# Traffic Impact Study Ponte Vista at San Pedro Project <br> City of Los Angeles, California <br> March 19, 2012 

### 1.0 InTRODUCTION

This traffic analysis ${ }^{1}$ has been conducted to identify and evaluate the potential traffic impacts of the proposed Ponte Vista at San Pedro project. The proposed project is located on the east side of Western Avenue Drive, generally between Green Hills Drive and Avenida Aprenda in the San Pedro area of the City of Los Angeles. The proposed project site also is located within the Wilmington-Harbor City Community Plan area of the City of Los Angeles. The proposed project site location and general vicinity are shown in Figure 1-1.

The traffic analysis follows City of Los Angeles traffic study guidelines ${ }^{2}$ and is consistent with traffic impact assessment guidelines set forth in the 2010 Congestion Management Program for Los Angeles County ${ }^{3}$. This traffic analysis evaluates potential project-related impacts at 56 key study intersections in the vicinity of the project site. The study intersections were determined in consultation with City of Los Angeles Department of Transportation (LADOT) staff. The Critical Movement Analysis method was used to determine Volume-to-Capacity ratios and corresponding Levels of Service at the study intersections. In addition, a review was conducted of Los Angeles County Metropolitan Transportation Authority intersection and freeway monitoring stations to determine if a Congestion Management Program transportation impact assessment analysis is required for the proposed project.

While the project site is situated within the jurisdiction of the City of Los Angeles, the traffic study also evaluates potential traffic impacts associated with the project at study intersections located in the cities of Torrance, Lomita, Rancho Palos Verdes, Rolling Hills Estates, and Carson, as well as unincorporated areas of the County of Los Angeles. The intersection, road and freeway segments analyzed herein were determined by consultation with the affected jurisdictions through the California Environmental Quality Act (CEQA) Notice of Preparation (NOP) process. Potential impacts to study intersections located in jurisdictions outside of the City of Los Angeles were determined using both the City of Los Angeles impact criteria and the impact criteria of the affected jurisdiction. The Intersection Capacity Utilization method was

[^0]
used to determine Volume-to-Capacity ratios and corresponding Levels of Service at the study intersections located in the above cities neighboring the City of Los Angeles. In addition, street and freeway segments under the jurisdiction of the California Department of Transportation (Caltrans) have been evaluated.

This study (i) presents existing traffic volumes, (ii) forecasts future traffic volumes with the related projects, (iii) forecasts future traffic volumes with the proposed project, (iv) determines project-related impacts, and (v) recommends mitigation measures, where necessary.

### 1.1 Study Area

Based on direction from LADOT staff, a total of 56 study intersections have been identified for evaluation. These study locations provide local access to the study area and define the extent of the boundaries for this traffic impact investigation. Further discussion of the existing street system and study area is provided in Section 4.0 herein.

The general location of the project in relation to the study locations and surrounding street system is presented in Figure 1-1. The traffic analysis study area is generally comprised of those locations which have the greatest potential to experience significant traffic impacts due to the proposed project as defined by the Lead Agency. In the traffic engineering practice, the study area generally includes those intersections that are:
a. Immediately adjacent or in close proximity to the project site;
b. In the vicinity of the project site that are documented to have current or projected future adverse operational issues; and
c. In the vicinity of the project site that are forecast to experience a relatively greater percentage of project-related vehicular turning movements (e.g., at freeway ramp intersections).

The locations selected for analysis were based on the above criteria, proposed Ponte Vista at San Pedro project peak hour vehicle trip generation, the anticipated distribution of project vehicular trips and existing intersection/corridor operations.

### 2.0 PROJECT DESCRIPTION

### 2.1 Site Location

The Ponte Vista at San Pedro project is located in the San Pedro area of the City of Los Angeles, California. The proposed project also is located within the Wilmington-Harbor City Community Plan area of the City of Los Angeles. The project site is situated on the east side of Western Avenue Drive, generally between Green Hills Drive to the north and Avenida Aprenda to the south.

### 2.2 Existing Project Site

The project site currently contains 245 duplex residential units that were formerly used for United States Department of Navy housing, a 2,161 square foot community center, and a 3,454 square foot retail convenience store. All of the existing dwelling units and commercial buildings on the project site are vacant and will be demolished to accommodate the proposed project.

### 2.3 Proposed Project Description

The proposed project consists of the development of 1,135 residential dwelling units, including 392 multi-family rental units, 600 multi-family condominium units, and 143 detached residential units. The multi-family rental units are proposed on the southerly portion of the site while the multi-family condominium and detached units are proposed on the middle and northerly portions of the site. In addition to the residential units, a 2.8 acre public park is proposed on the southwestern portion of the project site. It is anticipated that the proposed project will be constructed in phases, with completion and occupancy by the year 2017. The site plan for the Ponte Vista at San Pedro project is illustrated in Figure 2-1.

Access to the project site will be provided via Western Avenue at the existing intersections with Green Hills Drive and Avenida Aprenda. Further discussion of the proposed project site access and circulation scheme is presented in Section 3.0.

### 2.4 Mary Star of the Sea High School

Mary Star of the Sea High School, which opened in September 2007, is located along Taper Avenue, immediately east of the proposed Ponte Vista at San Pedro project site. Mary Star High School was approved by the City of Los Angeles in August 2001 with the requirement that the school take its primary vehicular access from Western Avenue. Mitigation measures to mitigate the traffic impacts of the school project were identified as part of the City's approval as required by CEQA.

The following provides a brief summary of the current traffic ingress and egress patterns implemented by the Mary Star High School in compliance with its Conditional Use Permit:

- Student Drop-Off and Pick-Up. Parents and other caregivers dropping-off (morning) and picking-up (afternoon) students currently enter the Ponte Vista site via the Green Hills Drive intersection, travel through the Ponte Vista site, drop-off/pick-up their students on the High School site, and then exit the High School site via Taper Avenue.

- Student Drivers. Student drivers enter the Ponte Vista site via the Green Hills Drive intersection in the morning, travel through the Ponte Vista site, park on the High School site, and then exit the High School site via Taper Avenue in the afternoon.
- Faculty/Staff/Visitors. Faculty, staff and visitors travel to and from the High School site via Taper Avenue.

Although Mary Star High School is not a component of the Ponte Vista at San Pedro project, vehicular access to and from the Mary Star High School is planned to be maintained through the Ponte Vista site as a public benefit. The project proposes to continue accommodating vehicular access to the Mary Star of the Sea High School. As part of the Ponte Vista project, vehicular access to the Mary Star High School campus through the Ponte Vista site would be shifted from the Green Hills Drive intersection to the Avenida Aprenda intersection. Parents related to student drop-off and pick-up, as well as student drivers would access the High School (i.e., ingress only) via the Western Avenue/Avenida Aprenda intersection and continue to exit the campus via Taper Avenue.

### 3.0 SIte Access and CIRCULATION

The site access scheme for the proposed project is displayed in Figure 2-1. The project entrance improvements at the site access points and along the project's Western Avenue property frontage are illustrated in Figure 3-1. Descriptions of the existing site access and proposed project site access and circulation schemes are provided in the following subsections.

### 3.1 Existing Site Access

Vehicular access to the existing project site is presently provided via the following two intersections on Western Avenue:

- The Western Avenue/Green Hills Drive-John Montgomery Drive intersection which is traffic signal controlled and provides full vehicular access (i.e., left-turn and right-turn ingress and egress turning movements) to the project site; and
- The Western Avenue/John Montgomery Drive intersection which is currently stopcontrolled with the stop signs facing the John Montgomery Drive approach. The Western Avenue/John Montgomery Drive intersection is a three-way intersection that does not connect to the existing residential subdivision to the west of Western Avenue. This intersection also provides full left-turn and right-turn vehicular access to the project site.

It is noted that the Western Avenue/Avenida Aprenda intersection provides an easterly, fourth leg which is adjacent to the project site; however, there is currently no improved on-site roadway that connects to this intersection. The Western Avenue/Avenida Aprenda intersection is traffic signal controlled and provides full vehicular access (i.e., left-turn and right-turn ingress and egress turning movements) to the project site.

### 3.2 Proposed Project Site Access

The proposed project site access scheme is displayed in Figure 2-1. The proposed project will use the existing signalized intersections on Western Avenue adjacent to the project site for access (i.e., the Western Avenue intersections at Green Hills Drive and Avenida Aprenda). Brief descriptions of the proposed project site access points are provided in the following paragraphs.

- Western Avenue/Green Hills Drive-Northerly Project Access

Vehicle access to the project site will be provided via the existing intersection on Western Avenue opposite Green Hills Drive near the northerly border of the project site. One lane will be provided for inbound project traffic and two lanes will be provided for outbound project traffic. As noted above, this intersection is currently traffic signal controlled. It is anticipated that full vehicular access (i.e., left-turn and right-turn ingress and egress turning movements) to and from the project will continue to be provided at this intersection. As a project feature, Western Avenue will be widened along the project frontage to accommodate an additional lane on the northbound approach to the intersection to facilitate through movements and right-turn movements.

FIGURE 3-1

- Western Avenue/Avenida Aprenda-Southerly Project Access

Vehicle access to the project site will be provided via the existing intersection on Western Avenue opposite Avenida Aprenda near the southerly border of the project site. The southerly project access will also provide primary access to the public park planned as part of the project. One lane will be provided for inbound project traffic and two lanes will be provided for outbound project traffic. The existing Western Avenue/Avenida Aprenda intersection is currently traffic signal controlled, and will provide full vehicular access (i.e., left-turn and right-turn ingress and egress turning movements) to and from Western Avenue. As a project feature, Western Avenue will be widened along the project frontage to accommodate an additional lane on the northbound approach to the intersection to facilitate through movements and right-turn movements. As previously noted (refer to Subsection 2.4), vehicular access to the Mary Star High School campus through the project site via the Western Avenue intersection at Avenida Aprenda is planned as part of the proposed project as a public benefit. Parents and students will access (i.e., ingress only) the campus via the Western Avenue/Avenida Aprenda intersection and continue to exit the campus via Taper Avenue.

In addition to the improvements noted in the paragraphs above, the following improvements to Western Avenue are proposed as project features (and illustrated on Figure 3-1):

- Western Avenue along the project frontage is proposed to be dedicated and improved so as to provide a 46 -foot half-street within a 56 -foot half right-of-way. This improvement would allow for the striping of a third northbound through lane along Western Avenue adjacent to the project site.
- The existing John Montgomery Drive intersection along the east side of Western Avenue (i.e., between Green Hills Drive and Avenida Aprenda) will be closed.
- If acceptable to Caltrans, LADOT and Metro, bus pull-out lanes would be provided along the east side of Western Avenue north of Avenida Aprenda and north of Green Hills Drive. In the area of the bus pull-out lanes, the dedication and improvement would be increased as needed (e.g., a 58 -foot half-street on a 68 -foot half right-of-way).
- The raised median on Western Avenue adjacent to the project site will be modified as needed to extend the length of left-turn pockets for southbound traffic turning left into the project site at Green Hills Drive and at Avenida Aprenda. Also, the existing left-turn pocket at the John Montgomery Drive intersection will be closed.
- If approved by Caltrans, LADOT and the City of Rancho Palos Verdes, left-turn traffic signal phasing would be provided for Western Avenue traffic (northbound and southbound directions) at the Green Hills Drive and Avenida Aprenda intersections.

### 3.3 Other Project Site Access Options Considered but Not Evaluated

In conjunction with the formal scoping process of the Draft Environmental Impact Report to be prepared for the Ponte Vista at San Pedro project, several comments were received regarding potential vehicular access options for the project. These comments are discussed below with an explanation as to why these options are not feasible, and thus they do not warrant further analysis in this traffic study.

- Vehicular Access Directly to Gaffey Street. Several comments suggested that the project should provide direct vehicular access to Gaffey Street, located approximately one-half mile east of the project site. However, most (or all) of this connector roadway would be required to be constructed on land that is owned by the U.S. Navy. The Navy site is currently used for the storage of jet fuel in underground tanks. In prior communications, the Navy has stated that its property is not available for purchase. Further, public access (by Ponte Vista or other traffic), whether by easement or other means, through the jet fuel storage site cannot be accommodated or permitted. Therefore, this site access option does not warrant further consideration within this traffic study.
- Vehicular Access to Taper Avenue. Several comments suggested that the project-related traffic should have access to Taper Avenue to the east of the site. However, this would require project-related traffic to travel onto property owned by Mary Star of the Sea High School. Further, this would result in project-related traffic driving directly through the middle of the High School campus, causing adverse safety impacts to students, faculty/staff, and others related to the High School. Beyond the High School, the section of Taper Avenue southerly to Westmont Drive is located within a residential community, and thus, would experience increases in traffic that would likely cause adverse impacts in the existing neighborhood if this option was implemented. Therefore, this site access option does not warrant further consideration within this traffic study. It is noted, however, that the vehicular access scenario via Taper Avenue through the Mary Star High School site is potentially feasible in terms of accommodating vehicular access during emergencies (i.e., permitting emergency vehicles to enter the Ponte Vista site and residents to exit in the event the Western Avenue access points become unusable).

### 4.0 Existing Street System

### 4.1 Regional Highway System

Regional access to the project site is provided by the Interstate 110 (Harbor) Freeway, Interstate 405 (San Diego) Freeway, State Route 213 (Western Avenue), State Route 107 (Hawthorne Boulevard), and State Route 1 (Pacific Coast Highway), as shown in Figure 1-1. Brief descriptions of the regional access roadways are provided in the following paragraph.

I-110 (Harbor) Freeway is a major north-south oriented freeway connecting Pasadena to the north with the San Pedro area to the south. In the project vicinity, four mainline travel lanes are provided in each direction on I-110. Northbound and southbound ramps are provided on I-110 Freeway at Pacific Coast Highway and Anaheim Street in the project vicinity, which are located approximately three miles northeast of the project and two miles east of the project site, respectively.

I-405 (San Diego) Freeway is a major north-south freeway that provides five mainline travel lanes in each direction in the project vicinity. Northbound and southbound ramps are provided on I-405 Freeway at Vermont Avenue, Normandie Avenue, Western Avenue, Crenshaw Boulevard, and Hawthorne Boulevard in the project vicinity.

SR-213 (Western Avenue) is a major north-south roadway that provides two mainline travel lanes in each direction in the project vicinity.

SR-107 (Hawthorne Boulevard) is a major north-south roadway that provides three mainline travel lanes in each direction in the project vicinity.

SR-1 (Pacific Coast Highway) is a major north-south roadway that provides two to three mainline travel lanes in each direction in the project vicinity.

### 4.2 Local Street System

Immediate access to the project site is via Western Avenue. The list of 56 study intersections selected in consultation with LADOT staff for analysis of potential impacts related to the proposed project is presented in Table 4-1 (jurisdiction of each intersection is noted in parenthesis for informational purposes). The study intersections selected for analysis in the traffic study also are noted in Figure 1-1. Of the 56 existing study intersections, 51 intersections are presently controlled by traffic signals and remaining 5 intersections are unsignalized. The existing lane configurations at the 56 existing study intersections are displayed in Figure 4-1.

### 4.3 Roadway Descriptions

A review of the important roadways in the project site vicinity and study area is summarized in Table 4-2. As indicated in Table 4-2, the important roadways within the project study area were reviewed on a segment basis in terms of the number of lanes provided, parking restrictions, posted speed limits, etc. Additionally, the roadway classifications as designated by the appropriate jurisdiction are noted on a segment basis in Table 4-2.

Table 4-1
LIST OF STUDY INTERSECTIONS

| Map No. | Location | Traffic <br> Control | Jurisdiction(s) |

### 4.4 Existing Public Bus Transit Service

Public bus transit service in the project study area is currently provided by the Los Angeles County Metropolitan Transportation Authority (Metro) and LADOT. A summary of the existing transit routes, including the transit route, destinations and peak hour headways on roadways within the project study area is presented in Table 4-3. The existing public transit routes in the proposed project site vicinity are illustrated in Figure 4-2.

Table 4-3
EXISTING TRANSIT ROUTES

| ROUTE | DESTINATIONS | ROADWAY NEAR SITE | $\begin{array}{\|c\|} \hline \text { NO. OF BUSES } \\ \text { DURING PEAK PERIOD } \\ \hline \end{array}$ |  |  |

### 5.0 Traffic Counts

Existing manual counts of vehicular turning movements were conducted in September and October 2010 at each of the 56 existing study intersections during the weekday morning (AM) and afternoon (PM) commuter periods to determine the peak hour traffic volumes. The traffic counts were conducted during weekdays when local schools were in session. The manual counts were conducted by several traffic count subconsultants (i.e., Accutek Traffic Data, City Traffic Counters, and The Traffic Solution) at the study intersections from 7:00 to 10:00 AM to determine the AM peak commuter hour, and from 3:00 to 6:00 PM to determine the PM peak commuter hour. Traffic volumes at the study intersections show the typical peak periods between 7:00 to 10:00 AM and 3:00 to 6:00 PM generally associated with peak commuter hours in the metropolitan Los Angeles area. In addition, Saturday mid-day peak period traffic counts were conducted at 17 study intersections along Western Avenue from 11:00 AM to 2:00 PM to determine weekend mid-day peak hour conditions, primarily associated with Saturday shopping traffic in the commercial sections of Western Avenue near the project site.

In addition to the manual intersection traffic counts conducted during the AM and PM commuter periods, supplemental spot counts were conducted at key intersections situated within close proximity to schools based on comments received during community outreach meetings. The comments received from community members indicated that traffic near schools during the school afternoon peak hour (i.e., approximately 2:00 to 3:00 PM) can be higher than during the typical PM peak commuter period (i.e., 3:00 to 6:00 PM). Accordingly, manual intersection traffic counts were conducted at 12 key intersections located near area schools for the 2:00 to 3:00 PM to supplement the 3:00 to 6:00 PM counts for purposes of determining the highest one hour period of traffic during the overall four hour count period.

### 5.1 Weekday and Saturday Peak Period Traffic Counts

The weekday AM and PM peak period manual counts of vehicle movements at the 56 existing study intersections are summarized in Table 5-1. The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are shown in Figures 5-1 and 5-2, respectively. Summary data worksheets of the weekday manual traffic counts at the study intersections are contained in Appendix A.

The Saturday mid-day peak period manual counts of vehicle movements at the 17 study intersections included in the weekend analysis are summarized in Table 5-2. The existing traffic volumes at these study intersections during the Saturday mid-day peak hour are shown in Figure 5-3. Summary data worksheets of the Saturday manual traffic counts at the study intersections also are contained in Appendix A.

### 5.2 Funeral Processions

In conjunction with the formal scoping process of the Draft Environmental Impact Report to be prepared for the Ponte Vista at San Pedro project, several comments noted that funeral processions associated with the Green Hills Memorial Park located on the west side of Western Avenue across from the Ponte Vista site caused significant traffic congestion that should be considered in the traffic study. It is noted that these processions (generally related to a service that occurs off-site) can cause momentary disruptions of traffic on Western Avenue. However, it has been observed that these processions are generally scheduled on weekdays during mid-day periods (i.e., after the morning commuter peak period and before the afternoon commuter peak period) and occur infrequently. Further, the disruption of traffic occurs momentarily (a matter of minutes) with regular traffic patterns recovering shortly thereafter. While it is recognized that the funeral processions have been a long fixture in the community, it does not appear that the Ponte Vista project would significantly contribute to the worsening of traffic conditions during these events. Instead, it is appropriate to analyze the traffic effects of the Ponte Vista project during the recurring peak commuter hours, which happen on a regular basis and are substantially longer in duration as compared to a funeral procession. Therefore, no additional or unique traffic analysis is required associated with the Green Hills funeral processions.

### 6.0 Cumulative Development Projects

A forecast of on-street traffic conditions prior to occupancy of the project was prepared by incorporating the potential trips associated with other known development projects (related projects) in the area. With this information, the potential impact of the proposed project can be evaluated within the context of the cumulative impact of all ongoing development. The related projects research was based on information on file at the City of Los Angeles Departments of Planning and Transportation, City Rancho Palos Verdes, City of Rolling Hills Estates, City of Carson, City of Long Beach, City of Torrance, City of Lomita, and the County of Los Angeles. The list of related projects in the project study area is presented in Table 6-1. The location of the related projects is shown in Figure 6-1. The list was compiled and then re-verified in October 2010, coinciding with the issuance of the Notice of Preparation for the Draft Environmental Impact Report to be prepared for the project. Many related projects have proposed or approved mitigation measures. However, consistent with LADOT policy, the beneficial effects of such measures were not assumed in this traffic analysis, except as noted herein.

Traffic volumes expected to be generated by the related projects were calculated using rates provided in the Institute of Transportation Engineers' (ITE) Trip Generation manual ${ }^{4}$. The related projects' respective weekday traffic generation for the AM and PM peak hours, as well as on a daily basis for a typical weekday, also is summarized in Table 6-1. The anticipated distribution of the related projects traffic volumes to the study intersections during the weekday AM and PM peak hours is displayed in Figures 6-2 and 6-3, respectively. The related projects' respective Saturday traffic generation for the mid-day peak hour, as well as on a daily basis, is summarized in Table 6-1. The forecast assignment of the related projects traffic volumes to the study intersections during the Saturday mid-day peak hour is displayed in Figure 6-4.

### 6.1 San Pedro Waterfront Project

The Port of Los Angeles previously announced the project referred to as the proposed San Pedro Waterfront Project (or the "Bridge to Breakwater" project). This project is a master plan for port facilities and improvements (e.g. port and public recreational improvements), as well as private uses (e.g. retail, office, commercial, warehouse) that would be developed on approximately 400 acres from the Vincent Thomas Bridge to the federal breakwater within the property of the City of Los Angeles Harbor Department, including replacing uses that are currently located there. The public facilities would be implemented by the Port of Los Angeles. The private facilities envisioned by the master plan would be developed by private developers. An EIR has been prepared to evaluate the potential environmental effects of this master plan with the project build-out at 2015. The related projects analysis incorporates the project build-out of the San Pedro Waterfront Project in the traffic analysis as a related project. A traffic study has been prepared for the San Pedro Waterfront project. Accordingly, this traffic study includes the project trips documented in the San Pedro Waterfront traffic study. It should be noted that San Pedro Waterfront Project is the single largest trip generator of related projects in the San Pedro area identified in this traffic study.

[NT] Near-Term Related Project; i.e. development that is under construction and/or expected to be completed in the year 2012.

### 6.2 Ambient Traffic Growth Factor

The existing traffic volumes were increased at an annual rate of one percent (1.0\%) per year both to the near-term year 2012 (i.e., the expected year of project approval) and to the future year 2017 (i.e., the anticipated year of project build-out). The ambient growth factor was based on general traffic growth factors provided in the 2010 Congestion Management Program for Los Angeles County (the "CMP manual") and determined in consultation with LADOT staff. The traffic growth rate is intended to anticipate future traffic generated by development projects in the project vicinity. It is also noted that based on review of empirical data and the general traffic growth factors provided in the CMP manual for the Palos Verdes area, it is anticipated that the existing traffic volumes are actually expected to increase at an annual rate of less than $1.0 \%$ per year between the years 2010 and 2020. Thus, the inclusion in this traffic analysis of both a forecast of traffic generated by known related projects plus the use of an ambient growth traffic factor based on CMP traffic model data likely overstates future pre-project conditions and future traffic volumes at the study intersections.

### 6.3 ATSACIATCS Traffic Signal Synchronization

Based on information provided by LADOT in February 2012, ATSAC (Automated Traffic Surveillance and Control) with ATCS (Adaptive Traffic Control System) capability has been constructed in its San Pedro system of signalized intersections and was functional as of the first quarter of 2011. As the proposed project's NOP occurred in October 2010 and project approval is expected in year 2012, the traffic benefits of the synchronized ATSAC/ATCS traffic signal system in San Pedro have been assumed in the year 2012 near-term condition of the traffic study. Design of ATSAC/ATCS for signalized intersections in Wilmington has been completed, and funding has been received by LADOT to begin construction. LADOT currently estimates that construction of the Wilmington ATSAC/ATCS system will be completed in July 2012. To provide a conservative analysis, the traffic benefits of the Wilmington ATSAC/ATCS have not been assumed in the 2012 near-term traffic analysis. Thus, the traffic benefits of the synchronized ATSAC/ATCS traffic signal system in Wilmington will be assumed in the year 2017 future condition (i.e., the anticipated year of project build-out) of the traffic study. Further, ATSAC/ATCS has not been assumed for potential traffic mitigation for the Ponte Vista project. Caltrans previously implemented a synchronization system similar to ATSAC for signalized intersections along Western Avenue (as well as on other nearby State highways such as State Route 1) not operated by LADOT, and thus, the traffic benefits have accordingly been assumed within the traffic analysis as part of existing conditions at these intersections.

### 6.4 Western Avenue Task Force

The Western Avenue Task Force is a working group overseen by Caltrans and consists of residents and technical staff from the City of Los Angeles and the City of Rancho Palos Verdes. The group was formed to serve as a forum for communication between public agencies and community representatives. The group has met to discuss transportation issues related to Western Avenue.

In the summer of 2005, Caltrans issued a report, Western Corridor Improvement Project ${ }^{5}$, which outlines recommended immediate, short-term, and long-term transportation improvements. The focus of the Caltrans report was the segment of Western Avenue between $25^{\text {th }}$ Street and Palos Verdes Drive North (identified as Segment 1 in the document). The key recommendations from the Caltrans report are as follows:

- Immediate Improvements: Coordinate traffic signals along Western Avenue by providing a consistent 90 -second cycle length currently used by LADOT. The signal coordination project has been completed.
- Short-Term Improvements: Synchronize the operation of traffic signals along Western Avenue through the installation of traffic signal interconnect and computer equipment. The report estimates that the synchronization of traffic signals will improve the calculated Levels of Service at intersections in the corridor by an average of 12 percent. Also, where feasible, the striping on Western Avenue at intersection approaches will be modified to provide a separate right-turn lane (e.g., a lane configuration of one left-turn lane, two through lanes, and one right-turn lane). The synchronization of the traffic signals has been partially completed.
- Long-Term Improvements: The report recommends that Western Avenue be widened through the corridor to provide a third through travel lane in each direction.

The Caltrans report provides target dates for implementation of the improvements of which some improvements have been implemented. For example, as noted above, Caltrans implemented a traffic signal synchronization system for intersections on Western Avenue it maintains by agreement with the cities of Rancho Palos Verdes and Lomita for the segment between Palos Verdes Drive North and Summerland Avenue. Further, as discussed above, LADOT is completing construction of the San Pedro ATSAC system, which includes Western Avenue intersections between $1^{\text {st }}$ Street and $25^{\text {th }}$ Street. Western Avenue intersections within the LADOT Wilmington ATSAC system are located between Lomita Boulevard and Anaheim Street, which will be constructed at such time LADOT receives funding from the State as noted above.

For the remaining Short-Term measures identified in the Western Avenue Task Force report (specifically, the separate right-turn lanes at intersections), as well as the Long-Term measures (i.e., a third through travel lane on Western in each direction), the report identifies no funding sources for their design and construction. Because there is no reasonable certainty regarding the schedule for the implementation of the remaining Short-Term improvements and the Long-Term measures, these capacity enhancements have not been assumed herein as part of the year 2017 future conditions (pre-project).

[^9]
### 7.0 Traffic Forecasting Methodology

In order to estimate the traffic impact characteristics of the Ponte Vista at San Pedro project, a multi-step process has been utilized. The first step is trip generation, which estimates the total arriving and departing traffic volumes on a peak hour and daily basis. The traffic generation potential is forecast by applying the appropriate vehicle trip generation equations or rates to the project development tabulation.

The second step of the forecasting process is trip distribution, which identifies the origins and destinations of inbound and outbound project traffic volumes. These origins and destinations are typically based on demographics and existing/anticipated travel patterns in the study area.

The third step is traffic assignment, which involves the allocation of project traffic to study area streets and intersections. Traffic assignment is typically based on minimization of travel time, which may or may not involve the shortest route, depending on prevailing operating conditions and travel speeds. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersection turning movements throughout the study area.

With the forecasting process complete and project traffic assignments developed, the impact of the proposed project is isolated by comparing operational (i.e., Levels of Service) conditions at the selected key intersections using existing and expected future traffic volumes without and with forecast project traffic. The need for site-specific and/or cumulative local area traffic improvements can then be evaluated and the significance of the project's impacts identified.

### 7.1 Project Trip Generation

Traffic volumes expected to be generated by the proposed project during the weekday AM and PM peak hours and Saturday mid-day peak hour, as well as on a daily basis for a weekday and a Saturday, were estimated using rates published in the ITE Trip Generation manual. Traffic volumes expected to be generated by the residential land use components were based upon rates per number of dwelling units. ITE Land Use Code 210 (Single-Family Detached Housing) trip generation average rates were used to forecast the traffic volumes expected to be generated by the detached residential land use. ITE Land Use Code 230 (Residential Condominium/Townhouse) trip generation average rates were used to forecast the traffic volumes expected to be generated by the multi-family condominium land use. ITE Land Use Code 220 (Apartment) trip generation average rates were used to forecast the traffic volumes expected to be generated by the apartment land use. Traffic volumes expected to be generated by the park land use component were based upon rates per acre. ITE Land Use Code 412 (County Park) trip generation average rates were used to forecast the traffic volumes expected to be generated by the park land use. The ITE project trip generation forecast was reviewed and approved by LADOT staff for use in the traffic analysis.

The ITE manual contains trip rates for a variety of land uses (including office buildings, shopping centers, condominiums, etc.), which have been derived based on traffic counts conducted at existing sites. The traffic count data submitted to ITE is for free-standing sites generally located in suburban locations. As stated on page 1 of the ITE Trip Generation, $8^{\text {th }}$ Edition, User's Guide:
"Data were primarily collected at suburban locations having little or no transit service, nearby pedestrian amenities, or travel demand management (TDM) programs."

For most of the land uses evaluated in the ITE manual, the trip generation data is summarized statistically in both weighted average and regression curve format. While the weighted average is simply a "straight line" through the trip generation data, the regression analysis provides a "best fit" line (typically nonlinear) of the data. As stated on page 17 of the ITE User's Guide:
"Regression analysis provides a tool for developing an equation that defines the line that "fits best" through the data points."

In certain circumstances, ITE recommends use of the regression equation as compared to the weighted average for purposes of forecasting trips associated with a land use. It is stated on page 9 of the ITE publication Trip Generation Handbook, $2^{\text {nd }}$ Edition:
"When the Trip Generation data plot contains more than 20 data points and a regression curve and equation are provided, use of the regression equation is recommended."

Also noted on page 9:
"A regression equation with an $R^{2}$ of at least 0.75 is preferred because it indicates the desired level of correlation between the trips generated by a site and the value measure for an independent variable."

With respect to the ITE Land Use Code 210 (Single-Family Detached Housing), ITE Land Use Code 220 (Apartment) and Land Use Code 230 (Residential Condominium/Townhouse), the trip generation data is such that use of the regression equation for forecasting purposes would be supported. However, to provide a conservative, worst case forecast, the weighted average trip rates provided by ITE for Land Use Codes 210, 220 and 230 have been used for purposes of estimating trip generation associated with the Ponte Vista project.

### 7.1.1 Weekday Project Trip Generation Summary

The weekday trip generation forecast for the proposed project is summarized in Table 7-1. As summarized in Table 7-1, the proposed project is expected to generate 112 inbound trips and 459 outbound trips during the weekday AM peak hour. During the PM peak hour, the proposed project is expected to generate 458 inbound trips and 241 outbound trips. Over a 24 -hour period, the proposed project is forecast to generate 3,734 inbound trips and 3,734 outbound trips.
Table 7-1
PROJECT TRIP GENERATION [1]

| LAND USE | SIZE | WEEKDAY |  |  |  |  |  |  | SATURDAY |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | DAILY <br> TRIP ENDS [2] <br> VOLUMES | AM PEAK HOUR VOLUMES [2] |  |  | PM PEAK HOUR VOLUMES [2] |  |  | DAILY <br> TRIP ENDS [2] <br> VOLUMES | MID-DAY PEAK HOURVOLUMES [2] |  |  |
|  |  |  | IN | OUT | TOTAL | IN | OUT | TOTAL |  | IN | OUT | TOTAL |
| Single-Family [3] | 143 DU | 1,369 | 27 | 80 | 107 | 91 | 53 | 144 | 1,441 | 70 | 63 | 133 |
| Condominium [4] | 600 DU | 3,486 | 45 | 219 | 264 | 209 | 103 | 312 | 3,402 | 152 | 130 | 282 |
| Apartment [5] | 392 DU | 2,607 | 40 | 160 | 200 | 158 | 85 | 243 | 2,505 | 110 | 94 | 204 |
| Park [6] | 2.8 AC | 6 | Nom. | Nom. | Nom. | Nom. | Nom. | Nom. | 34 | 4 | 2 | 6 |
| TOTAL |  | 7,468 | 112 | 459 | 571 | 458 | 241 | 699 | 7,382 | 336 | 289 | 625 |

[^10]
### 7.1.2 Saturday Project Trip Generation Summary

The Saturday trip generation forecast for the proposed project also is summarized in Table 7-1. As also summarized in Table 7-1, the proposed project is expected to generate 336 inbound trips and 289 outbound trips during the Saturday mid-day peak hour. Over a 24 -hour period, the proposed project is forecast to generate 3,691 inbound trips and 3,691 outbound trips.

### 7.2 Project Trip Distribution

Project generated traffic was assigned to the local roadway system based on a trip distribution pattern developed in consultation with LADOT staff. The traffic distribution pattern was based on the proposed project land uses, the existing and planned project site access schemes, existing traffic patterns, characteristics of the surrounding roadway system, and nearby population and employment centers. In addition, the trip distribution patterns developed from regional traffic models and documented in the Metropolitan Transportation Authority, 2010 Congestion Management Program for Los Angeles County, October 2010, were also considered. The trip distribution pattern developed for the proposed project was reviewed and approved by LADOT.

In addition to the distribution and assignment of trips expected to be generated by the proposed project, the existing traffic volumes associated with Mary Star High School were redistributed to account for the planned access scheme. As previously discussed (refer to Subsection 2.4), parents and students presently access (i.e., ingress only) the Mary Star High School campus through the project site via the existing traffic signal controlled Western Avenue intersection at Green Hills Drive. Vehicular access to the Mary Star High School campus through the project site via the Western Avenue intersection at Avenida Aprenda is planned as part of the proposed project as a public benefit. Parents and students will access (i.e., ingress only) the campus via the Western Avenue/Avenida Aprenda intersection and continue to exit the campus via Taper Avenue. Accordingly, the localized inbound trips associated with Mary Star High School were redistributed to the Avenida Aprenda intersection and are included in project traffic volumes.

The project traffic volume distribution percentages at the 56 study intersections are illustrated in Figure 7-1. The forecast project traffic volumes at the study intersections for the AM and PM peak hours are displayed in Figures 7-2 and 7-3, respectively. The forecast project traffic volumes at the study intersections for the Saturday mid-day peak hour are displayed in Figure 74. The redistributed trips associated with Mary Star High School at the study intersections along Western Avenue for the weekday AM and PM peak hours also are displayed in Figures 7-2 and 7-3, respectively.

### 8.0 TRAFFIC IMPACT ANALYSIS METHODOLOGY

The 56 study intersections were evaluated using the Critical Movement Analysis (CMA) method of analysis that determines Volume-to-Capacity ( $\mathrm{v} / \mathrm{c}$ ) ratios on a critical lane basis. The CMA method is required for use by LADOT in the City of Los Angeles traffic study guidelines. Twenty-eight (28) of the 56 study intersections either have shared jurisdiction between the City of Los Angeles and other neighboring jurisdictions, or are located in city or unincorporated county boundaries adjacent to the City of Los Angeles.

In addition to the traffic analysis using LADOT CMA methodology, further traffic analyses were prepared using the Intersection Capacity Utilization (ICU) method for those study intersections located in jurisdictions other than the City of Los Angeles. Specifically, the ICU method was used to determine Volume-to-Capacity ratios and corresponding Levels of Service at the 28 study intersections located outside of the City of Los Angeles as the ICU method is used to for traffic analysis purposes in these neighboring jurisdictions. The ICU calculations use a lane capacity of 1,600 vehicles per hour (vph) for left-turn, through, and right-turn lanes, and dual left-turn capacity of $2,880 \mathrm{vph}$. A clearance adjustment factor of 0.10 was added to each Level of Service calculation. For both the CMA and ICU methodologies, the overall intersection v/c ratio is subsequently assigned a Level of Service (LOS) value to describe intersection operations. The six qualitative categories of Level of Service have been defined along with the corresponding CMA or ICU value range and are shown in Table 8-1. A description of the CMA method and corresponding Level of Service is provided in Appendices B and $\boldsymbol{C}$.

Table 8-1
Level of Service Criteria For Signalized Intersections

| Level of Service (LOS) | Intersection Capacity Utilization Value (V/C) | Level of Service Description |
| :---: | :---: | :---: |
| A | $\leq 0.600$ | EXCELLENT. No vehicle waits longer than one red light, and no approach phase is fully used. |
| B | $0.601-0.700$ | VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles. |
| C | $0.701-0.800$ | GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles. |
| D | $0.801-0.900$ | FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups. |
| E | 0.901-1.000 | POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles. |
| F | > 1.000 | FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Potentially very long delays with continuously increasing queue lengths. |

For unsignalized study intersections located in the City of Rancho Palos Verdes, the Highway Capacity Manual $2000^{6}$ (HCM2000) unsignalized methodology for stop-controlled intersections was utilized. This methodology estimates the average control delay for each of the subject movements and determines the level of service for each constrained movement. Average control delay for any particular movement is a function of the capacity of the approach and the degree of saturation. The overall average control delay is measured in seconds per vehicle, and the level of service is then calculated for the entire intersection for a four-way stop controlled intersection. For a two-way stop controlled intersection, it should be noted that although the HCM2000 provides a procedure to calculate a value to reflect the intersection average control delay, it does not define a level of service for the intersection as a whole. Rather, the control delay and level of service for the most constrained approach are calculated and are reported for the two-way stop controlled intersections. The six qualitative categories of Level of Service have been defined along with the corresponding HCM control delay value range, as shown in Table 8-2.

Table 8-2
Level of Service Criteria For Unsignalized Intersections ${ }^{7}$

| Level of Service <br> (LOS) | Highway Capacity Manual <br> Delay Value (sec/veh) | Level of Service Description |
| :---: | :---: | :---: |
| A | $\leq 10.0$ | Little or no delay |
| B | $>10.0$ and $\leq 15.0$ | Short traffic delays |
| C | $>15.0$ and $\leq 25.0$ | Average traffic delays |
| D | $>25.0$ and $\leq 35.0$ | Long traffic delays |
| E | $>35.0$ and $\leq 50.0$ | Very long traffic delays |
| F | $>50.0$ | Severe congestion |

### 8.1 ATSAC/ATCS

The City of Los Angeles Automated Traffic Surveillance and Control (ATSAC) and Adaptive Traffic Control System (ATCS) provides computer control of traffic signals allowing automatic adjustment of signal timing plans to reflect changing traffic conditions, identification of unusual traffic conditions caused by accidents, the ability to centrally implement special purpose short term traffic timing changes in response to incidents, and the ability to quickly identify signal equipment malfunctions. ATCS provides real time control of traffic signals and includes additional loop detectors, closed-circuit television, an upgrade in the communications links and a new generation of traffic control software. LADOT estimates that the ATSAC system reduces the critical $v / c$ ratios by seven percent ( 0.07 ). The ATCS system upgrade further reduces the critical $v / c$ ratios by three percent $(0.03)$ for a total of 10 percent $(0.10)$. Caltrans estimates that a traffic signal synchronization system reduces the critical $v / c$ ratios by 12 percent, as stated in their report to the Western Avenue Task Force.

[^11]Per LADOT ${ }^{8}$ the San Pedro ATSAC/ATCS system became operational in the first quarter of 2011. Accordingly, ATSAC/ATCS in the San Pedro area has been assumed in the year 2012 near-terms condition of the traffic study. Funding for the Wilmington ATSAC/ATCS system has been secured from the State of California, with construction commencing in year 2011. Thus, the Wilmington ATSAC/ATCS system is expected to be fully operational in July 2012. ATSAC/ATCS in both the San Pedro and Wilmington areas is included in the year 2017 preproject future conditions. In addition, the traffic flow benefits of traffic signal synchronization for intersections on State Highways maintained by Caltrans (e.g., segments of Western Avenue and Pacific Coast Highway) are also included in the existing conditions based on recent implementation of traffic signal synchronization on these roadways.

### 8.2 Summary of Sunnyvale Court Decision

Traffic impact analysis of the proposed project has been prepared to evaluate additional scenarios (i.e., Existing With Project Conditions and Near-Term With Project Conditions) based on a recent California Court of Appeal decision. ${ }^{9}$ These analysis scenarios currently are not included in the City of Los Angeles traffic study guidelines. However, LADOT staff has indicated that the City's guidelines will be amended to address the Sunnyvale West Neighborhood Assn. decision (the "Sunnyvale decision"), and has provided interim guidance directing that traffic studies comply with the Sunnyvale decision.

LADOT traffic study methodology (which is the methodology used by most jurisdictions in Southern California) requires that a development project's potential traffic impacts be measured in a future baseline generally corresponding to the year of build-out for the proposed project. The future pre-project baseline would usually be derived through an additive calculation of: 1) existing traffic volumes; 2) additional traffic due to ambient traffic (usually calculated based on an annual percentage growth of the existing traffic extending to the year of project build-out); and 3) the forecast traffic due to known related development projects in the area that could contribute future traffic to the analyzed study intersections.

The Sunnyvale decision, however, requires that traffic impacts due to a development project be measured based on existing conditions. For example, in the Sunnyvale decision, a section from the CEQA Guidelines is reiterated:
"In assessing the impact of a proposed project on the environment, the lead agency should normally limit its examination to changes in the existing physical conditions in the affected area as they exist at the time the notice of preparation is published, or where no notice of preparation is published, at the time environmental analysis is commenced."

Also, the Sunnyvale decision provides some consideration for the assessment of project impacts at the date of expected project approval:

[^12]"Where environmental conditions are expected to change quickly during the period of environmental review for reasons other than the proposed project, project effects might reasonably be compared to predicted conditions at the expected date of approval, rather than to conditions at the time analysis is begun."

To comply with the Sunnyvale decision, this traffic analysis has been prepared to provide the following additional scenarios to evaluate potential project-related traffic impacts:

- An Existing + Project analysis scenario whereby "Existing" is defined by the traffic counts taken at the study intersections in September and October 2010, which correlates to the Notice of Preparation issued for the project in October 2010. The Existing preproject condition comprises only the existing traffic counts (i.e., no assumed background growth), as well as the travel lane and traffic signal operations as they existed at the study intersections when the traffic counts were conducted. Also, as previously noted, the traffic benefits of the synchronized ATSAC/ATCS traffic signal system in San Pedro and Wilmington have not been included in the existing condition of the traffic study.
- A Near-Term + Project analysis scenario to the year 2012, which is the expected year of project approval. As previously stated, the Sunnyvale decision does allow for assessment of project impacts at the expected date of project approval based on expected changes in the environment. For this analysis, such changes include additional traffic growth due to related projects currently under construction, as well as traffic improvements that will be completed prior to project approval (i.e., the San Pedro ATSAC/ATCS system which became operational in year 2011). The Near-Term pre-project condition analysis includes the existing traffic counts, ambient growth traffic to the year 2012, traffic from related projects currently under construction that could reasonably contribute traffic to the study intersections, as well as area traffic improvements, such as ATSAC/ATCS, which are expected to be implemented by 2012. As previously noted, the traffic benefits of the synchronized ATSAC/ATCS traffic signal system in San Pedro have been be assumed in the year 2012 Near-Term condition of the traffic study. In addition, the traffic benefits of the synchronized ATSAC/ATCS traffic signal system in Wilmington have not been included in the year 2012 Near-Term condition of the traffic study.

The traffic analysis evaluates the potential traffic impacts of the project in both the Existing + Project and Near-Term + Project conditions. This evaluation has been conducted to confirm that the recommended mitigation measures herein would be sufficient in terms of alleviating the traffic impacts identified in conjunction with the traffic analysis of the Existing + Project and Near-Term + Project conditions.

### 8.3 Impact Criteria and Thresholds

The relative impact of the added project traffic volumes to be generated by the proposed project was evaluated based on analysis of future operating conditions at the study intersections without and with the proposed project. The previously discussed capacity analysis procedures were
utilized to evaluate the future $v / C$ relationships and service level characteristics at each study intersection.

Each study intersection was evaluated for potential traffic impacts using the LADOT significant traffic impact thresholds. Additionally, each intersection outside the City of Los Angeles was evaluated on a supplementary basis using the significant traffic impact criteria utilized in the jurisdiction of the intersection (e.g., intersections in Rancho Palos Verdes were evaluated for potential traffic impacts using the criteria of the Lead Agency, the City of Los Angeles, as well as the City of Rancho Palos Verdes).

### 8.3.1 City of Los Angeles Impact Criteria

The significance of the potential impacts of project generated traffic at the 56 existing study intersections was identified using criteria set forth in the LADOT's Traffic Study Policies and Procedures, March, $2002{ }^{10}$. According to the City's Sliding Scale Method for calculating the level of impact due to traffic generated by the proposed project, a significant transportation impact is determined based on the sliding scale criteria presented in Table 8-3.

| Table 8-3 |  |  |
| :---: | :---: | :---: |
| CITY OF LOS ANGELES |  |  |
| INTERSECTION IMPACT THRESHOLD CRITERIA |  |  |
| Final $\mathbf{v / c}$ | Level of Service | Project Related Increase in $\mathbf{v / c}$ |
| $>0.700-0.800$ | C | equal to or greater than 0.040 |
| $>0.800-0.900$ | D | equal to or greater than 0.020 |
| $>0.900$ | E or F | equal to or greater than 0.010 |

The City's Sliding Scale Method requires mitigation of project traffic impacts whenever traffic generated by the proposed development causes an increase of the analyzed intersection $v / c$ ratio by an amount equal to or greater than the values shown above.

### 8.3.2 City of Torrance Impact Criteria

The relative impact of the added project traffic volumes generated by the proposed project during the AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at the six study intersections in the City of Torrance, without and with the proposed project. The previously discussed ICU capacity analysis procedures were utilized to investigate the future volume-to-capacity relationships and service level characteristics at each study intersection. The significance of the potential impacts of the project at each key intersection was then evaluated using the City of Torrance LOS standards and traffic impact criteria.

[^13]Impacts to local and regional transportation systems are considered significant if:

- An undesirable peak hour Level of Service (LOS) (i.e. LOS E or F) at any of the key intersections is projected. The City of Torrance considers LOS D (ICU $=0.801-0.900$ ) to be the minimum desirable LOS for all intersections. For the City of Torrance, the current LOS, if worse than LOS D (i.e. LOS E or F), should also be maintained; and
- The project increases traffic demand at the key signalized study intersection by $2 \%$ of capacity (ICU increase $\geq 0.020$ ), causing or worsening LOS E or F (ICU $>0.901$ ).

### 8.3.3 Cities of Lomita and Carson Impact Criteria

The relative impact of the added project traffic volumes generated by the proposed project during the AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at three study intersections in the City of Lomita and one intersection in the City of Carson, without and with the proposed project. The previously discussed ICU capacity analysis procedures were utilized to investigate the future volume-to-capacity relationships and service level characteristics at each study intersection. The significance of the potential impacts of the project at each key intersection was then evaluated using the Los Angeles County Congestion Management Program (CMP) traffic impact assessment (TIA) criteria.

The CMP TIA criteria indicates that a significant impact occurs when the proposed project's traffic increases demand by two percent of capacity (i.e., $v / c$ increase $>$ or equal to 0.02 ), causing the location to operate at LOS F ( $v / c>1.000$ ). Under CMP TIA criteria, a project would not have a significant impact if the analyzed location is operating at LOS E or better after the addition of project traffic.

### 8.3.4 City of Rancho Palos Verdes Impact Criteria

The relative impact of the added project traffic volumes generated by the proposed project during the AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at the 10 study intersections in the City of Rancho Palos Verdes, without and with the proposed project. The previously discussed ICU capacity analysis procedures were utilized to investigate the future volume-to-capacity relationships and service level characteristics at each study intersection.

The City of Rancho Palos Verdes utilizes the County of Los Angeles traffic thresholds of significance for signalized intersections. The significance of the potential project generated traffic impacts at the signalized intersections was identified using criteria set forth in the Los Angeles County Department of Public Works' Traffic Impact Analysis Report Guidelines ${ }^{11}$. According to the County's published guidelines, the impact is considered significant if the project-related increase in the $v / c$ ratio equals or exceeds the thresholds presented in Table 8-4. The City of Rancho Palos Verdes considers LOS D (ICU $=0.801-0.900$ ) to be the minimum acceptable LOS for all intersections.

[^14]| Table 8-4 |  |  |
| :---: | :---: | :---: |
| CITY OF RANCHO PALOS VERDES |  |  |
| SIGNALIZED INTERSECTION IMPACT THRESHOLD CRITERIA |  |  |
| Final $\mathbf{v / c}$ | Level of Service | Project Related Increase in $\mathbf{v / c}$ |
| $>0.700-0.800$ | C | equal to or greater than 0.040 |
| $>0.800-0.900$ | D | equal to or greater than 0.020 |
| $>0.900$ | E or F | equal to or greater than 0.010 |

As indicated in Table 8-4, the project-related increase in ICU value for the signalized intersections that defines a significant impact varies with LOS. At LOS C or D the threshold of significance is an increase of 0.04 or greater and 0.02 or greater, respectively, in the ICU value for signalized intersections. This is reduced to 0.01 or greater under LOS E and F.

The City of Rancho Palos Verdes has established the following thresholds of significance for unsignalized intersections:

- A significant impact would occur at an unsignalized intersection when the addition of project-generated trips causes the peak hour level of service of the intersection to change from acceptable operation (LOS D or better) to deficient operation (LOS E or F); or
- A significant impact would occur at an unsignalized intersection if the peak hour level of service of the intersection is LOS E or F and the addition of project-generated trips changes the delay by 2.0 seconds or more.

### 8.3.5 City Rolling Hills Estates Impact Criteria

The relative impact of the added project traffic volumes generated by the proposed project during the AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at three study intersections in the City of Rolling Hills Estates, without and with the proposed project. The previously discussed ICU capacity analysis procedures were utilized to investigate the future volume-to-capacity relationships and service level characteristics at each study intersection. The significance of the potential impacts of the project at each key intersection was then evaluated using the City of Rolling Hills Estates traffic impact criteria.

The City of Rolling Hills Estates traffic impact criteria indicates that a significant impact occurs when the addition of the proposed project results in a change in LOS from C to D , or D to E . A significant impact also occurs when the addition of the proposed project results in a LOS C or D and the increase in $v / c$ is greater than 0.02 . In addition, a significant impact occurs when the addition of the proposed project results in a LOS E or F and the increase in $v / c$ is greater than 0.01 .

### 8.3.6 County of Los Angeles Impact Criteria

The significance of the potential impacts of project generated traffic at the four study intersections within unincorporated Los Angeles County was identified using criteria set forth in the County of Los Angeles’ Traffic Impact Analysis Report Guidelines, January 1, 1997. According to the County's Sliding Scale Method for calculating the level of impact due to traffic generated by the proposed project, a significant transportation impact is determined based on the sliding scale criteria presented in Table 8-5.

| Table 8-5 |  |  |
| :---: | :---: | :---: |
| COUNTY OF LOS ANGELES |  |  |
| INTERSECTION IMPACT THRESHOLD CRITERIA |  |  |
| Final $\mathbf{v} / \boldsymbol{c}$ | Level of Service | Project Related Increase in $\mathbf{v / c}$ |
| $>0.700-0.800$ | C | equal to or greater than 0.040 |
| $>0.800-0.900$ | D | equal to or greater than 0.020 |
| $>0.900$ | E or F | equal to or greater than 0.010 |

The County's Sliding Scale Method requires mitigation of project traffic impacts whenever traffic generated by the proposed development causes an increase of the analyzed intersection $\mathrm{v} / \mathrm{c}$ ratio by an amount equal to or greater than the values shown above.

### 8.4 Traffic Impact Analysis Scenarios

### 8.4.1 City of Los Angeles Traffic Impact Scenarios

Based on City of Los Angeles traffic study guidelines and the recent Sunnyvale decision, Level of Service calculations at the study intersections were analyzed for the following impact analysis conditions:

- Existing and Near-Term Year 2012 Conditions
(a) Existing conditions.
(b) Condition (a) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(c) Condition (b) with implementation of project mitigation measures where necessary
(d) Condition (a) plus one percent (1.0\%) ambient traffic growth through year 2012 (i.e., the expected year of project approval) plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012).
(e) Condition (d) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(f) Condition (e) with implementation of project mitigation measures where necessary.
- Future Year 2017 Pre-Project and With Project Conditions
(a) Existing conditions.
(b) Condition (a) plus one percent (1.0\%) ambient traffic growth through year 2017.
(c) Condition (b) plus completion and occupancy of the related projects.
(d) Condition (c) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(e) Condition (d) with implementation of project mitigation measures where necessary.

The traffic volumes for each new condition were added to the volumes in the prior condition to determine the change in capacity utilization at the study intersections.

### 8.4.2 Cities of Torrance, Lomita, Rancho Palos Verdes, and Carson Traffic Impact Scenarios

Based on respective jurisdiction traffic study guidelines and the recent Sunnyvale decision, Level of Service calculations at the study intersections located within the cities of Torrance, Lomita, Rancho Palos Verdes, and Carson were analyzed for the following impact analysis conditions:

- Existing and Near-Term Year 2012 Conditions
(a) Existing conditions.
(b) Condition (a) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(c) Condition (b) with implementation of project mitigation measures where necessary
(d) Condition (a) plus one percent (1.0\%) ambient traffic growth through year 2012 (i.e., the expected year of project approval) plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012).
(e) Condition (d) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(f) Condition (e) with implementation of project mitigation measures where necessary.
- Future Year 2017 Pre-Project and With Project Conditions
(a) Existing conditions.
(b) Condition (a) plus one percent (1.0\%) ambient traffic growth through year 2017.
(c) Condition (b) plus completion and occupancy of the related projects.
(d) Condition (c) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(e) Condition (d) with implementation of project mitigation measures where necessary.

The traffic volumes for each new condition were added to the volumes in the prior condition to determine the change in capacity utilization at the study intersections.

### 8.4.3 City of Rolling Hills Estates Traffic Impact Analysis Scenarios

Based on Rolling Hills Estates traffic study guidelines and the recent Sunnyvale decision, Level of Service calculations at the study intersections located within the City of Rolling Hills Estates were analyzed for the following impact analysis conditions:

- Existing and Near-Term Year 2012 Conditions
(a) Existing conditions.
(b) Condition (a) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(c) Condition (b) with implementation of project mitigation measures where necessary
(d) Condition (a) plus one percent (1.0\%) ambient traffic growth through year 2012 (i.e., the expected year of project approval) plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012).
(e) Condition (d) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(f) Condition (e) with implementation of project mitigation measures where necessary.
- Future Year 2017 Pre-Project and With Project Conditions
(a) Existing conditions.
(b) Existing conditions with completion and occupancy of the Ponte Vista at San Pedro project.
(c) Condition (b) with implementation of project mitigation measures where necessary.
(d) Existing conditions (a) plus one percent (1.0\%) ambient traffic growth through year 2017 plus the completion and occupancy of the related projects.
(e) Condition (d) with completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(f) Condition (e) with implementation of project mitigation measures where necessary.

### 8.4.4 County of Los Angeles Traffic Impact Analysis Scenarios

Based on Los Angeles County traffic study guidelines and the recent Sunnyvale decision, Level of Service calculations at the study intersections located within the unincorporated Los Angeles County were analyzed for the following impact analysis conditions:

- Existing and Near-Term Year 2012 Conditions
(a) Existing conditions.
(b) Condition (a) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(c) Condition (b) with implementation of project mitigation measures where necessary
(d) Condition (a) plus one percent (1.0\%) ambient traffic growth through year 2012 (i.e., the expected year of project approval) plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012).
(e) Condition (d) plus completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(f) Condition (e) with implementation of project mitigation measures where necessary.
- Future Year 2017 Pre-Project and With Project Conditions
(a) Existing conditions.
(b) Condition (a) plus 1.0\% annual growth in ambient traffic through year 2017.
(c) Condition (b) with completion and occupancy of the Ponte Vista at San Pedro project (including the relocation of the Mary Star High School access point).
(d) Condition (c) with implementation of project mitigation measures where necessary.
(e) Condition (d) with completion and occupancy of the related projects.
(f) Condition (e) with implementation of cumulative mitigation measures where necessary.

### 9.0 City of Los Angeles Traffic Analysis

The Existing and Near-Term conditions traffic impact analysis prepared for the 56 study intersections using the LADOT CMA methodology and application of the City of Los Angeles significant traffic impact criteria is summarized in Table 9-1. The Existing and Near-Term conditions CMA data worksheets for the analyzed intersections are contained in Appendix B. The Future conditions traffic impact analysis prepared for the 56 study intersections using the LADOT CMA methodology and application of the City of Los Angeles significant traffic impact criteria is summarized in Table 9-2. The Future conditions CMA data worksheets for the analyzed intersections are contained in Appendix C.

### 9.1 Existing Conditions

### 9.1.1 Existing Conditions

As indicated in column [1] of Table 9-1, 37 of the 56 study intersections are operating at LOS D or better during the weekday AM peak hour, weekday PM peak hour and/or the Saturday midday peak hour under existing conditions. The remaining study intersections are operating at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday midday peak hour. As previously mentioned, the existing traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 5-1, 5-2 and 5-3, respectively.

### 9.1.2 Existing With Project Conditions

As shown in column [2] of Table 9-1, application of the City's threshold criteria to the "Existing With Project" scenario indicates that the proposed project is expected to create a significant impact at 16 of the 56 study intersections during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. Incremental but not significant impacts are noted at the remaining study intersections. The existing with project (existing plus project) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-1, 9-2 and 9-3, respectively.

### 9.2 Near-Term Conditions

### 9.2.1 Near-Term Cumulative Baseline Conditions

The near-term year 2012 cumulative baseline conditions were forecast based on the addition of traffic generated by the plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012), as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The near-term related projects included in this analysis condition are noted in Table 6-1 (noted as "NT" in the Project Status column). Also, this analysis condition accounts for the implementation of the San Pedro ATSAC/ATCS system at study intersections within the system based on information provided by LADOT (i.e., system capability has been constructed and is fully operational as of the first quarter of year 2011).

According to LADOT's "Traffic Study Policies and Procedures, " June 2009, page 16, a transportation impact on an intersection shall be deemed significant in accordance with the following table:

$$
\begin{gathered}
\quad \underline{\text { Final } \mathrm{v} / \mathrm{c}} \\
>0.700-0.800 \\
>0.800-0.900 \\
>0.900
\end{gathered}
$$

LOS
C
D, F

[^16]

As summarized in column [4] of Table 9-1, 37 of the 56 study are expected to operate at LOS D or better during the weekday AM peak hour, weekday PM peak hour and/or the Saturday midday peak hour with the addition of ambient traffic growth and the traffic due to the near-term related projects. The remaining study intersections are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. The near-term cumulative baseline (existing, ambient growth, and near-term related projects) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-4, 9-5 and 9-6, respectively.

### 9.2.2 Near-Term Cumulative With Project Conditions

As shown in column [5] of Table 9-1, application of the City's threshold criteria to the "NearTerm Cumulative With Project" scenario indicates that the proposed project is expected to create a significant impact at 15 of the 56 study intersections during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. Incremental but not significant impacts are noted at the remaining study intersections. The near-term cumulative with project (existing, ambient growth, near-term related projects and project) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-7, 9-8 and 9-9, respectively.

### 9.3 Future Conditions

### 9.3.1 Future Cumulative Conditions

The future year 2017 cumulative conditions were forecast based on the addition of traffic generated by the related projects, as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). This condition assumes implementation of the Wilmington ATSAC/ATCS system and related striping improvements to be provided by LADOT at several intersections.

The $v / c$ ratios at all 56 study intersections are incrementally increased with the addition of traffic generated by the related projects listed in Table 6-1 and growth in ambient traffic. As shown in column [3] of Table 9-2, 26 of the 56 study are expected to operate at LOS D or better during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour with the addition of ambient traffic growth and the traffic due to the related projects (future cumulative baseline conditions). The remaining study intersections are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. The future cumulative (existing, ambient growth, and related projects) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-10, 9-11 and 9-12, respectively.

FIGURE 9-6
N NEAR-TERM YEAR 2012 CUMULATIVE BASELINE TRAFFIC VOLUMES SATURDAY MID-DAY PEAK HOUR

FIGURE 9-9
N NEAR-TERM YEAR 2012 CUMULATIVE WITH PROJECT

### 9.3.2 Future Cumulative With Project Conditions

As previously noted (refer to Subsections 2.4, 3.2 and 7.2), vehicular access to the Mary Star High School campus through the project site via the Western Avenue intersection at Avenida Aprenda is planned as part of the proposed project as a public benefit. Parents and students will access (i.e., ingress only) the campus via the Western Avenue/Avenida Aprenda intersection and continue to exit the campus via Taper Avenue. Accordingly, the localized inbound trips associated with Mary Star High School were redistributed to the Avenida Aprenda intersection and are included in project traffic volumes.

As shown in column [4] of Table 9-2, application of the City's threshold criteria to the "With Proposed Project" scenario indicates that the proposed project is expected to create a significant impact at 20 of the 56 study intersections during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As indicated in Table 9-2, incremental but not significant impacts are noted at the remaining study intersections. The future cumulative with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-13, 9-14 and 9-15, respectively.

### 9.4 Summary of Impacted Intersections by Analysis Scenario

A summary of impacted intersections by analysis scenario (i.e., Existing With Project, NearTerm Cumulative With Project, and Future With Project conditions) is presented in Table 9-3. As indicated in Table 9-3 and discussed in Subsection 9.3.2 (Future With Project Conditions), the proposed project is expected to create a significant impact at 20 of the 56 study intersections during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour in the year 2017 Future With Project conditions. All 16 study intersections forecast to be significantly impacted by the proposed project under the "Existing With Project" scenario are included in the intersections forecast to be significantly impacted in the year 2017 Future With Project conditions based on City of Los Angeles threshold criteria. Thus, the Existing With Project analysis did not result in the identification of any impacts that were not previously disclosed in Subsection 9.3 .2 herein. All 16 study intersections forecast to be significantly impacted by the proposed project under the "Near-Term Cumulative With Project" scenario also are included in the intersections forecast to be significantly impacted in the year 2017 Future With Project conditions based on City of Los Angeles threshold criteria. In summary, the NearTerm With Project analysis did not result in the identification of any impacts that were not previously disclosed in Subsection 9.3.2 herein.

[1] Based on City of Los Angeles analysis methodology and threshold criteria.

### 10.0 Cities of Torrance, Lomita, Carson, and Rancho Palos Verdes, Traffic Analysis

The Existing and Near-Term conditions traffic impact analysis prepared for those study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes using the ICU methodology (as compared to the CMA methodology for LADOT) and application of the traffic impact significance thresholds for each respective jurisdiction is provided in Table 101. A description of the ICU method and corresponding Level of Service is provided in Appendix D. Refer to Subsection 8.2 herein for a discussion and comparison of the significance thresholds used by the City of Los Angeles (the lead agency), as well as the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes. The Existing and Near-Term conditions ICU data worksheets for the analyzed intersections for these nearby jurisdictions are contained in Appendix D. The Future conditions traffic impact analysis prepared for those study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes using the ICU methodology (as compared to the CMA methodology for LADOT) and application of the traffic impact significance thresholds for each respective jurisdiction is provided in Table 10-2. The Future conditions ICU data worksheets for the analyzed intersections for these nearby jurisdictions are contained in Appendix D.

### 10.1 Existing Conditions

### 10.1.1 Existing Conditions

As indicated in column [1] of Table 10-1, 17 of the 21 study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes are operating at LOS D or better during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour under existing conditions. The remaining study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes are operating at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As previously mentioned, the existing traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 5-1, 5-2 and 53 , respectively.

### 10.1.2 Existing With Project Conditions

As shown in column [2] of Table 10-1, application of the significant impact threshold criteria for each City to the "Existing With Project" scenario indicates that the proposed project is expected to create a significant impact at three study intersections (one intersection in the City of Lomita and two intersections in the City of Rancho Palos Verdes) during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. The study intersections forecast to be significantly impacted by the proposed project for these nearby jurisdictions are included in the intersections forecast to be significantly impacted based on City of Los Angeles threshold criteria. As indicated in Table 10-1, incremental but not significant impacts are noted at the remaining study intersections. As previously mentioned, the existing with project (existing plus project) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-1, 9-2 and 9-3, respectively.

### 10.1.3 Existing With Ambient Growth Conditions

Growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors was assumed to be one percent (1.0\%) per year through year 2017. This ambient growth incrementally increases the $v / c$ ratios at all of the study intersections. As shown in column [2] of Table 10-2, 12 of the 21 study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes are expected to continue to operate at LOS D or better during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour with the addition of ambient growth traffic through the year 2017. The remaining study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour.

### 10.2 Near-Term Conditions

### 10.2.1 Near-Term Cumulative Baseline Conditions

The near-term year 2012 cumulative baseline conditions were forecast based on the addition of traffic generated by the plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012), as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The near-term related projects included in this analysis condition are noted in Table 6-1 (noted as "NT" in the Project Status column).

As summarized in column [4] of Table 10-1, 14 of the 21 study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes are expected to operate at LOS D or better during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour with the addition of ambient traffic growth and the traffic due to the near-term related projects. The remaining study intersections located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As previously mentioned, the near-term cumulative baseline (existing, ambient growth, and near-term related projects) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-4, 9-5 and 9-6, respectively.

### 10.2.2 Near-Term Cumulative With Project Conditions

As shown in column [5] of Table 10-1, application of the significant impact threshold criteria for each City to the "Near-Term With Project" scenario indicates that the proposed project is expected to create a significant impact at three study intersections (one intersection in the City of Lomita and two intersections in the City of Rancho Palos Verdes) during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. The study intersection forecast to be significantly impacted by the proposed project for these nearby jurisdictions are included in the intersections forecast to be significantly impacted based on City of Los Angeles threshold criteria. As indicated in Table 10-1, incremental but not significant impacts are noted at the remaining study intersections. As previously mentioned, near-term cumulative with
project (existing, ambient growth, near-term related projects and project) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-7, 9-8 and 9-9, respectively.

### 10.3 Future Conditions

### 10.3.1 Future Pre-Project Conditions

The future year 2017 pre-project conditions were forecast based on the addition of traffic generated by the related projects, as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The $v / c$ ratios at all study intersections are incrementally increased with the addition of traffic generated by the related projects listed in Table 6-1 and growth in ambient traffic.

As shown in column [3] of Table10-2, nine of the 21 study intersections in the located in the cities of Torrance, Lomita, Carson, and Rancho Palos Verdes are expected to operate at LOS D or better during the weekday AM peak hour, weekday PM peak hour and/or the Saturday midday peak hour with the addition of ambient traffic growth and the traffic due to the related projects (future pre-project conditions). The remaining study intersections are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As previously mentioned, the future pre-project (existing, ambient growth, and related projects) traffic volumes at the study intersections during the weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-10, 9-11 and 9-12, respectively.

### 10.3.2 Future With Project Conditions

As previously noted (refer to Subsections 2.4, 3.2 and 7.2), vehicular access to the Mary Star High School campus through the project site via the Western Avenue intersection at Avenida Aprenda is planned as part of the proposed project as a public benefit. Parents and students will access (i.e., ingress only) the campus via the Western Avenue/Avenida Aprenda intersection and continue to exit the campus via Taper Avenue. If the Ponte Vista at San Pedro project is not approved, then the vehicular access for the Mary Star High School would continue to be provided via the Western Avenue/Green Hills Road intersection. Accordingly, the localized inbound trips associated with Mary Star High School were redistributed to the Avenida Aprenda intersection and are included in project traffic volumes.

As shown in column [4] of Table 10-2, application of the significant impact threshold criteria for each City to the "With Proposed Project" scenario indicates that the proposed project is expected to create a significant impact at one study intersection in the City of Lomita and four study intersections in the City of Rancho Palos Verdes during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. All five study intersections forecast to be significantly impacted by the proposed project for these nearby jurisdictions are included in the intersections forecast to be significantly impacted based on City of Los Angeles threshold criteria. As indicated in Table 10-2, incremental but not significant impacts are noted at the remaining study intersections. As previously mentioned, the future with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the
weekday AM peak hour, weekday PM peak hour and Saturday mid-day peak hour are provided in Figures 9-13, 9-14 and 9-15, respectively.

### 11.0 City of Rolling Hills Estates Traffic Analysis

The Existing and Near-Term conditions traffic impact analysis prepared for those study intersections located in the City of Rolling Hills Estates using the ICU methodology (as compared to the CMA methodology for LADOT) and application of the traffic impact significance thresholds for the City of Rolling Hills Estates is provided in Table 11-1. A description of the ICU method and corresponding Level of Service is provided in Appendix E. Refer to Subsection 8.2 herein for a discussion and comparison of the significance thresholds used by the City of Los Angeles (the lead agency), as well as the City Rolling Hills Estates. The Existing and Near-Term conditions ICU data worksheets for the analyzed intersections for this nearby jurisdiction are contained in Appendix E. The Future conditions traffic impact analysis prepared for those study intersections located in the City of Rolling Hills Estates using the ICU methodology (as compared to the CMA methodology for LADOT) and application of the traffic impact significance thresholds for each respective jurisdiction is provided in Table 11-2. The Future Conditions ICU data worksheets for the analyzed intersections for this nearby jurisdiction are contained in Appendix E.

### 11.1 Existing Conditions

### 11.1.1 Existing Conditions

As indicated in column [1] of Table 11-1, two of the three of the study intersections in the City of Rolling Hills Estates are operating at LOS D or better during the weekday AM and PM peak hours under existing conditions. The remaining study intersection located in the City of Rolling Hills Estates is operating at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As previously mentioned, the existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in Figures 5-1 and 5-2, respectively.

### 11.1.2 Existing With Project Conditions

As presented in column [2] of Table 11-1, two of the three study intersections in the City of Rolling Hills Estates are expected to continue operating at LOS D or better during the weekday AM and PM peak hours with the addition of the proposed project. As shown in column [2] of Table 11-1, application of the City's threshold criteria to the "With Proposed Project" scenario indicates that the proposed project is not expected to create a significant impact at any of the three study intersections. As indicated in Table 11-1, incremental but not significant impacts are noted at the three study intersections. Therefore, no mitigation measures are required or recommended. As previously mentioned, the existing with project (existing plus project) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in Figures 9-1 and 9-2, respectively.

### 11.2 Near-Term Conditions

### 11.2.1 Near-Term Cumulative Baseline Conditions

The near-term year 2012 cumulative baseline conditions were forecast based on the addition of traffic generated by the plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012), as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The near-term related projects included in this analysis condition are noted in Table 6-1 (noted as "NT" in the Project Status column).

As summarized in column [3] of Table 11-1, two of the three study intersections located in the City of Rolling Hills Estates are expected to operate at LOS D or better during the weekday AM peak and PM peak hours with the addition of ambient traffic growth and the traffic due to the near-term related projects. The remaining study intersection located in the City of Rolling Hills Estates is expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As previously mentioned, the near-term cumulative baseline (existing, ambient growth, and near-term related projects) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in Figures 9-4 and 9-5, respectively.

### 11.2.2 Near-Term Cumulative With Project Conditions

As shown in column [4] of Table 11-1, application of the significant impact threshold criteria for the City of Rolling Hills Estates to the "Near-Term With Project" scenario indicates that the proposed project is not expected to create a significant impact at any of the three study intersections. As indicated in Table 11-1, incremental but not significant impacts are noted at the three study intersections. As previously mentioned, near-term cumulative with project (existing, ambient growth, near-term related projects and project) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in Figures 9-7 and 9-8, respectively.

### 11.3 Future Conditions

### 11.3.1 Future Pre-Project Conditions

As shown in column [3] of Table 11-2, one of the three study intersections are expected to operate at LOS D or better during the weekday AM and PM peak hours with the addition of ambient traffic growth and the traffic due to the related projects (future pre-project conditions). The remaining study intersections located in the City of Rolling Hills Estates are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As previously mentioned, the future pre-project (existing, ambient growth, and related projects) traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in Figures 9-10 and 9-11, respectively.

### 11.3.2 Future With Project Conditions

As shown in column [4] of Table 11-2, application of the City's threshold criteria to the "With Proposed Project" scenario indicates that the proposed project is expected to create a significant impact at one study intersection in the City of Rolling Hills Estates during the weekday AM and/or PM peak hour. The City of Rolling Hills Estates study intersection forecast to be significantly impacted by the proposed project is included in the intersections forecast to be significantly impacted based on City of Los Angeles threshold criteria. As indicated in Table 112, incremental but not significant impacts are noted at the remaining study intersections. As mentioned previously, the future with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in Figures 9-13 and 9-14, respectively.

### 12.0 County of Los Angeles Traffic Analysis

The Existing and Near-Term traffic impact analysis prepared for those study intersections located within unincorporated Los Angeles County using the ICU methodology and application of the traffic impact significance thresholds for Los Angeles County is provided in Table 12-1. A description of the ICU method and corresponding Level of Service is provided in Appendix $\boldsymbol{F}$. See Subsection 8.2 herein for a discussion and comparison of the significance thresholds used by the City of Los Angeles (the lead agency), as well as the County of Los Angeles. The Existing and Near-Term conditions ICU data worksheets for the analyzed intersections for this nearby jurisdiction are contained in Appendix F. The Future conditions traffic impact analysis prepared for those study intersections located within unincorporated Los Angeles County using the ICU methodology (as compared to the CMA methodology for LADOT) and application of the traffic impact significance thresholds for each respective jurisdiction is provided in Table 12-2. The Future Conditions ICU data worksheets for the analyzed intersections for this nearby jurisdiction are contained in Appendix E.

### 12.1 Existing Conditions

### 12.1.1 Existing Conditions

As indicated in column [1] of Table 12-1, one of the four County study intersections is operating at LOS D or better during the weekday AM and/or PM peak hours under existing conditions. The remaining County study intersections are operating at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As previously mentioned, the existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in Figures 5-1 and 5-2, respectively.

### 12.1.2 Existing With Project Conditions

As shown in column [2] of Table 12-1, application of the County's threshold criteria to the "With Proposed Project" scenario indicates that the proposed project is not expected to create a significant impact at any of the four study intersections. As indicated in Table 12-1, incremental but not significant impacts are noted at the four County study intersections. Therefore, no mitigation measures are required or recommended. As previously mentioned, the existing with project (existing plus project) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in Figures 9-1 and 9-2, respectively.

### 12.1.3 Existing With Ambient Growth Conditions

Growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors was assumed to be one percent (1.0\%) per year through year 2017. This ambient growth incrementally increases the $v / c$ ratios at all of the study intersections. As shown in column [2] of Table 12-2, one of the four County study intersections is expected to continue to operate at LOS D or better during the weekday AM and/or PM peak hours with the addition of ambient growth traffic through the year 2017. The remaining study intersections are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour.

### 12.1.4 Existing With Ambient Growth Plus Proposed Project Conditions

The $v / c$ ratios at all four County study intersections are incrementally increased with the addition of traffic generated by ambient growth and the proposed project. As presented in column [3] of Table 12-2, one of the four County study intersections is expected to continue operating at LOS D or better during the weekday AM and/or PM peak hours with the addition of growth in ambient traffic and the traffic due to the proposed project. The remaining study intersections are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday mid-day peak hour. As shown in column [3] of Table 12-2, application of the County's threshold criteria to the "With Proposed Project" scenario indicates that the proposed project is not expected to create a significant impact at any of the four County study intersections.

### 12.2 Near-Term Conditions

### 12.2.1 Near-Term Cumulative Baseline Conditions

The near-term year 2012 cumulative baseline conditions were forecast based on the addition of traffic generated by the plus completion and occupancy of near-term related projects (i.e., those developments that are currently under construction and expected to be completed in year 2012), as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The near-term related projects included in this analysis condition are noted in Table 6-1 (noted as "NT" in the Project Status column).

As summarized in column [3] of Table 12-1, one of the four County study intersections is expected to continue operating at LOS D or better during the weekday AM and/or PM peak hours with the addition of ambient traffic growth and the traffic due to the near-term related projects. The remaining study intersections are expected to operate at LOS E or worse during the weekday AM and/or PM peak hours. As previously mentioned, the near-term cumulative baseline (existing, ambient growth, and near-term related projects) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in Figures 9-4 and 9-5, respectively.

### 12.2.2 Near-Term Cumulative With Project Conditions

As shown in column [4] of Table 12-1, one of the four County study intersections is expected to continue operating at LOS D or better during the weekday AM and/or PM peak hours with the addition of growth in ambient traffic, traffic due to the near-term related projects, and the traffic due to the proposed project. The remaining study intersections are expected to operate at LOS E or worse during the weekday AM peak hour, weekday PM peak hour and/or the Saturday midday peak hour. As shown in column [4] of Table 12-2, application of the County's threshold criteria to the "With Proposed Project" scenario indicates that the proposed project is not expected to create a significant impact at any of the four County study intersections.

### 12.3 Future Cumulative Conditions

The $v / c$ ratios at all four County study intersections are incrementally increased with the addition of traffic generated by the related projects listed in Table 6-1. As presented in column [4] of Table 12-2, all four County study intersections are expected to operate at LOS E or worse during the weekday AM and PM peak hours with the addition of growth in ambient traffic, project traffic, and the traffic due to the related projects. As also indicated in column [4] of Table 12-2, application of the County's threshold criteria to the "Future Cumulative" scenario indicates that cumulative significant impacts are forecast for all four County study intersections. The future cumulative (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in Figures 9-13 and 914 , respectively.

### 13.0 TRANSPORTATION Mitigation Measures

The following section provides an overview of feasible mitigation measures that can reduce the project's significant transportation impacts to less than significant levels.

### 13.1 Summary of Project Mitigation

As summarized in the Future Cumulative With Project Conditions section (refer to Subsection 9.3.2) of this study, application of the City of Los Angeles' threshold criteria to the "With Proposed Project" scenario indicates that 20 of the 56 study intersections are anticipated to be significantly impacted due to traffic generated by the Ponte Vista at San Pedro project. As previously discussed, a total of six study intersections located in other jurisdictions (one intersection in the City of Lomita, four intersections in the City of Rancho Palos Verdes and one intersection in the City of Rolling Hills Estates) are forecast to be impacted by the proposed project employing the respective jurisdiction analysis methodology and threshold criteria. All six study intersections forecast to be significantly impacted by the proposed project in these nearby jurisdictions are included in the intersections forecast to be significantly impacted based on City of Los Angeles threshold criteria. A summary list of the impacted intersections under the CMA and ICU methodologies by jurisdiction is presented in Table 13-1.

Transportation mitigation measures typically consist of improvements such as roadway and/or intersection restriping and roadway widening to accommodate additional travel lanes, and/or traffic signal modifications. A wide range of roadway improvement and operational mitigation measures have been recommended to reduce the forecast project-related impacts to less than significant levels. As indicated in Tables 9-1, 9-2, 10-1, 10-2, 11-1, 11-2, 12-1 and 12-2, the recommended transportation mitigation measures would mitigate the project impacts based on the CMA intersection analysis methodology and significance thresholds of the Lead Agency (City of Los Angeles), as well as using the ICU intersection analysis methodology and the significance thresholds of the nearby adjacent jurisdictions, as applicable. Further, these mitigation measures mitigate the potential project-related traffic impacts for each of the three analysis conditions: Existing + Project, Near-Term + Project, and Future + Project. The following paragraphs summarize the recommended transportation mitigation measures. A summary of the recommended mitigation measures for each study intersection forecast to be impact is presented in Table 13-2. The future lane configurations with the proposed mitigation measures are illustrated in Figure 13-1. Conceptual roadway improvement plans illustrating the recommended physical improvement mitigation measures are provided in Appendix G.

## Intersection No. 6: Crenshaw Boulevard/Pacific Coast Highway

The recommended mitigation consists of modifying the southbound approach on Crenshaw Boulevard at Pacific Coast Highway to accommodate installation of a second left-turn lane. To accommodate the proposed second left-turn lane, the existing roadway striping and median islands would be modified as needed. It is noted that a traffic signal modification would likely be required to accommodate this recommended mitigation measure. As shown in Figure 13-1, the resulting lane

Note(s):

- $\mathrm{No}=$ Intersection not impacted based on other jurisdiction methodology and thresholds.
- ---- = Denotes City of Los Angeles intersection.
- In addition to the forecast project-related impacts as noted above, the Ponte Vista at San Pedro project contributes to forecast cumulative impacts for the four Los Angeles County study intersections (i.e., Intersection Nos. 32, 33, 44 and 45) based on the County's methodology and thresholds.

Table 13-2
SUMMARY LIST OF MITIGATION MEASURES

| INT. NO. | LOCATION | MITIGATION |
| :---: | :---: | :---: |
| 6 | Crenshaw Boulevard/ <br> Pacific Coast Highway | - Modify the southbound approach on Crenshaw Boulevard to provide a second left-turn lane <br> - The resulting southbound approach lane configuration will be two left-turn lanes, two through lanes, and one shared through/right-turn lane <br> - Modify the traffic signal at the intersection to accommodate installation of the second left-turn lane |
| 7 | Crenshaw Boulevard/ <br> Palos Verdes Drive North | - Modify the traffic signal to provide northbound right-turn overlap signal phase with the westbound left-turn signal phase |
| 12 | Western Avenue/ <br> Lomita Boulevard | - Restripe the southbound approach to provide a right-turn only lane <br> - The resulting southbound approach lane configuration will be two left-turn lanes, two through lanes, and one right-turn only lane <br> - Modify the traffic signal to provide southbound right-turn overlap signal phase with the eastbound left-turn signal phase |
| 13 | Western Avenue/ <br> Pacific Coast Highway | - Modify the southbound approach to provide a second left-turn lane and a third through lane <br> - The resulting southbound approach lane configuration will be two left-turn lanes, two through lanes and one shared through/right-turn lane <br> - Modify the traffic signal at the intersection to accommodate the recommended improvement measures |
| 15 | Western Avenue/ <br> Palos Verdes Drive North | - Restripe the southbound approach to provide a right-turn only lane <br> - The resulting southbound approach lane configuration will be one left-turn lane, two through lanes, and one right-turn only lane <br> - Modify the westbound approach on Palos Verdes Drive North to provide a second left-turn lane <br> - The resulting westbound approach lane configuration will be two left-turn lanes, two through lanes and one shared through/right-turn only lane <br> - Modify the northbound approach on Western Avenue to add a right-turn only lane <br> - The resulting northbound approach lane configuration will be two left-turn lanes, two through lanes and one right-turn only lane |
| 16 | Western Avenue/ <br> Peninsula Verde Drive | - Fund installation of new traffic signal |
| 19 | Western Avenue/ <br> Fitness Drive | - Fund installation of new traffic signal |
| 20 | Western Avenue/ <br> Westmont Drive | - Modify the northbound approach to provide a right-turn only lane <br> - The resulting northbound approach lane configuration will be one left-turn lane, two through lanes and one right-turn only lane <br> - Restripe the eastbound approach to provide a left-turn lane <br> - The resulting eastbound approach lane configuration will be one left-turn and one shared through/right-turn lane |
| 23 | Western Avenue/ Capitol Drive | - Modify the northbound approach to provide a right-turn only lane <br> - The resulting northbound approach lane configuration will be one left-turn lane, two through lanes and one right-turn lane |
| 26 | Western Avenue/ Summerland Avenue | - Modify the traffic signal to provide westbound right-turn overlap signal phase with the southbound left-turn signal phase |

Table 13-2 Continued
SUMMARY LIST OF MITIGATION MEASURES

| INT. NO. | LOCATION | MITIGATION |
| :---: | :---: | :---: |
| 36 | Vermont Avenue-Palos Verdes Drive North -Gaffey Street/Anaheim Street | - Widen the eastbound approach on Anaheim Street to provide a right-turn only lane <br> - The resulting eastbound approach lane configuration will be one left-turn lane, one through lane, one shared through/right-turn lane and one right-turn only lane <br> - Provide enhanced right-turn signage for eastbound Anaheim Street as required |
| 37 | Gaffey Street/Westmont Drive | - Widen Gaffey Street north of Westmont Drive to provide a right-turn only lane at the southbound approach <br> - The modification of the intersection will accommodate continuation of the existing bicycle lane and the southbound right-turn only lane <br> - The resulting southbound approach lane configuration will be one left-turn two through lanes, and one right-turn only lane <br> - Modify the traffic signal to provide southbound right-turn overlap signal phase with the eastbound left-turn signal phase |
| 41 | Gaffey Street/ <br> Summerland Avenue | - Restripe the southbound approach to provide a southbound right-turn only lane <br> - The resulting southbound approach lane configuration will be one left-turn lane, two through-lanes and one right-turn only lane <br> - Modify the traffic signal to provide southbound right-turn overlap signal phase with the eastbound left-turn signal phase |
| 44 | Vermont Avenue/ Sepulveda Boulevard | - Modify the westbound approach on Sepulveda Boulevard to provide a second left-turn lane <br> - The resulting westbound approach lane configuration will be two left-turn lanes, two through-lanes and one shared through/right-turn lane <br> - Modify the traffic signal at the intersection to accommodate the recommended improvement measures |
| 46 | Vermont Avenue/ <br> Pacific Coast Highway | - Widen Pacific Coast Highway to provide a second left-turn lane at the westbound approach <br> - The resulting westbound approach lane configuration will be two left-turn lanes, two through lanes and one shared through/right-turn lane <br> - Modify the traffic signal at the intersection to accommodate the recommended improvement measures |
| 48 | Figueroa Place/ <br> I-110 SB Off-Ramp (north of Anaheim Street) | - Fund installation of new traffic signal as part of the mitigation at the Figueroa Place/Anaheim Street intersection |
| 49 | Figueroa Place/ Anaheim Street | - Modify the traffic signal to provide a southbound right-turn signal phase on Figueroa Place that would overlap with the eastbound left-turn and through sufficiently long enough to accommodate the southbound right-turn volumes |
| 51 | Figueroa Street/ <br> I-110 Northbound On-Ramp <br> (north of Pacific Coast Highway) | - Modify the southbound approach to provide a right-turn only lane <br> - The resulting southbound approach lane configuration will be two through lanes and one right-turn only lane |
| 52 | Figueroa Street/ <br> Pacific Coast Highway | - Modify the westbound approach on Pacific Coast Highway to provide a fourth through lane <br> - The resulting westbound approach lane configuration will be one left-turn lane, three through lanes, and one shared through/right-turn lane |
| 53 | Figueroa Street/ <br> I-110 NB On-Ramp (north of Anaheim Street) | - Fund installation of new traffic signal <br> - Restripe the northbound approach on Figueroa Street to provide one left-turn lane and one share left-turn/through/right-turn lane |
| 54 | Figueroa Street/ Anaheim Street | - Widen the westbound approach on Anaheim Street to provide a right-turn only lane <br> - The resulting westbound approach lane configurations will be one left-turn lane, two through lanes and one right-turn only lane |

FUTURE LANE CONFIGURATIONS WITH PROJECT MITIGATION

configuration at the southbound approach would provide two left-turn lanes, two through lanes, and one shared through/right-turn lane. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels.

It is noted that this intersection is located in the City of Torrance and is therefore outside the jurisdiction of the Lead Agency. Should the City of Torrance refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result. Also, Pacific Coast Highway is situated within Caltrans' jurisdiction and is therefore outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 7: Crenshaw Boulevard/Palos Verdes Drive North

The recommended mitigation consists of modifying the existing traffic signal to provide a northbound right-turn signal phase on Crenshaw Boulevard that would overlap with the westbound left-turn signal phase on Palos Verdes Drive North. To accommodate the proposed northbound right-turn signal phase on Crenshaw Boulevard, U-turn movements on the westbound approach of Palos Verdes Drive North would need to be prohibited. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels.

It is noted that this intersection is located in the City of Rolling Hills Estates and is therefore outside the jurisdiction of the Lead Agency. Should the City Rolling Hills Estates refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 12: Western Avenue/Lomita Boulevard

The recommended mitigation consists of modifying the southbound approach on Western Avenue at Lomita Boulevard to accommodate installation of a right-turn only lane. To accommodate the proposed right-turn only lane, the existing roadway striping would be adjusted as needed. As shown in Figure 13-1, the resulting lane configuration at the southbound approach would provide two leftturn lanes, two through lanes, and one right-turn lane. In addition, the existing traffic signal is proposed to be modified to provide a southbound right-turn signal phase on Western Avenue that would overlap with the eastbound left-turn signal phase on Lomita Boulevard. As shown in Table $9-2$, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix G.

This mitigation measure is consistent with the recommended transportation improvements outlined in the Western Corridor Improvement Project report issued by Caltrans for the Western Avenue Task Force. It is noted that Western Avenue is within Caltrans' jurisdiction and therefore implementation of the traffic mitigation would be outside the jurisdiction of the Lead Agency. Should Caltrans
refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 13: Western Avenue/Pacific Coast Highway

The recommended mitigation consists of modifying the southbound approach on Western Avenue at Pacific Coast Highway to accommodate installation of a second left-turn lane and a third through lane. South of Pacific Coast Highway, the third southbound through lane on Western Avenue (i.e., the curb lane) will merge with the number two southbound through lane. To accommodate the proposed second left-turn lane and third through lane, the existing roadway striping on Western Avenue would require modifications both north and south of Pacific Coast Highway. Also, it is noted that the raised median island on Western Avenue between $259^{\text {th }}$ Street and Anaheim Street would need to be modified to accommodate the recommended improvements. As shown in Figure 13-1, the resulting lane configuration at the southbound approach at the Pacific Coast Highway would provide two left-turn lanes, two through lanes, and one shared through/right-turn lane. In addition, a traffic signal modification at the Western Avenue/Pacific Coast Highway intersection also will be required to facilitate the recommended roadway improvements. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix G.

This mitigation measure is consistent with the recommended transportation improvements outlined in the Western Corridor Improvement Project report issued by Caltrans for the Western Avenue Task Force. It is noted that Western Avenue and Pacific Coast Highway are within Caltrans' jurisdiction and therefore implementation of the traffic mitigation would be outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 15: Western Avenue/Palos Verdes Drive North

The recommended mitigation consists of modifying the westbound approach on Palos Verdes Drive North at Western Avenue to accommodate installation of a second left-turn lane. To accommodate the proposed second left-turn lane, the existing median on Palos Verdes Drive North and traffic signal equipment would be modified and the roadway striping would be adjusted as needed. Approximately five parking spaces would be removed on the north side of Palos Verdes Drive North west of Western Avenue and 10 parking spaces would be removed on the north side of Palos Verdes Drive North east of Western Avenue. An additional mitigation measure is recommended which includes modifying the northbound approach on Western Avenue at Palos Verdes Drive North to accommodate installation of a right-turn only lane. To accommodate the proposed right-turn lane, the existing median on Western Avenue would be modified and the roadway striping would be modified as needed. Also, the roadway striping on the southbound Western Avenue approach would be modified to provide a right-turn lane. As shown in Figure 13-1, the resulting lane configuration at the westbound approach would provide two left-turn lanes, two through lanes, and
one shared through/right-turn lane. The resulting lane configuration at the northbound approach would provide two left-turn lanes, two through lanes, and one right-turn only lane. The resulting lane configuration at the southbound approach would provide one left-turn lane, two through lanes, and one right-turn only lane. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

This mitigation measure is consistent with the recommended transportation improvements outlined in the Western Corridor Improvement Project report issued by Caltrans for the Western Avenue Task Force and would be implemented by the applicant as a condition of project approval. It is noted that a portion of this intersection is located in the City of Lomita and is, therefore, outside the jurisdiction of the Lead Agency. Should the City of Lomita refuse to permit implementation of these feasible traffic mitigation measures, a residual, unmitigated traffic impact would result. Also, it is noted that Western Avenue is within Caltrans' jurisdiction and is therefore outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 16: Western Avenue/Peninsula Verde Drive

A traffic signal is proposed at the Western Avenue/Peninsula Verde Drive intersection, which is currently stop-sign controlled. Standard Caltrans and LADOT traffic signal warrant calculations were prepared for the Western Avenue/Peninsula Verde Drive intersection. The determination of whether the installation of a traffic signal is warranted was based on criteria set forth in Chapter 4C of the MUTCD 2003 California Supplement, July 21, 2010 and the City of Los Angeles Manual of Policies and Procedures, October 2005. The traffic signal warrant calculations were based on future forecast peak traffic volumes.

The Peak Hour Volume Warrant is intended for application where traffic conditions are such that for one hour of the day minor street traffic suffers undue delay in entering or crossing the major street. The Peak Hour Volume warrant is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 and Figure D for the applicable number of approach lanes.

The plotted points under the future with project conditions for the AM and PM peak hours lie below the applicable curve. Therefore, Warrant 3 is not satisfied for the Western Avenue/Peninsula Verde Drive. However, it is noted that in prior discussions with Caltrans, ${ }^{12}$ a traffic signal would be considered for this intersection. It is also noted that the Western Avenue/Peninsula Verde Drive intersection is located within Caltrans' and City of Rancho Palos Verdes jurisdiction and therefore implementation of the traffic mitigation may be outside the jurisdiction of the Lead Agency. Should Caltrans or City of Rancho Palos Verdes refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result. The traffic signal warrants

[^18](i.e., Figure 4C-4 and Figure D), as contained in the MUTCD 2003 California Supplement and the City of Los Angeles Manual of Policies and Procedures, also are provided in Appendix $G$.

The effectiveness of this mitigation measure was assessed through completion of the intersection capacity analyses, which assume implementation of the recommended project mitigation measure. As shown in Table 9-2, the proposed mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels.

## Intersection No. 19: Western Avenue/Fitness Drive

A traffic signal is proposed at the Western Avenue/Fitness Drive intersection, which is currently stop-sign controlled. Standard Caltrans and LADOT traffic signal warrant calculations were prepared for the Western Avenue/Fitness Drive intersection. The determination of whether the installation of a traffic signal is warranted was based on criteria set forth in Chapter 4C of the MUTCD 2003 California Supplement, July 21, 2010 and the City of Los Angeles Manual of Policies and Procedures, October 2005. The traffic signal warrant calculations were based on future forecast peak traffic volumes.

The Peak Hour Volume Warrant is intended for application where traffic conditions are such that for one hour of the day minor street traffic suffers undue delay in entering or crossing the major street. The Peak Hour Volume warrant is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 and Figure D for the applicable number of approach lanes.

The plotted points under the future with project conditions for the AM and PM peak hours lie above the applicable curve. Therefore, Warrant 3 is satisfied for the Western Avenue/Fitness Drive. It is noted that the Western Avenue/Fitness Drive intersection is located within Caltrans' and City of Rancho Palos Verdes jurisdiction and therefore implementation of the traffic mitigation may be outside the jurisdiction of the Lead Agency. Should Caltrans or City of Rancho Palos Verdes refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result. The traffic signal warrants (i.e., Figure 4C-4 and Figure D), as contained in the MUTCD 2003 California Supplement and the City of Los Angeles Manual of Policies and Procedures, also are provided in Appendix $G$.

The effectiveness of this mitigation measure was assessed through completion of the intersection capacity analyses, which assume implementation of the recommended project mitigation measure. As shown in Table 9-2, the proposed mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels.

## Intersection No. 20: Western Avenue/Westmont Drive

The recommended mitigation consists of modifying the northbound approach on Western Avenue at Westmont Drive to accommodate installation of a right-turn only lane. To accommodate the
proposed right-turn only lane, the existing roadway striping, as well as a portion of the raised median on Western Avenue north and south of Westmont Avenue would be adjusted as needed. As shown in Figure 13-1, the resulting lane configuration at the northbound approach would provide one leftturn lane, two through lanes, and one right-turn lane. An additional mitigation measure is recommended which consists of modifying the eastbound approach on Westmont Drive at Western Avenue to provide one left-turn lane. To accommodate the proposed left-turn lane, the existing roadway striping would be adjusted as needed. Approximately three parking spaces would be removed on each side of Westmont Avenue west of Western Avenue. The resulting lane configuration at the eastbound approach would provide one left-turn lane and one shared through/right-turn lane. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

This mitigation measure is consistent with the recommended transportation improvements outlined in the Western Corridor Improvement Project report issued by Caltrans for the Western Avenue Task Force and would be implemented by the applicant as a condition of project approval. It is noted that a portion of this intersection is located in the City of Rancho Palos Verdes and is, therefore, outside the jurisdiction of the Lead Agency. Should the City of Rancho Palos Verdes refuse to permit implementation of these feasible traffic mitigation measures, a residual, unmitigated traffic impact would result. Also, Western Avenue is situated within Caltrans' jurisdiction and is therefore outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 23: Western Avenue/Capitol Drive

The recommended mitigation consists of modifying the northbound approach on Western Avenue at Capitol Drive to accommodate installation of a right-turn only lane. To accommodate the proposed right-turn lane, the existing roadway striping as well as a portion of the raised median on Western Avenue north and south of Capitol Drive, would be adjusted as needed. As shown in Figure 13-1, the resulting lane configuration at the northbound approach would provide one left-turn lane, two through lanes, and one right-turn lane. As shown in Table 9-2, this mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

This mitigation measure is consistent with the recommended transportation improvements outlined in the Western Corridor Improvement Project report issued by Caltrans for the Western Avenue Task Force and would be implemented by the applicant as a condition of project approval. It is noted that a portion of this intersection is located in the City of Rancho Palos Verdes and is, therefore, outside the jurisdiction of the Lead Agency. Should the City of Rancho Palos Verdes refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result. Also, Western Avenue is situated within Caltrans' jurisdiction and is therefore outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

The recommended mitigation consists modifying the existing traffic signal to provide a westbound right-turn signal phase on Summerland Avenue that would overlap with the southbound left-turn signal phase on Western Avenue at the Summerland Avenue intersection. As shown in Table 9-2, this mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels.

It is noted that this intersection is located in the City of Rancho Palos Verdes and is, therefore, outside the jurisdiction of the Lead Agency. Should the City of Rancho Palos Verdes refuse to permit implementation of these feasible traffic mitigation measures, a residual, unmitigated traffic impact would result. Also, Western Avenue is situated within Caltrans' jurisdiction and is therefore outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 36: Vermont Avenue-Palos Verdes Drive North-Gaffey Street/Anaheim Street

The recommended mitigation consists of widening Anaheim Street west of Vermont Avenue to accommodate the installation of a right-turn only lane at the eastbound approach to the intersection. To accommodate the proposed right-turn lane, the south side of Anaheim Street would need to be widened by approximately 12 feet to accommodate a 180 -foot long turn pocket. The proposed rightturn only lane would accommodate vehicle movements to Palos Verdes Drive North and Gaffey Street. Enhanced signage would be provided as needed to guide the right-turn motorists from the eastbound Anaheim Street approach to Gaffey Street and Palos Verdes Drive North. As shown in Figure 13-1, the resulting lane configuration at the eastbound approach would provide one left-turn lane, one through lane, one shared through/right-turn lane, and one right-turn lane. As shown in Table 9-2, this mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

## Intersection No. 37: Gaffey Street/Westmont Drive

The recommended mitigation consists of widening Gaffey Street north of Westmont Drive to accommodate installation of a right-turn only lane. It is noted that the southbound approach on Gaffey Street can be modified to include continuation of the existing bicycle lane and the southbound right-turn only lane. However, it is noted that the southbound near-side Metro bus stop would needed to be relocated to the far-side of the intersection (i.e., south of the intersection). As shown in Figure 13-1, the resulting lane configuration at the southbound approach would provide one left-turn lane, two through lanes, and one right-turn only lane. An additional mitigation measure is recommended which includes modifying the existing traffic signal to provide a southbound rightturn signal phase on Gaffey Street that would overlap with the eastbound left-turn signal phase on Westmont Drive at the Gaffey Street intersection. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

## Intersection No. 41: Gaffey Street/Summerland Avenue

The recommended mitigation consists of modifying the southbound approach on Gaffey Street at Summerland Avenue to accommodate the installation of a right-turn only lane. To accommodate the proposed right-turn lane, the existing roadway striping would be adjusted as needed. As shown in Figure 13-1, the resulting lane configuration at the southbound approach would provide one left-turn lane, two through lanes, and one right-turn lane. An additional mitigation measure is recommended which includes modifying the existing traffic signal to provide a southbound right-turn signal phase on Gaffey Street that would overlap with the eastbound left-turn signal phase on Summerland Avenue at the Gaffey Street intersection. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

## Intersection No. 44: Vermont Avenue/Sepulveda Boulevard

The recommended project mitigation consists of modifying the westbound approach on Sepulveda Boulevard at Vermont Avenue to accommodate the installation of a second left-turn lane. To accommodate the proposed second left-turn lane, the existing raised median on Sepulveda Boulevard, east of Vermont Avenue, would need to be removed. As shown in Figure 13-1, the resulting lane configuration at the westbound approach would provide two left-turn lanes, two through lanes, and one shared through/right-turn lane. It is noted that a traffic signal modification would likely be required to accommodate this recommended mitigation measure. As shown in Table 9-2, these mitigation measures are anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix G.

It is noted that this intersection is located in the County of Los Angeles and is, therefore, outside the jurisdiction of the Lead Agency. Should the County of Los Angeles refuse to permit implementation of these feasible traffic mitigation measures, a residual, unmitigated traffic impact would result.

## Intersection No. 46: Vermont Avenue/Pacific Coast Highway

The recommended mitigation consists of widening Pacific Coast Highway to accommodate the installation of a second left-turn lane at the westbound approach at the Vermont Avenue intersection. To accommodate the proposed second left-turn lane, the north side and south sides of Pacific Coast Highway would need to be widened east and west of Vermont Avenue so as to provide up to a 42foot half roadway on the 50 -foot half right-of-way. The existing traffic signal equipment would be modified and the roadway striping would be adjusted as needed. As shown in Figure 13-1, the resulting lane configuration at the westbound approach would provide two left-turn lanes, two through lanes, and one shared through/right-turn lane. As shown in Table 9-2, the mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

It is noted that Pacific Coast Highway is within Caltrans’ jurisdiction and therefore implementation of the traffic mitigation would be outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

Intersection No. 49: Figueroa Place/Anaheim Street and Intersection No. 48: Figueroa Place/I-110 Freeway Southbound Off-Ramp (north of Anaheim Street)

The recommended mitigation consists modifying the existing traffic signal at Figueroa Place/Anaheim Street to provide a southbound right-turn signal phase on Figueroa Place that would overlap with the eastbound left-turn and through phase sufficiently long enough to accommodate the southbound right-turn volumes. The recommended mitigation is to facilitate access from the I-110 Freeway southbound off-ramp by coordinating operations of these predominant turning movements (i.e., the traffic signals would be coordinated to essentially allow these movements to occur concurrently). As shown in Table 9-2, this mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels.

It should be noted that in conjunction with the traffic signal improvements recommended at the Figueroa Place/Anaheim Street intersection, a traffic signal is proposed for installation as a voluntary project improvement at the Figueroa Place/I-110 Southbound Off-Ramp intersection, which is currently stop sign controlled. The proposed traffic signal at Figueroa Place/I-110 Southbound OffRamp intersection will be coordinated with the traffic signal at the Figueroa Place/Anaheim Street intersection to improve vehicular circulation in the area. Standard Caltrans and LADOT traffic signal warrant calculations were prepared for the Figueroa Place/I-110 Southbound Off-Ramp intersection. The determination of whether the installation of a traffic signal is warranted was based on criteria set forth in Chapter 4C of the MUTCD 2003 California Supplement, July 21, 2010 and the City of Los Angeles Manual of Policies and Procedures, October 2005. The traffic signal warrant calculations were based on future forecast peak traffic volumes.

The Peak Hour Volume Warrant is intended for application where traffic conditions are such that for one hour of the day minor street traffic suffers undue delay in entering or crossing the major street. The Peak Hour Volume warrant is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 and Figure D for the applicable number of approach lanes.

The plotted points under the future with project conditions for the AM and PM peak hours lie above the applicable curve. Therefore, Warrant 3 is satisfied for the Figueroa Place/I-110 Southbound OffRamp intersection. It is noted that the I-110 Southbound Off-Ramp intersection at Figueroa Place is within Caltrans' jurisdiction and therefore implementation of the voluntary installation of a traffic signal at the Figueroa Place/I-110 Southbound Off-Ramp intersection may be outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result. The traffic signal warrants
(i.e., Figure 4C-4 and Figure D), as contained in the MUTCD 2003 California Supplement and the City of Los Angeles Manual of Policies and Procedures, are provided in Appendix G.

## Intersection No. 51 Figueroa Street/I-110 Northbound On-Ramp (north of Pacific Coast Highway)

The recommended mitigation consists of modifying the southbound approach on Figueroa Street at the I-110 Northbound On-Ramp to accommodate the installation of a right-turn only lane. To accommodate the proposed right-turn-lane, the existing median and traffic control equipment would be modified and the roadway striping would be adjusted as needed. As shown in Figure 13-1, the resulting lane configuration at the southbound approach would provide two through lanes and one right-turn lane. As shown in Table 9-2, the mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

It is noted that the I-110 Northbound On-Ramp at Figueroa Street (north of Pacific Coast Highway) is within Caltrans’ jurisdiction and therefore implementation of the traffic mitigation would be outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 52: Figueroa Street/Pacific Coast Highway

The recommended mitigation consists of modifying the lane assignments on the westbound approach on Pacific Coast Highway at Figueroa Street to provide a fourth through lane on westbound Pacific Coast Highway. To accommodate the proposed lane assignments, the existing roadway striping would be adjusted as needed. As shown in Figure 13-1, the resulting lane configuration at the westbound approach would provide one left-turn lane, three through lanes, and one shared through/right-turn lane. As shown in Table 9-2, the mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix G.

It is noted that Pacific Coast Highway is within Caltrans’ jurisdiction and therefore implementation of the traffic mitigation would be outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result.

## Intersection No. 53: Figueroa Street/I-110 Northbound On-Ramp (north of Anaheim Street)

A traffic signal is proposed at the Figueroa Street/I-110 Northbound On-Ramp intersection (north of Anaheim Street) which is currently stop sign controlled. Standard Caltrans and LADOT traffic signal warrant calculations were prepared for the Figueroa Street/I-110 Northbound On-Ramp intersection. The determination of whether the installation of a traffic signal is warranted was based on criteria set forth in Chapter 4C of the MUTCD 2003 California Supplement, July 21, 2010 and the City of Los Angeles Manual of Policies and Procedures, October 2005. The traffic signal warrant calculations were based on future forecast peak hour traffic volumes. In addition, the
existing roadway striping at the northbound approach to the intersection would be adjusted based on discussions with LADOT staff. As shown in Figure 13-1, the resulting lane configuration at the northbound approach would provide one left-turn lane and one shared left-turn/through/right-turn lane.

The Peak Hour Volume Warrant is intended for application where traffic conditions are such that for one hour of the day minor street traffic suffers undue delay in entering or crossing the major street. The Peak Hour Volume warrant is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 and Figure D for the applicable number of approach lanes.

The plotted points under the future with project conditions for the AM and PM peak hours lie above the applicable curve. It is noted that the I-110 Northbound On-Ramp at Figueroa Street (north of Anaheim Street) is within Caltrans' jurisdiction and therefore implementation of the traffic mitigation would be outside the jurisdiction of the Lead Agency. Should Caltrans refuse to permit implementation of this feasible traffic mitigation measure, a residual, unmitigated traffic impact would result. Therefore, Warrant 3 is satisfied for the Figueroa Street/I-110 Northbound On-Ramp intersection (north of Anaheim Street). The traffic signal warrants (i.e., Figure 4C-4 and Figure D), as contained in the MUTCD 2003 California Supplement and the City of Los Angeles Manual of Policies and Procedures, are included in Appendix G.

The effectiveness of this mitigation measure was assessed through completion of the intersection capacity analyses that assume implementation of the recommended project mitigation measure. As shown in Table 9-2, the proposed mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels.

## Intersection No. 54: Figueroa Street/Anaheim Street

The recommended mitigation consists of the modifying the westbound approach on Anaheim Street at Figueroa Street to accommodate the installation of a right-turn only lane. To accommodate the proposed right-turn lane, the north side of Anaheim Street would need to be widened by approximately 10 feet to accommodate a 120 -foot long turn pocket. The resulting lane configuration at the westbound approach would provide one left-turn lane, two through lanes, and one right-turn lane. As shown in Table 9-2, this mitigation measure is anticipated to reduce the forecast Ponte Vista at San Pedro project impacts to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

### 13.2 Summary of Cumulative Mitigation - Los Angeles County Analysis

The traffic analyses in the previous section determined that development of the cumulative development projects is anticipated to result in significant impacts at four intersections located within unincorporated Los Angeles County. The recommended cumulative traffic mitigation program developed for these projects includes physical roadway improvements and funding of traffic signal improvements. Pursuant to the County of Los Angeles methodology, the project would be required to participate on a fair share basis towards implementation of these measures to mitigate cumulative traffic impacts. The following paragraphs summarize the recommended cumulative transportation mitigation measures.

## Intersection No. 32: Normandie Avenue/Sepulveda Boulevard

The recommended cumulative mitigation consists of installation of the County's traffic signal synchronization system for the Normandie Avenue/Sepulveda Boulevard intersection. Similar to the City of Los Angeles ATSAC/ATCS system, the County's synchronization system provides real time control of traffic signals and includes additional loop detectors, closed-circuit television, an upgrade in the communications links and a new generation of traffic control software. It is assumed that the system upgrade reduces the critical $v / c$ ratios by 10 percent ( 0.10 ). As shown in Table 12-2, this cumulative mitigation measure is anticipated to reduce the forecast cumulative impacts at the subject study intersection to less than significant levels.

It is noted that this intersection is located in the County of Los Angeles and is, therefore, outside the jurisdiction of the Lead Agency. Should the County of Los Angeles refuse to permit implementation of these feasible cumulative traffic mitigation measures, a residual, unmitigated cumulative traffic impact would result.

## Intersection No. 33: Normandie Avenue/Lomita Boulevard

The recommended cumulative mitigation consists of modifying the northbound approach on Normandie Avenue at Lomita Boulevard to accommodate the installation of a second left-turn lane. To accommodate the proposed second left-turn lane, the existing raised median on Normandie Avenue, south of Lomita Boulevard, would need to be removed. It is noted that the northbound approach on Normandie Avenue can be modified to include continuation of the existing bicycle lane and the second northbound left-turn only lane. The resulting lane configuration at the northbound approach would provide two left-turn lanes, one through lane, and one shared through/right-turn lane. As shown in Table 12-2, this cumulative mitigation measure is anticipated to reduce the forecast cumulative impacts at the subject study intersection to less than significant levels. A conceptual drawing of the proposed mitigation is provided in Appendix $G$.

It is noted that this intersection is located in the County of Los Angeles and is, therefore, outside the jurisdiction of the Lead Agency. Should the County of Los Angeles refuse to permit implementation of these feasible cumulative traffic mitigation measures, a residual, unmitigated cumulative traffic impact would result.

## Intersection No. 44: Vermont Avenue/Sepulveda Boulevard

The recommended cumulative mitigation consists of modifying the northbound and southbound approaches on Vermont Avenue at Sepulveda Boulevard to accommodate the installation of a second northbound right-turn lane. To accommodate the proposed second right-turn lane at the northbound approach, the existing raised median on Vermont Avenue, south of Sepulveda Boulevard, would need to be removed and the existing raised median on Vermont Avenue, north of the intersection, would need to be modified. The resulting lane configuration at the northbound approach would provide one left-turn lane, two through lanes, and two right-turn lanes. As shown in Table 12-2, this cumulative mitigation measure is anticipated to reduce the forecast cumulative impacts at the subject study intersection to less than significant levels. A conceptual drawing of the proposed cumulative mitigation is provided in Appendix $G$.

It is noted that this intersection is located in the County of Los Angeles and is, therefore, outside the jurisdiction of the Lead Agency. Should the County of Los Angeles refuse to permit implementation of these feasible cumulative traffic mitigation measures, a residual, unmitigated cumulative traffic impact would result.

## Intersection No. 45: Vermont Avenue/Lomita Boulevard

The recommended cumulative mitigation consists of modifying the eastbound approach on Lomita Boulevard, west of Vermont Avenue, to accommodate the installation of a second left-turn lane. To accommodate the proposed second left-turn lane, the existing raised median on Lomita Boulevard, west of Vermont Avenue, would need to be removed and the striping on the east leg of the intersection would need to be modified. The resulting lane configuration at the eastbound approach would provide two left-turn lanes, one through lane, and one shared through/right-turn lane. It is noted that a traffic signal modification would likely be required to accommodate this recommended mitigation measure. As shown in Table 12-2, these cumulative mitigation measures are anticipated to reduce the forecast cumulative impacts at the subject study intersection to less than significant levels. If implemented, these improvements are anticipated to reduce the forecast cumulative impacts at the subject study intersection to less than significant levels.

It is noted that this intersection is located in the County of Los Angeles and is, therefore, outside the jurisdiction of the Lead Agency. Should the County of Los Angeles refuse to permit implementation of these feasible cumulative traffic mitigation measures, a residual, unmitigated cumulative traffic impact would result.

### 13.2.1 Los Angeles County Fair Share Analysis

The methodology and the calculations of the project's pro-rata percentage at the study intersections that require cumulative improvement measures are summarized in Table 13-3. The method used for these calculations is based on the weekday AM and PM peak hour, project generated traffic volumes on the approaches to each affected study intersection divided by the project plus other development (related) project's traffic volumes on those same approaches. It should be noted that neither existing

Table 13-3
PRO-RATA PERCENTAGE OF MITIGATION COSTS CUMULATIVE IMPACTS - UNINCORPORATED LOS ANGELES COUNTY

traffic volumes nor ambient growth traffic volumes are included in the calculations. As shown in Table 13-3, the proposed project's fair share contribution toward the cumulative improvements is as follows:

- Intersection 32: Normandie Avenue/Sepulveda Boulevard $=3.3 \%$
- Intersection 33: Normandie Avenue/Lomita Boulevard $=14.8 \%$
- Intersection 44: Vermont Avenue/Sepulveda Boulevard $=4.2 \%$
- Intersection 45: Vermont Avenue/Lomita Boulevard $=12.4 \%$

### 13.3 Transportation Mitigation Measures Sequencing Plan

The project proposes a sequencing plan related to the implementation of the transportation mitigation measures recommended herein. Depending on market conditions and community needs, it is possible that the number and type of residential units (i.e., detached condominium, apartment or multi-family condominium) included in the project development program will be developed on a phased basis to meet future demand. Therefore, the purpose of the sequencing plan is to ensure that adequate mitigation measures from those identified are implemented to mitigate traffic impacts associated with new weekday PM peak hour trips with new project-related development as it actually takes place.

The implementation of transportation mitigation measures is planned to occur based on new weekday PM peak hour trips for three phases.

- Phase 1: Mitigation Required before 1 PM peak hour trip
- Phase 2: Mitigation Required before 151 PM peak hour trips
- Phase 3: Mitigation Required before 301 PM peak hour trips
- Project Build-Out: Mitigation Required before 451 PM peak hour trips

Thus, as outlined above, the Phase 1 mitigation would accommodate between 1 and 150 new PM peak hour trips (and proportional AM peak hour and Saturday peak hour trips) generated by the site. Similarly, Phase 2 mitigation would accommodate between 151 and 300 new PM peak hour trips generated by the site, etc. A summary of the sequencing plan Phase 1, Phase 2 and Phase 3 trip generation forecasts is provided in Appendix $\boldsymbol{H}$ (refer to Appendix Table H-1).

Traffic impact analyses prepared for the 56 study intersections using the LADOT CMA methodology and application of the City of Los Angeles significant traffic impact criteria were prepared for all four mitigation sequencing plan phases (i.e., Phases 1,2 and 3 as well as project build-out). Summaries of the $v / c$ ratios LOS values for the study intersections by sequencing plan phase are contained in Appendix $H$ (refer to Appendix Tables $\mathrm{H}-2, \mathrm{H}-3$ and $\mathrm{H}-4$ for sequencing plan

Phases 1, 2 and 3, respectively). As previously discussed, summaries of the $v / c$ ratios LOS values for the study intersections for project build-out are contained in Tables 9-1 and 9-2. A summary of intersection impacts under the mitigation sequencing plan is provided by phase and PM peak hour trips in Table 13-4. As indicated in Table 13-4, a total of 5 intersections is forecast to be impacted under Phase 1 (i.e., required for implementation prior to 1 new PM peak hour trip), a total of 9 intersections is forecast to be impacted under Phase 2 (i.e., required for implementation prior to 151 new PM peak hour trips), and a total of 16 intersections is forecast to be impacted under Phase 3 (i.e., required for implementation prior to 301 new PM peak hour trips).

Table 13-4
SUMMARY OF IMPACTS BY MITIGATION SEQUENCING PLAN PHASING

### 14.0 Congestion Management Program Traffic Impact Assessment

The Congestion Management Program (CMP) is a state-mandated program that was enacted by the State Legislature with the passage of Proposition 111 in 1990. The program is intended to address the impact of local growth on the regional transportation system.

As required by the 2010 Congestion Management Program for Los Angeles County, a Traffic Impact Assessment (TIA) has been prepared to determine the potential impacts on designated monitoring locations on the CMP highway system. The analysis has been prepared in accordance with procedures outlined in the 2010 Congestion Management Program for Los Angeles County, County of Los Angeles Metropolitan Transportation Authority, October 2010.

### 14.1 Intersections

The following CMP intersection monitoring locations in the project vicinity have been identified:

```
- CMP Station Intersection
    Int. No. 45 Gaffey Street/9 }\mp@subsup{}{}{\mathrm{ th }}\mathrm{ Street (Study Int. No. 43)
    Int. No. 56 Figueroa Street/Pacific Coast Highway (Study Int. No. 52)
    Int. No. 58 Western Avenue/Pacific Coast Highway (Study Int. No. 13)
    Int. No. }84\quad\mathrm{ Western Avenue/9 }\mp@subsup{}{}{\mathrm{ th }}\mathrm{ Street (Study Int. No. 29)
    Int. No. }128\quad\mathrm{ Western Avenue/Toscanini Drive (Study Int. No. 21)
    Int. No. 150 Hawthorne Boulevard/Sepulveda Boulevard (Study Int. No. 1)
    Int. No. 151 Crenshaw Boulevard/Pacific Coast Highway (Study Int. No. 6)
    Int. No. 152 Hawthorne Boulevard/Pacific Coast Highway (Study Int. No. 2)
    Int. No. 156 Western Avenue/Sepulveda Boulevard (Study Int. No. 11)
```

The CMP traffic impact assessment guidelines require that intersection monitoring locations must be examined for potential CMP traffic impacts if the proposed project will add 50 or more trips to a CMP monitoring location during either the AM or PM weekday peak hours. As shown in Figures 72 and $7-3$, the proposed project is forecast to add 50 or more trips during the AM or PM peak hours at the CMP monitoring intersections which is the threshold for preparing a traffic impact assessment, as stated in the CMP manual. Thus, a review of the potential impacts at the CMP intersection monitoring locations that are part of the CMP highway system is provided herein.

The CMP TIA significance criteria indicates that a significant impact occurs when the proposed project's traffic increases demand at a CMP arterial monitoring location by 2 percent of capacity (i.e., $v / c$ increase $>$ or equal to 0.02 ), causing the location to operate at LOS F ( $v / c>1.00$ ). Under CMP TIA criteria, a project would not have significant impact if the analyzed monitoring location is operating at LOS E or better after the addition of project traffic.

The nine CMP monitoring intersections were evaluated using the ICU method of analysis that determines $v / c$ ratios on a critical lane basis. As previously discussed, the overall intersection $v / c$ ratio is subsequently assigned a LOS value to describe intersection operations in the ICU methodology. Level of Service varies from LOS A (free flow) to LOS F (jammed condition). A description of the ICU method and corresponding Level of Service is provided in Appendix I.

As shown in Table 14-1, the Western Avenue/Pacific Coast Highway CMP monitoring intersection is anticipated to be significantly impacted by the proposed project applying the CMP TIA significant impact criteria. However, the mitigation measures described in Section 13.0 for the Western Avenue/Pacific Coast Highway (Study Intersection No. 13) intersection are anticipated to reduce the forecast project-related impact to less than significant levels. Therefore, no residual CMP traffic impacts due to the proposed project are anticipated at the CMP monitoring intersections. Copies of the CMA data worksheets for the CMP monitoring intersections are provided in Appendix I.

### 14.2 Freeways

Four CMP freeway monitoring locations in the project vicinity have been identified:

- CMP Station

Seg. No. $1045 \quad$ I-110 Freeway at Wilmington Boulevard south of C Street
Not Applicable ${ }^{13} \quad$ I-110 Freeway north of Sepulveda Boulevard
Seg. No. 1067 I-405 Freeway south of I-110 Freeway
Seg. No. 1068 I-405 Freeway north of Inglewood Avenue

The CMP TIA guidelines require that freeway monitoring locations must be examined for CMP traffic impacts if the proposed project will add 150 or more trips (in either direction) during either the AM or PM weekday peak hours. However, as shown in Table 14-2, the proposed project will not add 150 or more trips (in either direction) during either the AM or PM weekday peak hours to the CMP freeway monitoring locations which is the threshold for preparing a traffic impact assessment, as stated in the CMP manual. Therefore, no further review of potential CMP traffic impacts to freeway monitoring locations that are part of the CMP highway system is required.

[1] Although this segment is not identified in the CMP as a monitoring station, the segment was identified for review based on the distribution and assignment of forecast project-related trips.

### 14.3 Transit Impact Review

As required by the 2010 Congestion Management Program for Los Angeles County, a review has been made of the CMP transit service. As previously discussed, existing transit service is provided in the vicinity of the proposed project. It is noted that the CMP does not provide threshold of significance criteria for transit impacts. Therefore, this transit impact review is provided for informational purposes.

The project trip generation, as shown in Table 7-1, was adjusted by values set forth in the CMP (i.e., person trips equal 1.4 times vehicle trips, and transit trips equal 3.5 percent of the total person trips) to estimate transit trip generation. Pursuant to the CMP guidelines, the proposed project is forecast to generate demand for 26 new transit trips ( 5 inbound trips and 23 outbound trips) during the weekday AM peak hour. During the PM peak hour, the proposed project is forecast to generate demand for 34 new transit trips ( 22 inbound trips and 12 outbound trips). Over a 24 -hour period, the proposed project is forecast to generate a demand of 366 daily transit trips. The calculations are as follows:

- AM Peak Hour Trips $=571 \times 1.4 \times 0.035=28$ Transit Trips
- PM Peak Hour Trips $=699 \times 1.4 \times 0.035=34$ Transit Trips
- Daily Trips $=7,468 \times 1.4 \times 0.035=366$ Transit Trips

It is anticipated that the existing transit service in the project area will adequately accommodate the project generated transit trips. Based on the existing transit services provided in the project area, there are currently 14 buses per hour serving the project site during the AM peak hour and 12 buses per hour serving the project site during the PM peak hour. Thus, the project will add approximately two new transit riders per bus during the AM peak hour and two to three new transit riders per bus during the PM peak hour. Given the relatively few number of generated transit trips generated during the peak hours, no project impacts on existing or future transit services in the project area are expected to occur as a result of the proposed project.

While not required to mitigate potential traffic impacts, the following improvements and steps are recommended to enhance public transit service at the project site:

- In conjunction with the street widening of Western Avenue adjacent to the project site, provide a bus turnout lane and bus stop facilities (shelter, schedule information) at bus stops adjacent to the project site.

Coordinate with LADOT to potentially extend the existing San Pedro DASH route northerly on Western Avenue to serve the project site. If necessary, the project should provide appropriate turnaround facilities to allow the DASH vehicles to utilize the project site as an end point on the route.

### 15.0 Caltrans Freeway Analysis

As requested by Caltrans, additional traffic analysis of the project's potential impacts on the I-110 Freeway was conducted per guidelines documented in Caltrans' Guide for the Preparation of Traffic Impact Studies, June 2001. In accordance with the Caltrans guidelines, the "Operational Analysis" method from the Highway Capacity Manual (HCM) (Transportation Research Board, 2000) was utilized to perform the freeway analysis. The HCM freeway operation analysis method determines the passenger car per mile per lane ( $\mathrm{pc} / \mathrm{mi} / \mathrm{ln}$ ) density on the freeway segment. The HCM freeway analysis worksheets are contained in Appendix J.

The following two freeway segments were analyzed using the Caltrans guidelines:

- I-110 Freeway at Wilmington Boulevard, south of C Street
- I-110 Freeway north of Sepulveda Boulevard

Year 2009 traffic counts for the two subject I-110 Freeway segments were obtained from the Caltrans 2009 Traffic Volumes on California State Highways, 2010. The year 2009 traffic count data were adjusted upward by $0.64 \%$ per year to reflect year 2010 conditions. The derived year 2010 traffic counts were adjusted upward by $0.51 \%$ per year to reflect year 2017 conditions.

As shown in Table 15-1, the I-110 Freeway at Wilmington Boulevard is currently operating at LOS B in the northbound and southbound directions during the weekday AM and PM peak hours. The I110 Freeway north of Sepulveda Boulevard is operating at LOS D in the northbound direction and LOS C in the southbound direction during the weekday AM peak hour. During the weekday PM peak hour, the I-110 Freeway north of Sepulveda Boulevard is operating at LOS C in the northbound direction and LOS D in the southbound direction. The addition of project generated traffic to the analyzed freeway segments under the "Existing With Project" conditions is expected to nominally increase the density between 0.1 and $0.7 \mathrm{pc} / \mathrm{mi} / \mathrm{ln}$ during the weekday AM and PM peak hours. It is anticipated that the proposed project would not generate any significant impacts on the analyzed freeway segments in the Existing With Project scenario. The freeway segments are projected to continue operating at the same LOS as described in the existing conditions with the addition of project generated traffic to the analyzed freeway segments.

As also shown in Table 15-1, the I-110 Freeway at Wilmington Boulevard is forecast to operate at LOS B in both directions during the weekday AM and PM peak hours in the future pre-project condition (i.e., Year 2017 With Ambient Growth scenario). The I-110 Freeway north of Sepulveda Boulevard is forecast to operate at LOS D in the northbound direction and LOS C in the southbound direction during the weekday AM peak hour in the future pre-project condition. During the weekday PM peak hour, the I-110 Freeway north of Sepulveda Boulevard is forecast to operate at LOS C in the northbound direction and LOS D in the southbound direction in the future pre-project condition. The addition of project generated traffic to the analyzed freeway segments under the "Year 2017 With Proposed Project" conditions is expected to nominally increase the density between 0.1 and 0.9 $\mathrm{pc} / \mathrm{mi} / \mathrm{ln}$ during the weekday AM and PM peak hours. It is anticipated that the proposed project

［1］Based on year 2009 volumes provided in＂ 2009 Traffic Volumes on California State Highways＂，Caltrans，May 2009．The year 2009 volumes were increased by an ambient growth rate of $0.64 \%$ per year to reflect
year 2010 existing conditions．
［2］Based on the CMP traffic volume growth factors for the Palos Verde area，an ambient growth rate of $0.51 \%$ per year was used to derive the year 2017 volume．
［3］Although this segment is not identified in the CMP as a monitoring station，the segment was identified for review based on the distribution and assignment of f
3］Although this segment is not identified in the CMP as a monitoring station，the segment was identified for review based on the distribution and assignment of forecast project－related trips．
CALTRANS FREEWAY SEGMENT ANALYSIS
would not generate any significant impacts on the analyzed freeway segments in the Year 2017 With Proposed Project scenario. The freeway segments are projected to continue operating at the same LOS as described in the future pre-project conditions with the addition of project generated traffic to the analyzed freeway segments.

The Caltrans Guidelines do not recommend a significance threshold for purposes of assessing the potential traffic impacts of development projects to the state highway system. However, the City of Los Angeles (i.e., the Lead Agency) has adopted the CMP thresholds for purposes of reviewing the significance of project-related traffic impacts on freeway segments. As shown in Table 15-1, the I110 Freeway analyzed segments are forecast to operate at LOS D or better in future with project conditions, which is considered acceptable under the CMP significance thresholds. Therefore, this analysis of freeway segments using the analysis procedures recommended in the Caltrans guidelines reiterates the previous finding of a less than significant traffic impact to the freeway segments due to the proposed project.

### 16.0 Conclusions

This traffic analysis for the proposed Ponte Vista project has been prepared to identify and evaluate the potential traffic impacts for the proposed Ponte Vista at San Pedro project. Application of the City's threshold criteria to the "With Proposed Project" scenario indicates that 20 of the 56 study intersections are anticipated to the significantly impacted by the proposed project. Incremental but not significant impacts are noted at the remaining study intersections. Project-related mitigation measures have been recommended for the forecast impacted study intersections to reduce the forecast combined effects of the Ponte Vista project, including the relocation of the Mary Star High School access point, to less than significant levels.

Mitigation Monitoring and Reporting Program

## V. MITIGATION MONITORING AND REPORTING PROGRAM

## A. INTRODUCTION

Section 21081.6 of the Public Resources Code requires a Lead Agency to adopt a "reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment" (Mitigation Monitoring and Reporting Program).

Section 15097 of the CEQA Guidelines provides additional direction on mitigation monitoring or reporting):

## 15097. MITIGATION MONITORING OR REPORTING.

(a) This section applies when a public agency has made the findings required under paragraph (1) of subdivision (a) of Section 15091 relative to an EIR or adopted a mitigated negative declaration in conjunction with approving a project. In order to ensure that the mitigation measures and project revisions identified in the EIR or negative declaration are implemented, the public agency shall adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects. A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity which accepts the delegation; however, until mitigation measures have been completed the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program.

The City of Los Angeles is the Lead Agency for the Project. Any agency listed below is assumed to be within the City of Los Angeles, unless its jurisdiction is listed separately.

An Environmental Impact Report (EIR) has been prepared to address the potential environmental impacts of the Project. This Mitigation Monitoring and Reporting Program (MMRP) is designed to monitor implementation of the mitigation measures identified for the Project. The MMRP is subject to review and approval by the Lead Agency as part of the certification of the EIR and adoption of project conditions. The required mitigation measures are listed and categorized by impact area, as identified in the Draft EIR and Final EIR, with an accompanying identification of the following:

- Monitoring Phase, the phase of the Project during which the mitigation measure shall be monitored;
- Pre-Construction, including the design phase
- Construction
- Pre-Occupancy (prior to issuance of a Certificate of Occupancy)
- Occupancy (post-construction)
- Enforcement Agency, the agency with the power to enforce the mitigation measure; and
- Monitoring Agency, the agency to which reports including feasibility, compliance, implementation, and development are made.
- Monitoring Frequency, the frequency at which the mitigation measure shall be monitored.
- Action(s) Indicating Compliance, the action(s) of which the Enforcement or Monitoring Agency indicates that compliance with the identified mitigation measure has been implemented.

The Project Applicant shall be responsible for implementing all mitigation measures unless otherwise noted. The MMRP performance shall be monitored annually to determine the effectiveness of the measures implemented in any given year and reevaluate the mitigation needs for the upcoming year.

## Program Modification

After review and approval of the MMRP by the Lead Agency, minor changes and modifications to the MMRP are permitted, but can only be made by the Applicant or its successor(s) subject to approval by the City of Los Angeles. This flexibility is necessary due to the nature of the MMRP, and the need to protect the environment with a workable program. The Lead Agency, in conjunction with any appropriate agencies or departments, will determine the adequacy of any proposed change or modification. No changes will be permitted unless the MMRP continues to satisfy the requirements of CEQA, as determined by the Lead Agency.

## B. MITIGATION MONITORING AND REPORTING PROGRAM

## Section IV.A. Impacts Found to be Less Than Significant

No mitigation measures required.

## Section IV.B. Aesthetics

No mitigation measures required.

## Section IV.C. Air Quality

AQ-1 The following equipment specifications shall be implemented for construction activity, consistent with recent SCAQMD recommendations. ${ }^{1}$ If these exact specifications cannot be feasibly attained, the Project Applicant shall include a comparable measure demonstrating an equivalent effectiveness at reducing construction related air quality emissions.

- Three excavators shall meet Tier 3 off-road emissions standards;
- One grader shall meet Tier 3 off-road emissions standards;
- Two scrapers shall meet Tier 3 off-road emissions standards; and
- Six rubber-tired dozers shall meet Tier 3 off-road emissions standards and Diesel Particulate Filters (DPF) Level 2. ${ }^{2}$

Monitoring Phase: Construction

## Enforcement Agency: Department of Building and Safety <br> Monitoring Agency: Department of Building and Safety

Monitoring Frequency: Quarterly, during the time the listed equipment will be used
Action Indicating Compliance: Compliance report submitted by contractor

AQ-2 The Project Applicant shall ensure that construction contractors use super-compliant architectural coatings as defined by the SCAQMD (VOC standard of less than ten grams per liter). ${ }^{3}$

Monitoring Phase:<br>Enforcement Agency:<br>Construction<br>Department of Building and Safety<br>Monitoring Agency: Department of Building and Safety

## Section IV.D. Biological Resources

BIO-1 Potential impacts to nesting birds, migratory birds, and raptors shall be avoided either by scheduling grading, vegetation removal and demolition during the non-nesting period (August $30^{\text {th }}$ through February $14^{\text {th }}$ ), or if this is not feasible, by conducting a pre-construction survey for
raptor nests and avoiding disturbance of active nests. Provisions of the pre-construction survey and nest avoidance, if necessary, shall include the following:

- If grading or vegetation removal is scheduled during the active nesting period (February $15^{\text {th }}$ through August $31^{\text {st }}$ ), a qualified wildlife biologist shall conduct a pre-construction raptor and nesting bird survey no more than 30 days prior to initiation of grading to provide confirmation on presence or absence of active nests in the vicinity.
- If active nests are encountered, species-specific measures shall be prepared by a qualified biologist in consultation with the CDFW and implemented to prevent abandonment of the active nest. At a minimum, grading in the vicinity of the nest shall be deferred until the young birds have fledged. A nest-setback zone of at least 300 feet for all raptors and 100 feet for loggerhead shrike and other non-raptors shall be established within which all construction-related disturbances shall be prohibited. The perimeter of the nest-setback zone shall be fenced or adequately demarcated with staked flagging at 20 -foot intervals, and construction personnel restricted from the area.
- If permanent avoidance of the nest is not feasible, impacts shall be minimized by prohibiting disturbance within the nest-setback zone until a qualified biologist verifies that the birds have either a) not begun egg-laying and incubation, or b) that the juveniles from the nest are foraging independently and capable of independent survival at an earlier date.
- A survey report by the qualified biologist verifying that the young have fledged shall be submitted to the City prior to initiation of grading in any nest-setback zone.

## Monitoring Phase: Pre-Construction

## Enforcement Agency: <br> Department of Building and Safety <br> Monitoring Agency: <br> California Department of Fish and Wildlife

Monitoring Frequency:

## Action Indicating Compliance:

Survey report by qualified biologist

BIO-2 Prior to issuance of a demolition or grading permit, the Project Applicant shall have a qualified biologist conduct Phase 3 entry surveys within the interior of all buildings at the Project Site identified as having a high to moderate potential to provide bat roost habitat. These surveys shall involve accessing the attic and other areas (if warranted) to look for evidence of bats and utilizing heterodyne-style bat detectors to aid in the acoustic detection and identification of potentially roosting bats.

If bats or bat sign are not encountered during the Phase 3 surveys, the buildings shall be daylighted prior to demolition. Daylighting includes removal of substantial portions of the roof to create a well-lit, well-ventilated attic preventing bats from establishing in these buildings. Daylighting shall occur under the supervision of a qualified biologist at least 48 hours prior to building demolition. If bats are encountered during daylighting, all disturbance activities within the structure and within 200 feet shall be halted until: (a) the roost is vacated, or (b) a qualified biologist has coordinated with CDFW to develop alternative impact avoidance measures, up to and including bat removal.

If bats or bat sign are encountered during Phase 3 Surveys, the qualified biologists shall leave the building immediately to avoid further disturbance to roosting bats and conduct an emergence survey. Emergence surveys shall be conducted at dusk to determine where bats are exiting the building. Emergence surveys shall be conducted to determine the ingress/egress location, estimate the approximate number of bats using the roost, and identify the species occupying the roost using an ultrasonic bat detector. Demolition of occupied roosts shall be postponed until appropriate exclusion and mitigation measures have been determined in consultation with CDFW. Examples of exclusion measures include one-way barriers installed at the ingress/egress site that allow bats to exit the roost but not return.

## Pre-Construction

## Department of Building and Safety

## California Department of Fish and Wildlife

Once, prior to demolition or grading of each vacated housing structure

Once, during an emergence survey if bats are encountered
Survey report by qualified biologist; final report upon completion of demolition

BIO-3 Palm trees at the Project Site shall have the dead frond skirts removed between October 1 and March 31 before being felled to avoid impacts to roosting Southwestern Yellow Bats. A qualified arborist shall supervise removal of palm frond skirts in a systematic manner beginning with the top fronds and working towards the base of the tree. If bats are encountered during this process, trimming should halt and remain halted until (a) the roost is confirmed to have been vacated by a qualified biologist, or (b) a qualified biologist has coordinated with CDFW to develop alternative measures up to and including bat removal from the trees.

| Monitoring Frequency: | Daily, during removal of palm trees |
| Actions Indicating Compliance: | Compliance report submitted by contractor; |

Survey report and final report by qualified biologist, if bats are encountered

BIO-4 Prior to issuance of a grading permit, the Project Applicant shall enter into a Streambed Alteration Agreement or other documentation (satisfactory to CDFW) with CDFW to provide a 1:1 replacement of 0.86 acre of suitable streambed and associated riparian habitat either on-site as additional habitat creation, off-site either through habitat creation or purchase of credits in an approved mitigation bank in the Los Angeles Basin, or via a combination of these approaches.

Monitoring Phase: Pre-Construction
Enforcement Agency: Department of Building and Safety
Monitoring Agency: California Department of Fish and Wildlife
Monitoring Frequency: Once, prior to issuance of grading permit

## Action Indicating Compliance:

Streambed Alteration Agreement or other documentation to the satisfaction of the CDFW; submittal of same to Department of Building and Safety

## Section IV.E.1. Cultural Resources - Archaeological Resources

CULT-1: A qualified archaeologist shall be present to monitor all ground-disturbing activities associated with the Project.

Monitoring Phase:<br>Enforcement Agency:<br>Pre-Construction; Construction<br>Department of Building and Safety<br>Monitoring Agency:<br>Department of City Planning<br>Monitoring Frequency:<br>Daily, during ground-disturbing activities<br>Action Indicating Compliance: Quarterly compliance report submitted by qualified archaeologist

CULT-2: Prior to initiation of ground-disturbing activities, the archaeological monitor shall conduct a brief awareness training session for the benefit of all construction workers and supervisory personnel. The training, which could be held in conjunction with the Project's initial on-site safety meeting, shall explain the importance of and legal basis for the protection of significant archaeological resources. Each worker shall also learn the proper procedures to follow in the event that cultural resources or human remains/burials are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection and the immediate contact of the site supervisor and the archaeological monitor. It is recommended that this worker education session include visual images of artifacts that might be found in the Project vicinity.

NO-1 Noise and groundborne vibration construction activities whose specific location on the Project Site may be flexible (e.g., operation of compressors and generators, cement mixing, general truck idling) shall be conducted as far as possible from the nearest noise- and vibration-sensitive land uses.

## Monitoring Phase: Construction

Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Building and Safety

Monitoring Frequency: Periodic field inspections during construction
Actions Indicating Compliance: Field inspection sign-off;
Quarterly compliance report submitted by contractor

NO-2 When possible, construction activities shall be scheduled so as to avoid operating several pieces of equipment simultaneously, which causes high noise levels.

| Monitoring Phase: | Construction |
| :--- | :--- |
| Enforcement Agency: | Department of Building and Safety |
| Monitoring Agency: | Department of Building and Safety |
| Monitoring Frequency: | Periodic field inspections during construction |

## Actions Indicating Compliance:

Field inspection sign-off;
Quarterly compliance report submitted by contractor

NO-3 Flexible sound control curtains shall be placed around all drilling apparatuses, drill rigs, and jackhammers when in use.

| Monitoring Phase: | Construction |
| :--- | :--- |
| Enforcement Agency: | Department of Building and Safety |
| Monitoring Agency: | Department of Building and Safety |
| Monitoring Frequency: | Periodic field inspections during construction |
| Actions Indicating Compliance: | Field inspection sign-off; |
|  | Quarterly compliance report submitted by contractor |

NO-4 The Project contractor shall use power construction equipment fitted with the best available technology in noise shielding and muffling devices.

| Monitoring Phase: | Construction |
| :--- | :--- |
| Enforcement Agency: | Department of Building and Safety |
| Monitoring Agency: | Department of Building and Safety |
| Monitoring Frequency: | At initiation of construction activities, and quarterly thereafter |
| Action Indicating Compliance: | Quarterly compliance report submitted by contractor |

NO-5 Barriers such as plywood structures or flexible sound control curtains extending eight-feet high shall be erected around the Project Site boundary to minimize the amount of noise on the surrounding noise-sensitive receptors to the maximum extent feasible during construction.

| Monitoring Phase: | Construction |
| :--- | :--- |
| Enforcement Agency: | Department of Building and Safety |
| Monitoring Agency: | Department of Building and Safety |

Monitoring Frequency:<br>Actions Indicating Compliance:<br>Prior to construction activities, then periodic field inspections during construction<br>Field inspection sign-off;<br>Quarterly compliance report submitted by contractor

NO-6 All construction truck traffic shall be restricted to truck routes approved by the City of Los Angeles Department of Building and Safety, which shall avoid residential areas and other sensitive receptors to the extent feasible. Prior to the commencement of construction at the Project Site, a meeting shall be held with appropriate representatives of the Cities of Rancho Palos Verdes, Torrance, and Lomita. The purpose of the meeting will be to designate truck routes for off-site load hauling vehicles and other construction-related vehicles.

Monitoring Phase: Construction
Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Building and Safety
Monitoring Frequency: Periodic field inspections during construction
Action Indicating Compliance: Approval of Haul Route; quarterly compliance report submitted by contractor

NO-7 Two weeks prior to the commencement of construction at the Project Site, notification shall be provided to the immediate surrounding cities and off-site residential, school, and memorial park properties that discloses the construction schedule, including the various types of activities and equipment that would be occurring throughout the duration of the construction period.

## Monitoring Phase:

Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Building and Safety
Monitoring Frequency: Once, 2 weeks prior to construction
Actions Indicating Compliance: Compliance report submitted by contractor

NO-8 Equipment warm-up areas, water tanks, and equipment storage areas shall be located a minimum of 45 feet from abutting sensitive receptors.

| Monitoring Phase: | Construction |

No mitigation measures required.

## Section IV.N. Transportation and Traffic

TRANS-1 Prior to the generation of 301 PM peak hour trips at the site, the Project Applicant shall modify the existing traffic signal at the intersection of Crenshaw Boulevard and Palos Verdes Drive North to provide a northbound right-turn signal phase on Crenshaw Boulevard that would overlap with the westbound left-turn signal phase on Palos Verdes Drive North. To accommodate this signal phasing, U-turn movements on the westbound approach of Palos Verdes Drive North shall become prohibited.

Monitoring Phase:
Enforcement Agency:
Monitoring Agency:
Monitoring Frequency:

Action Indicating Compliance:

Pre-Occupancy
Department of Building and Safety
Department of Transportation
Once, prior to issuance of certificate of occupancy for a mix of uses that would generate 301 PM peak hour trips

Field inspection sign-off for the listed modifications

TRANS-2 Prior to the generation of 151 PM peak hour trips at the site, the Project Applicant shall do the following:
a. Restripe the southbound approach on Western Avenue at Lomita Boulevard to accommodate installation of a right-turn only lane; and
b. Modify the existing traffic signal at Western Avenue and Lomita Boulevard to provide a southbound right-turn signal phase on Western Avenue that would overlap with the eastbound left-turn signal phase on Lomita Boulevard.

## Monitoring Phase: Occupancy

Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Transportation

Monitoring Frequency:

Action Indicating Compliance:

Once, prior to issuance of a certificate of occupancy for a mix of uses that would generate 151 PM peak hour trips

Field inspection sign-off for the listed modifications

TRANS-3 Prior to the generation of 1 PM peak hour trip at the site, the Project Applicant shall do the following:
a. Modify the southbound approach on Western Avenue at Pacific Coast Highway to install a second left-turn lane and a third through lane; and
b. Modify the existing traffic signal at the intersection of Western Avenue and Pacific Coast Highway to accommodate the modification to the southbound approach.

Monitoring Phase:

Pre-Occupancy

Enforcement Agency:
Monitoring Agency:
Monitoring Frequency:

Action Indicating Compliance:

Department of Building and Safety
Department of Transportation
Once, prior to issuance of the first certificate of occupancy for the Project

Field inspection sign-off

TRANS-4 Prior to the generation of I PM peak hour trip at the site, the Project Applicant shall do the following:
a. Modify the westbound approach on Palos Verdes Drive North at Western Avenue to install a second left-turn lane;
b. Modify the existing median on Palos Verdes Drive North and the existing traffic signal at the intersection of Palos Verdes Drive North and Western Avenue to accommodate the modification to the westbound approach;
c. Modify the existing median and restripe the northbound approach on Western Avenue at Palos Verdes Drive North to install a right-turn only lane;
d. Restripe the southbound approach on Western Avenue at Palos Verdes Drive North to install a right-turn lane.

Monitoring Phase: Pre-Occupancy

Enforcement Agency: Department of Building and Safety

| Monitoring Agency: | Department of Transportation |
| :---: | :---: |
| Monitoring Frequency: | Once, prior to issuance of the first certificate of occupancy for the Project |
| Action Indicating Compliance: | Field inspection sign-off |
| TRANS-5 Prior to the gen install a traffic si | of 1 PM peak hour trip at the site, the Project Applicant shall the intersection of Western Avenue and Peninsula Verde Drive. |
| Monitoring Phase: | Pre-Occupancy |
| Enforcement Agency: | Department of Building and Safety |
| Monitoring Agency: | Department of Transportation |
| Monitoring Frequency: | Once, prior to issuance of the first certificate of occupancy for the Project |
| Action Indicating Compliance: | Field inspection sign-off |

TRANS-6 Prior to the generation of 151 PM peak hour trips at the site, the Project Applicant shall do the following:
a. Modify the northbound approach on Western Avenue at Westmont Drive to install a right-turn only lane; and
b. Restripe the eastbound approach on Westmont Drive at Western Avenue to provide one left-turn lane.
Monitoring Phase: Occupancy

Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Transportation
Monitoring Frequency: Once, prior to issuance of a certificate of occupancy for a mix of uses that would generate 151 PM peak hour trips

Action Indicating Compliance:
Field inspection sign-off for the listed modifications

TRANS-7 Prior to the generation of 301 PM peak hour trips at the site, the Project Applicant shall restripe the northbound approach on Western Avenue at Capitol Drive and modify the raised median to install a right-turn only lane.

Monitoring Phase:
Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Transportation
Monitoring Frequency:

Action Indicating Compliance:

## Occupancy

Once, prior to issuance of a certificate of occupancy for a mix of uses that would generate 301 PM peak hour trips

Field inspection sign-off for the listed modifications

TRANS-8 Prior to the generation of 151 PM peak hour trips at the site, the Project Applicant shall widen the south side of Anaheim Street west of Vermont Avenue by approximately 12 feet to accommodate a 180 -foot long turn pocket and install a right-turn only lane at the eastbound approach to the intersection.

## Monitoring Phase: <br> Occupancy

Enforcement Agency: Department of Building and Safety
Monitoring Agency:
Department of Transportation
Monitoring Frequency:

Action Indicating Compliance:
Once, prior to issuance of a certificate of occupancy for a mix of uses that would generate 151 PM peak hour trips

Field inspection sign-off for the listed modifications

TRANS-9 Prior to the generation of 151 PM peak hour trips at the site, the Project Applicant shall do the following:
a. Widen Gaffey Street north of Westmont Drive to accommodate installation of a right-turn only lane at the southbound approach to the intersection;
b. Relocate the existing southbound near-side Metro bus stop on Gaffey Street to the far side of the intersection (i.e., south of the intersection) where a full bus pad is to installed in the street;
c. Modify the existing traffic signal to provide a southbound right-turn signal phase on Gaffey Street that would overlap with the eastbound left-turn signal phase on Westmont Drive at the Gaffey Street intersection; and
d. Enhanced signage shall be provided as needed to guide the right-turn motorists from the eastbound Anaheim Street approach to Gaffey Street and Palos Verdes Drive North.

It is noted that the southbound approach on Gaffey Street can be modified to include continuation of the existing bicycle lane and the southbound right-turn only lane.
Monitoring Phase: Occupancy
Enforcement Agency: Department of Building and SafetyDepartment of Transportation
Monitoring Frequency: Once, prior to issuance of a certificate of occupancy for a mix ofuses that would generate 151 PM peak hour trips
Action Indicating Compliance: Field inspection sign-off for the listed modifications

TRANS-10 Prior to the generation of 301 PM peak hour trips at the site, the Project Applicant shall do the following:
a. Restripe the southbound approach on Gaffey Street at Summerland Avenue to accommodate the installation of a right-turn only lane, and
b. Modify the existing traffic signal to provide a southbound right-turn signal phase on Gaffey Street that would overlap with the eastbound left-turn signal phase on Summerland Avenue at the Gaffey Street intersection.

## Monitoring Phase: Occupancy

## Enforcement Agency: <br> Department of Building and Safety

Monitoring Agency: Department of Transportation
Monitoring Frequency:
Once, prior to issuance of a certificate of occupancy for a mix of uses that would generate 301 PM peak hour trips

## Action Indicating Compliance: <br> Field inspection sign-off for the listed modifications

TRANS-11 Prior to the generation of 301 PM peak hour trips at the site, the Project Applicant shall do the following:
a. Widen the north and south sides of Pacific Coast Highway east and west of Vermont Avenue to provide up to a 42 -foot half roadway on the 50 -foot half right-of-way;
b. Install a second left-turn lane at the westbound approach; and
c. Modify the existing traffic signal and roadway striping at the intersection as needed.

## Monitoring Phase:

Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Transportation
Monitoring Frequency: Once, prior to issuance of a certificate of occupancy for a mix of uses that would generate 301 PM peak hour trips

Action Indicating Compliance: $\quad$ Field inspection sign-off for the listed modifications

TRANS-12 Prior to the generation of 1 PM peak hour trip at the site, the Project Applicant shall do the following:
a. Modify the existing traffic signal at Figueroa Place/Anaheim Street to provide a southbound right-turn signal phase on Figueroa Place that would overlap with the eastbound left-turn and through phase sufficiently long enough to accommodate the southbound right-turn volumes; and
b. Install a new traffic signal at Figueroa Place/I-110 Southbound Off-ramp (north of Anaheim Street).

## Monitoring Phase: Pre-Occupancy

Enforcement Agency: Department of Building and Safety

| Monitoring Agency: | Department of Transportation |
| :--- | :--- |
| Monitoring Frequency: | Once, prior to issuance of the first certificate of occupancy for <br> the Project |
| Action Indicating Compliance: | Field inspection sign-off |

TRANS-13 Prior to the generation of 301 PM peak hour trips at the site, the Project Applicant shall do the following:
a. Modify the southbound approach on Figueroa Street at the Harbor Freeway Northbound On-ramp (north of Pacific Coast Highway) to accommodate the installation of a right-turn-only lane;
b. Adjust the median to accommodate the right-turn-only lane; and
c. Modify the traffic control equipment as needed.

Monitoring Phase: Occupancy
Enforcement Agency: Department of Building and Safety

Monitoring Agency: Department of Transportation
Monitoring Frequency: Once, prior to issuance of a certificate of occupancy for a mix of uses that would generate 301 PM peak hour trips

Action Indicating Compliance: Field inspection sign-off for the listed modifications

TRANS-14 Prior to the generation of 301 PM peak hour trips at the site, the Project Applicant shall modify the westbound approach on Pacific Coast Highway at Figueroa Street to accommodate a fourth through lane.

| Monitoring Phase: | Occupancy |
| :--- | :--- |
| Enforcement Agency: | Department of Building and Safety |
| Monitoring Agency: | Department of Transportation |

| Monitoring Phase: | Pre-Occupancy |
| :--- | :--- |
| Enforcement Agency: | Department of Building and Safety |
| Monitoring Agency: | Department of Transportation <br> Once, prior to issuance of the first certificate of occupancy for <br> the Project |

| Action Indicating Compliance: | Field inspection sign-off |

TRANS-18 Prior to the occupancy of the first residential unit within the Project, the Project Applicant shall, in accordance with applicable County protocols for calculating fair-share traffic improvement fees and based upon the assumption that all of the Related Projects affecting this intersection will be completed, make a fair-share payment toward the following:
a. Modify the northbound approach on Normandie Avenue to accommodate the installation of a second left-turn lane at the Lomita Boulevard intersection; and
b. Remove the raised median island on Normandie Avenue, south of Lomita Boulevard, to accommodate the installation of the second northbound left-turn lane.

It is noted that the northbound approach on Normandie Avenue can be modified to include continuation of the existing bicycle lane and the second northbound left-turn lane.

## Monitoring Phase: Pre-Occupancy

| Enforcement Agency: | Department of Building and Safety |
| :--- | :--- |
| Monitoring Agency: | Department of Transportation |

Monitoring Frequency: Once, prior to issuance of the first certificate of occupancy for the Project

## Action Indicating Compliance: Field inspection sign-off

TRANS-19 Prior to the occupancy of the first residential unit within the Project, the Project Applicant shall, in accordance with applicable County protocols for calculating fair-share traffic improvement fees and based upon the assumption that all of the Related Projects affecting this intersection will be completed, make a fair-share payment toward the following improvements:
a. Modify the eastbound approach on Lomita Boulevard, west of Vermont Avenue, to accommodate the installation of a second left-turn lane;
b. Remove the existing raised median island on Lomita Boulevard, west of Vermont Avenue, and modify the striping on the east leg of the intersection as needed; and
c. Modify the traffic signal to accommodate the installation of the second southbound left-turn lane.

Monitoring Phase: Pre-Occupancy
Enforcement Agency: Department of Building and Safety
Monitoring Agency: Department of Transportation
Monitoring Frequency: Once, prior to issuance of the first certificate of occupancy for the Project

Action Indicating Compliance: $\quad$ Field inspection sign-off

TRANS-20 Prior to the issuance of Building Permits for each residential building within the Project, the Project Applicant shall perform, to the satisfaction of LADOT, a trip generation analysis for the units to be constructed. The results of these studies shall indicate which of the intersection improvements shown above in Mitigation Measures TRANS-1 through TRANS- 16 must be operational prior to the occupancy of the subject residential units.

Monitoring Phase: Pre-Construction

| Enforcement Agency: | Department of Building and Safety |
| :--- | :--- |
| Monitoring Agency: | Department of Transportation |

| Monitoring Frequency: | As specified for TRANS-1 to TRANS-2419, above |
| :--- | :--- |
| Action Indicating Compliance: | Trip Generation analysis approval by LADOT |

TRANS-21 The Project Applicant shall coordinate with local and regional transit operators, including Metro and LADOT, to develop and implement strategies to increase transit utilization by Project residents. These transportation demand management (TDM) strategies could include, but would not be limited to, providing bus schedules and transit route information to residents, providing bicycle racks and information regarding optimal bike routes to local destinations to residents, and a carpooling information exchange.

| Monitoring Phase: | Pre-Occupancy, Occupancy |
| :--- | :--- |
| Enforcement Agency: | Department of Transportation |
| Monitoring Agency: | Department of Transportation |
| Monitoring Frequency: | Once, prior to issuance of a certificate of occupancy for each <br> residential structure; |
| Annually, during occupancy |  |
| Action Indicating Compliance: | Annual compliance report submitted by building management |

TRANS-22 In conjunction with the street widening of Western Avenue adjacent to the Project Site, the Applicant shall provide a bus turnout lane and bus stop facilities (shelter, bench and schedule information) at bus stops adjacent to the Site.

| Monitoring Phase: | Pre-Occupancy |
| :--- | :--- |
| Enforcement Agency: | Department of Transportation |
| Monitoring Agency: | Department of Transportatit |
| Monitoring Frequency: | Once, prior to issuance of <br> the Project |
| Action Indicating Compliance: | Field inspection sign-off |

TRANS-23 The Project Applicant shall coordinate with LADOT to potentially extend the existing San Pedro DASH route northerly on Western Avenue to serve the Project Site. If deemed necessary, the Project Applicant shall provide appropriate turnaround facilities to allow the DASH vehicles to utilize the Project Site as an end point on the route.

| Monitoring Phase: | Pre-Occupancy |
| :--- | :--- |
| Enforcement Agency: | Department of Transportation |
| Monitoring Agency: | Department of Transportation |
| Monitoring Frequency: | Once, prior to issuance of the first certificate of occup <br> the Project |
| Actions Indicating Compliance: | Determination by LADOT regarding the DASH Route; |
| Field inspection sign-off |  |

## Section IV.O.1. Utilities and Service Systems - Water

UTIL-1 In the event of full or partial public street closures, the Project Applicant shall employ flagmen during the construction of new water lines, to facilitate the flow of traffic.

Monitoring Phase: Construction
Enforcement Agency: Department of Transportation
Monitoring Agency: Department of Transportation
Monitoring Frequency: Periodic field inspections during closures
Actions Indicating Compliance: Field inspection sign-off;
Compliance report submitted by contractor

## Section IV.O.2. Utilities and Service Systems - Wastewater

No mitigation measures required.

## Section IV.O.3. Utilities and Service Systems - Solid Waste

No mitigation measures required.

## Section IV.O.4. Utilities and Service Systems - Energy

No mitigation measures required.
