatible with the current pattern of development in the surrounding area and would allow for the proposed construction of a new Permanent Supporting Housing development consisting of 454 residential units with approximately 11,772 square feet of supportive services as well as job creating commercial manufacturing uses. Thus, the Project would not accommodate industrial uses on the Property. However, the Project converts marginal industrial land, utilized most recently as surface parking and vehicle repair, to other uses as contemplated by the Industrial Light policy to give "consideration to other uses where parcels will not support viable industrial uses."
Policy 3.14.2 Provide flexible zoning to facilitate the clustering of industries and supporting uses, thereby establishing viable "themed" sectors (e.g., movie/television/media production, set design, reproductions, etc.).	The Project will not impede the City's effort to rezone or redesignate land to create clusters of industries. As described above, the proposed CM zoning allows light industrial and commercial uses, along with residential uses. This zoning will provide flexibility for a wide range of uses, including industrial uses. Thus, the Project would not hinder the City's efforts to establish themed sectors.
Policy 3.14.3 Promote the re-use of industrial corridors for small scale incubator industries.	The Project would not hinder the City's effort to re-use industrial corridors for small scale incubator industries. As described above, the proposed CM zoning allows light industrial and commercial uses. The Project does not involve a small scale incubator industry, but it does promote the reintegration of current homeless individuals into the economy.
Policy 3.14.4 Limit the introduction of new commercial and other non-industrial uses in existing commercial manufacturing zones to uses which support the primary industrial function of the location in which they are located.	As evident by the Land Use Map, the surrounding area within 500 feet of the Project Site is comprised of a mix of uses including residential uses (30%), office uses (14%), and commercial retail uses (13%). The remaining land uses include vacant lots and buildings (14%), the Virgil Middle School campus (9%), mixed-use with residential units

	(2%), mixed-uses with commercial uses[25] (5%), warehouse uses (5%), automotive uses (6%), and the Metro transit station entrance (2%). Therefore, industrial uses are not the primary function of the surrounding uses. The Project Site is located across the street from a newly constructed affordable housing project that provides housing and supportive services similar to those in the proposed Project. The current snapshot of the land uses today depict an area that is viable for mixed-use and transit-oriented development. The development of the Project is a continuation of this land use pattern.
Policy 3.14.5 Promote the development of a mix of commercial and light industrial uses in areas designated as Industrial-Transit.	This area is not designated as Industrial-Transit. Therefore, Policy 3.14.5 does not apply to the Project.
Policy 3.14.6 Consider the potential re-designation of marginal industrial lands for alternative uses by amending the community plans based on the following criteria: a. Where it can be demonstrated that the existing parcelization precludes effective use for industrial or supporting functions and where there is no available method to assemble parcels into a unified site that will support viable industrial development; b. Where the size and/or the configuration of assembled parcels are insufficient to accommodate viable industrial development; c. Where the size, use, and/or configuration of the industrial parcels adversely impact adjacent residential neighborhoods; d. Where available infrastructure is inadequate and improvements are economically infeasible to support the needs of industrial uses; e. Where the conversion of industrial lands to an alternative use will not create a fragmented pattern of development and reduce the integrity and viability of existing industrial areas;	The Policy recognizes that while parcels may be designated for industrial land uses, the size, configuration, or availability of infrastructure and improvements may not be adequate to serve the needs of industrial uses. Therefore, it would be appropriate to consider the re-designation of the Project's parcels to be compatible with the existing zone and uses of the surrounding area. The irregularly-shaped Project Site is approximately 90,974 square feet, or roughly 2 acres, and encompasses the majority of the city block bounded by Beverly Boulevard to the south, Madison Avenue to the east, Oakwood Avenue to the north and Juanita Avenue to the west. Other uses within the city block includes an automobile service shop, office buildings, and a car rental business. As indicated by the large areas colored in yellow on the Land Use Map, residential uses make up the largest share of land uses and consist of 30% of the Study Area. There are several multifamily residential buildings across the street from the site including the 6-story PATH affordable housing development consisting of 122 residential units and supportive services. Across Juanita Avenue to the west is improved with the La Kretz Villas, a 49-unit residential building that includes subsidized and affordable studio units. Located north of the site is the Delancey Street Foundation facility, which houses approximately 300 residents. Other residential uses range from one-story single-family

[25] This land use type includes a combination of office and warehouse uses.

f. Where the conversion of industrial lands to an alternative use will not result in an adverse impact on adjacent residential neighborhoods, commercial districts, or other land uses; g. Where it can be demonstrated that the reduction of industrial lands will not adversely impact the City's ability to accommodate sufficient industrial uses to provide jobs for the City's residents or incur adverse fiscal impacts; and/or h. Where existing industrial uses constitute a hazard to adjacent residential or natural areas.	dwellings to two-story apartment buildings and are generally located on the eastern edge of the Study Area between Westmoreland Avenue and Virgil Avenue. The second most common land use is commercial office, which consist of 14% of the Study Area. The other primary uses are vacant lots/buildings and commercial retail uses covering 14% and 13% of the Study Area, respectively. Notably, 9% of the Study Area is the Virgil Middle School campus and recreation area. As evident by the Land Use Map, the surrounding neighborhood does not include any traditional manufacturing uses, which is a common use associated with industrial land that generates a substantial amount of jobs. A small fraction of the Study Area is dedicated to automotive uses (6%) and warehouse uses (5%). Industrial uses, particularly manufacturing facilities, are not significant in the current land use pattern. As such, the re-designation of the Project's parcels will not adversely impact or impede the City's ability to accommodate sufficient industrial uses to provide jobs. Jobs are being created with in the office, retail, automotive and warehouse uses which will continue in the area. The supportive services with the Project will promote the reintegration of currently homeless individuals into the job market. The immediate vicinity does not contain any industrial infrastructure or uses other than access to US-101 (The Hollywood Freeway). Moreover, the existing improvements on the site are obsolete, and the size of the space is not in demand in the market. Indeed, the market for industrial uses in the area is limited; currently, there are only two industrial properties listed as available for rent less than three miles from the site. Both of those properties are significantly larger than the Project Site and are likely to receive higher rents than the Project Site. Overall, new industrial development in the Los Angeles market is infeasible where land costs are greater than approximately $101 per sq. ft. The current asking price of $21.72 per sq. ft. per year is below replacement costs for new construction and would therefore not be feasible as a reuse. Moreover, the project site has minimal features that

	would support industrial use, is not located in an active industrial district, and is surrounded by incompatible land uses. Current market conditions effectively foreclose the possibility of redeveloping the project site for industrial use. (See Memo dated April 15, 2020 prepared by MR+E.) The current snapshot of the land uses today depict an area that is viable for mixed-use and transit-oriented development that provide urgently needed housing, jobs and tax revenue. Located within 500 feet of the site is Metro's Vermont/Beverly Red Line transit station. With the appropriate zoning, the Project Site would qualify for Tier 4 level of development bonuses under the City's local Transit Oriented Communities ("TOC") affordable housing incentive program. The TOC program aims to promote high-density residential development around major transit stops. A Tier 4 site, which is the highest tier designation, would permit up to an 80% density increase in exchange for a certain percentage of on-site affordable units. Development of the Project would reinforce the current trend of residential and commercial development and would not result in a fragmented pattern of development while still maintaining an active tax base for the City.
Policy 3.14.7 Consider the potential redesignation of non-industrial properties located adjacent to lands designated and developed with industrial uses for industrial purposes by amending the community plans or by conditional use permits based on the following criteria: a. The redesignation is required to accommodate the expansion of existing industrial uses to facilitate their retention in areas in which they are located; b. There is substantial support of the property owners of the parcels to be redesignated; c. There is no significant disruption or intrusion into existing residential neighborhoods, commercial districts, or other land uses;	The Project does not involve re-designation of non-industrial properties for industrial purposes. As such, Policy 3.14.7 is not applicable to the Project.

d. There are no adverse environmental impacts (traffic, noise, lighting, air pollution, other) on adjacent land uses due to the industrial uses; and e. There is adequate infrastructure to support the expanded industrial use(s).	
Policy 3.14.8 Encourage the development in areas designated as "Industrial-Heavy" of critical public facilities that are necessary to support the needs of residents and businesses but normally are incompatible with residential neighborhoods and commercial districts, such as corporate yards.	This area is not designated as Industrial-Heavy. Therefore, Policy 3.14.8 does not apply to the Project.
Policy 3.14.9 Initiate programs for lot consolidation and implement improvements to assist in the retention/expansion of existing and attraction of new industrial uses, where feasible.	The Project will not impede the City's efforts to initiate programs for lot consolidation and implement improvements to assist in the retention/expansion of existing and attraction of new industrial uses.

***GOAL 7B**: A City with land appropriately and sufficiently designated to sustain a robust commercial and industrial base.*

> ***Objective 7.2**: Establish a balance of land uses that provides for commercial and industrial development which meets the needs of local residents, sustains economic growth, and assures maximum feasible environmental quality.*

Policies

Policies	*Project Consistency*
Policy 7.2.8. Retain the current manufacturing and industrial land use designations, consistent with other Framework Element policies, to provide adequate quantities of land for emerging industrial sectors.	The Project would change the existing designation to CM. This policy must be considered in light of Policy 3.14.6 and a balancing of policies. As discussed therein, the Project would meet the criteria to change the land use designation to accommodate for affordable housing units.
Policy 7.2.9. Limit the redesignation of existing industrial land to other land uses except in cases where such redesignation serves to mitigate existing land use conflicts, and where it meets the criteria spelled out in Policy 3.14.6 of Chapter 3: *Land Use*.	This policy must be considered in light of Policy 3.14.6. As discussed therein, the Project would meet the criteria to change the land use designation to accommodate for affordable housing units.
Policy 7.2.10. Ensure that the City's industrial sites are regionally competitive to maintain and enhance a core manufacturing base.	The immediate vicinity does not contain any industrial infrastructure or uses other than access to US-101 (The Hollywood Freeway). Moreover, the existing improvements on the site are obsolete, and the size of the space is not in demand in the market. Indeed, the

	market for industrial uses in the area is limited; currently, there are only two industrial properties listed as available for rent less than three miles from the site. Both of those properties are significantly larger than the Project Site and are likely to receive higher rents than the Project Site. Overall, new industrial development in the Los Angeles market is infeasible where land costs are greater than approximately $101 per sq. ft. The current asking price of $21.72 per sq. ft. per year is below replacement costs for new construction and would therefore not be feasible as a reuse. Moreover, the project site has minimal features that would support industrial use, is not located in an active industrial district, and is surrounded by incompatible land uses. Current market conditions effectively foreclose the possibility of redeveloping the project site for industrial use.(See Memo dated April 15, 2020 prepared by MR+E.) The Project will not impede the City's efforts to ensure that industrial sites are regionally competitive to maintain and enhance a core manufacturing base. However, those efforts need to be focused on areas with larger sites which can accommodate manufacturing uses.
Policy 7.2.11. Ensure that the City has sufficient quantities of land suitable to accommodate existing, new and relocating industrial firms, whose operations are appropriate to a specific location in Los Angeles.	The Project will not impede the City's efforts to ensure sufficient quantities of land suitable to accommodate existing, new and relocating industrial firms, whose operations are appropriate to a specific location in Los Angeles.
Policy 7.2.12. Establish, as shown in Figure 7-1, the area adjacent to the Port of Los Angeles, the rail corridor bisecting the San Fernando Valley, and the South Central/Southeast industrial area as market-linked targeted industrial areas (market-linked areas are described on page 7-4).	The Project is not located adjacent to the Port of Los Angeles, the rail corridor bisecting the San Fernando Valley or the South Central/Southeast industrial area. Therefore, Policy 7.2.12 does not apply to the Project. .
Policy 7.2.13. Facilitate environmentally sound operations and expansion of the Port of Los Angeles and the Los Angeles International Airport as major drivers of the local and regional economy.	The Project Site is not located at the Port of Los Angeles or the Los Angeles Airport. Therefore, Policy 7.2.13 does not apply to the Project.
Policy 7.2.14. Take steps to assure that new industries developed are sensitive to environmental and conservation issues, and that cumulative environmental impacts are addressed.	The Project is not introducing new industries to the area. Therefore, Policy 7.2.14 does not apply to the Project.

***GOAL 7C**: A City with thriving and expanding businesses.*

***Objective 7.3**. Maintain and enhance the existing businesses in the City.*

Policies	*Project Consistency*
Policy 7.3.4. Recognize the crucial role that the Port of Los Angeles and the Los Angeles International Airport play in future employment growth by supporting planned Port and Airport expansion and modernization that mitigates its negative impacts.	The Project Site is not located at the Port of Los Angeles or the Los Angeles Airport. Therefore, Policy 7.3.4 does not apply to the Project.
Policy 7.3.5. Improve the movement of goods and workers to industrial areas.	The Project does not involve the movement of goods and workers. Therefore, Policy 7.3.5 does not apply to the Project.
Policy 7.3.6. Retain the City's existing manufacturing base through an outreach program to existing businesses and an ongoing assessment of their specific land use requirements.	The Project Site does not have a manufacturing facility and is currently vacant. The majority of the site's land mass is dedicated to surface parking while the existing buildings are aging and include three small residences and three small one-story buildings used to service vehicles. The Project will not impede the City's efforts to retain existing manufacturing base.
Policy 7.3.7. Prioritize the retention and renewal of existing industrial businesses.	The majority of the site's land mass is dedicated to surface parking while the existing buildings are aging and include three small residences and three small one-story buildings used for the commercial operation of a telecommunications company which have abandoned the site.
Policy 7.3.8. Assist existing industries located in Los Angeles with their expansion plans and/or relocation efforts to find suitable industrial sites in the City.	The Project will not impede the City's efforts to expand or relocate existing industries to suitable industrial sites.

The Project would help to foster the development of a transitional neighborhood and outdated telecommunications infrastructure to construct 454 permanent supportive housing units. Although the Project is not wholly consistent with all policies listed above related to industrial land uses, a project does not need to be in perfect conformity with each and every policy or objective of a General Plan for a finding of consistency.

The Project is consistent with the majority of applicable policies and objectives transit oriented development and provision of a variety of housing types and styles. The Project will bring supportive housing units and services to an area that is largely characterized by residential and commercial uses and which lacks infrastructure for industrial uses. The Project Site is also well-served by transit and ideal for a more active, pedestrian oriented development. Additionally, the Project would meet or exceed several other relevant policies related to residential uses, mass

transit, and affordable housing.

Housing Element 2013-2021

The Project is harmonious with the following goals, objectives and policies of the Housing Element 2013-2021 of the General Plan:

The proposed residential Project would be consistent with the goals, objectives and policies of the General Plan Housing Element 2013-2021 to provide for affordable housing needs of the City's growing population.

The Housing Element 2013-2021 affirms in its Executive Summary that the need to accommodate growth results is the need not only for more housing but a "broader array of housing types to meet evolving household types and sizes." The development of more housing requires a strategy to accommodate residential development in a sustainable way.

The Wilshire Community Plan is identified in the Housing Element as having the capacity for 51,490 new housing units,[26] which represents the second highest capacity for new residential units of the 35 Community Plan areas. The approval of the requested Zone Change would advance the City towards the goal of providing more diverse housing by permitting the construction of a maximum of 449 Restricted Affordable Dwelling Units for Extremely Low to Low Income homeless persons and five market rate managers' units in an area specifically contemplated by the City to help meet the City's housing shortage and comply with its RHNA requirement. A General Plan Amendment from Limited Industrial to Commercial Manufacturing land use designation corresponding to the CM Zone would permit the construction of affordable housing where it is needed and compatible with the surrounding neighborhood. As the Project Site is located in a Community Plan area that has the capacity for more new housing units than other parts of the City, the Project is consistent with the Housing Element's stated need to accommodate growth.

The Project would be developed in a transit-rich area near a commercial corridor with a sustainable infill development appropriate to an area where the Project would be strategically located in proximity to transit and basic amenities. While the Project itself is not a mixed-use development, onsite supportive services will be included as part of the Project, providing opportunities for the residents with job training programs and other services. The Project is also in close proximity to Vermont Avenue, an established commercial corridor. The Project's intent for a smart, sustainable development is encouraged by the General Plan Housing Element's conclusion:

> *The City's General Plan lays out the strategy to meet this challenge, by directing growth to transit-rich and job-rich centers and supporting the growth with smart, sustainable infill development and infrastructure investments. By integrating the City's housing strategy with its growth strategy the City supports economic development, reduces housing costs, minimizes environmental impacts and enhances the quality of life. At the core of this strategy are complete mixed-use, mixed-income neighborhoods strategically located across the City that provide opportunities for housing, jobs, transit and basic amenities for all segments of the population. (Housing Element 2013-2014, Executive Summary, Page*

[26] Housing Element 2013-2014, Table 3.1 Summary of Sites with Housing Capacity by Community Plan Area, page 3-4.

c-xiii.)

The Project would provide much needed housing for Extremely Low to Low Income homeless individuals in an area where easy access to many transit options would provide opportunities for disadvantaged persons to enhance their quality of life by having the ability to access employment centers and neighborhood-serving services and retail uses. Considering the City is expected to need an additional 82,002 new units through 2021, of which 46,590 units (57%) are designated for very low- and low-income households based on the Regional Housing Needs Assessment (RHNA), the Housing Element notes that the "City will face significant challenges in meeting its RHNA income distribution if it is not able to secure additional funding for affordable housing production and preservation." The Applicant proposes to construct affordable housing by proposing a maximum of 449 Restricted Affordable Dwelling Units at the Extremely Low to Low Income level and five managers' units, which would assist the City to meet the challenge of the RHNA by maintaining and adding affordable housing units to the housing stock.

Goal 1: *A City where housing production and preservation result in an adequate supply of ownership and rental housing that is safe, healthy and affordable to people of all income levels, races, ages, and suitable for their various needs*

> ***Objective 1.1:*** *Produce an adequate supply of rental and ownership housing in order to meet current and projected needs.*
>
> > ***Policy 1.1.2:*** *Expand affordable rental housing for all income groups that need assistance.*
> >
> > ***Policy 1.1.3:*** *Facilitate new construction and preservation of a range of different housing types that address the particular needs of the city's households.*
> >
> > ***Policy 1.1.7:*** *Strengthen the capacity of the development community to develop affordable housing.*

The Housing Element notes that the "City of Los Angeles is committed to providing affordable housing and amenity-rich, sustainable neighborhoods for its residents, answering the variety of housing needs of its growing population." The Housing Element recognizes that City households comprise a diverse set of needs that can only be met by providing a wide variety of housing types. The proposed Project would provide affordable housing and supportive social services in furtherance of the foregoing goal, objective and policies at a site which is currently underutilized with surface parking lots, three small one-story commercial buildings, and three small single-family buildings that would be demolished in order to develop a maximum of 454 dwelling units.

The Applicant proposes an affordable housing development in a campus setting where the new construction of five buildings with 454 dwelling units and containing supportive social services would create an environment that is safe, healthy and affordable to persons at the Extremely Low to Low Income level. The Project would provide the safe and healthy housing for a population that often lacks any housing options whatsoever, having to rely on shelters, if space is available, or resorting to street encampments that are neither safe nor healthy. By providing onsite services such as case management, mental health services, independent living skills programs, substance abuse programs, and job training, the Project provides for the various needs of the formerly homeless, an income group with the greatest need for affordable housing and the various services. The provision of the supportive social services is a critical element to helping the at-risk population to seek personal betterment, and the Applicant is committed to these supportive

service programs and affordable housing to be provided in a high-quality environment.

Consistent with Policy 1.1.2, the Project expands the availability of affordable rental housing with its 449 Restricted Affordable dwelling units for persons that need assistance. The requested General Plan Amendment from Limited Industrial to Commercial Manufacturing land use designation corresponding to the CM Zone would provide the Applicant the opportunity to develop the affordable housing in a location that is in close proximity to several transit options and neighborhood-serving uses.

The City's Comprehensive Homeless Strategy notes that land use is "an inseparable factor creating additional opportunities to increase housing stock. Los Angeles has not responded to stronger housing demand by allowing for greater residential density in the nearly 500 square miles of our City. Land use and zoning restrictions can and have limited the supply of housing throughout the City."[27] The Comprehensive Homeless Strategy presents data that the City experiences a 9,049 bed deficit for permanent supportive housing for single individuals, which represents the highest need the City is facing relative to the housing gap for the homeless in Los Angeles.

The Comprehensive Homeless Strategy encourages greater density in areas of the City most capable of supporting it, and proposes that the City "should also investigate how well its various zoning density programs are doing to encourage or mandate additional residential development. Further study into reducing or removing parking minimums for affordable and homeless housing profiles, where residents own cars at much lower rates than market-rate housing, could lower the cost of affordable and homeless housing development and ensure efficient use of space for areas where more residential density is needed."[28]

In the Land Use chapter of the Comprehensive Homeless Strategy, the root cause of the affordability crisis is identified as the mismatch in the supply and demand for housing, which is observed as a result of the "limited supply of multi-family zoned housing sites and the difficulty of entitling multi-family housing projects throughout the City limits the creation of affordable housing units. A constrained affordable housing supply coupled with high rent burdens increases the likelihood low wage earners will fall into homelessness if their hours are reduced or if they encounter unavoidable/unforeseen costs……The constrained supply also makes finding affordable replacement housing more difficult and opens the door to homelessness."[29]

L.A.'s Green New Deal, the 2019 update to the Mayor's Sustainable City pLAn, sets targets to accomplish the following:

- End street homelessness by 2028.
- Ensure 57% of new housing units are built within 1,500 feet of transit by 2025; and 75% by 2035.
- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.
- Create or preserve 50,000 income-restricted affordable housing units by 2035 and increase stability for renters.

L.A.'s Green New Deal's targets include milestones and initiatives. These include the following:

[27] Comprehensive Homeless Strategy, page 17.
[28] Ibid, page 17.
[29] Ibid, page 183.

- Build 10,000 new permanent supportive housing units by implementing Prop HHH and streamlining the permitting process of permanent supportive housing.
- Build 100,000 new housing units by 2021.
- Build 15,000 units of affordable housing by 2021; and 45,000 by 2035.

In adopting Assembly Bill No. 2162 to address California's homelessness crisis by making it easier to build supportive housing, the State Legislature made findings that twenty-five percent of the nation's total homeless population and almost half of the nation's unsheltered population reside in California. The Legislature found that evidence shows "supportive housing – an affordable rental with intensive services promoting housing stability – works to reduce chronic homelessness." Additionally, AB 2162 notes that studies "reveal supportive housing benefits communities by reducing homelessness locally, addressing blight, and increasing property values. Yet one of the barriers to creating supportive housing has been local delays or denials of applications to build supportive housing, based on subjective local planning standards."

The Los Angeles Homeless Services Authority (LAHSA) reports in its 2018 Greater Los Angeles Homeless Count that within the City of Los Angeles the homeless population consists of 31,285 persons, of which 22,887 are unsheltered and 8,398 are sheltered. The LAHSA report indicates that there has been a 6% decline in the number of homeless in the City of Los Angeles but the economic factors driving people in homelessness persist. Los Angeles has a growing affordable housing crisis. Los Angeles County needs over 565,000 new affordable housing units for low income renters – 16,000 more than the previous year. LAHSA also reports that more people are falling into homelessness for the first time, with a count of 9,205 new homeless persons in 2018 as opposed to 8,044 homeless persons for the first time in 2017.

In contrast to the 2018 report on the homeless count from LAHSA, on June 4, 2019, Peter Flynn, Executive Director of LAHSA, presented the results of its 2019 Greater Los Angeles Homeless Count to the Los Angeles County Board of Supervisors, noting that within the City of Los Angeles the homeless population consists of 36,300 persons, of which 27,221 are unsheltered and 9,079 are sheltered. The 2019 LAHSA report indicates that there has been a 16% increase in the number of homeless in the City of Los Angeles, thereby reversing the trend of the previous year. The LAHSA report states that 516,946 new affordable housing units are needed in the County, according to the May 2019 "Los Angeles County Annual Affordable Housing Outcomes Report" prepared by the California Housing Partnership Corporation.

The Applicant's request for approval of a General Plan Amendment to the Commercial Manufacturing land use designation to permit the construction of restricted affordable housing for the formerly homeless and supportive social services and approval of a new Subarea D.2 in the Vermont/Western Station Neighborhood Area Plan (SNAP) to construct the affordable housing project for the formerly homeless would be consistent with Goal 1 of the Housing Element, the City's Comprehensive Homeless Strategy, L.A.'s Green New Deal, State law as the result of the adoption of AB 2162, and housing reports issued by the State and County that are addressed elsewhere in this application.

Goal 2: *A City in which housing helps to create safe, livable and sustainable neighborhoods.*

> ***Objective 2.2:*** *Promote sustainable neighborhoods that have mixed-income housing, jobs, amenities, services and transit.*
>
> > ***Policy 2.2.2:*** *Provide incentives and flexibility to generate new multi-family*

housing near transit and centers, in accordance with the General Plan Framework element, as reflected in Map ES.1.

The Project's development of affordable housing for formerly homeless persons in a campus setting with the new construction of five buildings with 454 dwelling units affordable to Extremely Low to Low Income individuals, and containing supportive social services would create a safe, livable and sustainable neighborhood. The Project would create synergy with the adjacent similar residential developments that are also safe and livable for formerly homeless residents. The Project supports sustainability by providing 454 multi-family residential units in close proximity to numerous transit options, including being in walking distance to the Vermont/Beverly Metro Red Line Rail Station. The Project Site is also in close proximity with Vermont Avenue, which is an established commercial corridor that provides employment opportunities and neighborhood services and amenities.

The requested General Plan Amendment from Limited Industrial to Commercial Manufacturing land use designation corresponding to the CM Zone would provide the incentive and flexibility that is needed to generate new multi-family housing near transit and commercial centers. The City's L.A.'s Green New Deal, the 2019 update to the Mayor's Sustainable City pLAn, proposes that by 2025 the development of 57% of new housing units should be built within 1,500 feet of transit, that 50,000 income-restricted affordable units should be created and preserved by 2035, that 15,000 units of affordable housing need to be built by 2021, and that 10,000 new permanent supportive housing units need to be built by implementing Prop HHH and streamlining the permitting process of permanent supportive housing. The requested General Plan Amendment, along with the Zone Change and the proposed Specific Plan Amendment, would facilitate the process of meeting the City's goals of more restricted affordable housing with supportive services.

Objective 2.3: *Promote sustainable buildings, which minimize adverse effects on the environment and minimize the use of non-renewable resources.*

to the Project would construct 449 Restricted Affordable dwelling units and five managers' units where existing surface parking lots, three small, underutilized one-story i commercial buildings, and three small single-family residential buildings are located and would be demolished. The Project design addresses sustainability and minimizes environmental effects. Project would comply with the L.A. Green Building Code, effective January 1, 2017, which requires the use of numerous conservation measures, beyond those required by Title 24 of the California Code of Regulations. The L.A. Green Building Code contains both mandatory and voluntary green building measures to conserve energy, water and other resources, and to avoid other environmental impacts. Among many requirements, the L.A. Green Building Code requires projects to achieve a 20 percent reduction in wastewater generation. Compliance with Title 24 of the California Code of Regulations and the L.A. Green Building Code would reduce the Project's energy and water consumption and other potential environmental effects.

.

Objective 2.5: *Promote a more equitable distribution of affordable housing opportunities throughout the City.*

Policy 2.5.1: *Target housing resources, policies and incentives to include affordable housing in residential development, particularly in mixed use development, Transit Oriented Districts and designated Centers.*

Policy 2.5.2: *Foster the development of new affordable housing units citywide*

and within each Community Plan area.

The Los Angeles City Council has pledged to support the development of supportive housing in each Council district as an effective measure at ending homelessness. Councilmember Mitch O'Farrell, representative of the district in which the Project Site is located, has stated on his website that "homelessness and the lack of access to services and affordable housing is the most serious crisis facing the City," noting the City of Los Angeles is the most unaffordable housing market in the country. The Councilmember seeks to combat homelessness by working to increase the supply of covenanted affordable housing and providing access to services and permanent supportive housing. Councilmember O'Farrell also states that he "firmly believes the City has an obligation to provide services and access to affordable, supportive housing." The Councilmember's position is in line with the City's Comprehensive Homeless Strategy.

The proposed Project would meet the City's vision of combating homelessness by developing new affordable housing units within the Wilshire Community Plan area, which as previously noted has the City's second greatest capacity for the provision of new housing units. The Project Site is located within walking distance to the Vermont/Beverly Metro Red Line Rail Station, and within the Vermont/Western Transit Oriented District, which is noted in its Purpose to "improve the quality of housing stock in the neighborhood through the construction of affordable housing units" and to "facilitate the provision of studio and one bedroom apartments for…senior citizens (a significant segment of the homeless population) located near….subway stations." Although the Project itself, is not mixed-use, it does provide onsite supportive services for its residents, including case management, mental health services, independent living skills programs, substance abuse programs and job training, and is located in close proximity to Vermont Avenue, which is an established commercial corridor that provides job opportunities and neighborhood retail and services.

Goal 4: *A City committed to preventing and ending homelessness.*

> ***Objective 4.1:*** *Provide an adequate supply of short-term and permanent housing and services throughout the City that are appropriate and meet the specific needs of all persons who are homeless or at risk of homelessness.*

The City's commitment to preventing and ending homelessness has been realized in its Comprehensive Homeless Strategy, which notes that land use is "an inseparable factor creating additional opportunities to increase housing stock. Los Angeles has not responded to stronger housing demand by allowing for greater residential density in the nearly 500 square miles of our City. Land use and zoning restrictions can and have limited the supply of housing throughout the City."[30] The Comprehensive Homeless Strategy presents data that the City experiences a 9,049 bed deficit for permanent supportive housing for single individuals, which represents the highest need the City is facing relative to the housing gap for the homeless in Los Angeles. The Project would provide permanent supportive housing and supportive social services for persons who are homeless or at-risk of homelessness.

In addition to the Comprehensive Homeless Strategy, the City has recently updated the Mayor's Sustainable City pLAn with L.A.'s Green New Deal which has set targets that would end homelessness by 2028, ensure 57% of new housing units would be built within 1,500 feet of transit by 2025 and 75% of new housing units by 2035, create or preserve 50,000 income-restricted affordable housing units by 2035, build 10,000 new permanent supportive housing units by

[30] Comprehensive Homeless Strategy, page 17.

implementing Prop HHH and streamlining the permitting process of permanent supportive housing, and build 15,000 units of affordable housing by 2021 and 45,000 units by 2035. The City's vision for the creation of new affordable units is ambitious and requires the support of the development community to provide such units, particularly ones that would accommodate homeless persons. The Applicant's Project would generate 449 new dwelling units to be occupied by formerly homeless persons and five market rate managers' units.

The Applicant's request for approval of a General Plan Amendment of the land use designation from Limited Industrial to Commercial Manufacturing corresponding to the CM Zone to permit the construction of affordable housing for the formerly homeless and supportive social services, the request for a Zone Change from M1-1 to CM-1 Zone, and the request for approval of a new Subarea D.2 in the Vermont/Western Station Neighborhood Area Plan (SNAP) to construct the affordable housing Project for the formerly homeless would provide for a supply of permanent supportive housing and services to meet the specific needs of persons who are homeless or at-risk of homelessness.

> ***Policy 4.1.3:*** *Provide permanent supportive housing options with services for homeless persons and persons/families at risk of homelessness to ensure that they remain housed and get the individualized help they may need.*
>
> ***Policy 4.1.4:*** *Target chronically homeless individuals and prioritize the most vulnerable among them for services and Permanent Supportive Housing, including through the coordination of service provision and the efficient access to information so as to rapidly match available services to those in need of services.*
>
> ***Policy 4.1.6:*** *Provide housing facilities and supportive services for the homeless and special needs populations throughout the City, and reduce zoning and other regulatory barriers to their placement and operation in appropriate locations.*

The proposed Project would provide housing for Extremely Low to Low Income homeless individuals in furtherance of the foregoing goal, objective and policies with a permanent housing solution in a residential development that also would provide supportive social services onsite for its residents. The supportive social services would offer a range of services that include case management, mental health services, independent living skills programs, substance abuse programs, and job training. The provision of supportive social services to Extremely Low to Low Income homeless persons is a critical element to helping the at-risk population to seek personal betterment, and the Applicant is committed to these supportive service programs and affordable housing to be provided in a high-quality environment.

Enlightenment Plaza will offer a Service Plan dedicated to assisting the residents that are homeless individuals, including those experiencing chronic homelessness with special needs as defined by HUD, unaccompanied homeless persons with disabling conditions, and other homeless individuals with conditions of mental illness and/or chronic medical conditions, developmental disabilities, substance abuse, and HIV/AIDS or co-occurring disorders.

Each resident will be provided case management services as well as mental health services. The program would use the Housing First approach that prioritizes permanent housing for those experiencing homelessness so that the resident may pursue personal goals and improve their quality of life. This approach will be achieved by providing integrated services that allow for a wide range of mental health, substance abuse, and medical and functional needs of the resident to be addressed simultaneously and directly by on-site case managers or coordinated with the

appropriate community provider.

Enlightenment Plaza will provide supportive services and amenities including:

- New tenant orientation to identify the types of services and activities that would benefit them.
- Case management services to develop an Individual Service Plan for each resident to identify short- and long-term goals to be achieved, along with a plan for monthly reviews, at a minimum, of the resident's progress.
- Mental health services on-site that include psychiatric assessments, individual and group therapy, and crisis intervention with a focus on achieving wellness, recovery and housing stability.
- Substance abuse treatment services that address recovery planning and relapse prevention strategies, along with outpatient and inpatient provider referral and treatment options.
- Recreational and educational activities to foster a sense of community within the building and engage the residents with the surrounding neighborhood. Residents will have the opportunity to participate in theatre classes and perform plays in the Project's outdoor amphitheater.
- Housing stabilization and retention are the primary goals for each resident. Residents with specific issues or barriers to complying with lease regulations or pay rent will be helped to overcome these issues in order to prevent eviction.

Enlightenment Plaza's general goals of the Service Plan are to assist the residents in 1) maintaining stable housing, 2) increasing skills and/or income, and 3) achieving self-determined life goals.

The Project is consistent and compatible with the goals, objectives and policies of the Housing Element 2013-2021.

Wilshire Community Plan

The Wilshire Community Plan observes that the "Wilshire area includes only minimal light industrial uses," and that only 0.43 percent of the total Plan Area is designated for industrial use. The largest such area is located along Beverly Boulevard, from Oakwood Avenue to the north, to Council and 1st Streets on the south, to Hoover Street on the east, to Juanita Avenue on the west, and is occupied by various business park type uses. Some of these industrial areas, according to the Community Plan, have been developed with "two story retail and medium-rise office buildings (two to four story); however, the majority of the area has been developed with retail/wholesale businesses and light manufacturing uses."

The Project Site is located on parcels zoned M1-1 and is developed with three small one-story buildings for single-family residences, three small one-story commercial buildings and surface parking lots. The adjacent properties are improved with a variety of residential, commercial and industrial uses. The Project Site is surrounded by parcels that are zoned R4, C2, CM and M1. Within the blocks surrounding the Project Site, bounded by Oakwood Avenue to the north, Juanita Avenue to the west, Madison Avenue to the east, and property adjoining Beverly Boulevard to the south, the adjoining properties are developed with a used-car sales lot and a pest control company that front on Beverly Boulevard on M1-1 zoned property. Adjoining the Project Site on the northwest end is a manufacturer of stone furnishings and fireplace mantels. Directly across from

the Project Site to the east, on the other side of Madison Avenue, the property is zoned M1-1 and is developed with the PATH Affordable Housing Project that provides housing and supportive services similar to those proposed by the Applicant. Additional affordable housing units are currently under construction across the Project Site on the east side of Madison Avenue. Across the Project Site to the west, on the other side of Juanita Avenue, a R4-1 zoned parcel is developed with the La Kretz Villas, a 49-unit residential building that combines subsidized and affordable studio units for individuals who have experienced homelessness and/or disabilities. This Project also provides integrated case management services for the residents through PATH Ventures. Across the Project Site to the west is an office building on a parcel zoned C2-1. A CM zoned parcel is also located across the Project Site to the west. Other nearby buildings in the vicinity along Beverly Boulevard include auto repair shops and a dog and cat hospital located on parcels zoned M1-1.

The Applicant is requesting a General Plan Amendment from Limited Industrial to the Commercial Manufacturing land use designation corresponding to the CM Zone to permit the construction of a new Restricted Affordable housing Project containing a maximum of 454 residential dwelling units including 449 Restricted Affordable Units at the Extremely Low to Low Income level and five managers' units as well as approximately 11,772 square feet of resident-focused supportive services.

The Project is consistent with the following goals, objectives and policies of the Wilshire Community Plan:

> ***Goal 1:*** *Provide a safe, secure and high quality residential environment for all economic, age, and ethnic segments of the Wilshire Community.*
>
> ***Objective 1-1:*** *Provide for the preservation of existing quality housing, and for the development of new housing to meet the diverse economic and physical needs of the existing residents and expected new residents in the Wilshire Community Plan Area to the year 2010.*

The Project would provide housing opportunities for Extremely Low to Low Income homeless population that seeks restricted affordable units in a development that provides onsite supportive social services, including case management, mental health services, independent living skills programs, substance abuse programs, and job training. The provision of supportive social services to the residentsis a critical element to helping the at-risk population to seek personal betterment, and the Applicant is committed to these supportive service programs and affordable housing to be provided in a high-quality environment. The Project would increase the housing stock and address the homelessness crisis that is most acute in Los Angeles County, which has one-third of the state's homeless population. The Project would replace surface parking lots, three small one-story commercial buildings and three small detached residential buildings with the new construction of affordable dwelling units in a development with high quality design, supportive social services for residents, and open space areas throughout the Project's campus setting.

The proposed Project would offer permanent housing choices for the homeless individuals that are often relegated to shelters or transitional housing. The proposed Project also brings new residential units to an area which consists of a mix of residential, commercial and industrial uses, and is within easy walking distance of several public transit alternatives to access jobs and services.

The proposed Project would guard against the loss of units through conversion or deterioration of units, as the new construction of Restricted Affordable units would guarantee the long-term supply of very low-income housing stock. The Applicant proposes permanent affordable housing with the supportive services designed to ensure that the homeless persons remain housed and get the individualized help they need. The Project would target the chronically homeless individuals as permanent residents, while providing access to the residential supportive services to be provided within the campus setting.

> ***Objective 1-2:*** *Reduce vehicular trips and congestion by developing new housing in close proximity to regional and community commercial centers, subway stations and existing bus route stops.*
>
> > ***Policy 1-2.1:*** *Encourage higher density residential uses near major public transportation centers*.

The Project is a 100% Restricted Affordable housing development for the formerly homeless who will also be provided with onsite supportive social services. The Project would provide 449 Extremely Low to Low Income dwelling units and five managers' units within five new high-quality buildings. Due to economic circumstances, residents are unlikely to own personal vehicles, and the Project would not provide any parking for automobiles for these residential units, and only provides parking for the onsite supportive services and for guests. Therefore, the Project by design would result in a low vehicle miles traveled.

Located in close proximity to a subway station and existing bus route stops, the Project site is located within 500 feet of the intersection of Beverly Boulevard and Vermont Avenue, where the Vermont/Beverly Metro Red Line Rail Station, Metro Rapid Bus 754 and two Metro Local Bus lines have stops. The Metro Red Line rail station provides access to the Metro Purple Line at the Wilshire/Vermont rail station and access to the Metro Expo Line and Metro Blue Line at the 7th Street/Metro Center rail station in downtown Los Angeles. The Metro Expo Line ends in downtown Santa Monica and the Metro Blue Line ends in downtown Long Beach with a stop that connects to the Metro Green Line. The Metro Red Line runs from North Hollywood to Union Station, where riders may access the Metro Gold Line.

The most convenient Metro Rapid Bus stop to the Project site is Metro Rapid Bus 754, which runs north-south on Vermont Avenue with a stop at Vermont Avenue and Beverly Boulevard, one block to the west of the Project site. Metro Rapid Bus 754 runs from Sunset Boulevard to the north to the Vermont/Athens Metro Green Line stop to the south. Metro Rapid Bus 754 includes a stop at Exposition Boulevard that accesses the Expo/Vermont Metro Expo Line rail station.

Metro Rapid Bus 754 offers connections to several Metro Rapid Bus lines. To the north, Metro Rapid Bus 754 includes a stop at Hollywood Boulevard which includes a connection to Metro Rapid Bus 780 that runs from the Washington/Fairfax Transit Hub to the west to Colorado Boulevard and Hill Avenue in Pasadena to the east. To the north at Santa Monica Boulevard, a connection is available to Metro Rapid Bus 704 which runs from Santa Monica to the west to the Patsaouras Bus Plaza/Union Station to the east. The Metro Rapid Bus 754 stop at Wilshire Boulevard provides access to Metro Rapid Bus 720 that runs from Santa Monica to the west to the Commerce Center to the east with stops on 5th and 6th Streets through downtown Los Angeles. At Olympic Boulevard and Vermont Avenue, Metro Rapid Bus 728 runs from Century City to the west to the Patsaouras Bus Plaza/Union Station to the east with stops on Hill and Spring Streets through downtown Los Angeles. At Venice Boulevard and Vermont Avenue, Metro Rapid Bus 733 runs from Santa Monica to the west to Patsaouras Bus Plaza/Union Station to the east with

stops on Main and Spring Streets in downtown Los Angeles. Further to the south at Vernon Avenue, Metro Rapid Bus 705 runs from La Cienega Boulevard and Rodeo Road to the west and Santa Monica and San Vicente Boulevards to the north to Long Beach Boulevard and Vernon Avenue to the east.

Two Metro Local Bus lines with stops at Vermont Avenue and Beverly Boulevard are located one block to the west of the Project site. Metro Local Bus 204 runs north-south on Vermont Avenue along the same path as Metro Rapid Bus 754. Metro Local Bus 204 runs from Sunset Boulevard to the north to the Vermont/Athens Metro Green Line stop to the south. Metro Local Bus 204 includes a stop at Exposition Boulevard that accesses the Expo/Vermont Metro Expo Line rail station.

Metro Local Bus 14 runs east-west along Beverly Boulevard from Beverly Hills to the west, with stops at the Beverly Center, Farmer's Market/The Grove and Larchmont Village, to Adams Boulevard and Figueroa Street to the east, with stops at locations in downtown Los Angeles along Grand Avenue and Olive Street.

Therefore, the Project furthers this objective and policy.

> ***Objective 1-4:*** *Provide affordable housing and increased accessibility to more population segments, especially students, the handicapped and senior citizens.*
>
> > ***Policy 1-4.1:*** *Promote greater individual choice in type, quality, price and location of housing.*
> >
> > > ***Program:*** *The plan promotes greater individual choice by allocating adequate lands in the Plan Area for a variety of residential densities, and for the promotion of housing in mixed-use projects.*

The General Plan and the Housing Element 2013-2021 identify the critical need for more affordable housing to be built in the City of Los Angeles. As discussed more fully in the findings for the Housing Element, the assessment is that the City of Los Angeles is "facing an unprecedented housing crisis," and this crisis impacts all segments of the housing market. The housing crisis is most acute for the homeless population, as observed in the City's Comprehensive Homeless Strategy which reports that a 9,049 bed deficit for permanent supportive housing for single individuals represents the highest need the City is facing relative to the housing gap for the homeless in Los Angeles.

The lack of adequate housing supply has resulted in the increased need for affordable housing for lower income families. The Housing Element notes that housing production is likely insufficient to meet future demands, as the City has not kept pace with projected growth according to the Regional Housing Needs Assessment and that the City has been producing an average of 1,100 affordable units per year since 2006, which falls far below the provision of adequate housing for persons of Extremely Low to Low Income.

The Project proposes an affordable housing development, consisting of 449 Restricted Affordable Units and five managers' units, for the formerly homeless with a majority of the units to be provided as studio units along with a mix of one- and two-bedroom units. Each unit would contain its own bathroom and kitchen. The Project would draw a homeless population that would benefit from the supportive social services to be provided onsite for the residents. The Project Site is in close proximity to transit options offered by the Metro Red Line, Metro Rapid Bus and Metro Local Bus

lines.

The Project is consistent and compatible with the goals, objectives and policies of the Wilshire Community Plan.

Wilshire Center/Koreatown Redevelopment Project

Section 105 – Project Goals

The Project is consistent with the following Wilshire Center/Koreatown Redevelopment Project land use goals :

Goal 3: Promote the economic, social, educational and cultural and physical well-being through the revitalization of the residential, commercial and industrial areas.

The Project would promote the social and physical well-being of the formerly homeless persons that are in great need of supportive housing. The Project would provide housing for a homeless population that would no longer reside on the streets or in makeshift encampments. The residents would be provided with a variety of supportive social services, including case management, mental health services, independent living skills programs, substance abuse programs, and job training. The provision of supportive social services to homeless persons is a critical element to helping the at-risk population to seek personal betterment, and the Applicant is committed to these supportive service programs and affordable housing to be provided in a high-quality environment. The Project would be located where other high-quality affordable dwelling units are located on properties adjoining to the west and the east of the Project Site. The Project would revitalize the existing industrial property that is underutilized with small buildings and surface parking lots with residential uses that have already been established on adjacent parcels.

Goal 4: Promote the livability of the Project Area as a cohesive and sustainable neighborhood.

The Project Site is uniquely located within 500 feet of major transit options. The intersection of Beverly Boulevard and Vermont Avenue, one block to the west of the Project Site, includes the Metro Red Line Rail Station and the bus stops for a Metro Rapid Bus Line and two Metro Local Bus lines which run to areas throughout the City where residents may have easy access to a variety of neighborhood-serving commercial uses and services. The neighborhood would become more cohesive as the Project would connect with the two affordable housing developments that have been constructed in recent years, providing a more cohesive neighborhood.

Goal 5: Encourage the development of housing in a wide range of types, prices, rent levels and ownership options.

The General Plan and the Housing Element 2013-2021 identify the critical need for more affordable housing to be built in the City of Los Angeles. As discussed more fully in the findings for the Housing Element, the assessment is that the City of Los Angeles is “facing an unprecedented housing crisis,” and this crisis impacts all segments of the housing market. The housing crisis is most acute for the homeless population, as observed in the City’s Comprehensive Homeless Strategy which reports that a 9,049 bed deficit for permanent supportive housing for single individuals represents the highest need the City is facing relative to the housing gap for the homeless in Los Angeles.

The lack of adequate housing supply has resulted in the increased need for affordable housing for Extremely Low to Low Income families. The Housing Element notes that housing production is likely insufficient to meet future demands, as the City has not kept pace with projected growth according to the Regional Housing Needs Assessment and that the City has been producing an average of 1,100 affordable units per year since 2006, which falls far below the provision of adequate housing for persons of Extremely Low to Low Income.

The Project proposes an affordable housing development, consisting of 449 Restricted Affordable Units and five managers' units, for the formerly homeless with a majority of the units to be provided as studio units along with a mix of one- and two-bedroom units. Each unit would contain its own bathroom and kitchen. The units would be available to a range of income levels, including Extremely Low (5%), Very Low (11%) and Low (84%), in addition to five market rate managers' units. The Project would draw a homeless population that would benefit from the supportive social services to be provided onsite for the residents. Therefore, the Project provides a wide range of a range of housing types at various affordability levels.

Goal 6: Enhance the safety and security of residents, businesses, employees and visitors.

Security for the Project would be provided via site planning and secured access points of entry. The Project includes an onsite leasing office and onsite manager's units which will provide continuous onsite presence and services for residents to report security concerns. Entry doors to the main building and public areas will be secured with locks and gates to ensure safe and convenient access for residents.

The plans for the Project will incorporate design guidelines as identified in the "Design Out Crime Guidelines: Crime Prevention Through Environmental Design," published by the Los Angeles Police Department. Such design guidelines provide security design measures for semi-public and private spaces, which may include but not be limited to access control to the building, secured parking facilities, walls/fences with key systems, well-illuminated public and semi-public space designed with a minimum of dead space to eliminate areas of concealment, location of building entrances in high-foot traffic areas.

To complement the two affordable housing developments that are located adjoining the Project Site to the west and east, the Project would add to the 24-hour population with "eyes on the street," thereby enhancing the safety and security of the residents. The formerly homeless that would occupy the dwelling units are unlikely to own personal vehicles, and therefore, are very likely to increase the pedestrian activity in the neighborhood, thereby adding more "eyes on the street" and enhancing the safety and security of the neighborhood.

Section 401 - General Redevelopment Actions

To accomplish the goals of the Plan as set forth in Section 401, the Project proposes to implement the Plan by:

9. Provision for low- and moderate-income housing;

Section 409.4 – New or Rehabilitated Dwelling Units Within the Project Area

"…..at least fifteen percent (15%) of all new and rehabilitated dwelling units developed within the Project Area by public or private entities or persons other than the Agency shall be available at affordable housing cost to persons and families of low- or moderate-income; and of such fifteen (15%) not less than forty percent (40%) thereof shall be at affordable housing cost to very low-income households."

The Project would provide 100% Restricted Affordable dwelling units to the formerly homeless at the Extremely Low to Low Income level. The Project would be consistent with the Redevelopment Plan's general development action of providing low-income housing.

Section 411 – Social Needs

"The realization of the goals established in this Plan are dependent upon providing for the social as well as the physical and economic needs of the residential and business communities of Wilshire Center and Koreatown."

"The social needs of the community include but are not limited to the need for day care facilities, housing very low- and low-income persons including the elderly and the homeless, English as a second language and literacy programs, educational and job training facilities, counseling and youth-at-risk programs and facilities."

The Project would fulfill the social needs of the community by providing Extremely Low to Low Income housing for the formerly homeless with supportive social services that include case management, mental health services, independent living skills programs, substance abuse programs, and job training.

The redevelopment of the Project Site with a new affordable housing project would promote community revitalization. The goals of the Redevelopment Plan are met with a project that would provide permanent affordable housing with supportive services in an environment that would be safe and secure for the residents and visitors. The immediate vicinity, which includes residential, commercial and industrial uses, is already developed with affordable residential uses and homeless supportive services that are compatible with the proposed Project. The Project would provide a significant amenity for the Extremely Low to Low Income and homeless population with much needed supportive services. The Project would also be developed with high quality architectural design features.

The Project is consistent and compatible with the goals of the Wilshire Center/Koreatown Redevelopment Project.

Mobility Plan 2035

The Mobility Plan 2035 includes goals that define the City's high-level mobility priorities. Each of the goals contains objectives and policies that guide the City's Mobility goals.

In the Mobility Plan 2035, Chapter 3 entitled "Access for All Angelenos" includes the discussion topic "A transportation system is only useful insofar as it accessible and convenient."

One aspect of accessibility relates to the design of the built environment. The Mobility Plan 2035

recognizes that the "3.8 million people who live in the City have widely varying levels of physical ability. They include the large numbers of children, senior, and people with disabilities." The Project would accommodate affordable housing for homeless persons, some of whom may well have disabilities or limited physical abilities.

Approval of the 454 Restricted Affordable dwelling units for the formerly homeless, inclusive of the five managers' units, at a site in close proximity to several mass transit options would be consistent with the purposes of the Mobility Plan. Various modes of travel are encouraged by the Mobility Plan 2035, including walking, biking and using public transit. The proposed General Plan Amendment would be in conformance with the following policies of the Mobility Plan 2035:

Policy 3.1: Access for All: Recognize all modes of travel, including pedestrian, bicycle, transit, and vehicular modes – including goods movement – as integral components of the City's transportation system.

The residents of the 100% Restricted Affordable housing development would be less likely to own personal vehicles, thereby relying on alternative modes of travel, including pedestrian, bicycle and transit modes. The Project would be located within 500 feet of the Vermont/Beverly Metro Red Line rail station, the Metro Rapid Bus 754 line on Vermont Avenue and two Metro Local Bus lines. The Project would be in close walking distance of the multiple transit options. The Project would provide bicycle parking and storage for the residents. The Project would improve the public sidewalks adjacent to Project Site and would include active ground floor uses to enhance the pedestrian experience and promote walkability. In addition, the Proposed Project will provide 251 bicycle spaces to promote travel by bicycle.

Policy 3.3: Land Use Access and Mix: Promote equitable land use decisions that result in fewer vehicle trips by providing greater proximity and access to jobs, destinations, and other neighborhood services.

The Project Site is located approximately 90 feet from Beverly Boulevard, designated as an Avenue II in the Mobility Plan, and within 500 feet of Vermont Avenue, designated as an Avenue I in the Mobility Plan. Vermont Avenue is a major commercial corridor in the Wilshire Community Plan. Residents of the affordable housing development are less likely to own personal vehicles and the close proximity to several mass transit options would further reduce the need for vehicle trips. As such, the siting of the proposed Project at this location would result in fewer vehicle trips. The Vermont/Beverly Metro Red Line rail station and the Metro Rapid Bus that runs north-south on Vermont Avenue allow easy access to other destinations for employment opportunities, retail stores and neighborhood services.

Policy 3.3 notes that "it makes sense for land uses situated near major transit stops to be of the intensity and type that they attract a high number of transit riders" and that the "greatest benefits of transit accrue when the greatest number of potential riders can be located within easy access of the transit services." The Policy also observes that neighborhoods with "frequent, reliable transit seven days a week are the ideal place to cluster uses and services so that area residents, students, and/or employees can complete a number of errands within a single walk or bike trip." The proposed Project is ideally situated to allow the residents not only easy access to commercial services in the neighborhood by walking or bicycling, but the ability to use reliable transit options for trips to access job opportunities and services or to accomplish errands without the use of personal vehicles.

Policy 3.4: Transit Services: Provide all residents, workers and visitors with affordable, efficient, convenient, and attractive transit services.

Policy 3.4 recognizes that transit services offer a mobility alternative for residents who do not have access to a car. The policy recognizes that car ownership may be expensive when factoring, besides the cost of a vehicle, the additional costs of fuel, insurance and maintenance. The Project would accommodate Extremely Low to Low Income homeless residents who are less likely to own personal vehicles due to these costs as well as having to bear the costs of housing, food, and health care, among other basic necessities. As described in detail above, the Project provides easy access to several public transit options, including the Vermont/Beverly Metro Red Line Rail Station located within 500 feet of the Project Site. Policy 3.4 notes that when "private vehicles are no longer considered to be a necessity, the cost of living decreases and quality of life improves for everyone." Residents of the Project would have no need to own a personal vehicle as a mode of transportation.

Policy 3.8: Bicycle Parking: Provide bicyclists with convenient, secure and well-maintained bicycle parking facilities.

The Project Site accommodates the required bicycle parking according to the Vermont/Western Transit Oriented District Specific Plan, as amended in new Subarea D.2.

The Project would provide the required 227 bicycle parking spaces in a secure, convenient and well-maintained parking facility located at grade on the ground level in the five residential buildings. An additional 24 short-term bicycling parking spaces would be provided near the main entrance to buildings fronting on Juanita Avenue and Madison Avenue in bike racks installed, per the design guidelines of the Vermont/Western Transit Oriented District Specific Plan, three feet from the curb edge or per the City Department of Transportation's requirements.

In the Mobility Plan 2035, Chapter 5 entitled "Clean Environments & Healthy Communities" includes the discussion topic "Transportation is deeply implicated in the health of both human beings and natural systems. Mobility directly impacts human health and wellness, both physical and mental. Active transportation modes such as bicycling and walking can significantly improve personal fitness and create new opportunities for social interaction, while lessening impacts on the environment."

The discussion topic notes that a "2004 analysis found that each additional hour spent in a car per day was associated with a six percent increase in the likelihood of obesity. Walking to transit or biking adds a fitness element to an everyday routine." As described in detail above, the Project Site's location in close proximity to public transit and to neighborhood services and retail stores would promote more walking and bicycling by the residents which allow an improvement in personal fitness and create an environment for social interaction as an alternative to the use of personal vehicles.

Policy 5.1: Sustainable Transportation: Encourage the development of a sustainable transportation system that promotes environmental and public health.

The Project Site is located in close proximity to the Vermont/Beverly Metro Red Line rail station, Metro Rapid Bus 754 that runs north-south on Vermont Avenue, and two Metro Local Bus lines. With easy access to transit options and local retail establishments and neighborhood services, residents of the Project would have the healthy option of walking, bicycling and using public transit as a safe, attractive, and convenient mode for environmentally sustainable and physically

beneficial transportation choices.

Policy 5.2: Vehicle Miles Traveled (VMT): Support ways to reduce vehicle miles traveled (VMT) per capita.

This policy notes that a sustainable approach to reducing Vehicle Miles Traveled is to increase "the availability of affordable housing options with proximity to transit stations and major bus stops" and to offer "more attractive non-vehicle alternatives, including transit, walking, and bicycling." The Project would add 545 affordable housing units to the housing stock in a location with close proximity to a major stop for the Metro Red Line at the Vermont/Beverly Rail Station and Metro Rapid Bus 754 that runs north-south on Vermont. The residents of the Project are less likely to own personal vehicles and thus by walking, bicycling and using public transit the Vehicle Miles Traveled would be reduced.

The Project would be compatible and consistent with goals, objectives and policies of the Mobility Plan 2035.

Health and Wellness Element

In the Introduction to the Health and Wellness Element, the "City of Los Angeles' Vision of Health" articulates goals for a healthy Los Angeles that include "safe and just neighborhoods that are free of violence;" "a balanced, multi-modal, and sustainable transportation system that offers safe and efficient options for all users;" and "access to affordable, healthy, and safe housing for residents of all ages and income levels." The Project would create a safe environment with new affordable housing dwelling units for homeless persons, allowing residents to escape the unsafe alternative of living in homeless encampments where personal safety and health are easily jeopardized. As a result, the new housing will be affordable, healthy and safe for the formerly homeless residents, who will also benefit from the sustainable transportation system of the Metro Red Line and Metro Rapid Bus and Local Bus lines as safe and efficient options that are easily accessible.

The Introduction in the "Housing and Community Stability" section notes that "housing and health are inextricably linked. Where a person lives determines their access to, or lack of, health-promoting resources such as goods and services, quality schools, transportation access and jobs." In addition, the Health and Wellness Element observes that access "to safe, affordable, accessible, and healthy housing is of paramount importance to living a healthy life." The Project would offer Extremely Low to Low Income homeless persons easy access to goods and services as well as transportation access that are easily accessible in the neighborhood.

The health and wellness of the Project's residents would be further enhanced by the supportive social services contained within the new residential development. These services would include mental health services with psychiatric assessments, individual and group therapy and crisis intervention. Substance abuse treatment services would address recovery and relapse prevention strategies. The well-being of the residents would be addressed with independent living skills programs and job training. The Project would offer recreational and educational activities to foster a sense of community within the building and engage the residents with the surrounding neighborhood.

In Chapter 2 entitled "A City Built for Health," a healthy city is one where goods and services are abundant and accessible, so that the "healthy choice is the easy choice for all residents." Health is supported by active transportation alternatives, which would be in fact accessible to the Project's residents.

Policy 2.2: Healthy Building Design and Construction:
Promote a healthy built environment by encouraging the design and rehabilitation of buildings and sites for healthy living and working conditions, including promoting enhanced pedestrian-oriented circulation, lighting, attractive and open stairs, healthy building materials and universal accessibility using existing tools, practices, and programs.

The Project would revitalize the underutilized Project Site and surrounding area. The Project would demolish large surface parking lots, three small one-story residential buildings, and three small, one-story commercial buildings and would provide a campus of new affordable housing buildings constructed to be consistent with the L.A. Green Building Code which is based on the California Green Building Code and represents a high standard of sustainability, incorporating features that minimize adverse effects on the environment. Healthy building design and construction would also reduce environmental hazards and improve indoor air quality.

A Project's healthy building design develops communal spaces for social interactions, green and open spaces for active and passive activity. The campus-like site plan provides well-positioned open space areas from west to east allowing site grading to Enlightenment Plaza naturally. The largest open space is located along Madison Avenue as a backdrop to the pedestrian and vehicular arrival area. The addition of the drop-off/pick-up turnaround along Madison will slow traffic providing a safer pedestrian crossing connecting PATH Metro Villas to the Project. Once riders and walking visitors arrive at the Project, they will be met with a park-like setting, including a large front lawn and orchard grove, both leading to community gardens to the west. The Project will provide approximately 26,000 square feet of open-to-sky, park-like and courtyard open space for residents and visitors. Building frontage will be set back to provide 12-foot sidewalks along both Madison and Juanita avenues. All units along Oakwood Avenue, on the north side of the site, will face to the east, west or south away from the 101 highway, thereby providing more enjoyable courtyard views.

The Project is designed around a pedestrian oriented site plan, with five multi-family housing buildings framing open spaces that weave through the site. All buildings will have service or community areas flanking the central open axis to activate the ground level and allow for easy flow between indoor and outdoor amenity and circulation spaces. The common open spaces will include one to two larger outdoor hardscape areas with planters and seating for residents to gather for social events. Community gardens and other interactive green spaces and planting areas will be available for residents to encourage wellness, healthy living options, and social interaction. Shaded walking paths lead through the site and connect to the two streets flanking the property to the east and west.

In Chapter 5 entitled "An Environment Where Life Thrives," Los Angeles is committed to green and sustainable growth that provides a healthy environment for all Angelenos. Persons who have been homeless and living on the streets would be a vulnerable population to be affected by environmental hazards. Affordable housing in a clean, safe and healthy environment where residents have access to supportive services would offer a focus on health that would not otherwise be available to homeless persons.

Policy 5.7: Land Use Planning for Public Health and GHG Emission Reduction:
Promote land use policies that reduce per capita greenhouse gas emissions, result in improved air quality and decrease air pollution, especially for children, seniors and others susceptible to respiratory diseases.

This policy notes that creating "land use patterns that make walking, cycling and taking transit viable modes of transportation to multiple destinations reduces the need for driving, and therefore reduces pollution and greenhouse gas emissions." The Project would provide affordable housing for Extremely Low to Low Income homeless persons in a location that is easily accessible by walking or bicycling to neighborhood-retail uses and services and to the transit corridor of Vermont Avenue where the Metro Red Line Rail Station and Metro Rapid Bus 754 are within 00 feet of the Project Site. As described above, the Project Site is located within walking distance of many bus lines. As such, residents of the Project would have numerous alternatives to the use of personal vehicles, thereby reducing air pollution and greenhouse gas emissions.

In Chapter 7 entitled "Safe and Just Neighborhoods," public safety is an essential component of a healthy neighborhood, and the effects of violence and crime disproportionately affect the city's low-income neighborhoods. One of this chapter's Objectives is to increase the number of non-violent vulnerable offenders, which includes the homeless, who are diverted from incarceration and rerouted into support services.

Policy 7.6: Diversion:
Proactively collaborate with public, private, and nonprofit partners to divert vulnerable populations such as homeless individuals, veterans, individuals with mental health issues, at-risk youth and young adults, and other non-violent offenders from conviction and incarceration to supportive services that promote access to economic, education, housing, and health resources within their communities.

The Project would offer a safe environment for the residents of the 449 Restricted Affordable dwelling units reserved for homeless persons with supportive social services to address the needs of its residents. The supportive services for the residents would include case management, mental health services, independent living skills programs, substance abuse programs, and job training. The provision of supportive social services to homeless persons is a critical element to helping the at-risk population to seek personal betterment, and the Applicant is committed to these supportive service programs and affordable housing to be provided in a high-quality environment consistent with City's vision to achieve better health and quality of life to be provided in the Applicant's affordable housing development.

The Project would be compatible and consistent with goals, objectives and policies of the Plan for a Healthy Los Angeles, a Health and Wellness Element of the General Plan.

FINDINGS FOR ZONE CHANGE
PURSUANT TO LOS ANGELES MUNICIPAL CODE (L.A.M.C.) SECTION 12.32 F

A. That the proposed Zone Change is in conformity with the General Plan.

See General Plan consistency findings above.

B. That the proposed Zone Change is in conformity with public necessity, convenience, general welfare and good zoning practice.

The proposed Zone Change from M1-1 to CM-1 seeks to create consistency with the emerging land use pattern of an area already developed with multi-family residential, commercial and light industrial uses on residential, commercial and industrial zoned land. The properties zoned M1-1 to the immediate east are developed with the PATH Affordable Housing Development, along with additional affordable units currently under construction. The properties to the immediate east are zoned [Q]CM-1, R4-1 and C2-1 and developed with affordable housing units, an office building and surface parking lots. The properties zoned M1-1 adjoining the Project Site to the south are developed with the commercial businesses of a car rental agency and pest control company. Other properties in the surrounding area to the south and east are zoned M1-1 and developed with a mix of commercial and industrial uses.

The proposed Zone Change to CM-1, in conjunction with the approval of a Specific Plan Amendment to the Vermont/Western Transit Oriented District Station Neighborhood Area Specific Plan (SNAP) to create a new Subarea D.2, would permit the development of residential units with a floor area ratio of up to 3 to 1 that would allow the development of 454 dwelling units, of which 449 units would be Restricted Affordable dwelling units for the Extremely Low to Low Income level. The proposed Subarea D.2 would utilize the use and area regulations of LAMC Section 12.17.1 (CM Zone), except that the permitted residential uses would be those that have met the requirements of a Qualified Permanent Supportive Housing Project (these requirements are contained within this application under the request for a Specific Plan Amendment that creates Subarea D.2).

The Wilshire Community Plan observes that the "Wilshire area includes only minimal light industrial uses," and that only 0.43 percent of the total Plan Area is designated for industrial use. The largest such area is located along Beverly Boulevard, from Oakwood Avenue to the north, to Council and 1st Streets on the south, to Hoover Street on the east, to Juanita Avenue on the west, and is occupied by various business park type uses. Some of these industrial areas, according to the Community Plan, have been developed with "two story retail and medium-rise office buildings (two to four story); however, the majority of the area has been developed with retail/wholesale businesses and light manufacturing uses." The M1-1 zoned property located to the east, immediately across Madison Avenue from the Project Site, has been previously approved and developed with a similar affordable housing development. Also on the east side of Madison Avenue, additional affordable housing units are being constructed on the M1-1 zoned land. As a result, the neighboring industrial properties have been developed with a mix of residential, commercial and light industrial uses. The proposed Zone Change to CM-1 would be compatible with existing adjacent development. The Project Site is designated as "Limited Industrial" in the Wilshire Community Plan, with a zoning designation of M1, which does not permit any dwelling units. As part of this application, the Applicant is requesting a General Plan Amendment to the land use of "Commercial Manufacturing," a designation compatible with the proposed Zone Change to CM-1.

With an approval of the requested Zone Change, the proposed Project would contribute to a more stable population for homeless individuals by the development of a maximum of 449 new Restricted Affordable dwelling units on property now zoned industrial but which has been previously used for residential and commercial purposes. Replacing outmoded, small detached residential buildings and underutilized, small commercial buildings with a well-designed campus of residential buildings would offer housing and supportive services to Extremely Low to Low Income homeless individuals. The Project would create synergy with the existing residential properties for the lower income and homeless that are located to the immediate east and west of the Project Site. This, in turn, creates a vibrant, cohesive neighborhood that is greatly needed in very close proximity to a Metro Rapid Bus stop and the Vermont/Beverly Metro Red Line Rail Station, allowing the residents easy access within walking distance to several transit options. Additionally, the Project Site is located in very close proximity to the commercial corridor of Vermont Avenue.

Approval of the Zone Change to CM-1 would permit the location of residential housing in close proximity to commercial centers, a rail station and several existing bus stops. The Wilshire Community Plan proposes in its land use plan policies support for the type of housing that would be permitted in the CM Zone. Objective 1-2 of the Wilshire Community Plan proposes to "Reduce vehicular trips and congestion by developing new housing in close proximity to regional and community commercial centers, subway stations and existing bus route stops." This objective is supported by Policy 1-2.1 which seeks to "Encourage higher density residential uses near major public transportation centers." With a maximum of 454 residential units, the Project proposes a higher density residential use near a major public transportation center, considering that the intersection of Vermont Avenue and Beverly Boulevard, which is within 500 feet of the Project Site, includes a rail station and a Metro Rapid Bus stop.

The Vermont/Western Transit Oriented District Specific Plan (SNAP) includes in its introduction that the Specific Plan was created for the purpose of making "the neighborhood more livable, economically viable, as well as pedestrian and transit friendly…..and achieve maximum benefit from the subway stations as a valuable public asset." As noted in Section 2 of the SNAP, the purposes of the Specific Plan include "D. Establish a clean, safe, comfortable and pedestrian oriented community environment for residents to shop in and use the public community services in the neighborhood," and "R. Facilitate the provision of studio and one bedroom apartments for adult students and senior citizens located near colleges, subway stations and along commercial corridors." The proposed Project, designed with five residential buildings in an open campus setting, would establish a clean, safe, comfortable and pedestrian oriented environment where the residents would have easy access to a subway station and the commercial corridor of Vermont Avenue.

The proposed CM zoning of the Project Site is consistent with the proposed land use designation of Commercial Manufacturing and supports higher density residential development within a Restricted Affordable housing development for Extremely Low to Low Income homeless individuals. The Project is compatible with the Wilshire Community Plan's goals, objectives and policies, as discussed in the findings for the Community Plan. In general, these goals, objectives and policies encourage the development of higher density new housing in proximity to commercial centers and major transportation centers, along with providing more affordable and increased accessibility for the handicapped and senior citizens, many of which are within the Target Population for Permanent Supportive Housing, i.e., homeless individuals. The proposed Project would offer better housing choices for homeless individuals that are often relegated to shelters or transitional housing, or even worse, have no temporary housing options at all. The proposed Project would also bring new residential units to an area that has a mix of residential, commercial

and light industrial uses, but which offers several options to place residents within easy walking distance of several public transit alternatives and a major commercial corridor.

The approval of the proposed Zone Change would permit the construction of the new residential development consisting of supportive services that are vitally needed by the Extremely Low to Low Income homeless individuals that would occupy the Restricted Affordable dwelling units. Without the approval of the Zone Change, the property would remain underutilized by outmoded buildings that do not generate improved benefits for the homeless community and to the area at large. The immediate area, consisting of existing affordable housing projects and aging commercial properties and limited industrial uses, is no longer viable for the new industrial development. As noted above, the Wilshire Community Plan has already observed that the area has been developed with non-industrial uses.

The Zone Change would permit the construction of a residential development which is compatible with its surroundings (including similar housing developments adjacent to the subject property) and consistent with State and City planning goals. The approval would allow this urban infill site to achieve numerous laudable Planning goals, including affordable housing proximate to mass transit and the introduction of supportive services that are much needed by the Extremely Low to Low Income homeless residents.

Public Necessity, Convenience and General Welfare

Approval of the Zone Change would facilitate a vibrant residential development that would replace aging, outmoded small single-family residences and small commercial buildings. The new development would create a higher density affordable housing project that would be proximate to mass transit options and easily accessible to the commercial corridor of Vermont Avenue. A portion of the surrounding area has emerged as a neighborhood with affordable housing developments that have supportive services. In fact, properties immediately adjacent to the east and the west of the Project Site have been developed with affordable housing for Low income and the homeless. Housing for the Extremely Low to Low homeless individuals is a public necessity, and the location of the proposed new affordable housing development provides a convenience for the public and helps to provide for the general welfare of the public.

In support of the type of residential development proposed by the Applicant, the Wilshire Community Plan includes Objective 1-2 which proposes to "Reduce vehicular trips and congestion by developing new housing in close proximity to regional and community commercial centers, subway stations and existing bus route stops." This objective is supported by Policy 1-2.1 which seeks to "Encourage higher density residential uses near major public transportation centers." With a maximum of 454 residential units, the Project proposes a higher density residential use near a major public transportation center, considering that the intersection of Vermont Avenue and Beverly Boulevard, which is within 500 feet of the Project Site, includes a rail station and a Metro Rapid Bus stop.

The Housing Element 2013-2021 affirms in its Executive Summary that the need to accommodate growth results in the need not only for more housing but a "broader array of housing types to meet evolving household types and sizes." The development of more housing requires a strategy to accommodate residential development in a sustainable way. The Housing Element estimates that the Wilshire Community Plan has the capacity for 51,490 new housing units,[31] which represents the second highest capacity for new residential units of the 35 Community Plan areas.

[31] Housing Element 2013-2014, Table 3.1 Summary of Sites with Housing Capacity by Community Plan Area, page 3-4.

The approval of the requested Zone Change, along with the General Plan Amendment and Specific Plan Amendment, would advance the City towards the goal of providing more housing by permitting the construction of a maximum of 449 Restricted Affordable Dwelling Units for Extremely Lot to Low Income homeless persons in an area specifically contemplated by the City to help meet the City's housing shortage and comply with its RHNA requirement. A Zone Change to the CM Zone and a General Plan Amendment to Commercial Manufacturing land use designation would permit the construction of affordable housing where it is needed and compatible with the surrounding neighborhood. As the Project Site is located in a Community Plan area that has the capacity for more new housing units than other parts of the City, the Project is consistent with the Housing Element's stated need to accommodate growth.

According to the Regional Housing Needs Assessment (RHNA), the City is expected to need an additional 82,002 new units through 2021, of which 46,590 units (57%) are designated for very low- and low-income households. The Housing Element notes that the "City will face significant challenges in meeting its RHNA income distribution if it is not able to secure additional funding for affordable housing production and preservation." The Applicant proposes to construct affordable housing by proposing a maximum of 449 Restricted Affordable Dwelling Units at the Extremely Low to Low income level and five managers' units, which would assist the City to meet the challenge of the RHNA by maintaining and adding affordable housing units to the housing stock. Considering that the Wilshire Community Plan, as noted above, has the second highest capacity for new housing units of all 35 community plans, the approval of the Zone Change to CM-1 would facilitate the development of much needed housing for Extremely Low to Low Income homeless individuals that is a public necessity which may be fulfilled with the appropriate zoning designation.

The Community Plan further encourages new housing in proximity to transit, goods, services and facilities. In its introductory chapter, the Wilshire Community Plan observed as one of its residential issues that new "development needs to be coordinated with the availability of public infrastructure." Objective 1-2 of the Wilshire Community Plan proposes to "Reduce vehicular trips and congestion by developing new housing in close proximity to regional and community commercial centers, subway stations and existing bus route stops." This objective is supported by Policy 1-2.1 which seeks to "Encourage higher density residential uses near major public transportation centers." The Vermont/Beverly Metro Red Line Rail Station, which is within 500 feet of the Project Site, is the type of public infrastructure improvement that should be easily available to the residents of new residential projects. With a maximum of 454 residential units, the Project proposes a higher density residential use near a major public transportation center. The proposed Project's location near transit options would facilitate the residents' interaction with the community, activating the pedestrian environment and providing more customers to businesses on the commercial corridor of Vermont Avenue. The public convenience and general welfare is enhanced by offering homeless individuals the ability to live in close proximity to transit, job opportunities, various public and private facilities, shopping for necessities and other basic services.

The public necessity, convenience and general welfare are further enhanced by a well-designed campus, with the five buildings arranged to provide common open space areas in courtyards and passageways that serve to improve the quality of life in the neighborhood with improved security and an increased 24-hour population that activates the street. With the development of an attractive residential development consisting of a maximum of 449 Restricted Affordable units for Extremely Lot to Low Income homeless individuals and five managers' units, the Project is not only compatible and complementary with the adjacent residential and commercial uses in the immediate vicinity, the Project would fulfill the need to provide clean, sanitary and safe housing

for underserved segment of society. The need for this type of housing is greatly underscored by the report of the Los Angeles Homeless Services Authority in its 2019 Greater Los Angeles Homeless Count that the homeless population in the City of Los Angeles increased by 16% over the previous year, which now consists of 36,300 homeless persons, of which 27,221 need shelter.

The proposed CM zoning of the Project Site is consistent with the proposed General Plan land use designation of Commercial Manufacturing and supports higher density residential development within a affordable housing development for Extremely Low to Low Income homeless individuals. The Project is compatible with the Wilshire Community Plan's goals, objectives and policies, as discussed in the findings for the Community Plan. In general, these goals, objectives and policies encourage the development of higher density new housing in proximity to commercial centers and major transportation centers, along with providing more affordable and increased accessibility for the handicapped and senior citizens, many of which are within the Target Population for Permanent Supportive Housing, i.e., homeless individuals. The proposed Project would offer better housing choices for homeless individuals that are often relegated to shelters or transitional housing, or even worse, have no temporary housing options at all. The proposed Project would also bring new residential units to an area that has a mix of residential, commercial and light industrial uses, but which offers several options to place residents within easy walking distance of several public transit alternatives and a major commercial corridor. The proposed Zone Change to the CM Zone would facilitate the much needed housing for an underserved segment of society, and as a result, the Zone Change would promote the public necessity, convenience and general welfare to accommodate a population that would benefit from housing and supportive services for those in the greatest need.

Good Zoning Practices

The location of the proposed Restricted Affordable housing development as it fronts on Madison Avenue to the east and Juanita Avenue to the west supports good zoning principles in that this location would be appropriately rezoned to the CM Zone. The General Plan Framework notes that the City of Los Angeles has "insufficient vacant properties to accommodate forecast population increases. Consequently, the City's growth will require the reuse and intensification of existing developed properties."[32] The existing Project Site consists of three, small one-story residential buildings and three, small underutilized one-story commercial buildings. The Project Site also includes a large amount of parking lot areas that should be utilized to accommodate an intensification of the land use in order to construct an affordable housing development.

A basic principle of good zoning practice, and State law as required by California Government Code Section 65860, is consistency between the General Plan land use designation and zoning designations. The General Plan Framework's Objective 3.1 seeks to accommodate a "diversity of uses that support the needs of the City's existing and future residents, businesses and visitors." The Objective is supported by Policy 3.1.6 which proposes to allow for the "adjustment of General Plan Framework Element land use boundaries to account for the changes in the location and introduction of new transit routes and stations…and, in such cases, consider the appropriate type and density of use generally within one-quarter mile of the corridor and station to reflect the principles of the General Plan Framework Element and the Land Use/Transportation Policy." The Applicant is requesting approval of a General Plan Amendment to revise the land use designation in the Wilshire Community Plan from Limited Industrial (corresponding to the existing M1 Zone) to Commercial Manufacturing (corresponding to the requested CM Zone). The requested General Plan Amendment to Commercial Manufacturing would create a development site compatible with

[32] The Citywide General Plan Framework, page 3-4.

the Wilshire Community Plan's recognition of a residential community issue that there is a need to accommodate more affordable housing in transit-rich areas.

Rezoning the subject property from M1 to CM would result in consistency with residential goal, objectives and policies of the Wilshire Community Plan. Goal 1 seeks a "high quality residential environment for all economic, age, and ethnic segments of the Wilshire Community." The Applicant proposes to build a high quality residential campus of five buildings of Restricted Affordable units for Low income and formerly homeless individuals. Objective 1-2 seeks to "Reduce vehicular trips and congestion by developing new housing in close proximity to regional and community commercial centers, subway stations and existing bus route stops.: This objective is supported by Policy 1-2.1 which proposes to "Encourage higher density residential uses near major public transportation centers." The CM Zone, in conjunction with the proposed Specific Plan Amendment, would permit the development of the affordable housing project. The Project would be located within 500 feet of the Metro Red Line Rail Station located at Vermont Avenue and Beverly Boulevard, and several Metro bus lines, including the Metro Rapid Bus Line 754, that have stops at Vermont Avenue and Beverly Boulevard. Additionally, Vermont Avenue is a commercial center within easy walking distance of the Project. The Project would replace underutilized buildings on a lot that is 2.09 acres in size in order to create a higher density residential use that is near the major transportation center at Vermont Avenue and Beverly Boulevard. Objective 1-4 seeks to "Provide affordable housing and increased accessibility to more population segments, especially students, the handicapped and senior citizens." The Target Population for the Applicant's affordable housing project would include the handicapped and senior citizens." Policy 1.4-2 proposes to "Ensure that new housing opportunities minimize displacement of residents." In addition to the demolition of commercial buildings, the Project would replace three small one-story single family residential buildings in order to facilitate the development of 454 dwelling units, of which 449 units would be occupied by Extremely Low to Low Income homeless individuals. As such, the displacement of existing residents is significantly minimized by the development of a high-density residential project, which would provide affordable housing for a wide range of population segments that are lacking permanent housing opportunities.

The Project reflects the existing land use patterns, trends and uses in the immediate area, which is developed with a mix of residential, commercial and light industrial projects on properties currently zoned for a mix of residential, commercial and industrial uses. The Project would create synergy with the existing residential properties for the lower income and homeless that are located to the immediate east and west of the Project Site. This, in turn, creates a vibrant, cohesive neighborhood that is greatly needed in very close proximity to a Metro Rapid Bus stop and the Vermont/Beverly Metro Red Line Rail Station, allowing the residents easy access within walking distance to several transit options.

Based on the foregoing, the proposed Zone Change promotes good zoning practices by allowing the affordable housing development that is consistent with a coherent zoning pattern of establishing a CM Zone for parcels that are within close proximity to a commercial center and a major transportation corridor that includes a Metro Rail station and Metro Rapid Bus stop.

SPECIFIC PLAN AMENDMENT VERMONT/WESTERN TRANSIT ORIENTED DISTRICT SPECIFIC PLAN (STATION NEIGHBORHOOD AREA PLAN) PURSUANT TO L.A.M.C. SECTION 11.5.7 G

The Applicant requests approval of a Specific Plan Amendment to introduce a new Subarea within the Vermont/Western Transit Oriented District Specific Plan - Station Neighborhood Area Plan (SNAP), Subarea D.2 - Commercial Manufacturing/Permanent Supportive Housing, to permit the construction of a new five building Restricted Affordable housing project with supportive social services for homeless and formerly homeless individuals containing a maximum of 454 residential dwelling units including 449 Restricted Affordable units and 5 managers' units and approximately 11,772 square feet of resident focused supportive services.

The Project Site is located in a developed area and affords a unique opportunity for redevelopment of an otherwise underutilized site on industrial land in a neighborhood where adjoining industrial land has been similarly converted to much-needed affordable housing for homeless persons. The goals of the SNAP seek to create a higher density of land uses and a livelier pedestrian environment along and in close proximity to major transit corridors such as Vermont Avenue. With the approval of the Specific Plan Amendment, the Project would be consistent with the following goals and purposes outlined by the Specific Plan:

Section 2.C: Establish a clean, safe, comfortable and pedestrian oriented community environment for residents to shop in and use the public community services in the neighborhood.

The Specific Plan Amendment creates regulations to ensure the proposed Project would provide a much needed, convenient, high quality affordable housing development for Extremely Low to Low Income homeless persons in a location that is now occupied by surface parking and underutilized small, one-story residential uses and buildings for storage and telecommunications purposes. The Project would provide a safe, clean and healthy environment for a resident population that is currently underserved.

Currently, the SNAP allows the use and area regulations of the CM Zone (LAMC Section 12.17.1) to be applied to all lots in Subarea D, except that projects with residential uses are prohibited. The Specific Plan Amendment to create a new Subarea D.2 to allow for an affordable housing development in the proposed CM Zone would be consistent with the purpose of the SNAP to establish a clean, safe, comfortable and pedestrian oriented community environment for the residents. The Project would be located within 500 feet of the commercial corridor of Vermont Avenue, where residents may shop and use the public community services in the neighborhood. The development of the Applicant's Project would be incompatible with adjacent development and would provide a sense of place in the vicinity of Beverly Boulevard and Vermont Avenue consistent with good zoning practice. Properties that adjoin the Project Site are zoned residential, commercial and industrial, developed with a mix of residential, commercial and industrial uses. Similar affordable housing developments adjoin the Project Site to the immediate east and west, with one affordable development on industrially zoned land and the other on residentially zoned land. The development of the proposed affordable housing Project would create a synergy with other similar projects, resulting in an enhanced pedestrian oriented community.

Section 2.E: Guide all development, including use, location, height and density, to assure compatibility of uses and to provide for the consideration of transportation and public facilities, aesthetics, landscaping, open space and the economic and social well-being of area residents.

The Specific Plan Amendment would establish a new Subarea D.2 with associated Development Standards and Guidelines and would change the Subarea designation for the Project Site from Subarea D (Light Industrial/Commercial) to Subarea D.2 (Commercial Manufacturing/Permanent Supportive Housing). Subarea D.2 would contain development regulations tailored to the specific needs of a high density affordable housing project. The Specific Plan Amendment proposed regulations are intended to accommodate the Project while requiring it to adhere to design and development regulations ensuring that its built form is urban scaled, pedestrian friendly, transit oriented, and otherwise compatible with the mix of uses in adjacent developments.

The Specific Plan Amendment would create regulations for allowable uses, height, floor area, density, usable open space, and parking. It would also include design guidelines that address landscape plans, streetscape, pedestrian and vehicular circulation, building design, trash and recycling location, urban form, building form, façade treatment, building setbacks, and lighting.

The Specific Plan Amendment would only apply to the Project Site. Subarea D.2 would contain specific requirements for eligibility, including that the Project Site must be improved with a Qualified Permanent Supportive Housing Project to be eligible for residential uses.

The Specific Plan Amendment would lead to a development that would be deemed consistent with public necessity, convenience, general welfare and good zoning practice, as outlined in the findings for the requested Zone Change from M1-1 to CM-1. As specified in the findings for the General Plan Amendment, Zone Change and the Site Plan Review, the proposed Specific Plan Amendment would be consistent with the General Plan Framework, the Housing Element, the Wilshire Community Plan, the Wilshire Center/Koreatown Redevelopment Project, the Mobility Plan 2035, and the Health and Wellness Element.

Section 2.G: Create a transit friendly area by requiring conformance to pedestrian oriented design guidelines that establish building façade treatments, landscape standards, criteria for shade-producing building overhangs and awnings, street lighting and security lighting for streets, alleys, sidewalks and other pedestrian areas that adjoin new development.

The Specific Plan Amendment would create regulations for allowable uses, height, floor area, density, usable open space, and parking. It would also include design guidelines that address landscape plans, streetscape, pedestrian and vehicular circulation, building design, trash and recycling location, urban form, building form, façade treatment, building setbacks, and lighting.

The Specific Plan Amendment requires the Project achieve almost the same design criteria as required for residential developments in other Subareas. A few design criteria would be modified in recognition of the unique development constraints for an affordable housing project on industrial land, but the Project proposes to be a transit and pedestrian friendly project that is conveniently located within close proximity to major transit options. The Project would support transit usage as the residents of the affordable housing development would less likely to own personal vehicles for transportation. As described above, the Project would improve adjacent streetscape and activate the streets with more pedestrian activity.

Section 2.R: Facilitate the provision of studio and one bedroom apartments for adult students and senior citizens located near colleges, subway stations and along commercial corridors.

The Specific Plan Amendment would facilitate the development of affordable housing for

Extremely Low to Low Income homeless persons. The resident population would most likely include, among other age groups, senior citizens who are homeless or at-risk of homelessness. The Los Angeles Homeless Services Authority issued the "Greater Los Angeles Homeless Count" report in 2018, noting there was a 22% increase in homelessness for persons aged 62 and older, while there was a decrease in homelessness for all other age groups. Senior citizens would benefit from the provision of more affordable units located near subway stations and commercial corridors.

The Project proposes to provide 454 Restricted Affordable units, inclusive of the five managers' units, consisting of 370 studio units, 71 one-bedroom units and 13 two-bedroom units. The Specific Plan Amendment facilitates the provision of studio and one bedroom apartments for approximately three-quarters of the total units. The Project is located within 500 feet of the Vermont/Beverly Metro Red Line subway station and the commercial corridor of Vermont Avenue.

FINDINGS FOR PROJECT PERMIT COMPLIANCE PURSUANT TO L.A.M.C. SECTION 11.5.7.C

1. That the project substantially complies with the applicable regulations, standards and provisions of the Specific Plan.

For the reasons stated above, the proposed Project substantially complies with the applicable regulations, standards and provisions of the Vermont/Western Transit Oriented District Station Neighborhood Area Specific Plan (SNAP) as amended by the Specific Plan Amendment to create Subarea D.2.

2. That the project incorporates mitigation measures, monitoring measures when necessary, or alternatives identified in the environmental review which would mitigate the negative environmental effects of the project, to the extent physically feasible.

The Project will undergo CEQA review by the City and any appropriate environmental mitigation measures will be placed on the project at that time.

PROJECT PERMIT COMPLIANCE FINDINGS

1. **ADDITIONAL INFORMATION/FINDINGS:** Please complete all of the following which apply to your request. You may attach additional sheets if necessary if there is not enough room in the spaces provided.

a. Specific Plan area: **Vermont/Western Transit Oriented District Station Neighborhood Area Specific Plan**

b. Specific Plan subarea (if any): **Subarea D.2**

c. Specific Plan land use designation (if any): **Commercial Manufacturing**

d. Specific Plan requirements: Specify those which apply to the subject property:

i. Maximum permitted height: **Unlimited**

ii. Maximum permitted floor area ratio (FAR): **The maximum permitted FAR for Qualified Permanent Supportive Housing is 3 to 1.**

iii. Minimum required setbacks/yards:

Front: None (CM Zone)

Side: Developer Incentive for 5 ft.

Rear: Does not apply to Development Site.

iv. Maximum lot coverage: **n/a**

v. Parking requirements: **None for affordable units with Target Population residents. 1 space per every 20 dwelling units for the purpose of accommodating guests, supportive services, case management and managers' units.**

vi. Transportation improvements/fees: **n/a**

vii. Other requirements: **n/a**

e. What is the current zoning on the subject property? **Existing Zone: M1-1. Proposed Zone: CM-1 (per Zone Change)**

f. Subject property is (check whichever applies): ☒ level; sloping; ☐ rectangular;

☒ irregular-shaped parcel of land.

g. Describe how the site is presently developed, including details such as square footage of buildings, occupancy loads, number of stories, number of parking spaces provided, etc.

Site is presently developed with six small buildings and parking lots to be demolished. These buildings include: 1. One-story masonry building with 387.69 square feet. 2. One-story brick building with 5,336.04 square feet. 3. One-story sheet metal building with 2,157.39 square feet. 4. One-story wood building with 390.02 square feet. 5. One-story wood buildings with 390.41 square feet. 6. Two-story wood building with 738.42 square feet. 194 parking spaces, including one handicapped space, are located on the surface parking lots.

h. Adjacent Properties

	Zoning or Specific Plan Land Use Designation	Existing Land Use
Northerly	**PF-1XL**	101 Freeway
Southerly	**M1-1**	Surface parking; auto sales; warehouse; light manufacturing and auto body repair.
Westerly	**[Q]CM-1, R4-1 and C2-1**	A low-income multi-family affordable housing residential building, an office building, and surface parking.
Easterly	**M1-1**	Affordable housing residential development and a pest control company.

i. Proposed Project

i. Height: (Approximates)
Building NE: 92 feet 3 inches
Building NW: 94 feet 3 inches
Building SE: 93 feet 7 inches
Building SW-A: 94 feet 6 inches
Building SW-B: 95 feet 0 inches

ii. Project floor area: 247,812 square feet (floor area definition from Subarea D.2)

iii. Total floor area ratio (FAR): 2.8:1

iv. Number of dwelling units: 454

v. Setbacks/yards:
Front: 0 feet
Rear: n/a
Side: at least 5'-1" feet

vi. Lot coverage: 48% building coverage

vii. Number of parking spaces to be provided: The Applicant proposes to provide up to 23 parking spaces.

viii. If demolition is proposed, describe the type of buildings/structures to be removed, amount of floor area demolished and any buildings/structures to remain:

Six buildings and surface parking lots with 194 spaces are to be removed. The six buildings have a combined floor area of approximately 9,400 square feet. No buildings or structures are to remain on the Development Site.

FINDINGS FOR SITE PLAN REVIEW PURSUANT TO L.A.M.C. SECTION 16.05

Pursuant to LAMC Section 16.05 F, the following findings are required for any project that proposes more than 49 new residential dwelling units.

1. That the project is in substantial conformance with the purposes, intent and provisions of the General Plan, applicable community plan, and any applicable specific plan;

See General Plan consistency findings above.

2. That the project consists of an arrangement of buildings and structures (including height, bulk and setbacks), off-street parking facilities, loading areas, lighting, landscaping, trash collection, and other such pertinent improvements, that is or will be compatible with existing and future development on adjacent properties and neighboring properties; and

The Project is designed to be compatible with the existing and future development on adjacent and neighboring properties. To the east of the Development Site, across Madison Avenue, is the PATH Affordable Housing Project and the construction of additional affordable dwelling units in multi-family buildings. To the west of the Development Site, across Juanita Avenue, is a four-story La Kretz Villas affordable housing development. The Project would be designed with many similar design features of building articulation that is provided with building massing, fenestration locations and material color and texture choices.

The Project would be consistent with the City's vision in its Comprehensive Homeless Strategy that encourages greater density in areas of the City most capable of supporting it, and proposes that the City "should also investigate how well its various zoning density programs are doing to encourage or mandate additional residential development. Further study into reducing or removing parking minimums for affordable and homeless housing profiles, where residents own cars at much lower rates than market-rate housing, could lower the cost of affordable and homeless housing development and ensure efficient use of space for areas where more residential density is needed."[33]

The City's Comprehensive Homeless Strategy notes that land use is "an inseparable factor creating additional opportunities to increase housing stock. Los Angeles has not responded to stronger housing demand by allowing for greater residential density in the nearly 500 square miles of our City. Land use and zoning restrictions can and have limited the supply of housing throughout the City."[34]

The City's vision to address the housing crisis is contained within L.A.'s Green New Deal, the 2019 update to the Mayor's Sustainable City pLAn, which sets targets to increase cumulative new housing unit construction to 150,000 by 2025 and 275,000 units by 2035, and to ensure 57% of new housing units are built within 1,500 feet of transit by 2025 and 75% by 2035. These targets, by necessity, require higher density residential development, given that the Comprehensive Homeless Strategy has identified the need for greater residential density.

The proposed Project consists of an arrangement of buildings and structures, off-street parking,

[33] Ibid, page 17.
[34] Comprehensive Homeless Strategy, page 17.

lighting, landscaping and trash collection that is or will be compatible with existing and future development on the neighboring properties:

- Height of Buildings: 95 feet for tallest building (unlimited height limit is permitted by the Specific Plan Amendment for Subarea D.2 in the SNAP).

- FAR: Approximately 2.8 to 1 overall (3 to 1 FAR is permitted for Qualified Permanent Supportive Housing Projects by Specific Plan Amendment for Subarea D.2 in the SNAP).

Off-street Parking Facilities: 23 automobile parking spaces and 251 bicycle parking spaces are required and provided. The following automobile parking standards apply to all Qualified Permanent Supportive Housing Projects: None for affordable units with Target Population residents. One (1) parking space for every 20 dwelling units or guest rooms shall be provided for the purpose of accommodating guests, supportive services, case management and managers' units. Up to 40% of the total required parking spaces may be provided as compact stalls. The Project consists of 454 dwelling units, resulting in the requirement of 23 parking spaces that are provided on-site in ground level garage spaces. The Project will provide 15 standard parking spaces, 5 compact spaces and 3 handicapped spaces.

- Off-street parking spaces for bicycles shall be provided at a ratio of one-half parking space per dwelling unit, which results in 251 bicycle parking spaces for the 454 dwelling units. No bicycle parking shall be required for the non-residential uses in a Qualified Permanent Supportive Housing Project that consist of supportive services, case management offices, computer rooms and other non-residential uses related to providing services to the Target Population. In addition, 24 bicycle parking spaces are provided on the street frontages of Juanita Avenue and Madison Avenue, consistent with the design guidelines of the Vermont/Western Transit Oriented District SNAP.

- Yards: The minimum front yard setback would be 0 feet. The minimum interior yard setback would be 5' – 1" for a portion of the Southwest Building B between the building and the southwesterly property line. All other interior yard setbacks range from 10' – 2" to 13' – 11".

- Open Space and Landscaping: The Project would create approximately 36,580 square feet of open space including 7,627 square feet of landscaped areas. The large central courtyard will activate pedestrian activity on the Development Site with landscaping provided with trees and planters.

Height, Bulk and Setbacks

The project is proposed to reach a maximum height of 95 feet for the eight-story residential Southwest Building B located within the interior of the Development Site behind the Southwest Building A that fronts on Juanita Avenue. The Southwest Building A is proposed to reach a maximum height of 94 feet 6 inches. The Northeast Building that fronts on Oakwood Avenue is proposed to reach a maximum height of 92 feet 3 inches. The Northwest Building that fronts on Juanita Avenue is proposed to reach a maximum height of 94 feet 3 inches. The Northeast Building is proposed to reach a maximum height of 92 feet 3 inches. The Southeast Building that fronts on Madison Avenue is proposed to reach a maximum height of 93 feet 7 inches.

The bulk and massing of the five residential buildings that are 8 stories in height avoid blank

walls with articulations, recesses, balconies and terraces on upper level. The approximately 26,000-square foot courtyard is the Project's driving concept, which is allowed to transform both horizontal and vertical planes. The transformations provide various scales of communal spaces for tenants to engage with and activate. Horizontal plane transformation informs building location, spacing, orientation, proportions and size. Vertical plane transformations inform initial building massing, voids and unit orientation. Additionally, the courtyard influences the location of interior communal spaces that overlook the larger outdoor park space in the courtyard.

Madison Avenue is designated as the Development Site's front yard, which will have varying setback from 0 feet to 21 feet. The minimum interior side yard setbacks are 5 feet, but generally range between 10 feet and 13 feet. Pedestrian activity is encouraged throughout the Project Site as outdoor passageways connect to the street frontages of Juanita Avenue, Oakwood Avenue and Madison Avenue.

Off-street Parking Facilities

Residential parking will be provided according to the following automobile parking standards that apply to all Qualified Permanent Supportive Housing Projects: None for affordable units with Target Population residents. One (1) parking space for every 20 dwelling units or guest rooms shall be provided for the purpose of accommodating guests, supportive services, case management and managers' units. Up to 40% of the total required parking spaces may be provided as compact stalls. The Project consists of 454 dwelling units. Although the City cannot enforce parking requirements pursuant to Government Code Section 65915(p), the Project will provide 23 parking spaces on-site in ground level garage spaces. The Project will provide 15 standard parking spaces, 5 compact spaces and 2 3 handicapped spaces.

Bicycle parking will be provided according to the ratio of one-half parking space per dwelling unit, which results in 251 bicycle parking spaces for the 454 dwelling units. No bicycle parking shall be required for the non-residential uses in a Qualified Permanent Supportive Housing Project that consist of supportive services, case management offices, computer rooms and other non-residential uses related to providing services to the Target Population. In addition, 24 bicycle parking spaces are provided on the street frontages of Juanita Avenue and Madison Avenue, consistent with the design guidelines of the Vermont/Western Transit Oriented District SNAP.

As shown on the Plot Plan, all automobile parking is provided within the ground level of the Northeast Building, the Southwest Building A and the Southeast Building, which is accessed respectively by the driveways on Oakwood Avenue, Juanita Avenue and Madison Avenue. Bicycle parking and storage are provided with the ground level of all five buildings.

Open Space and Landscaping

The required open space would be 45,725 square feet of open space. However, the Applicant is requesting a Developer Incentive pursuant to LAMC Section 11.5.11(e) for a 20% reduction in overall open space for a total requirement of 36,580 square feet.

The Project would provide the majority of open space in one large landscaped courtyard area throughout the entire Development Site. The Northeast Building would provide additional outdoor open space in a podium deck and a roof deck. Indoor common open space would be provided in community rooms in some buildings. Consistent with the proposed SNAP

Subarea D.2 open space requirements, all common open space areas would have a minimum horizontal dimension of 20 feet and an overall minimum dimension of 600 square feet, and they make up less than 40 percent of the required open space. Additionally, 27,229 square feet of open space would be provided on the ground floor level.

The courtyard will activate pedestrian activity on the Development Site with landscaping provided with trees and planters. Activity space will be created with the barbecue and dining areas and the game tables. Residents will have access to the community garden. Outdoor seating areas are spread throughout the open space courtyard and the passageways that link all buildings.

The Project will provide 7,627 square feet of landscaped area, which would accommodate a total of 114 trees.

Loading Areas, Lighting and Trash Collections

Lighting and trash collection areas are provided consistent with City Code requirements. Trash room and trash enclosure areas are provided for the residential and supportive services uses of the Project. The trash collection areas are accessible on the ground level of each building. Loading areas are not contained within the buildings. The Project proposes a drop-off and arrival area within a loop driveway along Madison Avenue, as it fronts on the courtyard and is located between the Northeast Building and the Southeast Building.

3. That any residential project provides recreational and service amenities to improve habitability for its residents and minimize impacts on neighboring properties.

As a Qualified Permanent Supportive Housing project, the Applicant's development provides 11,772 square feet of case management supportive services including 5,700 square feet dedicated to case management offices with meeting areas and 6,072 square feet of interior common open space for the residents. The Project will provide an indoor fitness center and extensive outdoor recreational activity areas in the approximately 26,000-square foot open space courtyard. The courtyard includes barbecue and dining areas, a community garden, outdoor seating areas, a dog park, game tables, an outdoor amphitheater, a shade structure, and a passageway that connects to the street frontages of Juanita Avenue, Oakwood Avenue and Madison Avenue. The Project's recreational and service amenities will improve the habitability for its residents. With a large outdoor courtyard that provides many activity areas for the residents, the Project's recreational amenities minimize impacts on neighboring properties.

SUBDIVISION MAP ACT

FINDINGS FOR VESTING TENTATIVE TRACT MAP NO. 82798 PURSUANT TO LAMC SECTIONS 17.01 & 17.15

Pursuant to **California Government Code Sections 66473.1, 66474 (Subdivision Map Act) and LAMC Section 17.01 and 17.15**, the Project Applicant requests approval of a Vesting Airspace Tentative Tract Map to permit the merger and re-subdivision of the land and the creation of one ground lot containing 5 air space lots necessary to facilitate the development of the project. The Project Applicant also requests to record the Final Map in phases. The requested Lots included:

i. Lot 1: Master Ground Lot
ii. Airspace Lot 2: Northeast
iii. Airspace Lot 3: Southeast
iv. Airspace Lot 4: Southwest B
v. Airspace Lot 5: Southwest A
vi. Airspace Lot 6: Northwest

1. The proposed map will be/is consistent with applicable General and Specific Plans.

The proposed Vesting Airspace Tentative Tract Map enables the consolidation of urban infill lots for the proposed affordable housing development project. The project as designed is consistent with various elements and objectives of the General Plan. See General Plan consistency findings above.

2. The site is physically suitable for the proposed type of development.

The Development Site consists of a Lot Area of 90,974 square feet comprised of the Assessor Parcels 5501-001-023 and 5501-001-800. Located mid-block on the east side of Juanita Avenue, north side of Oakwood Avenue and fronting on the west side of Madison Avenue, the Project Site is generally bound by Juanita Avenue to the west, Oakwood Avenue to the north, Madison Avenue to the east, and private property to the south that borders on Beverly Boulevard. The site is a generally level parcel of land which is physically suitable for the proposed five residential buildings, all of which are 8 stories. The Project is not located in a Hillside Area, a Very High Fire Hazard Severity Zone, a Flood Zone, a Hazardous Waste Area, a Landside Area, or a Liquefaction Area.

The site is prime location for developing a high-density residential development in close proximity to major transit options and a commercial corridor. The site is located within 500 feet of the Vermont/Beverly Metro Red Line Rail Station and the commercial corridor of Vermont Avenue. The Wilshire Community Plan includes Objective 1-4, which seeks to "provide affordable housing and increased accessibility to more population segments, especially students, the handicapped and senior citizens. The Vermont/Western Transit Oriented District Specific Plan (SNAP) includes as one its purposes to "facilitate the provision of studio and one bedroom apartments for adult students and senior citizens located near colleges, subway stations and along commercial corridors." The Project would consist of Restricted Affordable units for the Extremely Low to Low Income level homeless individuals, many of whom would be senior citizens. The Project proposes to provide primarily studio and one bedroom units, with only a few two bedroom units.

Therefore, the Development Site is suitable for Permanent Supportive Housing project.

3. The site is physically suitable for the proposed density of development.

The Development Site is physically suitable for the 454 residential units that would be ultimately constructed within 8-story buildings on 2.09 acres. The Project includes a maximum of 454 residential units; ample supportive services that consist of community rooms, case management offices, computer rooms and kitchens; and common indoor area consisting of lobbies, mailrooms and laundry rooms. The Project would be allowable under the requested land use designation of Commercial Manufacturing and the Zone Change from M1-1 to CM-1, along with the Specific Plan Amendment to create new Subarea D.2. The subject site is currently zoned M1-1 within the Wilshire Community Plan area of the City of Los Angeles and is designated Limited Industrial by the Community Plan. The designated height for the site is "1," limiting the site to a FAR of 1.5 to 1 on the project site. Concurrent with this application for a Vesting Tentative Airspace Tract Map, the Applicant has requested a General Plan Amendment from Limited Industrial to Commercial Manufacturing to Commercial Manufacturing, corresponding to the requested Zone Change to the CM Zone.

The Applicant has also requested a Specific Plan Amendment to the Vermont/Western Transit Oriented District Specific Plan Station Neighborhood Area Plan (SNAP) to permit the construction of a new Restricted Affordable housing development. The Specific Plan Amendment to the SNAP would create a new Subarea D.2, which would establish a FAR of 3 to 1 for the project site. The Buildable Area of the project site is 87,466 square feet, which would yield 262,398 square feet of floor area for a 3 to 1 FAR upon approval of the requested Zone Change and Specific Plan Amendment. The project is proposed to provide 247,812 square feet of floor area for the residential units, case management services, indoor open spaces and common areas. which results in a FAR of 2.8 to 1.

The subject property is located within the Wilshire Center/Koreatown Recovery Redevelopment Project which designates the site as Limited Industrial. Section 1100 of the Redevelopment Plan indicates that "if and when the City's General Plan is amended so as to change the land uses permitted within the Project Area, the land uses specified for the Project Area in the City's General Plan as so amended shall supersede the land use designations on the attached Redevelopment Plan Map and all of the other land use provisions of this Plan, to the extent that such Plan land use designations and provisions are inconsistent with the City's General Plan as so amended." As part of this application, the Applicant is requesting a General Plan Amendment from Limited Industrial to Commercial Manufacturing, a land use designation that would permit, along with the Zone Change to the CM Zone, the residential development that is proposed for the subject property.

Section 401 of the Redevelopment Plan proposes to implement general redevelopment actions, which include Section 409.4 (New or Rehabilitated Dwelling Units Within the Project Area), which states that "…..at least fifteen percent (15%) of all new and rehabilitated dwelling units developed within the Project Area by public or private entities or persons other than the Agency shall be available at affordable housing cost to persons and families of low- or moderate-income; and of such fifteen (15%) not less than forty percent (40%) thereof shall be at affordable housing cost to very low-income households." The Project would provide 100% Restricted Affordable dwelling units to the homeless and formerly homeless at the Extremely Low to Low income level. The Project would be consistent with the Redevelopment Plan's general development action of providing low-income housing.

Immediately adjacent to the subject property, to the east across Madison Avenue, is an existing affordable housing development on M1-1 zoned land. Additionally, adjoining this existing development is the construction of additional affordable housing units. Immediately adjacent to the subject property, to the west across Juanita Avenue, is an existing affordable development on R4 zoned land. The Project would provide an appropriate transitional development between these existing residential developments in an area that is within close proximity to a commercial center and the major transportation corridor on Vermont Avenue which includes a Metro Red Line rail station, Metro Rapid Bus line 754 and Metro Local Bus lines.

The proposed project would comply with Los Angeles Municipal Code (LAMC) sections as permitted by the proposed CM-1 Zone and the Specific Plan Amendment to the Vermont/Western Transit Oriented Specific Plan (SNAP) that would create a new development standards for the new Subarea D.2.

The Vesting Airspace Tentative Tract Map, to permit the merger and re-subdivision of the land and the creation of one ground lot containing 5 air space lots necessary to facilitate the five-lot development of the project, is the subject of this application. The Vesting Airspace Tentative Tract Map would facilitate the creation of an affordable housing development with space provided for supportive services for the benefit of the Extremely Low to Low income homeless residents.

4. The design of the subdivision and the proposed improvements are not likely to cause substantial environmental damage or substantially and avoidably injure fish or wildlife or their habitat.

The site of the proposed project is relatively flat and developed with three, small detached residential buildings, three, small one-story commercial buildings and large surface parking lots that will be demolished to create a campus of five residential buildings for Restricted Affordable units and supportive services. The project is undergoing an environmental review pursuant to the CEQA. As there are apparently no water bodies on the site and runoff would be directed to local storm sewers, it would not be likely to result in any injury to fish as a result of the development of the project.

Any potential wildlife and habitats will also be studied in the CEQA analysis. The project site and the surrounding area are presently developed with structures and surface parking lots that do not provide a natural habitat for either fish or wildlife. Given the developed nature of the site and the surrounding area, it is not likely that there are any existing habitats or endangered wildlife that would be disturbed.

The site is located in an urbanized area in the Wilshire Community Plan area. The subject property has been developed with paved parking lots and structures which do not provide a natural habitat for either fish or wildlife. Similarly, the surrounding area has been developed with a mix of residential, commercial and industrial structures and paved parking lots.

The design of the subdivision and the proposed improvements are not likely to cause substantial impacts to the environment.

5. That design of the subdivision or type of improvements is not likely to cause serious public health problems.

There appear to be no potential public health problems caused by the design of the subdivision or the proposed improvements to the property. The design merely merges the lots into one ground level lot and five airspace lots.

The development is required to be connected to the City's sanitary sewer system, where the sewage will be directed to the LA Hyperion Treatment Plant, which has been upgraded to meet State-wide ocean discharge standards.

The City Planning Commission has taken an increased interest in the relationship of populations living near freeways and health risks. This issue creates tension between the City's desire to focus high intensity residential development near jobs and transit centers, which are typically serviced by or proximate to freeways and arterials.

In 2009, the City created a policy that required projects located near vehicular pollution sources to include a higher level of air filtration and to consider these potential impacts when designing the site massing and landscaping. On November 8, 2012, the City Planning Commission approved a Staff recommendation to attach a notice to all properties within 1,000 feet of a freeway highlighting that this potential health risk needs to be analyzed if residential uses are being proposed. Such notice is identified as a zoning information report ZI No. 2427 in this instance which gives property owners who are subject to discretionary permits notice to consider design alternatives to help reduce or address impacts and public health risks. The Project is located within approximately 500 feet of the 101 Freeway and will require a discretionary permit for approval of the subdivision map and therefore could potentially be subject to ZI No. 2427. Alternatives to help reduce or address impacts and public health risks will be considered in the Project design as established by compliance with CALGreen standards.

The proposed subdivision and subsequent Project improvements will be subject to numerous provisions of the Los Angeles Municipal Code (e.g., the Fire Code, Planning and Zoning Code, Health and Safety Code, and the Building Code). Other health and safety related requirements mandated by state and local law would apply where applicable to ensure the public health and welfare (e.g., asbestos abatement, seismic safety, flood hazard management).

The Project could improve the public health by the removal of the surface parking lots which facilitates the heat island effect and uncontrolled runoff.

The Project would not be placed over a hazardous materials site, flood hazard area, or be located on unsuitable soil conditions. The project would not place any occupants or residents near a hazardous materials site or involve the use or transport of hazardous materials or substances. The proposed residential land uses are consistent with surrounding land uses, as similar affordable housing developments are located to the immediate east and west of the Project Site.

The Department of Transportation requires the submittal of a parking and driveway plan to ensure safe egress and ingress of the project site and to ensure conformance with transportation safety design policies. The Applicant will work with the Department of Transportation to arrive at the proposed design of ingress and egress to the proposed Project.

Therefore, the design of the subdivision and the proposed improvements are not likely to cause serious public health problems.

6. **That the design of the subdivision or the type of improvements will not likely conflict with easements acquired by the public at large, for access through or use of, property within the proposed subdivision**.

No such easements are known to exist. Needed public access for roads and utilities will be acquired by the City prior to recordation of the proposed tract.

7. **The design of a subdivision for which a tentative map is required pursuant to Section 66426 shall provide, to the extent feasible, for future passive or natural heating or cooling opportunities in the subdivision.**

In assessing the feasibility of passive or natural cooling opportunities in the proposed subdivision design, the Applicant has prepared and submitted materials which consider the local climate, contours, configuration of the parcels(s) to be subdivided and other design and improvement requirements.

Providing for passive or natural heating or cooling opportunities will not result in reducing allowable densities or the percentage of a lot which may be occupied by a building or structure under applicable planning and zoning in effect at the time the tentative map was filed.

The lot layout of the subdivision has taken into consideration the maximizing of the north/south orientation.

The topography of the site has been considered in the maximization of passive or natural heating and cooling opportunities.

In addition, prior to obtaining a building permit, the subdivider shall consider building construction techniques, such as overhanging eaves, location of windows, insulation, exhaust fans; planting of trees for shade purposes and the height of the buildings on the site in relation to adjacent development.

Exhibit B

Proposed Specific Plan Amendment

EXHIBIT B
SPECIFIC PLAN AMENDMENT
VERMONT/WESTERN TRANSIT ORIENTED DISTRICT SPECIFIC PLAN
(STATION NEIGHBORHOOD AREA PLAN)
PURSUANT TO L.A.M.C. SECTION 11.5.7 G

Section 10.A Subarea D.2 – Commercial Manufacturing/Permanent Supportive Housing

Definitions

Whenever the following terms are used in this Subarea, they shall be construed as defined in this Section. Words and phrases not defined herein shall be constructed as defined in Section 4 of this Specific Plan, and Sections 12.03, 13.07.C and 13.09.B.3, Division 4 of Article 1, Chapter 9 of the Code, and Division 62 of Article 1, Chapter 9 of the Code if defined there:

Local Public Agency. A local public agency identified on a list maintained by the Department of City Planning (Department) that funds Supportive Services, keeps a prequalified list of service providers, or both.

Qualified Permanent Supportive Housing Project. The construction of, addition to, or remodeling of a building or buildings offering Supportive Housing; and where all of the total combined Dwelling Units or Guest Rooms, exclusive of any manager's units, are affordable. For the purposes of this subdivision, affordable means that rents or housing costs to the occupying residents do not exceed 30 percent of the maximum gross income of Extremely Low, Very Low or Low Income households, as those income ranges are defined by the United States Department of Housing and Urban Development (HUD) or any successor agency, as verified by the Housing & Community Investment Department (HCIDLA). A minimum of 50 percent of the total combined Dwelling Units or Guest Rooms is occupied by the Target Population.

Target Population. Persons with qualifying lower incomes who (i) have one or more disabilities, including mental illness, HIV or AIDS, substance abuse, or other chronic health condition, and are homeless as defined by any Los Angeles City, Los Angeles County, State of California, or Federal guidelines; or (ii) are chronically homeless, as defined by any Los Angeles City, Los Angeles County, State of California, or Federal guidelines.

~~**Local Public Agency**. A local public agency identified on a list maintained by the Department of City Planning that funds Supportive Services, keeps a prequalified list of service providers, or both.~~

A. Use. The use and area regulations of Section 12.17.1 of the Code (CM Zone) shall apply to all lots in the Subarea D.2, except that residential uses are permitted provided the following requirements are met ~~such that~~and the ~~Project~~ project meets the definition of~~is~~ a Qualified Permanent Supportive Housing Project:

1. Supportive Services. Applicants shall provide documentation describing the Supportive Services that will be provided onsite and offsite. Prior to any approval of a Qualified Permanent Supportive Housing Project, the applicant shall submit information demonstrating that Supportive Services will be provided to residents

of the project. The applicant shall indicate the name of the entity or entities that will provide the Supportive Services, the Local Public Agency funding source(s) for those services, and proposed staffing levels. If a preliminary funding commitment is needed, the applicant shall also submit a signed letter of intent from the Local Public Agency verifying that it is providing a preliminary funding commitment for the Supportive Services. If no funding commitment is needed, the applicant shall demonstrate that the entity or entities that will provide the Supportive Services are service providers prequalified by a Local Public Agency.

2. Affordable Housing Covenant. Projects shall record a covenant acceptable to HCIDLA that reserves and maintains the total combined number of Dwelling Units and Guest Rooms designated as restricted affordable for at least 55 years from the issuance of the Certificate of Occupancy.

3. Housing Replacement. Projects shall meet any applicable dwelling unit replacement requirements of California Government Code Section 65915(c)(3), or as thereafter amended, as verified by HCIDLA, and all applicable covenant and monitoring fees in Section 19.14 of this Code shall be paid by the applicant prior to the issuance of any building permit.

4. Notification of Application. The following requirements shall be completed at least 30 days prior to the Department ~~of City Planning~~'s approval of the Qualified Permanent Supportive Housing Project:

a. Written Notices. The Department shall send written notices of the Qualified Permanent Supportive Housing Project application by U.S. mail to the abutting property owners,

b. Posting. The applicant shall post, in a conspicuous place near the entrance of the property, a public notice of the Qualified Permanent Supportive Housing Project application. The applicant shall submit proof of posting to the Department, which includes submission of a completed public notice form provided by the Department and photographs of the posted notice.

5. Performance Standards. A Qualified Permanent Support Housing Project must comply with the following Performance Standards:

a. Location Requirement. The Qualified Permanent Supportive Housing Project shall be located within a High Quality Transit Area for the horizon year in the current Regional Transportation Plan/Sustainable Communities Strategy for the Southern California Association of Governments region.

b. Onsite Supportive Services Requirement. Nonresidential floor area shall be provided for onsite Supportive Services in the following ratios:

(i) For Qualified Permanent Supportive Housing Projects with 20 or fewer total combined Dwelling Units or Guest Rooms, no less than 90 square feet of dedicated office space shall be provided onsite; or

(ii) For Qualified Permanent Supportive Housing Projects with greater than 20 Dwelling Units or Guest Rooms, a minimum of 3 percent of the total Residential Floor Area shall be dedicated for onsite Supportive Services provided solely to Project residents, including but not limited to community rooms, case management offices, computer rooms, and/or a community kitchen.

c. Massing. Buildings more than 200 feet in length along any exterior street-facing building facade shall include a design element that provides visual relief every 100 feet. The design element shall either setback from or step forward from the face of the building by at least a depth of 12 inches and shall be a width of no less than 5 percent of the building face (ex: 5 percent of 100' = 5') and shall extend up the face of the building to at least 50 percent of the facade height.

d. At-Grade Parking. No at-grade parking space shall be located within the front yard. Loading areas and off-street parking facilities containing three or more spaces shall be effectively screened from abutting streets and lots. The screening shall not obstruct the view of the driver entering or leaving the loading area or parking facility, or the view from the street of entrances and exits to a loading area or parking facility. The screening shall consist of one or more of the following:

(i) A strip at least 5 feet in width of densely planted shrubs or trees that are at least 2 feet high at the time of planting and are of a type that may be expected to form, within three years after time of planting, a continuous, unbroken, year round visual screen; or

(ii) A wall, barrier, or fence of uniform appearance. Such wall, barrier, or fence may be opaque or perforated, provided that not more than 50 percent of the face is open. The wall, barrier or fence shall be between 4 and 6 feet in height.

Commercial Corner Exemption. Notwithstanding any provisions of Sections 12.22 A 23 and 12.24 W 26 of the Code to the contrary, and except as otherwise required by this Specific Plan, ~~Projects~~ projects that constitute a Commercial Corner Development or Mini-shopping Center, as defined in Section 12.03 of the Code, may be developed within Subarea D.2 without first obtaining a conditional use approval pursuant to Section 12.24 W 26 of the Code or having to comply with the requirements and conditions set forth in Section 12.22 A 23 of the Code.

B. Density. Qualified Permanent Supportive Housing ~~projects~~ Projects shall be permitted unlimited density. No other residential uses are permitted includ~~ed~~ing hotel, motel and apartment hotel.

C. Floor Area. Qualified Permanent Supportive Housing Projects shall not exceed a maximum Floor Area Ratio of 3:1. Areas designated exclusively for ~~supportive~~ Supportive ~~services~~ Services uses or ~~public~~ common areas accessible to all residents, including those for accessory residential or ~~supportive~~ Supportive ~~services~~ Services uses, shall not be considered floor area of the building for purposes of calculating the total allowable Floor Area. The Floor Area shall be measured to the center line of wall partitions between public and non-public areas.

D. Transitional Height. Notwithstanding any provisions of Section 12.21.1 A 10 of the Zoning Code to the contrary, portions of buildings on a lot located within Subarea D.2 shall not exceed the transitional height limits set forth below when located within the distances specified therein from a lot within the Subarea A.

Distance	Height
0 to 49 feet	25 feet
50 to 99 feet	33 feet
100 to 200 feet	61 feet

E. Usable Open Space. Notwithstanding any provisions of Section 12.21.G of the Zoning Code to the contrary, ~~Projects constituting~~ Qualified Permanent Supportive Housing Projects containing two or more Dwelling Units or Guest Rooms ~~dwelling units~~ contain usable open space in accordance with the standards of Section 12.21.G.2 of the Code, with the following exceptions:

1. **Common Open Space.** Notwithstanding the requirements in Section 12.21 G.2(a)(4)(i) of the Zoning Code, recreation rooms at least 600 square feet in area for a development of 10 or more ~~dwelling units or guest rooms~~Dwelling Units or Guest Rooms, or at least 400 square feet in area for a development of fewer than 10 ~~dwelling units or guest rooms~~Dwelling Units or Guest Rooms, may qualify as common open space, but shall not qualify for more than 40 percent of the total required usable open space.

2. **Above Grade.** Up to 75% of the common or private open space, regardless of the underlying zone, may be located above the grade level or first habitable room level.

3. **Roof decks.** Roof Decks, regardless of the underlying zone, may be used in their entirety as common or private open space, excluding that portion of the roof within 20 feet of the roof perimeter.

F. Project Parking Requirement

1. **Residential.** Notwithstanding the contrary provisions of Section 12.21.A.4(a) of the Code and regardless of the underlying zone, no parking spaces shall be required for ~~dwelling units or guest rooms~~Dwelling Units or Guest Rooms restricted to the Target

Population of a Qualified Permanent Supportive Housing Project. For a Qualified Permanent Supportive Housing Project located within one-half (1/2) mile of a Transit Stop, no more than one-half (1/2) parking space shall be required for each income-restricted Dwelling Unit or Guest Room not occupied by the Target Population. Otherwise, no more than one (1) parking space shall be required for each income-restricted Dwelling Unit or Guest Room not occupied by the Target Population.

Notwithstanding the contrary provisions of Section 12.21 A 4 of the Zoning Code and regardless of the underlying zone, the following parking standards shall apply to all Qualified Permanent Supportive Housing Projects: One (1) parking space for every 20 ~~dwelling units or guest rooms~~Dwelling Units or Guest Rooms shall be provided for the purpose of accommodating guests, ~~supportive~~ Supportive ~~services~~Services~~, case management~~ and managers' units. Up to 40% of the total required parking spaces may be provided as compact stalls.

Additionally, market rate units that do not qualify as managers' units for Qualified Permanent Supportive Housing Projects shall comply with the following standards:

a. Minimum Standards. Notwithstanding the contrary provisions of Section 12.21 A 4 (a) of the Code and regardless of the underlying zone, the minimum number of parking spaces required shall be provided at the following ratios: at least one parking space for each ~~dwelling unit~~Dwelling Unit or Guest Room having fewer than three habitable rooms, and at least one and one-half parking spaces for each ~~dwelling unit~~Dwelling ~~u~~Unit or Guest Room having more than three habitable rooms, in addition to at least one quarter parking space for each ~~dwelling unit~~Dwelling Unit or Guest Room as guest parking.

b. Maximum Standards. Notwithstanding the contrary provisions of Section 12.21 A 4 (a) of the Code and regardless of the underlying zone, the maximum number of parking spaces provided shall be limited to the following ratios: a maximum of one parking space for each Dwelling Unit or Guest Room ~~dwelling unit~~ having fewer than three habitable rooms, a maximum of one and one-half parking spaces for each Dwelling Unit or Guest Room ~~dwelling unit~~ having three habitable rooms, a maximum of two parking spaces for each Dwelling Unit or Guest Room ~~dwelling unit~~ having more than three habitable rooms, and a maximum of one-half parking space for each Dwelling Unit or Guest Room ~~dwelling unit~~ as guest parking.

2. **Non-residential uses.** Parking shall be required pursuant to Section 12.21.A.4 of the Code.

3. **Bicycles.** Notwithstanding the contrary provisions of Section 12.21 A 16 of the Code and regardless of the underlying zone, for Projects with two or more dwelling units, off-street parking spaces for bicycles shall be provided at a ratio of one-half parking space per Dwelling Unit or Guest Room~~dwelling unit~~, and for Projects with non-residential uses, regardless of the underlying zone, off-street parking spaces for bicycles shall be provided at a ratio of one parking space for every 1,000 square feet of non-residential floor area for the first 10,000 square feet of floor area, and one bicycle parking space for every additional 10,000 square feet of floor area. Bicycle parking spaces shall conform to the standards set forth in Section 12.21 A 16 (c)

through (h) of the Code, and the Guidelines.

G. Development Standards. Projects shall be in substantial conformance with the Guidelines.

Exhibit C

Proposed Development Standards

EXHIBIT C

VI. SUBAREA D.2 – COMMERCIAL MANUFACTURING/PERMANENT SUPPORTIVE HOUSING

The purpose of these regulations is to create a more opportunities for Qualified Permanent Supportive Housing; require concealment of offensive elements and activities from view; regulate transitional treatments where industrial sites abut residential uses; provide criteria for improved building design; and to improve the landscape standards.

Residential uses shall be prohibited except that Qualified Permanent Supportive Housing linked to onsite or offsite supportive services for the target population are be permitted. The height permitted is 100 feet, except that transitional height for portions of buildings located within specific distances of Subarea A must be observed.

Pedestrian arcades or mid-block pass throughways are required for projects with more than 250 feet of street frontage on Boulevards and Avenues.

Development Standards
The following standards have been established to promote development that enhances the economic vitality of the community by providing opportunities for offices and stores, live/work space, workshops and affordable housing. These standards apply to all new development and extensive remodeling projects.

Landscaped Buffers, or landscaped setbacks, referred to in this section of the document, unless otherwise indicated, shall conform to the following standards:

a. be at least three feet wide;
b. contain clinging vines along any adjacent walls or fences with a minimum height of three feet at maturity, and continuous ground cover planted over the entire setback;
c. contain one twenty-four inch shade box tree, not less than ten feet in height at the time of planting, planted every 20 lineal feet. Shade trees as identified in the Street Tree List of the Bureau of Street Maintenance shall be planted;
d. include an automated irrigation system; and
e. be in accordance with a landscape plan prepared by a landscape architect, licensed architect, or licensed land scape contractor.

1. Landscape Plan. All open areas not used for buildings, driveways, parking, recreational facilities, or pedestrian amenities shall be landscaped by shrubs, trees, clinging vines, ground cover, lawns, planter boxes, flowers, fountains, and any practicable combination so that it is dust free and allows convenient outdoor activities, especially for children in mixed use or residential projects. Indigenous plantings are preferred, especially those that can support native species of butterflies and other small insects or animals. All landscaped areas shall be landscaped in accordance with a landscape plan prepared by a licensed landscape architect, licensed architect, or licensed landscape contractor.

2. Usable Open Space. No portion of the required usable open space shall have a slope exceeding 10%. Up to 75% of the usable open space may be provided above the ground floor regardless of the underlying Zone.

Common Usable Open Space. No portion of the required common usable open space shall have a dimension of less than 20 feet or be less than 400 square feet for projects under 10 dwelling units and 600 square feet for projects 10 dwelling units or more.

Private Usable Open Space. Once the standards for the common usable open space referenced in the paragraph above have been met, Projects may provide private usable open space, such as balconies or patios, with a minimum dimension of six feet for balconies and ten feet for patios, thereby reducing the required usable open space directly commensurate with the amount of private open space provided.

3. Streetscape Elements.
Note that virtually all street furniture requires the issuance of a revocable permit from the Bureau of Street Services in the Department of Public Works, prior to placement in the public right of way. Some variation in the design of the tree well covers, bike racks, street trees, trash receptacles or public benches may be authorized by the Director of Planning or his /her representative, for aesthetic, consistency or practical purposes, but not for the purpose of lowering costs to the Project.

Street Trees. At least one 36-inch box shade tree shall be planted in the public right of way on-center, or in a pattern satisfactory to the Bureau of Street Maintenance, for every 30 feet of street frontage. Shade trees as

identified in the Street Tree List of the Bureau of Street Maintenance shall be planted. An automatic irrigation system shall also be provided within the tree well. Businesses, tenants, and property owners along both block faces of a street are encouraged to collaboratively select a signature tree.

Tree Well Covers. A four foot by eight foot, black, cast iron tree well cover shall be provided for each new and reused street tree in the project area. The design shall meet the Americans With Disabilities Act requirements and minimize trip and fall accidents, and provide a cut out adequate for whatever tree used.

Bike Racks. One bike rack per lot, or 50 feet of lot frontage for lots with more than 50 feet of frontage, shall be required. Bike racks shall be installed three feet from the curb edge or per the City Department of Transportation's requirements. Simple bike racks painted black are required.

Trash Receptacles. One trash receptacle, painted black, per 100 feet of a lot frontage along major or secondary highways, to be maintained and emptied by the Project owner, and placed in the public right of way, according to the requirements of the City Department of Public Works.

Public Benches. One public bench, painted black with a backrest, three armrests, and intermediate frame, for every 250 feet of lot frontage on a major or secondary highway shall be required and placed in the public right of way according to the requirements of the City Department of Public Works.

4. Pedestrian/Vehicular Circulation. All structures shall be oriented toward the main commercial street where the parcel is located and shall avoid pedestrian/vehicular conflicts by adhering to the following standards:

Parking Lot Location. Surface parking shall be located to the rear of all structures if vehicular access is available to the rear of the parcel either via an alley or a public street. Where no vehicular access is available from the rear of any lot, parking shall be provided to the rear of a lot via a "flag" parking layout.

Waiver. The Director of Planning or his/her representative may authorize a waiver from the requirement to provide parking in the rear of the lot for mid-block lots that do not have through access to an alley or public street at the rear, and where creation of a flag parking lot results in a total building frontage of 30 feet or less. Applicants requesting a waiver shall submit

alternative site plan scenarios with calculations showing total building frontage. Applicants shall incorporate design mitigation measures to ensure the pedestrian oriented streetscape is not undermined.

Curb cuts. Whenever a project must take its access from a major or secondary street, only one curb cut shall be permitted for every 150 feet of street frontage on the main commercial street. Such curb cuts shall be a maximum width of 20 feet, unless otherwise required by the Departments of Public Works, Transportation or Building and Safety.

Pedestrian Entrance. All buildings that front on a Boulevard or Avenue or main commercial street, including parking structures, shall provide a pedestrian entrance at the front of the building, even when rear public entrances are provided. Maximum spacing of entries along commercial frontages for shops, lobbies or arcades is fifty feet.

Design of Entrances. Pedestrian Walkways, arcades or entrances shall be located in the center of the facade, or symmetrically spaced if there are more than one, or at the corner if in a corner building. Entrances shall be accented by architectural elements such as columns, overhanging roofs, awnings, etc.

Speed Bumps. Whenever a pedestrian walk way and a drive way share the same path for more than 50 lineal feet, speed bumps shall be provided on the driveway at a distance of no more than 20 feet apart.

5. Utilities. When new utility service is installed in conjunction with new development or extensive remodeling, all proposed utilities on the project site shall be placed underground. If underground service is not currently available, then provisions shall be made for future underground service.

6. Building Design. The purpose of the following provisions is to ensure that a project avoids large blank expanses of building walls, is designed in harmony with the surrounding neighborhood, and contributes to a lively pedestrian friendly atmosphere. Accordingly, the following standards shall be met:

Stepbacks. No portion of any structure located in Subareas D.2 shall exceed more than 30 feet in height within 15 feet of the front property line. (See Figure 1) All buildings with a property line fronting on a major highway, including Hollywood Boulevard, Sunset Boulevard, Santa Monica Boulevard

and Vermont Avenue, shall set the second floor back from the first floor frontage at least ten feet.

Transparent Building Elements. For any building located in a Non-Residential Zone, a minimum of 25 percent of that portion of the exterior street-facing walls which are between 2 feet to 8 feet above the sidewalk grade shall be comprised of transparent (untinted, unfrosted, non-reflective) windows or openings, exclusive of areas for walkways, driveways, paseos and plazas.

A minimum of 10 percent of the upper story portions of the exterior street-facing building facade as measured from the top of the finished ground floor to the top of the building facade shall be comprised of transparent (untinted, unfrosted, non-reflective) windows or openings.

Glass Transparency. Glass is considered transparent where it has a transparency higher than 80 percent and external reflectance of less than 15 percent.

Facade Relief. All exterior building walls shall provide a break in the plane, or a change in material every 45 feet in horizontal length and every 30 feet in vertical length, created by an articulation or architectural detail such as: a change in plane of at least six inches for a distance of not more than 45 feet; recessed entry ways, recessed windows, or pop-out windows; porticos, awnings, terraces, balconies, or trellises; building overhangs, projections or cantilevered designs; horizontal moldings; cornice lines; or other features or building materials that create a visual break. Aluminum framed window or doors that are flush with the plane of the building shall not be included as a change in material or as a break in the plane. Materials such as wood, glass block, brick, adobe and tile are encouraged. Architectural treatments on the building front elevation shall be continued on the sides and back of buildings.

Building Materials. All buildings shall apply at least two types of complementary building materials to exterior building facades such as adobe, wood, brick, stone or tile. Transparent building elements shall not be included as a change in material towards this requirement.

Surface Mechanical Equipment. All surface or ground mounted mechanical equipment, including transformers, terminal boxes, pull boxes, air conditioner condensers, gas meters and electric meter cabinets shall be

screened from public view and treated to match the materials and colors of the building which they serve.

Roof Lines. All roof lines in excess of forty feet must be broken up through the use of gables, dormers, plant-ons, cutouts or other appropriate means. (See Figure 4)

7. Rooftop Appurtenances. All rooftop equipment and building appurtenances shall be screened from public view or architecturally integrated into the design of the building as follows:

Flat Roofs. Building equipment and ducts shall be screened from view from any street, public right of way or adjacent property. The screening shall be solid and match the exterior materials, design and color of the building.

Pitched Roofs. Building equipment and ducts on pitched roofs shall be screened from view from any street, public right of way or adjacent property. The pitched roof shall be designed and constructed to accommodate roof-mounted equipment. A platform shall be constructed and recessed into the roof such that one side of the equipment shall be below the pitch of the roof. The remainder of the equipment and ducts which are above the roof pitch shall be screened from view. The screening shall be solid and match the exterior materials, design and color of the building.

Parapet Roofs. The parapet roof shall be designed and constructed to accommodate roof-mounted equipment. Any portions of the equipment or ducts which are above the parapet shall be screened from view from any street, public right of way or adjacent property. The screening shall be solid and match the exterior building material, design and color. 8. Trash and Recycling Areas. Trash storage bins shall be located within a gated, covered enclosure constructed of materials identical to the exterior wall materials of the building. The trash enclosure shall be minimum six feet high, and shall have a separate area for recyclable materials. (See Figure 5) 9. Pavement. Paved areas, excluding parking and driveway areas, shall consist of enhanced paving materials such as stamped concrete, permeable paved surfaces, tile, and/or brick pavers.

8. Trash and Recycling Areas. Trash storage bins shall be located within a gated, covered enclosure constructed of materials identical to the exterior wall materials of the building. The trash enclosure shall be minimum six feet high, and shall have a separate area for recyclable materials. (See Figure 5)

9. Pavement. Paved areas, excluding parking and driveway areas, shall consist of enhanced paving materials such as stamped concrete, permeable paved surfaces, tile, and/or brick pavers.

10. Freestanding Walls. All freestanding walls shall contain an architectural element at intervals of no more than 20 feet. All freestanding walls shall be setback from the property line adjacent to a public street with a landscaped buffer. Chain-link, barbed and concertina fences are not permitted. (See Figure 6)

11. Parking Structures-Required Commercial Frontage. All of the building frontage along major or secondary highways, for a parking structure shall be for commercial, community facilities, or other non-residential uses to a minimum depth of 25 feet. (See Figure 7).

12. Parking Structures-Facade treatments. The exterior elevations of all parking structures shall be designed to match the style, materials and color of the main building they serve so there is no notable differentiation between the parking and non-parking structure. (See Figure 8) If the parking structure is not architecturally associated with any one building, the wall at ground level shall be screened by a landscaped buffer.(See Figure 9)

13. Parking Structures Across from Residential Uses. Wherever a parking structure abuts or is directly across an alley or public street from any residential use or zone, the facade facing such residential use or zone shall conform to the following standards: a landscaped buffer in front of a decorative perimeter wall at least three feet six inches in height shall be provided along the sides of any structure which faces any residential use or zone, so that light is blocked and noise deflected; a maximum of 40% of the building facade shall be for openings that allow for natural ventilation; solid panels a minimum of three feet six inches tall shall be installed at the ramps of the structure which are adjacent to residential uses or zones so as to minimize headlight glare; light standards on any uncovered above ground level areas of the structure shall not be higher than the adjacent perimeter walls; and garage floors and ramps shall be constructed with textured surfaces to minimize tire squeal noises.

14. Surface Parking lots. Surface parking lots and driveways shall be paved with portland cement concrete, pervious cement, grass-crete or any other porous surface acceptable to the Department of Building and safety, that reduces heat radiation and/or increases surface absorption. A landscape plan prepared by a licensed landscape architect, licensed architect or licensed

landscape contractor shall be required. At least ten percent of a surface parking lot shall be landscaped in accordance with the following standards: One 24-inch box shade tree for every four parking spaces, spaced evenly to create an orchard-like effect; a landscaped buffer around the property line; and a three and a half foot solid decorative masonry wall trees as identified in the Street Tree List of the Bureau of Street Maintenance shall be planted. The trees shall be located so that an overhead canopy effect is anticipated to cover at least 50 percent of the parking area after ten years of growth. **(See Figure 10)**

15. Surface Parking Abutting Residential. Whenever a surface parking lot abuts or is directly across an alley from an residential use or zone, a decorative wall at least six feet in height shall be erected along the perimeter of the parking area facing such residential lot or use, and a landscaped buffer shall be installed along this wall with one 24-inch box shade tree planted for every 20 feet of landscaped buffer around the property line. A landscape plan prepared by a landscape architect, licensed architect, or licensed landscape contractor is required.

16. On-Site Lighting. On-site lighting shall be installed along all vehicular access ways and pedestrian walkways. Parking areas shall have a minimum of 3/4 foot-candle of flood lighting measured at the pavement. All on-site lighting shall be directed away from adjacent properties. This condition shall not preclude the installation of low-level security lighting.

Lighting Shielded. Sources of illumination shall be shielded from casting light higher than fifteen degrees (15) below the horizontal plane as measured from the light source. They shall not cast light directly into adjacent residential windows. Light Mounting Height. A maximum mounting height of light sources for ground level illumination shall be fourteen feet, measured from the finished grade of the area to be lit.

Lamp Color. Color corrected ("white") high pressure sodium (HPS), color corrected fluorescent (2,700-3,000 degrees K), metal halide, or incandescent lamps shall be used for ground level illumination. Standard "peach" high pressure sodium, low pressure sodium, standard mercury vapor, and cool white fluorescent shall not be used for ground floor illumination.

17. Security Devices. Security devices shall be screened from public view. Alternative methods such as interior electronic security and fire alarm systems are encouraged. If metal security grills are used, grilles which recess into pockets or overhead cylinders, completely concealed and retractable shall be

used and shall be integrated into the design of the building, using the space behind signage to house the gate if possible. Vertical or horizontally folding accordion grills in front of a building are prohibited. All security window bars shall be installed on the inside of the building.

18. Privacy. Buildings shall be arranged to avoid windows facing windows across property lines, or the private open space of other residential units.

19. Hours of operation. Parking lot cleaning and sweeping, trash collections and deliveries to or from a building shall occur no earlier than 7AM and no later than 8PM, Monday through Friday, and no earlier than 10AM and no later than 4PM on Saturdays and Sundays.

20. Noise Control. Any dwelling unit exterior wall including windows and doors having a line of sight to a public street or alley, shall be constructed so as to provide a Sound Transmission Class of 50 or greater, as defined in the Uniform Building Code Standard No. 35-1, 1979 edition, or latest edition. The developer, as an alternative, may retain an acoustical engineer to submit evidence, along with the application of a building permit, specifying any alternative means of sound insulation sufficient to reduce interior noise levels below 45dBA in any habitable room.

21. Required Ground Floor Uses. Any residential, community facility or commercial use permitted by the Specific Plan Ordinance is allowed on the ground floor.

Industrial Feasibility Memo prepared by MR+E

MR+E

Memo

From: David Bergman, MR+E

To: Flexible PSH Solutions

RE: Industrial feasibility at 316 Juanita, Los Angeles

Date 4/15/20

Project Description

Flexible PSH Solutions, a not-for-profit public benefit corporation, is proposing to develop 454 permanent supportive housing units for the chronically homeless along with 11,772 sq. ft. of program service support space. The project is called Enlightenment Plaza (henceforth referred to as "the Project"). Exclusive of the five managers' units, the Project would be 100% Restricted Affordable housing, serving extremely low- to low-income individuals, and would be available only to target population members. To construct these units, the Project would redevelop an approximately 90,984-square-foot site located at 312–328 N. Juanita Avenue in the City of Los Angeles (henceforth referred to as "the Site"). The Site is located in an M1-1 zone with a limited industrial land use designation. The Site is currently improved with light industrial and commercial buildings, three residential units, and accessory surface parking. Table 1 summarizes the existing improvements at the site.

Table 1

Address	Use	Sq. Ft.	Year Built
316 N. Juanita	Industrial (Telecom)	6,105	1960
316 N. Juanita	Storage	240	1960
316 N. Juanita	Garage	2,160	1974
3812 W. Oakwood	Multi-unit Residential	384	1924
3813 W. Oakwood	Storage	160	1961
3814 W. Oakwood	Storage	760	1961

Source: City of Los Angeles Department of Building and Safety

Industrial Rents

Industrial use at this site is a remnant from a previous technological regime that required infrastructure and proximity of hard-wired telephone connections to users. The main industrial building at 316 N. Juanita was

constructed in 1961 to house telephone switching equipment, a function that is now largely obsolete. At present, the facility is mostly used for its surface parking capacity. It is not part of any local industrial agglomeration or district. There are currently two industrial land uses within 500 feet of the property, including:

- 310 N. Madison Ave (APN # 5501-00-2034). A 7,860 sq. ft. warehouse building constructed in 1971 that is used for vehicle storage and is occasionally rented for special events.
- 3655 Beverly Blvd. (APN #5501-002-009). A 1,296 sq. ft. building originally constructed as a retail store in 1964, now used for vehicular storage and office space for a pest control company.

The character of the surrounding area is primarily a mix of residential and commercial buildings, along with surface parking. The immediate vicinity does not contain any industrial infrastructure or uses other than access to US-101 (The Hollywood Freeway).

The market for industrial use in the area is limited. At present, two industrial properties are listed as being available for rent less than three miles from the site. These properties are listed in Table 2.

Table 2

Address	Size	Rent Sf/ Year	year built	Distance
1027 Lillian Way	12,400	$30	1962	2.25
1260 W 2nd St	11,900	$9.72	1921	2.25

Source: LoopNet (accessed 4/12/20)

Both the available properties in the nearby market are significantly larger than the existing industrial properties on the site and, as such, are likely to receive higher market rents than what would be achieved by the existing buildings on site. The rental rates for leasable industrial buildings that are 6,000 sq. ft. or less and are located within Central Los Angeles range from $10.20 per sq. ft. per year to $33.60, with a median listed price of $21.72 per sq. ft. per year.

Residual Land Value Analysis

At present, the cap rate for stabilized class A industrial space in the Los Angeles market averages 4.0%. Capital construction costs for new industrial/warehouse space in Los Angeles currently ranges between $317 and $203 per sq. ft., with an average cost of $285 per sq. ft. Using these parameters, it is possible to prepare a residual land value analysis to determine the maximum feasible price that an industrial user could

pay for the land at the site in order to develop industrial space. Table 3 shows the results of this analysis. Given these inputs, the maximum feasible price at which an industrial user could purchase the site would be $4.4 million per acre, or approximately $9.2 million for the entire site. This compares to the $17.8 million land purchase price that the Project was able to offer for the site.

Summary and Conclusions

New industrial development would not be feasible at the project site. The maximum price a feasible industrial project could purchase the project site for would be $9.2 million. Generally speaking, new industrial development in the Los Angeles market is infeasible where land costs are greater than approximately $101 per sq. ft. The existing improvements on the site are obsolete due to their configuration and the size of the space is not in demand in the market. The current asking price of $21.72 per sq. ft. per year is below replacement costs for new construction and would therefore not be feasible as a reuse. The project site has minimal features that would support industrial use, is not located in an active industrial district, and is surrounded by incompatible land uses. Current market conditions effectively foreclose the possibility of redeveloping the project site for industrial use.
